In some Aquaria these animals have been kept for more than two years without ever taking food given them on purpose. Dr. Mettenheimer killed two Proteus which he had kept without any food for two years and two months, and was surprised to find in the stomach of one them two living intestinal worms. Our specimens did not show the same abstemiousness, but were often seen to devour earthworms and other food with avidity. They displayed the greatest activity, however, when there were brought into their tank water insects and small crustacea, such as Gammarus and Daphnia, to be found in sufficient quantities in Ceratophyllum and similar aquatic plants. Then the Proteus were observed to cross the tank in every direction, snapping and catching the insects easily and quickly without impeding their rapid progress. But they did not perceive animals being at rest, their vibrating motion being necessary to rouse the usually inert Amphibia to activity. One of the Proteus was observed to have smaller gills than the rest, but it seemed that this had been done by biting, and it remains questionable whether the Proteus, like the Axolotl, may occasionally lose the gills entirely and become a genuine lung-breathing animal. Until now very few facts of the development of the Proteus are known. Prof. Max Schultze, in Strasburg, a renowned naturalist, a short time before his death last year, made the first description of the eggs of the Proteus, which never before had been seen by any naturalist. They nearly resemble those of the Axolotl, differing from them principally by having a light-colored yolk.

[To be continued.]

—Mr. Monroe A Green, the brother of Seth Green, has just returned from a trip to the river St. Lawrence, during which he obtained for the State fish hatching establishment three million eggs of lake fish, and about two million eggs of brook trout.

—Seventy-five black bass were put into Winooski river at Montpelier, Vermont, Friday week, by the fish commissioners of the State. This gamey fish increases so rapidly that in a few years the river should be over stocked with them.

—Last week some evil disposed persons attempted to destroy the salmon in the Government tank at Oxford, by placing in the water upwards of a bushel of lime. The night watchman, who was in the building, hearing a commotion among the fish, went to the tank, and finding the lime, immediately ran to the hotel and notified Mr. Wilmot, who fortunately happened to be in the village. By the immediate removal of the lime and admission of fresh water, the whole of the fish were saved from destruction.—*Amerst (N. S.) Gazette*.

IMPREGNATING SPAWN.

Seth Green, the veteran fish culturist, writes us from Rochester, under date Nov. 10th, as follows:—

I have repeatedly been asked the question what I thought the best manner of impregnating spawn. In the year 1864 I discovered what is known as the dry process of impregnation, and have practiced it ever since. I will briefly describe the process: We take a pan and dip it into water, rinse it around, then pour it out again, leaving only that in which adheres to the pan. We then strip the spawn of the female in the pan, and on top of it the milt of the male; mix them thoroughly by gently tipping the pan from side to side for a few seconds. When you have spawn enough in the pan to cover the bottom let it stand about five

minutes; then put about one-half an inch of water over the spawn, then let it stand about thirty minutes in a cool place—a good place is in an empty hatching trough with a little water flowing through. Then fill the pan two-thirds full of water, and if the spawn does not stick to the pan wash them by filling the pan two-thirds full of water, and carefully pouring it off, do so till the spawn is perfectly clean, and they are ready for the hatching trough. This process is found to work admirably on brook trout, salmon trout, white fish, salmon and shad.

SETH GREEN.

Natural History.

ADDRESS OF A. R. WALLACE BEFORE THE BRITISH ASSOCIATION

ON SOME RELATIONS OF LIVING THINGS TO THEIR ENVIRONMENT.

OF all the external characters of animals, the most beautiful, the most varied, and the most generally attractive are the brilliant colors, and strange, yet often elegant markings with which so many of them are adorned. Yet of all characters this is the most difficult to bring under the laws of utility or of physical connection. Mr. Darwin, as you are well aware, has shown how wide is the influence of sex on the intensity of coloration; and he has been led to the conclusion that active or voluntary sexual selection is one of the chief causes, if not the chief cause of all the variety and beauty of color we see among the higher animals. This is one of the points on which there is much divergence of opinion even among the supporters of Mr. Darwin, and one as to which I myself differ from him. I have argued, and still believe that the need of protection is a far more efficient cause of variation of color than is generally suspected, but there are evidently other causes at work, and one of them seems to be an influence depending strictly on locality, whose nature we cannot yet understand, but whose effects are everywhere to be seen when carefully searched for.

Although the careful experiments of Sir John Lubbock have shown that insects can distinguish color—as might have been inferred from the brilliant colors of flowers which are such an attraction to them—yet we can hardly believe that their appreciation and love of distinctive colors is so refined as to guide and regulate their most powerful instinct, that of reproduction. We are therefore led to seek some other cause for the varied colors that prevail among insects, and as this variety is most conspicuous among butterflies—a group, perhaps, better known than any other, it offers the best means of studying the subject. The variety of color and marking among these insects is something marvellous. There are probably about ten thousand different kinds of butterflies now known, and about half of these are so distinct in color and marking that they can readily be distinguished by this means alone. Almost every conceivable tint and pattern is represented, and the hues are often of such intense brilliance and purity as can be equalled by neither birds nor flowers.

Any help to a comprehension of the causes which may have concurred in bringing about so much diversity and beauty must be of value, and this is my excuse for laying before you the more important cases that I have met with of a connection between color and locality. Our first example is from tropical Africa, where we find two unrelated groups of butterflies belonging to two very distinct families, characterized by a prevailing blue color not found in any other continent. Again we have a group of African Pieridæ which are white or pale yellow with a marginal row of bead-like spots, and in the same country, one of the Lycaenidæ is colored exactly like these that it was at first described as a species of *Pieris*. None of these four groups are known to be in any way specially protected so that the resemblance cannot be due to protective mimicry.

In South America we have far more striking cases. For in the three sub-families—Danainæ, Acraenæ, and Heliconiæ—all of which are especially protected, we find identical tints and patterns reproduced, often in the greatest details, each peculiar type of coloration being characteristic of distinct geographical subdivisions of the continent. Nine very distinct genera are implicated in these parallel changes. The resemblance thus produced between widely different insects is some times general but often so close and minute that only a critical examination of structure can detect the difference between them. Yet this can hardly be true mimicry, because all are alike protected by the nauseous secretion which renders them unpalatable to birds. But it is among islands that we find some of the most striking examples of the influence of locality on color generally in the direction of paler, but some times of darker and more brilliant hues and often accompanied by an unusual increase of size. Thus in the Moluccas and New Guinea we have several Papilio's distinguished from their allies by a much paler color, especially in the females, which are almost white. Many species of *Danaïdæ* are also very pale. But the most curious are the *Euploeas*, which in the larger islands are usually of rich dark colors, while in the small islands of Banda, Ké, and Matabello, at least three species not nearly related to each other are all broadly banded or suffused with white. * * * * * From the Fiji Islands we have comparatively few butterflies, but there are several species of *Diadema* of unusually pale colors, some almost white.

The Philippine Islands seem to have the peculiarity of developing metallic colors. We find there at least three species of *Euploeas* not closely related, and all of a more intense metallic luster than their allies in other islands. In these islands also we find the extensive and wonderful

genus of weavils *Pachyrhynchus* which in their brilliant metallic coloring surpass anything found in the whole eastern hemisphere, if not in the whole world.

In the Andaman Islands in the Bay of Bengal, in Madagascar and the West, India Islands, are to be found many examples similar to those which have been already given.

[To be continued.]

THE U. S. NATIONAL MUSEUM HAS ISSUED AS ITS FOURTH BULLETIN, a pamphlet of 56 pages, consisting of a catalogue of the "Birds of Southwestern Mexico, collected by Francis E. Sumichrast." This catalogue was prepared by Mr. Geo. A. Lawrence, of this city, than whom no ornithologist is more familiar with the bird life of this continent, especially of that portion of it south of the United States. The list which is given contains no less than 321 species, and the whole number of specimens examined was 1,700. The publication includes besides a brief preface by Mr. Lawrence, and the list already referred to, some valuable "Notes on the Geographical Distribution of the Birds in the Isthmus of Tehautepec," by Prof. Sumichrast, and in many cases the collectors notes on the habits of the different species secured.

Among the birds mentioned in the catalogue are many of our best known northern species, most of which were of course taken during the winter months, while spending the period of cold weather in the south. Among the warblers and the waders especially, do we notice a great number of more or less common North American forms. We observe, however, that several species are mentioned as being taken during the summer and early fall, which we should scarcely have looked for so far to the southward at that season. Such are *Polioptila cerules*, taken in "August;" *Salpinctes obsoletus*, "June"; *Contopus borealis*, "September"; *Contopus virens*, "May," etc., etc. Not a few very rare birds are included in the collection; among others the *Ciccaba squamulata*, which has hitherto been regarded as a doubtful species, and the great Harpy Eagle, *Thrasaetus harpyia*.

On the whole, the work before us must be regarded as a most important contribution to the ornithology of this continent, and having the stamp of Mr. Lawrence's authority it becomes doubly valuable.

Snowy owls have been unusually abundant this fall about Boston, over two hundred having been brought into town, it is said, within a week. This is a chance for inland collectors, with whom this species is much more uncommon than with us on the coast, to secure a specimen or two of a bird nowhere very abundant. All along the coast north of New York these birds have been found in unusual numbers; does their great abundance this fall point to the approach of unusually cold weather?

—Mr. H. Fassett, Esq., of Philadelphia, has sent us a beautifully marked quail, a partial albino, which was shot last week in Worcester county, Maryland, near Pittsville. Its plumage is like the autumn dress of the ptarmigan, in its transition from the brown of summer to the pure white of winter. We have sent it to Wallace's to be set up. Quail albino are infrequent, but not rare.

A NEW KANGAROO IN PAPUA.—A new kangaroo, of the genus *Dorcopsis*, has recently been received from the southeastern part of Papua, or New Guinea, by Dr. Albertis, who has described it under the name of *Dorcopsis luctuosa*; it is the second species of the genus at present known from New Guinea. It has long been known that the island of Aru possesses a species of true kangaroo, with a hairless naked muzzle, described under the name of *Macropus bruni*. This is a remarkable fact in geographical distribution, all other known kangaroos being natives of Australia and its immediate surroundings.—*La Nature*. (Paris, France.)

THE BARNACLE GOOSE.

STREATOR, La Salle county, Ill., Nov. 6th.

EDITOR FOREST AND STREAM:—

In your issue of October 26th is an article having reference to the barnacle goose, and from the observations of the writer, Mr. G. C. Kendall, (as he does not give us the ornithological name of the bird) I am led to believe that this is a bird comparatively unknown. In Giraud's "Birds of Long Island" but two species are mentioned, viz: the *Anser Hutchinsii* and the *Anser berniclus* or common brant. Of the latter there are many on the Atlantic coast, exceeding in numbers the other varieties; therefore this cannot be the one named. The former, *Anser Hutchinsii* of Audubon and Swainson & Richardson, appears to be much more of a rarity. Audubon says that there are plenty around Hudson's Bay, and unknown on the Atlantic, while Giraud reports that there, some thirty years since, when he compiled his valuable work, "at the eastern end of Long Island this bird is not uncommon, etc., while on the south shore it is not known."

I have been in this locality but a short time. My father, Mr. Martin A. Howell, Jr., the author of "The Waterfowl of the West," in *Harper's Magazine* of November, 1874, has a fine collection of photos and negatives of the various waterfowl and waders of this migratory tract, and among them a specimen of the *Anser Hutchinsii*, procured from the well-known shipper of game, T. D. Randall of Chicago, who reports it not a rare specimen, and generally considered a young specimen of the *Anser canadensis*, which it resembles exactly, save that it is about one-half size; but a careful examination reveals the fact that it is an adult specimen of a distinct species. A fine specimen shot on the prairie near this place was hanging at the door of one of our meat markets last week, and the only person here, in a population of 5,000, who could identify the bird was Mr. M. A. Howell, Jr., above. This was an adult bird, 27 inches in length. These birds are frequently shot throughout this tract, and usually come in company with the Canada goose. Most shooters call it brant, just as they call the *Anser albifrons* or white-fronted goose, brant. Is this the bird mentioned in your article, "The Hutchins Barnacle Goose?"

THOS. H. HOWELL.

[The bird referred to by our correspondent Mr. Kendall was probably not the *Anser Hutchinsii* of Giraud, but the much rarer *A. leucopsis* of Audubon, the *Branta leucopsis* of recent writers. The former is only occasionally taken

on the Atlantic coast, while it is not uncommon in the west, and it is extremely abundant on the Pacific coast. It is now regarded as only a variety of *B. canadensis*, the common wild goose. *Branta leucopsis*, on the other hand, is a European bird, which is very rarely taken in this country, and then only as a straggler. Audubon never saw it alive. The difference in size of the two species is not great; in length only about two inches, but the patches of white on the throat and sides of the head of *leucopsis* are much more extended than in the other.—Ed.]

MELANISM IN CYNOMYS LUDOVICIANUS.

[EDITOR FOREST AND STREAM:—I send you an interesting account of a black prairie dog, from the agreeable pen of the lady who recently wrote of her pet prairie dogs; and I am sure the brief article possesses popular interest as well as scientific value.—ELLIOTT COUES.]

CHEYENNE DEPOT Wyoming, Nov. 13, 1876.

DR. ELLIOTT COUES, U. S. A., Washington:

DEAR SIR—Would an account of a black prairie dog prove of interest? You know, I believe, that he was presented to us in a dilapidated bird cage. Of his antecedents I know nothing. He was much larger than the brown dogs, and totally black; so black that our little girl exclaimed "Why, he must have been painted with shoe polish!" He seemed very quiet, even gentle, in his restricted quarters, but obstinately refused all food, even sugar or apples, which the others devour with avidity. When we placed the cage on the verandah his brown brothers gathered around him with what we considered affectionate attention. Alas! for our shortsightedness. No sooner had we opened the cage and driven him out than the perfidious little wretches withdrew, and held a council of war, while the poor little "fifteenth amendment" stood perfectly bewildered at his surroundings. Finally, as he gained courage and ventured to move, five of the largest dogs attacked him furiously, and in spite of our efforts to save him they struggled and fought him successfully into the hole which must have proved his tomb. From that day to this he has never been seen, and the brown dogs carried their scars for weeks afterwards, showing the fight had been severe.

Are not black prairie dogs uncommon? Even in this much-be-prairie-dogged country he was considered a great curiosity, and many people saw him while he was caged. We very much regret now that we liberated him, but of course could not foresee the consequences.

We were much interested in your account of our foundling puppy.* He still lives and thrives, is as gentle and affectionate as if he were really the Newfoundland which he so strongly resembles.

Yours truly,

JULIA S. GILLISS.

[*Lately published in FOREST AND STREAM under the heading of "Reversion of the Dog to a Wild State."—Ed. F. & S.]

TAPE WORM IN A HARE.

WARREN, Pa., November 11th.

EDITOR FOREST AND STREAM:—

Yesterday, while gunning, I shot a brown hare. When first started he seemed to run very slowly, making short jumps, as though something was wrong. This aroused suspicion, and it was resolved to examine him closely. Upon dressing him he appeared to be in rather poor condition for this season, and upon searching among his intestines a tape worm—*taenia solium*—was found, which measured eighteen (18) inches in length, and a trifle over one-fourth ($\frac{1}{4}$) of an inch in width. Is this a rare case?

H. E. B.

Tape worms are liable to be found in any animal, and they are not even very uncommon in fishes.

GUNNER'S NAMES.

FRAMINGHAM, Mass., Nov. 11th.

EDITOR FOREST AND STREAM:—

In looking over the "List of Gunner's Names," printed from my manuscript, I notice two errors, or rather one repeated, which should be corrected. Against the two tringas—*Alpina* and *Bonapartei*—for "stille," as you have it, read "stib." Why stib, I can't make out; it seems entirely arbitrary. Most of the local names are derived either from (1) the color, (2) the form, (3) the note, or (4) the movement of the bird in question; no one of these applies here.

Appropos of your remark on the fitness of gunners' names, I would say that in working out the above list, I gave particular attention to that point, and satisfied myself in some cases, but failed in others. In the case of the yellow-leg, if any one familiar with its note will whistle it, prefixing a c. (a commencing consonant being naturally required in rendering the note into a name ready to the tongue) he will have the "cucu" of the gunners. The appellation of the turnstone is also evidently derived from its rasping note—"chicoric." The loud, rather startling note of the golden plover gives him his title of "squealer." I could make out no reason for "skinner," (the sanderling) unless it be that the birds are generally so fat that the skin slides off easily. The black-breast plover gets his title fairly enough—"bottlehead"—(I never heard the "beerhead" of the books at Plymouth). "Plunkett" or *Plunk*—it could be nothing else than the bittern. The red-throated loon carries his "pegging awl" in front of him, as for that matter do all the loons. The "quandle," (long-tailed duck) is also called the "old squaw," (never "old wife" hereabout) from its constant chattering. The surf duck is often called "skunkhead" which "goes without saying" if you have an old male in hand. The "driver," (red-breast snipe) "doe-bird" (*Esquimaux curlew*) "pine knot" (little auk) and "Daniel gull" (black-backed) puzzled me. The "brant bird" and "humility," I failed to identify; not being able to obtain specimens. Probably some of your readers can do it.

Yours truly,

F. C. BRONX.

For Forest and Stream.

OUR HAPPY FAMILY.

We have many of us seen in the museums a large cage wherein cats, rats, rabbits, squirrels, birds and mice live together in peace and harmony; and at a country fair we have seen a small cage which held a cat, rabbit and pigeon. The first is something truly marvelous, the last is simply ridiculous, for the poor cat, under the effect of an anodyne, might have been surrounded with rats even, and they might have slept between her feet and yet had their lives secure from danger. But this has nothing to do with our happy family, you say. True enough; but wait friends, until we have written our introduction, for our article may need one. Well, now, to commence. Our happy family consists, or consisted for a short time during the summer, of Fan, a large English setter, who has before appeared in FOREST AND STREAM; Trip, a bright little black and tan; Jeff, a handsome Irish setter; two pups, children of the above Fan; three cats, plenty of pigeons, and quantities of peeping turkeys and chickens. And we may as well include rats and mice, for though these do not as often appear in our sight, we have proof positive that they help to make up our happy family. Do all these live peaceably together? you ask. We answer in the words of the old nursery rhyme, "The rat ran after the butcher; the butcher ran after the ox." But to

speaking more plainly, they all agree to disagree. Trip, who is rather elderly, is decidedly cross and surly; he says to all children, "hands off!" and he reigns as supreme in our happy family. With Fan he shows some degree of politeness, except at meal time, and then he fills his own stomach before she may take a mouthful. After he has partaken freely of the repast he stands back, and the great dog, who is large enough truly to swallow him, walks meekly forward and finishes the pile, for there's no end to Fan's capacity in this respect. This is laughable, but to see the same little brute with Jeff is funny—extremely so. Jeff although not fully grown, is large and quite majestic in appearance, and one would think that a mite like Trip would fear him. But no, the latter is very jealous of him, and has always considered him an intruder and treated him accordingly. When Jeff is chained Trip goes up to him with bristling back and flashing eyes, and growls and scolds (dog fashion) till poor Jeff whines and begs piteously. The latter is peaceably inclined, and has frequently tried to obtain black and tan's friendship, but has been decidedly denied. "I make no friendship with such as you," says Trip, and no coaxing or imploring will alter this decision. The young pups he treats as badly. They try to gambol about him, but such snaps and growls as they receive warn them to desist. All of the dogs growl at the cats when they can do so unobserved, and the cats slyly catch the pigeons when they may unsee. The young pups devour the small fowls, not by one or two, but by the dozen. Trip gives the rats no time for second thought when he seizes them, and of course the mice suffer death when caught by the cats. Fan, who evidently wishes her young children to forget the relationship subsisting between them, growls whenever they venture near her, and Jeff is furious if they even come towards his kennel.

Yet all these dumb creatures have enjoyment of their own. Trip in being petted and carressed; Fan in going out with master and guns; Jeff occasionally has a share in the same; the pups delight in eating and mischief, for what does a pup like so well as eating, except doing mischief? The cats lie in the warm sun and are happy, if they can do this unmolested. The little peeping broods go round and around with their clucking mothers, happy in their protection and the food they provide for them. And even the rats and mice find enjoyment in nibbling away our walls, and building homes where they fancy none can molest or make them afraid. The pretty pigeons coo with their love to their mates, and enjoy life in a sweet way of their own. This ends the description of our happy family.

A. D. W.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDENS NOV. 16TH. —One snowy owl, (*Nyctea nivea*) presented by W. Carpenter, Jr., Salem, N. J.; one alligator, (*A. mississippiensis*) presented by Dr. E. J. Elbridge, Americus, Ga.; one white throated capuchin, (*Cebus hypoleucus*) one black-handed spider monkey, (*Ateles melanochis*) four parakeets, one red-billed tree duck, (*Dendrocygna autumnalis*?) one vervet monkey, (*Cercopithecus lanandii*) twelve macaque monkeys, (*Macacus cynomolgus*) two pig-tailed monkeys, (*M. nemestrinus*) one Rhesus monkey, (*M. Erythracus*) one mandrill, (*Cynocephalus mormon*) Purchased.

ARTHUR E. BROWN, General Superintendent

Woodland, Farm and Garden.

HOME DECORATION, OR WINDOW GARDENING.

NOTHING gives such an air of home to a room in winter, as a few plants well grown, and tastefully arranged, and showing at a glance the tender daily care of a lover of nature. One unconsciously feels their heart warm from the very first, to a good cultivator of flowers in a dwelling. And this is the season when perhaps more care is requisite to have the plants in good condition, that they may successfully pass through the dull days of winter, and grow and bloom more luxuriantly as the days lengthen, and the need of so much artificial heat is lessened. Many, especially, many ladies think that all they have to do, to have a flowery bower in winter, is, at the approach of cold weather to go out to the garden, dig up, and place in pots those geraniums, fuchsias, heliotropes, or kindred plants, that they have watched with so much pleasure during the summer and fall months, and that have so amply repaid their care that they are now large bushes with strong sappy shoots and probably full of bloom. They cannot bear to prune in a shoot or cut off a limb, but cram the roots into as small a pot as possible, and probably place them in a shady, but windy place for a few days, or even in the house at once, and wonder why they droop so soon, the leaves fall off, and they eventually die. This is the experience of many, and a disheartening one it is. Now, if about the middle of September, those plants are selected that are desired to be taken into the house for winter blooming (the smallest plants being the most desirable,) the shoots cut back at least half way, and as soon as the young growth starts nicely the plants taken up and carefully potted in some good compost, placed in a shady sheltered situation for a few days, to enable the plants to make some new rootlets, for their support, and then gradually exposed, till they are enabled to stand the full sunlight without flagging; there is no doubt whatever that the plants treated in this way, with ordinary care in winter will, on removal to the house give a pleasure and satisfaction to which many who dearly love plants, but who treat them wrongly, are entire strangers. These remarks, however, apply only to those plants that are expected to do double duty, that is, to bloom in summer and give a supply in winter also. There is a large number of winter blooming plants that are safer to depend on, and that give a larger return for the care expended on them, more especially during the dull months, from December to April. First of all, perhaps, come the purple and white Chinese primroses, blooming from December to May. The Persian Cyclamen, with its curious scented blossoms and beautifully netted or marbled leaves. Hyacinths of all shades of color, that by being brought to the light at different times, their season can be prolonged indefinitely, the double and single Due van Tholl and Tournesol tulips, and white, striped or purple crocuses requiring similar treatment. Oxalis of different sorts, calla lilies, favorites with all. Cape jessamines, Bouvardias, red and white, Begonia Saundersii, with its crimson clusters. The crab's claw cactus (*Epiphyllum*), of various colors, one of the easiest plants to manage. The feathery lopezia and cuphea, and even the Chinese daphne and Azalia can be grown with great success as window plants, and in connection with many others that could be named give a show of flower, during the en-

tire winter. But after all, probably the plants best suited for house decoration, are those grown for their foliage alone. There is so much diversity of shape and coloring among them, and they stand the dry air and sudden changes of temperature so well, that they are really better suited for such purposes than the generality of flowering plants. Many of the more hardy palms, such as *Lantana Borbonica*, *Corypha*, of sorts *chamædorea*, *areca lutescens*, and *rubra*, *Phoenix*, *Seaforthea*, &c. The screw pine, *Pandanus utile*, The rubber tree, *Ficus elastica*, *aralia sieboldii*, *aspidistra*, the various *dracaenas* and many others are well suited for grouping in windows, adding a grace and beauty that flowering plants alone cannot give, while many of the more hardy ferns, the various varieties of *Pteris*, *Nephrolepis*, *Onychium*, *Platyloma*, *Aspidium*, with some of the more tender *adiantums*, *Gymnogrammas*, and *Selaginellas*, are indispensable to fill up below the higher plants and give a truly exotic appearance to the whole group.

A word now as to temperature. Most of our plants are injured by too much heat. For a general collection of house plants, it is not desirable to allow the thermometer to get above 70°, and if they could be kept in a room where the temperature did not get over 65°, so much the better. In the night time 50° degrees is high enough. Give a little fresh air every fine day and all the sunlight attainable. Cleanliness is just as necessary to plants as animals, therefore sponge off the leaves occasionally with clean luke warm water, and syringe them overhead, especially on clear mornings. A little moisture in the air of a room is pleasant and healthy, for the family, as well as for the plants, but if they have to remain in over-heated, ill ventilated, and dusty rooms, they will soon droop and eventually die. Cleanliness, fresh air, moderate heat, and a moist atmosphere, sum up the requirements necessary to have healthy vigorous plants. W. J. D.

SWINE IN FLORIDA.

THE Florida hog seems to be of less domestic importance than his fellows in the north. He is little cared for, and being left to his own devices assumes an independent and self-reliant character. In New England the pig is the most important animal on the farm; he furnishes the largest part of the family meat, and his death is attended with many ceremonials. In the west the hog is still more important, for, representing so many square rods of corn crop turned into pork for convenience of transport to market, he often furnishes most of the cash product of the farm. But in Florida he lives a wild and independent life in the woods, and knows nothing of his owner, whom he perhaps never sees in life or benefits in death, since he is as likely to be eaten by a bear, panther, or alligator, as by the planter who nominally owns him. He reverts almost to the wild type in form and color, and displays much of the sagacity of a wild animal. It was first, we think, mentioned by Prof. Jeffries Wyman that most of the hogs in Florida were black, and this he attributes to the curious fact that those of light color are poisoned by a certain root which grows abundantly in that State, the effect of which is to cause the loss of their hoofs, so that by gradual selection most of the swine in that region have become black. Another scientist thinks that the black color prevails, because the light-colored hogs are more apt to be seen and devoured by the bears than the black ones; but in either case the fact is claimed by Darwin and his followers as an example of the "survival of the fittest."

My host in East Florida had a large herd of swine which lived in the woods or on the sea beach, from the latter of which they got most of their food in the shape of clams, mussels, and crabs, which they dug up from the sand, and waiting upon the fishermen for the refuse fish from the nets. When we came home from fishing, certain of these sagacious brutes were ever on the watch to meet us at the landing, and get the surplus of our sport. One day as we were anchored in deep water about fifty yards from the shore, an old sow with her pigs came along the beach. Our fishermen called to her, and she swam off to the boat, expecting some fish, which we flung to her. She took it, and then swam round the boat asking for more. I had often heard in the north that a hog cannot swim, as he cuts his throat with his hoofs, and was much surprised to see this one as much at home in the water as a Newfoundland dog. My host informed me that the bears generally got half his stock of pigs, those that escaped owing their safety to their speed of foot, though sometimes an old boar with well developed tusks would beat off a bear, and defend his family. S. C. C.

CURE FOR CHICKEN CHOLERA.—A correspondent of the *Rural World* sends that paper a remedy for chicken cholera which is certainly simple, and said to be an effectual cure for that disease. It appears to be a preventive of that disorder, and as an ounce of prevention is better than a pound of cure, it is at least worthy of a trial. It is as follows:—"Scald as much cornmeal as is required to feed the number of fowls, with boiling water. Make it tolerably greasy with lard or meat fryings. If lard, salt in the same proportion as for bread. If salty grease, no salt is necessary. Black pepper, ground, a level teaspoonful to a pint of meal. Feed this twice a week, in the morning, warm, and chickens will not need any watching. They have neither cholera or gaps. Chickens, or turkeys, either, should not be fed too often; twice a day in summer, if they are running out, and three times in winter is often enough. Most people feed their fowls too much. My experience has been, that all fowls that die with cholera are excessively fat."

GRAFTED STANDARD GOOSEBERRIES.—So much interest having been shown in the standard gooseberries and currants, exhibited by Kuhn & Co., Hoboken, N. J., directly in the rear of Horticultural Hall, at the Centennial Exhibition, and also at the September exhibition of the New York Horticultural Society, and their being indorsed so fully by such careful authorities as Dr. Zeidof and Charles Downing, as being entirely free from mildew, larger, and of finer flavor when grown in this manner. We are happy to lay before our readers the method of cultivation as described in the *Gardener's Monthly*, merely stating that the stock used is known generally as the Buffalo or Missouri currant, a native of Western Missouri, and cultivated generally for its very sweet scented yellow blossoms.

"By growing gooseberries in the form of standards their productiveness is increased, and the fruits themselves grow larger than I have ever seen them on plants that stood on their own roots. The stock on which the gooseberry is 'worked' in Germany, when it is grown as a standard, is *Ribes aureum*, a perfectly hardy shrub, often found in gardens on account of its little yellow sweet-scented flowers. To secure a large stock of this in the shortest possible time it is necessary to have or plant old bushes in good rich soil. As soon as the young bottom shoots get from two to three feet high, they must be covered with loose soil to the height of about six inches, so as to induce them to push roots from their lower ends. A few cuts in the bark, where such young roots should appear, will help their production materially. They should have plenty of water all through the dry season. In August or the first part of September some trimming is necessary. Remove all the small and weakly wood in order to strengthen the remainder. Whenever two or three good top branches are found on one shoot leave them, and on such plants graft both gooseberries and currants, or different sorts of each kind. To make sure of getting stocks with branched heads, stop the required number of shoots at the proper time, when they are about four feet high. In autumn, when the plants have dropped their foliage, dig all around the old plants, and take off such young shoots as are strong and well rooted. They should then be potted in a soil that contains plenty of sand and leaf mould; place them in a cold frame and cover them when the weather gets cold. About Christmas or a little after remove them to a greenhouse that is kept at an average temperature of from 45 degrees to 55 degrees, and in a short time they will make a start and can be grafted. As tying material use common paper spread over thinly with some grafting wax, and cut into narrow strips about six inches long. This is better than cotton or any other tying material. During the grafting, and after it is done, the house should be kept in a moderately warm and moist state, and must be shaded whenever the sun shines out brightly. In from two to three weeks the buds on the graft, as well as those on the stem, will commence to swell and the latter should be taken off as fast as they appear. A light sprinkling with tepid water must be given daily as soon as you see some leaves breaking on the scion. Thus they should be kept till all danger of frost is over; then take your plants carefully out of the pots and plant them out of doors in a nursery or in their permanent places. There they will require a few ties to suitable sticks to keep them straight and protect them against wind. Even the first year after grafting you may expect a crop of large showy fruit."

—A Lansing (Mich.) telegram to the *Chicago Tribune*, says: "Owing to the large apple crop in Michigan this year, a new business has been started. Good fruit can be bought for ten cents per bushel, for which, converted into jelly, a good market is found both at home and in Europe. Large shipments have been made to foreign markets of the product of this new industry."

—What the Colorado bug destroys in one section is compensated for by abundance in another. The *Boston Advertiser* of Saturday, says: "Potatoes in large quantities are coming from the British provinces. The steamer *Alpha* arrived yesterday from Prince Edward Island with 10,000 bushels—the largest cargo ever received at this port."

A NEW FOOD FOR HORSES.—A new kind of mash for horses is now coming into use. It is thus described by the *California Farmer*:—

"It is composed of two quarts of oats, one of bran, and half a pint of flax seed. The oats are first placed in the stable bucket, over which is placed the linseed; add boiling water, then the bran, covering the mixture with an old rug and allowing it thus to rest for five hours; then stir the mass well up. The bran absorbs while retaining the vapor, and the linseed binds the oats and bran together; a greater quantity of flax seed would make the preparation too oily and less relished. One feed per day is sufficient; it is easily digested, and is especially adapted to young animals, adding to their volume rather than to their height, giving substance to the frame. Prof. Sanson reminds us not to overlook the food, in connection with the amelioration of the stock. He considers oats, as so generally given to sheep, as objectionable, and approaching the unprofitable, rams generally receive one pound of oats daily; ewes half the quantity. Oats forming an exciting food are especially suited to rams during the season they are to serve, but for hastening the development of young sheep, they only build up the bones, not the flesh."

AN OLD SACRED TREE.—The cypress of Somma, in Lombardy, is said to be the oldest tree on record, dating from the year 42 B. C.; but at Anuradhapura, in Ceylon (noted for its ancient palaces), there is a Bo tree—a very famous object in connection with Buddhism—which, according to a writer in "Science Gossip," was planted 288 years B. C. It would have blown down long ago but for a thick wall built round the trunk, and all its main branches are supported by pillars. The leaves that fall off are collected by the Buddhist priests every day, and are kept in a holy part of the temple. They are offered to their deity on festival occasions, also sold to the poor ignorant natives, who believe the money paid for these holy leaves will buy them the righteousness of saints. This tree is held in such reverence that it is often visited by numbers of pilgrims.

A HORSE ON A LARK.—A correspondent tells the following incident:—

"One day a white horse afforded considerable amusement, who having loosened his leather halter, which hung dangling from his neck to the ground, escaped from the stable, and feeling himself master of the situation, determined to make the most of it. So he rolled on his back from side to side with four feet upward; then rising, trotted furiously about, or galloped, kicking his hind heels against the air. Then he thought he would run away, and did, nearly a quarter of a mile toward the woods, when his sober second thought was to return. Next he made a fierce onslaught upon a flock of geese, who unanimously spread their wings like the cherubim, and cleared the way, protesting that they had no desire to hurt him, earnestly hoping that there would be peace between his horshship and themselves, and that they would by no means tread on one another."

JAPANESE VEGETABLE WAX TREE.—The *Japan Mail* contains some further particulars respecting the preparation of the vegetable wax produced in Japan, and chiefly exported to England. This wax is obtained from the fruit, or, more correctly, berry of the wax tree. The tree, which is a species of *Rhus* (*R. succedanea*), flourishes more especially in the southern provinces of the empire. The fruit, which usually ripens about the month of October, is gathered when ready, and cleansed from its loose outer husk, a process which is accomplished in large wooden vessels with wooden malls, similar to those in use for cleaning rice. The residue product, available for the manufacture of wax, is a bean-shaped kernel of the size of a lentil, possessing an unusual degree of hardness of a dark yellow wax color, and offering a saponaceous exterior to the touch. The kernel is subsequently exposed in a sufficient degree to the steaming process, which deprives it of its extreme hardness, and allows of its oily properties being more easily extracted in the pressing stage. In this process the oil is received into small earthen vessels, in which it subsequently hardens to a blueish-green mass, in the shape which it is commonly met with in home consumption. Wax so produced is impure, and is only suitable for certain descriptions of candles and for wax-thread manufacture for home use. In order to render it merchantable for the exporter, the following refining process is resorted to: The wax is boiled with a lye until it is brought to a perfectly fluid state, and is then drawn off into a reservoir filled with clear water, the pure wax, which floats upon the surface, being removed. The mass is then exposed to the sun's rays for a period of fifteen or sixteen days, during fine weather, for the purpose of bleaching it, at the expiration of which time the wax presents a dirty white crumbling appearance and a strong tallowy smell. The boiling and bleaching are repeated with the view of rendering the refining process still more complete, the only difference being that, instead of lye, pure water alone is employed in boiling it. The product is a clear white powder, which, in place of its former crumbling appearance, has assumed an almost crystalline formation. The last stage of preparation for export consists in rendering the powder a compact mass, which is effected by melting it over a fire with a little water (in order to avoid burning), and running it off into flat vessels. The product thus obtained, and known to commerce as vegetable wax, differs exceedingly from white beeswax, with which it possesses the properties of color, brittleness, and similarity in its fan-shaped fracture in common. The only characteristic difference may be said to be in the odor, the beeswax giving off a refreshing aromatic scent in burning, while the tallowy smell of the Japanese wax is far from being agreeable. Vegetable wax is chiefly used in England in the manufacture of wax candles.—*The Garden* (London).

DEATH OF AN HISTORICAL HORSE.—At Dunelg, Woodstock, Canada, on the 26th of October, died the late Lord Raglan's charger. At the time of his death he was in the possession of Lieut.-Col. Skinner, M. P., who purchased him from Major Stewart, of the P. C. O. Rifle Brigade, some fourteen years ago. He was presented by Omar Pasha to Lord Raglan on his leaving for the Crimea. He served through the Crimean campaign and then came into the possession of Knollys; from his hand he passed into those of Major Stewart, who brought him to Canada, where he eventually became the property of his present owner, in whose service he died. He died at the age of thirty, curiously enough upon the anniversary of the battle of Balaklava.

—Geiger, in his "Peep at Mexico," thus describes the vegetation near Colima: "The trees are not large, but are so interwoven as to form impassable barriers, even apart from the bushes and shrubs that spring from every spot of vacant ground. Hundreds of creepers cling to every trunk, and twine round every branch, connecting by a thousand wiry threads, thickets, shrubs, and Cacti—a massive bulwark of profuse vegetation, through which the axe alone can hew a way. The huge *Organo Cactus*, with its tree-like stem, often two feet in diameter, and 10 to 15 feet high, sends up its stiff straight branches to a height of 30 or 40 feet from the ground, while the smaller species mingle in thousands with the shrubs and bushes near the earth. Wherever the creepers may have neglected trunk or bough, prolific parasites, gay alike with taper leaf and gorgeous blossom, hasten to perform their part in this fairy work of nature. The flowers have little scent, but their profusion of white, yellow and red, blended with the countless shades of green, charm the eye with tints as various as they are magnificent."—*The Garden*.

A SIMPLE DISINFECTANT.—One pound of green copperas, costing seven cents, dissolved in one quart of water, and poured down a water closet, will effectually concentrate and destroy the foulest smells. On board ships and steamboats, about hotels and other public places, there is nothing so nice to purify the air. Simple green copperas dissolved in anything, will render a hospital or other places for the sick, free from unpleasant smells. In fish markets, slaughter-houses, sinks, and wherever there are offensive gases, dissolve copperas and sprinkle it about, and in a few days the smell will all pass away. If a cat, rat, or mouse dies about the house, and sends forth an offensive gas, place some dissolved copperas in an open vessel near the place where the nuisance is, and it will purify the atmosphere. Then, keep all clean.

Furs and Trapping.

CANADA.—Our correspondent "Stansted," writing from an Eastern Township, Province of Quebec, under date of November 16th, reports that mink and muskrats are plenty in that vicinity, but scarcely prime as yet.

COON HUNTING.

TENAFLY, N. J., Nov. 18th, 1876.

EDITOR OF FOREST AND STREAM:—

There has been some very good coon hunting this fall in the woods near this place, and we have one old fellow about as smart as they make them. His trick is this, when the dogs start him he makes for a small pond in the woods, and swimming out into the middle remains there with only the tip of his nose out of the water. This is too small an object to see with an ordinary torch or brush fire, and the dogs around here are afraid of him in the water. We shall have some fun with him when the pond is frozen over. We used to have dogs that would kill a coon in the water as soon as on land, but the stock has degenerated, and now we have only an apology for a coon dog. It is fine sport in the middle of a dark, frosty, or what is better, rainy night, following a leader with a lantern, now falling into a hole or stepping into a puddle of water and mud, all of which make themselves felt on a long chase, finally coming up to where the dogs have treed the coon, when all else is forgotten in the excitement of capturing him. With the aid of a brush fire, shooting him, or shaking him down for the dogs to kill. The first is by far the easiest way, as it saves climbing, but furnishes less sport. RED WING.

TRAPPING MUSKRATS.—The Housatonic river, Mass., is being trapped by a professional trapper, who travels down the river with two boats, a tent, and some two hundred traps, moving down about two miles each day. He began at Pittsfield, and in a week had three hundred and eight muskrats and two otters. He says that after an experience of twenty years in trapping he never before was on a river where the muskrats were so thick and good as on the Housatonic; and he proposes, if his good luck continues, to follow the river to its mouth. He has a contract with the Gunthers, of New York, who pay him twenty cents each for muskrats, making his week's work yield him over sixty dollars.

A YOUNG TRAPPER.—A young down-easter named Hendrick, makes his headquarters at Rumsey, Maine, every winter season, and sets over three thousand traps for different kinds of animals in Coos and Grafton counties. It takes him two weeks to make the round of his traps on horseback. He has very good success in his chosen vocation, and last season secured fur to the value of \$1,000, including seventeen otters at \$28 each. He has already captured \$600 worth this season.

—"It is estimated," says the *Temps*, "that the value of the violets sold in Paris amounts to 587,000*fr.* a year. The average number of bouquets disposed of is 5,825,000."

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

—Many of the yachting readers of the FOREST AND STREAM will be pained to learn of the death of Com. M. R. Todd, of Norfolk, Va. He was a veteran hunter and yachtsman, and after a well spent life of three fourths of a century, he has furled his sails, and gone aloft. He was buried at 12 m., on the 14th.

NASSAU BOAT CLUB.—At the annual meeting of the Nassau Boat Club, held at their rooms on Monday evening, November 13th, the following officers were elected for the ensuing year: President, General Charles Roome; Vice President, Robert L. Reade; Secretary, Walter S. Wilson; Treasurer, James Willis; Captain, Christian G. Petersen; Coxswain, Charles Badgley; Trustees, Daniel Appleton, John H. Abeel, Jr., William Brookfield, Chas. D. Belden.

GREENWOOD LAKE.—The following letter from the captain of the Triton Boat Club, bears further testimony as to the advantage of Greenwood Lake:—

New York, November 13th.

EDITOR FOREST AND STREAM:—

Your request for my opinion of Greenwood Lake as a regatta course is received, and it gives me great pleasure to be permitted to add my mite to the already accumulated mass of testimony in its favor. It has been my privilege during the last eight years that I have been connected with boating, to have witnessed regattas upon all of the principal courses of the east, and I say without fear of contradiction or the least hesitation, that Greenwood Lake possesses more points in its favor than any other rowing course I have ever seen. Combined with its nearness to New York, the center of boating, it has the advantage of a clear straight course of at least four miles, all positions equally free from tide or current, with no endless number of steamboats to disturb its placid surface, and ample accommodations for thousands to witness a race; not at every eligible point a grand stand with a charge for admittance, but only such as furnished by the high and rocky shore, shaded from the sun and free to all. Under proper management, such as characterized the regatta given last summer, it cannot fail to become the favorite rowing course of the future. And with wishes for its success, I am, S. A. SMITH.

New Publications.

MAGAZINES.

There is a decided "sporting" flavor about some of the December magazines, which are already at hand. It is a very healthy sign, and an indication that legitimate sport with dog and gun must no longer be pursued sub rosa, as it were, when periodicals of the standing of *Scribner's* and *Appleton's* give prominence to sketches of sporting incidents. The opening article in *Scribner's* is a capital article on "Bay Shooting," from the pen of T. Robinson Warren, Esq. The favorite resorts along the coast for bay bird and duck shooting, together with the *modus operandi*, are faithfully described. Every habitue of Barnegat will recognize the pictures of Bill Chadwick and the Ridgways. Mr. Albert Rhodes contributes a paper on "Our Diplomats and Consuls," which, we think, is not half severe enough. The system of appointment is bad enough, but the men sent out to represent us are, in many instances, simply a disgrace to the nation. We could go beyond Mr. Rhodes and mention ports, in the East particularly, where the name of "American Consul" was a by-word and a reproach. Mr. Hale's serial story, "Philip Nolan's Friends," is concluded, and in book form we imagine it will prove a story of great interest. "That Lass 'o Lowrie's" is continued and creates an interest which is almost painful. Dr. Holland, in this issue, commences a new story entitled "Nicholas Minturn," which opens well, and promises to be up to the Doctor's high standard. The short sketches and miscellany are all good.

Appleton's opens with an illustrated article by Mr. Maurice Perry, entitled "Some of Our Game Birds." We cannot, however, award to it the same merit as is found in Mr. Warren's article just alluded to. The sketches, with one or two exceptions, are not good. That of the woodcock conveys no adequate idea of the noblest of our game birds; indeed, it more resembles the snipe proper, while the cut intended for the latter would answer very well for one of the bay birds, yellow legs, for instance. The plover we do not recognize, nor are the quails good. Neither can we agree with Mr. Perry in some of his descriptions. He considers a bag of half a dozen woodcock as of very rare occurrence, while one of a hundred snipe is, with him, quite ordinary. We should rather be induced to reverse these conditions, if anything. Bags of one hundred snipe are exceedingly rare in our experience. Plover he describes as being shot in Florida with a heavy gun and three ounces of shot. The courage of a man who will stand behind three ounces of shot to kill plover is worthy of our admiration. Mr. Perry himself prefers the "long bow" to the shot gun, even in plover shooting. "Well!" as a certain old lady remarked on a memorable occasion, "there's no accounting for taste." The other illustrated article in the current number of *Appleton's* is the continuation of Mr. Toulé's "Old Time France," in which the pleasures and pastimes of the French during the reign of Louis XV and Louis XVI are described. Mr. Payne's serial "Fallen Fortunes" is continued, a story by George Sand—"The Tower of Percefont"—is commenced, and there are a number of capital short sketches by well known writers.

The *Atlantic* for December opens with an installment of Mr. Henry James Jr.'s very interesting story, entitled "The American." In it we are given some excellently drawn characters of the "old regime" Parisians, contrasted with the strong, plain spoken, self-made American. Under the title of "Old Woman's Gossip" Mrs. Francis Anne Kemble continues her reminiscences of notable men and women. Mark Twain is a contributor to this number of a sketch entitled "The Canvaser's Tale." The subject, as may be imagined, is one in which the humor of the inimitable Twain finds a capital field. Mr. James Russell Lowell contributes "An Ode for the 4th of July, 1876." In "Crumbs of Travel" Mr. J. W. DeForest introduces us to the mysteries and incongruities of a British boarding house. Besides those we have mentioned there are a number of papers by writers the majority of whose names are familiar.

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

G. W. C., Northampton, Mass.—Will you give the address of some party who has Scotch stag hounds for sale? Ans. We know of none at present, but they are frequently advertised in our columns.

J. M., Chicago.—Which style of rubber boots is the most durable, the plain black rubber, or that having brown cloth on the outside? Ans. The brown cloth or "mackintosh;" besides the color being better for duck shooting, &c.

J. H. P., Philadelphia.—Please tell me if you can where I can get "snake-tanned," or as some say, "Indian-tanned," deer skin moccasins. Ans. Can be obtained from H. A. Bromley, M. Ryder, or A. Moore, St. Paul, Minnesota.

TOP SHOT, Cazenovia, N. Y.—Can you tell me where I can procure artificial bird's eyes with raised pupils? Ans. Our dealers in taxidermists goods report that they have never met with artificial eyes with raised pupils.

H. H., New York.—Will you please inform me if there is good shooting at St. Augustine? Ans. Very fair sport can be had in the immediate vicinity of St. Augustine. Quail are abundant and also ducks and shore birds generally.

C. W., New York.—What sort of shooting can be had now near South Amboy, say within five or six miles of it? Where is the best place for ducks near there? Ans. Quails, ruffed grouse and a few woodcock. You will find much better duck shooting on Barnegat Bay.

E. W. C., Germantown.—Would like to know where would be a good place on Chesapeake to go on Thanksgiving day after ducks, and what would be probable cost for one day's gunning. Ans. At Havre de Grace, Md., you will find duck shooting and duckers with boats, decoys, etc., at about \$25 per day.

R. E., New Orleans, La.—1. What book on "Training Dogs" do you consider the best? 2. What breed of dogs is the most easily taught to "tree" squirrels? 3. What is the price, in your city, of a pointer or setter pup, of good pedigree? Ans. 1. Dink, Hutchinson, & Mayhew, price \$8; can send a copy. 2. A Scotch terrier would be good for the purpose. 3. About \$25.

INEXPERIENCE, Washington, D. C.—I have a skye terrier who constantly scratches, and also bites the hair on her legs and back. Apparently there appears to be neither skin disease or fleas. Can you suggest any cure? Ans. Give him a small dose of cathartic pills occasionally, feed no meat, and give her exercise every day, the more the better.

F. E. B., Harrisburg.—My setter dog three years old, after carrying him in wagon two or three miles, becomes very sick and vomits; before vomiting he pants very much. Can you suggest a remedy? Ans. Give your setter as much wagon riding as you can before feeding him, and he will soon become accustomed to the motion, and will not be affected by it.

C. B., Springfield, Mass.—Can you give me the name of some locality about the latitude of North Carolina where I can find good quail and partridge shooting during December? I should prefer North Carolina, Texas, Kentucky, or Virginia. Ans. We have found good quail shooting near Greensboro, N. C., and on the Ohio river bottoms in Virginia and Ohio below Wheeling.

W. H. L., Philadelphia.—Please inform me of the best way to get to the Homosassa river in Florida, and also if sweet oranges grow there? Ans. By rail from Jacksonville to Cedar Keys and thence by boat; or by boat from Jacksonville to Silver Spring, thence back to Ocala, thence wagon, thirty-six miles to Homosassa. See "Camp Life in Florida," published by us, page 55. Sweet oranges grow to perfection there.

F. F. B., Battle Creek.—1. What is considered the best color for a setter? Is white a good color? 2. Can you give me the directions of a house publishing a book upon training sporting dogs, also the price? Ans. 1. White is a good color, but we prefer orange and white, black and white, or black, tan, and white. 2. Dinks, Hutchinson, & Mayhew; price \$3, is one of the best works on training, &c. Can send to you a copy.

DICK, Fowler, Ohio.—What would be the cost of a trip to Texas and a stay of four weeks, and what would be the best route? Also what point should I go to to have plenty of bird shooting? Ans. It costs \$42 to go to Deminon which is near the northern boundary of the State. Take Missouri, Kansas and Texas R. R. Can get good quail and grouse shooting anywhere along the line.

W. L. A., Chestnut Hill, Philadelphia.—1. Has there not been a book on North America Bats by Dr. Coues, published lately? If so, where can I get it, and at what price? 2. Is the manatee found at the present time in Florida? Ans. 1. We believe that Dr. Coues has such a work on hand, but it has not yet been published. 2. Yes; in considerable numbers, but it is of course growing scarce each year.

SNIRE, London, Ont.—Can you tell me what one and one-half brace of English pheasants are worth? The hens laying last year 30 eggs? Ans. We can not tell what live pheasants are worth, but there are probably many persons who would like to have them and willing to pay liberally. You had better fix your own price and advertise them, when you will doubtless have many offers.

J. McK., Philadelphia.—Not having much faith in imported dogs, "blue-bloods" or blue Beltons, wishes to hunt his native dog against one of them for one month every day. Ans. J. J. Seitzenger, Esq., of your city, has a thoroughbred blue Belton setter named Czar, imported by Mr. Horace Smith, our Field and Kennel Editor, which he is willing to match against any dog as to bottom and staunchness on game.

J. A., Aurora, N. Y.—1. Please tell me how to reline a rifle barrel, and if the old browning will have to be removed? 2. Is Stevens "Hunters pet" well adapted for short range off-hand shooting? 3. Is there any law on squirrels in this State? Ans. 1. It is a trade secret; send your gun to a gunsmith. 2. Yes; very accurate up to 200 yards. 3. No general law relating to squirrels.

E. H. J., New York.—I am thinking of making a fly rod of the wood called "green heart," but before doing so I would like to learn several things about the quality of this wood. 1. Has it as firm and reliable a spring as lancewood? 2. Would it do to make a 6 or 8 oz. rod entirely of it, butt, second joint and tip? 3. Would it need staining? Ans. 1. Yes; better. 2. All but the tip; the latter made of lancewood would be better for so light a wood. 3. No.

E. S., Baltimore.—I have a setter two years old that hunts splendid without a gun, but when taken into the field at the first fire gives up and becomes a blinker for the rest of the day; does not run away, but lies down and will not hunt. Do you think there is any hope of his ever becoming a hunter? Have tried leashing him to another dog, and every known expedient, without success. Ans. In our next issue you will find an article upon the subject of gun shy dogs.

G. E. W., New Haven, Conn.—Can a dog that is A No. 1 in other respects be made to bark at a hole whenever he drives anything in, such as squirrels or rabbits? I have such a one, and would like, if possible, to have him acquire that. Will you please tell me how I can teach him? Ans. Perhaps a little moral suasion may cause him to give tongue on proper occasion, but we doubt if he would any longer be A No. 1 in other respects.

W. T. R., New York City.—I have a Greener breech-loader, 10 bore, 9½ pounds, 30 inch barrels. I did not purchase it as a choke-bore, but recently made with it with 3½ drachms powder, 1½ oz. No. 7 American shot, 30-inch circle, 40 measured yards, the following consecutive targets: 241, 236, 209, 112, 247, 239, 243, 240. Please tell me whether you would consider the gun a choke-bore, or how the gun compares with choke-bore performances under like conditions. Ans. There is very little doubt but that your gun has been choke-bored.

E. S. and G. S., Bonneau's P. O.—I have a setter puppy about 15 months old that has had red mange for ten months. I have tried several remedies, rubbing with sulphur and lard, washing with carbolic acid, sulphuret of potassium, etc., but all have failed to cure. Ans. Add a little turpentine to the sulphur ointment you are using, and the day after applying it wash the dog with carbolic soap; and besides give him eight drops of Fowler's solution of arsenic twice a day for three days.

W. H. M., Sterling Run, Pa.—I have a setter; he is about three or four years old and is sick. The chief symptom that the setter has is that he is very poor, nothing but a walking skeleton; appetite very poor; will eat nothing unless it just happens to please. Ans. Have mailed to you some condition powders, which give as directed, besides which give him a piece of garlic the size of a small marble twice a day for three days.

TRAPPER, Columbia, S. C.—1. Where would you advise us to go to trap this winter, where to buy our traps, and to what city go direct from here nearest the place. 2. How many guns and rifles should we take? 3. Please say how far a Moore & Harris double muzzle loader 12-bore 31-inch barrel will kill duck with No. 4 shot. Ans. 1. Go to Virginia, in our issue of November 2d, in the department of Furs and Trapping, you will find a description of the places to trap. If you cannot buy your traps at home send to the Oneida Community, at Oneida this State. We question whether you would make it pay. 2. One shot gun and one rifle would be sufficient. 3. 40 yards would be an outside distance.

F. K. G., Noroton, Conn.—1. What is the charge of powder and shot for a Remington gun, 12-gauge, 8½ lbs., for ducks? 2. Which is the best for ducking, paper or brass shells? 3. What effect will three wads have over the powder? Ans. 1. About 4 drs. powder to 1½ oz. shot. Some guns of same weight will bear 4½ drs. powder. We always use as much powder as the shoulder will comfortably bear. 2. There is very little difference between paper and metallic shells. The latter for duck shooting alone are good and more economical. 3. Many guns shoot harder with three wads on the powder.

SANDY HOOK, New York.—I am informed that Capt. Bogardus and Green Smith once upon a time shot a pigeon match, 25 birds each, 20 yards rise and one yard boundary; Green Smith scored 23, Capt. Bogardus, 16. Is this performance on record? Did the two gentlemen named ever shoot a match under such conditions, and if so, what was the score? Ans. Such a match was shot by the gentlemen named at Dexter Park, Chicago, on October 7th, 1875. The scores were "nil" on the first round also in shooting off the first tie (of misses); on the second Mr. Smith killed his first bird within the required one yard boundary and won the match. No record was kept of the birds killed out of bounds.

C. R. M., Pittsburgh.—1. I have a double muzzle loading shot gun, 13 gauge, 28 inch barrel. It made the following pattern at 30 yards: right-barrel, 86; left-barrel, 56; 20-inch circle, 3 drs. powder, 1½ oz. No. 7 shot. It has not got the name of the maker on it. What is your opinion of it? 2. Will a cross between a pointer and a setter make a good bird dog? 3. Should a growing pup be fed all he will eat? 4. Do you know of a good squirrel ground near Pittsburgh? Ans. The right-hand barrel made a good pattern, the left is not good, but you should not judge of the shooting of your gun without repeated trials, so as to see the average. 2. We have seen exceedingly good dogs bred by crossing the pointer and setter, but by no means approve of such breeding. 3. A growing pup should be frequently well fed but not kept grossly fat. 4. No.

—Seven miles nearly north from Charlottesville Virginia, is the place where the army surrendered by Gen. Burgoyne in the Revolution were located as prisoners of war. The foundations of the cabins in which these prisoners lived can be seen at this day, and in the forests are seen the graves of those who died while they were quartered there. The fields retain the names given them at that time; "Headquarters," &c.

A WEEKLY JOURNAL.

NEW YORK, THURSDAY, NOVEMBER 23, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published without permission. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

Trade supplied by American News Company.

CHARLES HALLOCK.

Editor and Business Manager.

—Brooklyn's Ocean Parkway, from Prospect Park to the sea, which was opened to the public last week, is six miles long, 210 feet wide. Its central drive is 70 feet wide, its side roads each 25 feet wide, and its two sidewalks 15 feet wide. A space of 30 feet is reserved between the main and side roads for shade trees. The concourse at Coney Island is covered with asphalt pavement, and has a road on it 75 feet wide, and a sidewalk 25 feet wide. The promenade can accommodate 8,000 dancers. There are two shelters, 75 feet long by 25 feet wide, facing the ocean, and containing seats. The entire cost of the boulevard is nearly \$500,000. The road is level, and thoroughly macadamized.

Reported Exclusively for Forest and Stream.

"ASTRONOMY IN ITS RELATIONS TO RELIGION."—The learned Professor Pericord, in his recent lecture to the senior Sophisters on the Occult Sciences, remarked that all nations, from the most primitive times recognized and believed in a Deity. Indeed, so intimately is the divine essence blended with material things, that physical and spiritual objects, if not absolutely and technically identical, are certainly analogous, reciprocal, and correlative. Celestial objects, he said, benignly, "have their reflex and counter-part on earth. The good that exists in this world, and the good that men do, is reflected in the firmament. Astronomy has contributed in a marvellous degree to demonstrate this. The fixed stars, the nebulae, the constellations: are the written history of human deeds, and the expression of human thoughts. They are recorded on the celestial canopy in characters of undying light. Religion, which is the germ and agency of all the principles and actions of life, has invested the moral forces from the beginning. No nation or tribe was ever found without some religion—some species of belief in a Deity. There are no less than 365 distinct forms and outward expressions of this religious belief, and yet, strange to say, my friends, only two of these are true and genuine. And this brings me directly to the pith and point of my discourse, and is illustrative thereof. I say there are only two accepted doctrines of religion, and these are the Catholic and the Baptist. They are indicated by their respective constellations, each located in its celestial hemisphere. The one constellation is the 'Southern Cross,' and the other the 'Great Dipper.'"

This effort to elucidate one of the most abstruse and recondite mysteries of theology, brought much perspiration to the Professor's brow, so that he was obliged to wipe his eye-glasses and dismiss the class. —From Professor Pericord's *Spasms of Wisdom*.

GAME PROTECTION.

SPEARING TROUT IN OWASCO LAKE.—The following is an extract from a letter received from a correspondent at Auburn, in this State, under date of November 12th:—

"For several years past the laws of this State prohibited the spearing of trout in Owasco lake, in this county (Cayuga). Previous to this prohibition, a few persons residing in the vicinity of this lake had been in the habit of spearing them by jack lights when they were depositing their spawn. Since the prohibition, however, this manner of taking them has been nearly stopped, and owing to the natural increase and the stocking of the lake by individuals, the numbers of the trout have largely increased. Last season we obtained 80,000 young trout from the State Hatching House, and the same were safely deposited in the waters of the lake, making the number so obtained and deposited there within a few years past some 200,000. Last winter, however, the Member of Assembly from the district in this county, in which this lake is situated, in compliance with the demand of a few *pot* fishermen, obtained an amendment to the law, by which it was evidently intended to repeal this prohibition. It, however, did not repeal it so far as the months of October, November and December are concerned. On being remonstrated with by several intelligent men who are in sympathy with the settled policy of the State on this question, he says he 'desires that the Fishery Commission should be abolished.'"

During the past few nights the lake over the spawning beds has been almost covered with boats, each containing a jack light and from one to three persons, who were engaged in the miserable work of spearing the trout in the beds. The consequences can easily be foreseen. The reproduction of the fish will be greatly lessened, and all efforts to stock the lake may be abandoned as useless.

F. D. WRIGHT.

[If we understand our correspondent right, the law was not so amended as to remove the prohibition against spearing during the months of October, November and December, and in fact whether it was or not is of little consequence, as there are at least three sections of the game laws which refer directly to this case, with penalties aggregating \$100 or more for each fish so taken. First, the general law with regard to trout, which provides a penalty of \$25 for every trout taken between September 15th and March 15th; next, the section which provides a penalty of \$50 for the taking of trout at any time with any means except hook and line; and, thirdly, the special enactments with regard to Cayuga county, which are more voluminous and carefully worded than those referring to any other county in the State. By the first section of these enactments a penalty of \$50 is provided for any reprobate who shall at any time capture a trout, whether speckled, salmon, or lake, with a *spear*. The same close season is named as in the general law, and if our correspondent is referring to salmon or lake trout instead of *salmo fontinalis*, October, November and December. Again, in Section 5, it is especially provided that "no person shall take or attempt to take or kill any of the fish hereinbefore in this act named, in the lakes of or in Cayuga county, with a *spear*, under a penalty of \$25 for each offence; and the possession by any person in the night time of any *spear*, jack or light on the lakes or on the shores of the lakes of or in Cayuga county, shall be presumptive evidence of such undertaking and attempt, etc., etc." Now, then, we hold that if, as our correspondent writes, the spawning beds of the lakes are covered with men with jacks engaged in spearing trout, that it is a disgrace to the citizens of Cayuga county to countenance such proceedings, and that if with all the law on the subject provided for them, they permit it, they are entitled to no sympathy and deserve to lose their fish. The "newspaper talk" will not stop it. The man who will spear trout while spawning would regard it as little as he would the wind, and should be made to suffer in his pocket. Multa a few of your spearmen to the extent of a hundred or more dollars, and you will soon put an end to it. Why, it seems the easiest kind of law-breaking to stop. Your evidence is all before you; the transgression is patent to every one who is not blind, and you have "law" enough for all the cases you can bring. As for appealing to the poachers to consider the interest they have in the fish, you might as well argue with a burglar that it would be money in his pocket to be honest. Even the fact that the fish are unfit for food at this season appears to have no force. The people of Cayuga county should rise in their might and see that the laws which were passed for their benefit and at their request are properly enforced.—ED.]

VERMONT.—The Rutland Herald says that the modified fish and game laws introduced into the Vermont Legislature by the Hon. W. D. Taylor, representative from Sherburne, meets with general favor from the farmers and others. It has heard, it says, "of several propositions to rent the shooting and fishing rights upon farms in this vicinity, at a price nearly sufficient to pay the annual taxes, in case this bill is passed. The value of the production of fish and game that is possible in this State, under proper protection, is simply incredible to any one who has not studied the subject."

MASSACHUSETTS.—A correspondent at New Bedford sends us the following appeal to the sportsmen of Massachusetts:—

"Until recently I had supposed we had laws protecting game birds in this State, but am now convinced that there is not any protection whatever except during the month of September. They may be killed in any number, or by any means at all other times, as the law now stands. And as far as we sportsmen are interested, it does not amount to anything. Now if we wish to do anything for the coming year, we must be about it, the sooner the better. We ought to throw the old game laws aside altogether, and have new ones, and let them be so amended and constructed that they shall be simply concise and tight, with no

loop holes to crawl out of. I caused the arrest of a party for snaring and selling partridges that were snared; when brought before the court the Judge decided that there was no law forbidding the snaring them, or killing them in any other way. I have since consulted most eminent lawyers, and their decision is that the game laws as they now stand do not amount to anything whatever. Let us go to work right off and have this corrected. I appeal to every one who feels interested. I hope to hear from others in the matter. Most earnestly, J. EATON, JR.

The fishermen's protective association met at Springfield on the 11th inst., to discuss the action of the Connecticut river canal company. Theodore Lyman, of Brookline, chairman of the Massachusetts fish commission, was present, and stated that, as soon as the Massachusetts board could find out what were the real and substantiated grounds of complaint, they would call on the Connecticut fish commissioners to remove the obstructions, and put an engineer at work on the dam to ascertain what has actually been done. Mr. Lyman spent most of the time in collecting facts and figures heretofore published in regard to obstructions in the river, the increased height of water resulting, and the shortening of the shad-fishing season in Massachusetts as a consequence of filling up the gap in the dam next the eastern shore. It is Commissioner Lyman's intention to call a meeting of all the interested parties in both States, including the canal company, at an early day, and see if an accommodation cannot be agreed upon.—*Republican*.

CANADA.—Hon. Mr. Garneau has introduced a bill to amend the game laws of the Province of Quebec, saying the principal object was to consolidate these laws that had several times been amended. He did not contemplate to make much alteration to the present law. The gamekeepers were not always properly informed of their duties, and it would be more to the advantage of the public if these laws were consolidated.

—The Toronto Globe says that "with a desire to protect whitefish somewhat during the spawning season, the Fisheries department some time back caused the fishermen to be notified that the first ten days of November must be observed as a 'close season,' and no whitefish captured. In theory this seemed perfectly reasonable and just, and under other circumstances than those that exist along the frontier line must have elicited approbation from all who were not directly engaged in fishing, if not from the fishermen themselves. But along the line, and especially on Detroit river, to stop the business even for a day during November must work hardship to our own people, while at the same time it would utterly fail to accomplish the desired end, as in Michigan the fishermen are under no restraint whatever as to taking whitefish, and if our people were compelled to desist they would have the mortification of seeing their American neighbors reaping a bountiful harvest (catching the whole lot, practically) while their hands were tied. The member for Essex saw the Premier about the matter, submitted the case of his constituents, and Mr. Mackenzie, after listening to Mr. McGregor's explanation, saw at a glance the position a cessation of operations on this side would place Canadians in, and at once communicated with Mr. Smith, Minister of Marine. As a consequence the fishermen were promptly informed that they might go on with their business without interruption.

—We have received from Adam Watters, Esq. of Quebec, a box of sea trout in fine condition, weighing about four pounds apiece, and apparently as fresh as when taken from the salt water last August. Those familiar with the habits of sea trout are aware that they can be caught only during about six weeks of summer, commencing to run, as they do, in some localities, about the middle of June, and in others not until two weeks later. These fish are often caught in great abundance, and have always been a commodity and staple article of commerce, being salted when caught, and barrelled. Of late years they have been preserved fresh by the refrigerating process, thereby enhancing their value by retaining their flavor and succulent qualities. The provisions of the Dominion Game Laws, which prohibit the sale or having in possession of fresh trout out of season, has operated so disadvantageously that the Government, in the interests of commerce, has been obliged to grant licenses to certain responsible merchants to sell fresh fish out of season. Those sent to us were from the establishment of A. Fraser & Co., so licensed.

This is a matter which it is evident touches our own fish dealers "with a needle" acutely, and we feel quite confident that it will be desirable to take the whole subject into consideration, and follow the example set by the Canadians. The great advantage the latter have over us rests in the fact that the power of granting privileges is vested in the Government, whereas there seems no way to reach the case in this country except by tedious legislative process. One of these days our State Fish Commissioners may be invested with something more than merely nominal prerogatives, and if the power of applying the law's provisions is not placed in the hands of the chief executive, it would naturally vest in them. Certainly, conscientious dealers of sufficient responsibility can be found among us who can be trusted with a special license of this sort, and who would not illegally receive fish taken at illegal times, but would rather, as self-appointed guardians of the interests which the laws aim to protect, hold and prosecute any person offering unseasonable fish to them for sale.

—Attention is called to the advertisement elsewhere which offers a rare chance for a gentleman sportsman or gentleman fish culturist to purchase beautiful property, with trout pond, within 35 minutes of New York.

—For Cheap Time Keeper see advertisement of J. Bridge & Co., New York.

GOOSING ON SINEPUXENT BAY.

FROM NOTES BY THE EDITOR.

BERLIN, Worcester Co., Maryland, Nov. 18th.

Worcester county comprises a large part of the peninsula that lies between the Atlantic Ocean and Chesapeake Bay. Its seaward boundary is skirted by Sinepuxent Beach, twenty-five miles in extent, which incloses Sinepuxent Bay, and extends to Chincoteague Sound, of which it is really a part. Here wild fowl resort in immense quantities for food. Snipe and beach birds in great variety also abound, and there is fine quail shooting on the main land. The locality is easily reached by rail from Wilmington to Herrington station, and thence by either of two railroads, *via* Georgetown or Salisbury, to Berlin. From Berlin there is rail communication in summer to Ocean City, a delightful resort on the beach, six miles distant; but cars are not run in winter except for the special accommodation of chance shooting parties, whom the railway officials are always ready to favor. The hotel at Ocean City accommodates some 400 guests, and is largely patronized by visitors from Baltimore and Philadelphia, who prefer it to Cape May and Atlantic City. The railroad was only opened last year; but, now that access is made easy, Ocean City will hereafter be more largely patronized than ever, and a second hotel is being built in anticipation of increasing numbers.

Capt. Ayres keeps a small hostelry open all winter, to accommodate sportsmen, whom he provides for sumptuously. He can lodge a dozen very comfortably.

During the past few days the bay and sound have been filled with ducks and geese, and sportsmen are here in force. Gentlemen of means have their private sailing smacks fitted up with decoys, skiffs, and all appliances for pursuing their vocation, in which they cruise about the bay, taking the upland, beach, and bay shooting at pleasure. This is a luxurious and engaging method to those who can afford the time and money; though I take occasion to say here that comfort, and success in shooting, would be much increased if a model of vessel could be introduced into these shallow waters similar to that in vogue on the Florida coast. The topography and conditions of the coast and channels here and there are much alike. The water in all the bays and estuaries is seldom more than four feet deep except in the main channels, and the usefulness of the round bottom craft in service here is therefore very much limited. They serve chiefly as portable shooting boxes, while skiffs must be continually in readiness for work, and as constantly resorted to. It is not pleasant to be obliged to come to anchor in mid-sound, two miles from shore, and weather a storm of several days' duration when the skipper could run in under the land with a flat-bottomed craft and be happy. The jib-and-mainsail boats built at St. Augustine, Florida, by a Polander named A. Iwanowski, are models of beauty, and when in the water show lines as graceful as the handsomest round-bottomed keel-boat afloat. Indeed, for what hull they show above the water line, they might be taken for round-bottomed boats. An idea of their model might be conveyed by imagining the section below the water line sliced off parallel therewith. The chief desiderata for a gunning craft in these waters, and indeed in all waters along the coast, are light draft and plenty of cabin room.

Several gentlemen on the bay have built snug shanties or shooting boxes at eligible points, or on the islands, which are supplied with all requisites for comfort and enjoyment. A sneak boat or skiff, and several dozen decoys for geese, ducks, and snipe, are indispensable. Hon. Stephen Taber, who owns some twelve miles of the beach and main land, maintains two dozen live geese, which have been domesticated and take especial delight in luring their credulous kindred within gun shot, when their services are brought into requisition. Capt. Stokes, of Philadelphia, with a party of friends, is now on the bay off St. Martin's river, with his gunning smack, doing a good business. Messrs. Johnson and Sclee, of Poughkeepsie, are also cruising in the smack "Chatham," owned by Capt. Coffin, who keeps a good hotel six miles below here. The bunches of wild geese triced up in the rigging, and the miscellaneous lot of ducks, quail, plover, snipe, and rabbits, on deck, show that they have put in their time with profit. Mr. Johnson owns the Isle of Wight, above St. Martin's river, where he has a snug farm and shooting box. Messrs. Fassitt, father and son, of Philadelphia, went home yesterday, with 150 quail, woodcock, plover, etc. Mr. Charles Hallock, Editor of FOREST AND STREAM, has been the guest of Mr. Stephen Taber, for four days, occupying the shanty at Hammock Point, opposite Ocean City, always one of the best thoroughfares for wild-fowl on the coast. Two sides of the building, at last accounts, were covered with a miscellaneous lot of feathered game, which had been hung up on nails for future disposition. Every train to Wilmington carries home a score of gunners well loaded, chiefly with quail and woodcock, which they have picked up on the farms adjacent to convenient stations on the railroads. Favorite points of departure for the field are Canterbury, Herrington, Farmington, Greenwood, Seaford, Georgetown, Salisbury, Pittsville, and Berlin. As a rule, the farms are all posted, as a protection against market gunners, but gentlemen sportsmen can almost invariably obtain permission to shoot over private territory. It is better, in all cases, to obtain letters of introduction to land owners. There seems to be no obstacle to beach or bay shooting. Efforts are about to be made by Dr. H. R. Pitts, President of the Wicomico and Pokomoke Railroad, B. Jones Taylor, R. J. Henry, L. Sho-

well, Dr. Dennis, and other prominent citizens of Worcester county, to organize a Game and Fish Protective Society, to prevent present abuses, which are serious, not only with respect to game, but fish. Seining and netting is practised by residents and non-residents, not only at improper seasons, but with one-inch-mesh nets which destroy small fry in innumerable quantities. Sinepuxent Bay and Chincoteague Sound both abound in oysters, blue fish, striped bass, weakfish, perch, terrapin, etc., which, with the products of the land, make the stated bill of fare very attractive and replete.

"Goosing," in its various methods, is an art which requires much study to acquire, and patience, judgment and endurance, to bring into successful practice. The adage, "Set a thief to catch a thief," does not apply to this business. "Set a goose to catch a goose" holds good only as to decoys; and these must be properly set in suitable locations. The gunner must learn not only the habits of wild fowl—their flight and feeding grounds—but he must be able to distinguish at sight the several varieties by their peculiar cry or note, their movements through the air, and their general appearance, at whatever distance. He will not mistake a loon for a goose, or a flock of geese for brant, or black ducks for red-heads, or red-heads for canvas backs. He will never waste powder on coots, old squaws, or sheldrakes, when better game is afloat or aloft, or throw his shot away on dippers and divers. He will lose no precious time by watching chances at high-flyers and "travellers," when great masses of birds are pitching into the bays where decoys can be set with advantage. He will determine at all times whether it be better to place his decoys out from blinds on shore, or from his sink-box in mid-water; for sometimes, for various reasons, the fowl feed far out, and at other times close in shore. He must understand the numerous artifices to be employed to circumvent his wary customers, and determine promptly when and where to bring them into play. The gunner must be serene in rough weather, and learn to endure cold and shed rain like a duck; for it is in stormiest weather that the fowl fly best. He must at all times shun observation, for the birds are as keen of vision as deer are of scent. Reward comes, too, only to the early riser. The sluggard will get few birds. The gunner must take his stand at daybreak when the fowl fly low. To ensure success, he must be a good wing shot, quick and accurate of aim; must learn to measure distances and rapidity of flight, and accustom his arm and shoulder to rough usage from the breech of a forty-eight inch barrelled gun charged with eight drams of powder and a handfull of T shot. He should be a good boatman, as well, and in emergencies a fair cook. A little knowledge of dogs is desirable at times, when a spaniel can be employed to retrieve birds that fall into the water out of reach. Sterner qualities than those that belong to the fair-weather sportsman are needed.

The geese that have been passing over the past week have been chiefly high-flyers—most of them "travellers," not tempted to tarry by luxurious feeding grounds, but bound for far distant regions in lower latitudes. It required the "tallest" kind of shooting to reach the nearest of them, and scarcely one known to have been killed, has dropped at less than 100 yards! [Just here we have assurance enough to predict that the time will come soon when the sporting rifle, under the skill acquired by practice at our Rifle Ranges, will become the chosen weapon of sportsmen for shooting geese. And we believe, now, that an expert rifleman would save more game than the man with the shot gun, who cripples or wounds nine out of ten that he shoots at. We know this to be true, for any one can hear the shot rattle against their bodies—not always harmlessly, we are positive.]

The ducks, too, were driving birds, and expert pigeon shooters might have had their best skill brought into play to drop them within bounds. No doubt it was a great aggravation to the individual goose, hastening on with the rank and file, in full blown anticipation of speedily reaching the objective point for which he had started—very discouraging, indeed, to be suddenly halted on his melodious flight by a pellet of lead, and tumbled headlong to earth. Quite likely the rest of the "honkers" wondered why he had so suddenly taken sick and dropped out of the ranks; but they never paused to inquire. Pat Mullins' famous five-bore guns never did nobler duty than on several of these occasions. No ordinary bird gun, of whatever pattern, could have done execution. No. 2 pellets would have rattled harmlessly against their armature of feathers and quills. The early breakfast at the shanty was often abruptly interrupted by the signal of the lookout seated at the cabin window that a flight was approaching; knife and fork would drop instantly, and a rush be made for guns, as in the primitive days, following an alarm from Indians; then a furtive reconnaissance from the gable ends of the building, and possibly a fusillade, presently answered by a fluttering corpse dropping to the ground with a thud, almost into the cooking-pot. These interruptions were intermittent. And after the spasmodic meal there followed a two-hours bivouac at the blinds, where the rain pelted and the chill air made the teeth chatter.

At times a resort to the outer beach, or a cruise down the bay, would vary the programme. Very exciting it was to see the dark lines of geese in the distance, like low clouds on the horizon, gradually approach, and resolve themselves into squads and platoons as they drew near to the decoys; the suspicious file leaders with outstretched necks, sounding their horns, sheering off momentarily to the westward and southward, then hesitate, wheel, and finally pitch into the waves with a splash that made the salt spray fly. Then

the great guns would thunder, and the vast living mass rise with a tumult of wings and din of trumpetings and screams, leaving many behind, and more to fall as they flapped in disordered flight to the upper air. How complacent the live decoys seemed as they triumphantly surveyed the havoc they had helped to create! and with what a self-satisfied air they settled down to business again and awaited the coming of the next reinforcement! The keen observer could almost fancy he detected mutual congratulations among the flock and saw, as in the historical olden time

"The old gray goose a smiling at the gander."

It was rare sport, too, for the gunners who harvested the plunder, while visions of roast goose and apple sauce filled the "mind's eye, Horatio."

Nothing like goose shooting to whet the appetite and woo sound slumber! What larder can excel that of Sinepuxent? Lucious oysters and fresh fish to alternate with roast goose and duck; fresh eggs, rich sausage, and potatoes from the farms? One can live royally at the shanty, and every hour of rest and sleep after eating adds an ounce to a man's avoirdupoise and a steel spring to his lifting power. Soon the red-heads will come in force, and then there will be fresh fields for sport. But these I must now leave to others less trammelled with business. "*Dido et dux*." No wonder! Nathless the editor must stick to his quills. Alas! that poor editors, like swine, should be driven to a pen for a living! Nevertheless, his brief holiday at Sinepuxent will be remembered when many others are forgotten.

I volunteer the information here that a large tract of land of many miles in extent, embracing some of the best grounds for upland, beach and bay shooting, is available here at a low lease for a party of gentlemen who wish to organize a Club similar to those at Currituck and elsewhere. I shall be glad to further any movement of the kind and to place proposals before the parties in interest.

HAL.

"LATE AT THE FEAST."—Under this title may be seen at Miss S. J. Gibbons' art gallery, 95 Fifth avenue, a picture of rare merit from the easel of Benno Adams, representing a fox and three hounds, and in it may be traced a master hand, as the painting and natural delineation of the fox and dogs will compare well with the best of the late Edwin Landseer. So natural is the pose and coat of the fox that the eye conceives a living, breathing animal. In color her work is particularly happy in all its figures and surroundings. This picture was purchased at a cost of \$5,000, and is the property of a lady of discriminate taste, who is about to part with it at a sacrifice of \$2,500. Our readers will do well to make a critical examination of this grand original picture. Five hundred dollars were offered to allow a copy to be taken, but refused. The painting is without question one of the finest in the United States, and of its kind the best one known of.

Rifle.

A NEW DEPARTURE IN RIFLE SHOOTING.

THE matches at Creedmoor on Saturday represented a new departure in rifle shooting, and will undoubtedly result in interesting a new class of riflemen, as well as increasing the attraction of the range to the old habits. Many of the Creedmoor marksmen who are old hunters have frequently complained that the off-hand shooting at an immovable target had a tendency to make them "too slow on the trigger." The same objection has been urged by many others, who have not used the range for that reason. The system of match shooting has also given the preference to those rifles which are best adapted to deliberate aim at the target. Even at 200 yards the elaborately sighted and heavy rifles using a heavy charge had an advantage over the leading sporting rifles, although in the field the latter would have the advantage. The Winchester Arms Company, of New Haven, deserve great credit for the attempt which they have made to place a sporting gun upon an equality with the match rifle. They have, at an expense of \$1,750, erected and completely finished a "Running Deer" target upon the range at Creedmoor, which they have presented to the National Rifle Association for the purpose of encouraging the same practice on the range as would be required on a run way in the forest, and to afford the ordinary sporting rifle a fair chance in its proper field.

The Running Deer is an outline of an ordinary sized deer, composed of two sheets of boiler iron bolted together, and consequently bullet proof. The figure is suspended from an upright by a pivot in the center, which gives it a slight up and down motion. The whole apparatus rests upon a low truck running upon a narrow railroad track laid in a double inclined plane 150 feet long from end to end, with a fall from each end to the center of about eight feet. In the rear of the target is a ball-proof fence of timber 25 feet high, filled with stone, at each end of which are wings 20 feet in length of the same material. The markers are stationed on a platform in the rear of each wing. Upon a whistle from the firing point, which is given as the shooter takes his position, the marker gives the deer a violent push, which sends him down and across the track to the other side, where he is received by the other marker, who marks the hits he may have received in his passage, by placing a disc upon the corresponding

portion of the figure of a deer painted in the front of each of the wings. He then turns the deer round upon its pivot, and at a signal pushes it back. The lines are painted on the fence thirty feet from the wings and ninety feet apart, and no firing is allowed except when the deer is between them. Any shot fired while it is out of these bounds is punished by a fine of ten cents. The deer has an 8-inch bullseye painted over his heart, and a center and outer, there being no inner. Bullseyes count 4, centers 3, outers 2. A shot hitting the haunch is marked with a black disc, and is punished by a fine of ten cents, partly on the theory that it would spoil the venison, but more from the fun which arises out of its infliction. It takes the deer about five seconds to pass over the ninety feet in which he is allowed to be shot at. The shooting is done at 100 yards, consequently it is necessary that the marksman should shoot from three to four feet in front, and the neglect to hold far enough forward is certain to produce a "haunch," and a consequent fine of ten cents.

This match was inaugurated for the first time on Saturday last. The weather was very disagreeable, being cold with a blustering wind, which made shooting from the shoulder very difficult; still, a number of the best off-hand shots of Creedmoor entered for the match, and before a half dozen shots had been fired the shouts of laughter brought up nearly every man on the range, and one after another entered whether their guns were fitted for the purpose or not.

The want of practice was seriously felt, as well as the imperfect manner in which most rifles were sighted, rendering a quick sight difficult. The Winchester had a decided advantage on account of the facility with which they could be fired, those using them getting in three or four shots at each round. At the same time those who used a single-loader and confined themselves to a single shot fired with deliberate aim and aid almost as well. All were surprised to find how far forward it was necessary to aim and how difficult to do so. The force of habit at almost every run caused some competitor who aimed on or just in front of the deer to hit the haunch, the result being a display of the black disc followed amid a roar of laughter and the payment of the ten cents fine as compensation.

The match was commenced at such a late hour that the darkness obliged its discontinuance before the competitors had had an opportunity of shooting all the entries which they had made, nearly every one having increased his entries up to the full number allowed. Still it was one of the greatest successes of the season and will undoubtedly attract a large number of competitors hereafter. The score will be found below.

The trophy offered by Schuyler Hartley and Graham for rapidity and accuracy was shot on the same afternoon. This is intended to test the relative merits of repeating fire-arms and single-loaders, and as most of those shooting in it were professional experts the amateurs stood but very little chance. Messrs. Stetson and Bennett, who made the two highest scores, used the Winchester rifle. In firing they had their cartridges inserted in a series of tubes attached to a piece of metal which was strapped on the left forearm. In firing they kept the gun at the shoulder and inserted the cartridge with the right thumb, the spring which closed the ends of the magazine on their rifles having been eased up, and the opening enlarged so as to enable the insertion of the cartridge in that position. Mr. Waterman, one of the best rapidity shots in the country, used a Henry Martini; Mr. Wood a Winchester, and most of the other guns were represented. The practice scores made just before the match were much higher than those in the match as the competitors became chilled while waiting their turn. Mr. Stetson made a score of 53, which is the highest score known to have been made in thirty seconds. The badge having been won three times by Mr. Stetson this closes the competition for the present of what is known at Creedmoor as the "agility" badge. It will probably be repeated in the spring in some similar form.

AMATEUR RIFLE CLUB.—The competition for the bronze medal of the National Rifle Association, will take place at Creedmoor, Saturday, November 25th, at 1:30 p. m. The conditions are as follows: Open only to members of the Amateur Rifle club; distance, 1,000 yards; rounds: 30, with privilege of two sighting shots; rifles: any within the rules; position: any without artificial rest. Entrance fee, \$1. Prize to become the personal property of the winner in this competition.

SWAN SHOOTING WITH A RIFLE.—We have seen some capital practice made with an old fashion small bore Kentucky rifle at geese while sitting, particularly in California, where the birds congregate on the plains in immense numbers. With the increased interest in rifle shooting, it is probable that for such large game that weapon will be used, and some of our marksmen will doubtless in time come to be as expert in bringing down a bird on the wing as they are now in hitting the running deer or a bullseye.

A Norfolk correspondent writes us that two northern gentlemen, (one from Nahant) now rusticated at Back Bay, Princess Anne Co., Virginia, while out after ducks one day this week, saw a flight of swan passing out of gunshot range. Both having rifles handy agreed to try a shot on the wing and both succeeded in bringing down one. They sent them north by express to be mounted as trophies.

—A new rifle target has been proposed to the War Department of France. It is elliptical in shape and is constructed in reference to those parts of the human frame which are mortally vulnerable, in the trunk and the head.

CREEDMOOR.—Saturday was hardly an inviting day for rifle shooting, yet quite a number of experts assembled at Creedmoor to shoot for the badge for "rapidity and accuracy" presented by Messrs. Schuyler, Hartley & Graham. The scores made were as follows:—

	First chance.			Second chance.			Total.
	Shots.	Hits.	Score.	Shots.	Hits.	Score.	
C. E. Stetson.....	14	9	24	14	11	39	83
T. G. Bennett.....	11	8	27	11	8	27	54
J. Wentworth.....	10	5	17	16	6	19	36
George Waterman....	6	1	2	7	5	12	14
G. W. Davison.....	9	0	0	8	2	5	5

Mr. Stetson used the Winchester rifle as a single loader. The first competition for the Winchester Company match (prize \$50 in money), shot at the running deer, followed. Each competitor fired as many shots as practicable during six "runs." Mr. Stetson won this match also, making 6 hits and 16 points. He fired four shots during several "runs," in one of which three shots struck the deer. He was fined twice for striking the horns. Mr. Bennett had 5 hits and 14 points; W. Robinson, 3—9; Wm. Hayes, 1—3; J. B. Holland, 1—3. Messrs. Bennett and Robinson were fined once each for striking the haunch. Nine competitors failed to strike the deer.

CONLIN'S GALLERY.—Last Tuesday evening, Nov. 14th, the sixth weekly contest for the Marksmen's Badges took place at Conlin's Shooting Gallery, 930 Broadway. The interest shown by the large number of competitors has no signs of decreasing, and a very pleasant evening's sport is obtained. The following are the winners of the badges with their scores:—

Name.	Total.	Name.	Total.
Charles A. Cheever.....	46	W. Campbell.....	42
C. E. Blydenburgh.....	43	J. T. Murch.....	41
H. D. Blydenburgh.....	42	C. E. De Forest.....	41
B. S. Brown.....	42	Leon Backer.....	40

At the 75-foot range a scarf pin was presented to the maker of the best score (an old-fashioned musket bullet suspended by a string) in ten shots. This match proved very interesting and well contested: Charles A. Cheever, 8 bullets; J. B. Blydenburgh, 6 bullets.

A neat prize was also given for the best score made on the 60-foot range; conditions, 10 shots; rifle 22 cal.; regulation sights and 6-pound trigger, at 200 yards; Wimbledon target reduced for the range. The hard trigger and open sights made a difference in the scores of the best shot: C. E. DeForest, 45; C. E. Blydenburgh, 43; W. Campbell, 39; W. F. Banks, 39.

—The protest against the scores of the 48th Regiment team at the recent Creedmoor Fall meeting is to be considered by the committee of the N. R. A. at the State Arsenal in this city to-day at 8 o'clock p. m.

MASSACHUSETTS.—The "team" of the Holyoke Rifle Club shot for their badge on Saturday week, the conditions being 10 shots each at 400 yards. Mr. E. C. Smith was the winner with a clean score of 50 points. The other scores were—H. White 48, D. H. Smith 43, R. McDonald 43, R. Rhodes 40. The previous match was won by R. McDonald with a score of 41 points, made at 200 yards on a reduced target, with an 8 inch bullseye, and the other circles reduced to 16, 28 and 40 inches. The week before, under the same conditions, Mr. H. White made 41, D. H. Smith 41, E. C. Smith 39, R. McDonald 40, E. A. Whiting, 38 and J. L. Mercier 37. In shooting off ties H. White made three consecutive bullseyes and won.

—The new range of the Massachusetts Rifle Association at Walnut Hill, near Boston, was opened on the 15th inst., when about thirty members of the Association participated in pool and prize shooting. At present only the 200 yards range is ready for practice, and at this distance a match was shot, each competitor having ten shots, with the following result:—

Names.	Total.	Names.	Total.
J. B. Osborn.....	45	J. B. Parker.....	41
C. E. Sanborn.....	44	J. A. Lockhart.....	41
W. Poland.....	44	W. Gerrish.....	41

E. W. Davidson.....	43	A. Perkins.....	38
Carl Bittmar.....	42	A. H. Hebbard.....	38
W. H. Jackson.....	42	E. W. Stevens.....	37
E. F. Hunt.....	42		

CONNECTICUT.—The first annual meeting of the Connecticut Rifle Association was held at Willowbrook range on Saturday week, but the report came to hand too late for our last issue. Four contests took place, the first being the long range, ten shots each, at 800, 900 and 1,000 yards, any rifle and any position; prize, a silver trophy valued at \$25. The results were:—

Names.	800	900	1000	Total.
C. O. Case, New Britain.....	45	33	43	126
O. Judd, Middletown.....	41	39	42	125
William Parker, New Britain.....	47	39	37	123
C. O. Judd, Middletown.....	40	45	37	122
J. E. Stetson, New Haven.....	42	45	27	115
G. W. Davidson, Providence.....	44	39	32	113
O. V. Coffin, Middletown.....	43	31	34	108
W. H. Payne, Jr., New Haven.....	32	45	27	105
F. Wessel, New Britain.....	41	22	32	95
S. Clark, Worcester.....	36	32	27	95
H. Woodward, Middletown.....	41	34	18	93
J. N. Camp, Middletown.....	32	50	30	92
J. Duggan, Norwich.....	46	35	10	91

The trophy for all comers was won by Mr. Orange Judd of Middletown.

The second contest was the bullseye match for the most bullseyes in 15 shots at 500 yards, any rifle; position, any; entrance fee 50 cents, for a bullseye badge offered by the Middletown team:—

Names.	Bullseyes.	Names.	Bullseyes.
Dr. A. M. Shew.....	13	O. V. Coffin.....	9
G. W. Davidson.....	12	Charles Gerner.....	9
Orange Judd.....	12	J. E. Stetson.....	8
A. G. Mitchell.....	12	J. C. Kinney.....	7
William H. Layne, Jr.....	11	L. H. Mayott.....	7
C. O. Case.....	10		

The third contest was short range, rifles any weight, 7 shots, 200 yards off hand, for a silver cup valued at \$15. The scores made were: S. S. Bumsted, Springfield, 31; J. E. Stetson, New Haven, 30; George Nichols, New Haven, 29; F. W. Tiesing, New Haven, 28; S. V. Kennedy, New Haven, 29; Col. S. R. Smith, New Haven, 25; J. N. Lane, Meriden, 24; Charles Gerner, New Haven, 24; F. Wessel, New Britain, 23; W. Vandusen, Middletown, 23.

The fourth contest, long range, open to members of the association only, conditions same as No. 1, score to count on both matches, if members entered for both, was not shot, and the prize, a badge valued at \$25, was awarded to C. O. Case of New Britain, on his score in the first match.

—Rabbits must be abundant in Pennsylvania, an exchange says that ten men recently killed 109 rabbits in one day in Lancaster county.

Game Bag and Gun.

GAME NOW IN SEASON.

Moose, *Alces melchis*. Pinnated grouse or prairie chicken, *Cupido cupido*. Caribou, *Tarandus rangifer*. Elk or wapiti, *Cervus canadensis*. Ruffed grouse or pheasant, *Bonasa umbellus*. Red or Virginia deer, *C. virginianus*. Quail or partridge, *Ortyx virginianus*. Squirrels, red, black and gray. Hares, brown and gray. Wild turkey, *Meleagris gallop.* Woodcock, *Philohela minor*.

"Bay-birds" generally, including various species of plover, sand-pipers, snipe, curlews, oyster-catchers, surf-birds, phalaropes, avocets, etc., coming under the group *Limicola* or Shore Birds.

—The St. Clair flats, on the Canada side of Lake Ontario used to be a fine ducking ground, but has deteriorated of late years. The Syracuse *Standard* however mentions that a gentleman of that city, bagged in eleven day's shooting, three hundred and thirteen ducks, mostly canvas-backs. This would seem to indicate that the old ground has regained its prestige from some cause or other.

—A quartette of devotees of field sports started from Chattanooga, a few days ago, for the hunting grounds of the Indian river, in Florida. They were well equipped with rifles, skeleton knapsacks and haversacks, and will doubtless find plenty of enjoyment.

MASSACHUSETTS.—*Wachusett Mountain, Princeton, Mass.*—Partridge and quail shooting in this part of the State is not up to the average this year, which is owing I think to the abundance of the red fox. They make a business during the summer of breaking all the eggs and eating all the young birds they can find. There is now hardly a dozen hounds in the county, where a few years since there were hundreds, so the fox has full swing, and the poor ground-nesting birds have to suffer in consequence. The fall woodcock shooting has been good, as they are a flight bird at this season they are not affected by the foxes in this section. S. K., Jr.

Salem, Nov. 21st.—Bush gunning is fair. Sea ducks reported plenty by some gunners and scarce by others. Cooting has not "tallied up" to former seasons off our immediate shore, though at and about Cape Ann it has been "they say." Great geese have been flying some lately. About 75 went along Sunday. A seal was shot at Bass Point, Nahant, one day last week; it weighed a hundred pounds, and was brought in so the man got hold of it by a dog named Ned, of Lynn, and he is there on such jobs every time. Nick's dog is boss, so Frank says. TEAL.

Dunbury, Nov. 13th.—Quail plenty; several fine strings the past week, in consequence of flooded swamps forcing them to higher ground. Partridges pretty well thinned out by snarers, there being no protective law that will reach them; rabbits suffering likewise. A few snipe and woodcock have been taken during the month. Coots, shell-drake, black ducks, whistlers, and quandys are in the bay in large numbers. A few flocks of geese have passed over the past week, none stopping. GROUSE.

NEW YORK—Good Ground, L. I., Nov. 19th.—We have plenty of ducks now in the Bay, but for some reason but few birds are being killed, the weather I presume being too warm. As yet we have had no shooting that would encourage sportsmen to pay us a visit. When the weather shall become cooler the sportsman who chances to be here may expect rare sport. There have been so many stories told in the past of fine sport at Good Ground that many who come here are disappointed. I have company here now who have killed nine ducks this forenoon, which is a fair average. ORVILLE WILCOX.

Islip, L. I., Nov. 22d.—Deer shooting commenced here on the 15th, as regulated by the law. Very few have been shot, however, compared with last year, and it is believed that total prohibition for a period of years will be necessary to preserve them. AMASA.

Hornellsville, Nov. 20th.—Last week, after a fall of snow that dampened the leaves, John Penell killed nine grouse in three hours. There has also been quite a number of red foxes shot; no quail reported, but rabbits very plenty. JOHN.

MARYLAND.—Quail are found in the greatest abundance in the southern part of Worcester county, Md. (eastern shore), say around Stockton, Hornhaven, etc., and as yet the birds have not been trapped. It is thought that this section, owing to its accessibility (by steamers of the Old Dominion Steamship Co.), offers a fine field for sportsmen who have but a limited time to enjoy the same in.

VIRGINIA—Norfolk, Nov. 14th.—Weather hot; fair supply of canvas-backs, bald pates, black ducks, mallards, teal, and a slight sprinkling of bay-birds. Quail are abundant this season; two guns bagged 46 birds (quail) a few miles from town Monday in a short while, from 1 p. m. to sunset. H.

Blacksburg, Nov. 12th.—Quail very abundant and in beautiful order. I am having good sport over an inferior dog, having had the misfortune to lose my Flora, by Pride of the Border, out of Kirby, by poison. Saturday afternoon I bagged 19 quails between 2:30 and 5 o'clock in eighteen shots, killing two with one barrel and one with the other at the first flush, having walked into their midst with my gun at a shoulder, then bagged 16 straight shots. Some teal in the meadows; black ducks, mallards, ruffle-heads, and wood-duck on New river; ruffed grouse very plenty. Twenty deer killed last week by two parties on Salt Pond Mountain; several bear caught and killed in same place. E.

TEXAS—Galveston, Nov. 17th.—Galveston Island is 30 miles long by 3 wide. The city is situated on the north end. The small lakes are black with duck; the sand hills abound with curlew. The record taken by the signal officers yesterday for the twenty-four hours ending at 9:49 p. m., shows maximum temperature 55 deg.; minimum, 45 deg. Harley's narrow gauge railroad runs ten miles from city limits for ten cents, a great accommodation to sportsmen. R. R. B.

TENNESSEE—Nashville, Nov. 13th.—With the exception of partridges and ducks game is plentiful in Davidson county, and good bags are brought in by expert marksmen. Partridges are in excellent demand and bring fancy prices.

Deer, ducks and birds are reported to be numerous in Hardin and Humphries counties, and quite a number of sportsmen will visit those regions within the next few weeks.

MISSOURI—*Hannibal, Nov. 15th.*—Quail and duck shooting fine here. One party of five, camped twenty miles below here, sent up 190 mallards yesterday, the result of two days' shooting.

WISCONSIN—*Westfield Nov. 14th.*—Ruffed grouse are quite abundant in the woodlands a short distance from this village, and pinnated grouse—known as "prairie chickens"—have been plenty, but have begun to "pack," and will no longer lie to the approach of the dogs. Snipe are scarcely so plentiful as usual at this season, but a few sharp frosts will probably bring them in goodly numbers from the north, and then, should all prove propitious, your humble correspondent intends to try the "scolopaces," and may report further as to the sport. Waterfowl are very abundant at Puckaway Lake, but owing to rather high water and pleasant weather, little sport has yet been had in duck shooting in this locality, as the waterfowl fly but very little, and that only at early morn and eve. A few wild geese have been shot in this vicinity, but the "Arctic voyageurs" are not yet plenty, and when found are "gun-shy." Other game is scarce in this particular locality, though deer are reported plenty to the northward, in the deep woods and pine lands.

CALIFORNIA—*Los Angeles, Nov. 12th.*—Quail shooting this season about on average, two guns sending, during last 21 shooting days, 1,597 birds to San Francisco market, all single shots on the wing except 13 birds pot shot. Venison going out of season, but has been unusually abundant at from six to ten cents per pound. Duck, geese and snipe just coming in, seldom plenty until late in December. Bull-head plover on plains in great numbers. One party, three guns, bagging sixteen dozen last Sunday in about six hours' shooting.

CANADA—*Eastern Township, Quebec, Nov. 16th.*—Ruffed grouse are very plenty here this season; it is a common thing to meet a "habitant" with his six or eight fine birds, shot with his cheap German gun after being treed by a small yelping cur.

St. John, N. B., Nov. 12th.—We have had a full week of wet weather just past. What few sportsmen left here for the north have returned with very slim bags.

The Kennel.

THE BALTIMORE BENCH SHOW.—We noticed in our last issue that the Maryland Poultry and Fancier's Association would hold a bench show of dogs on the 2d, 3rd, 4th, and 5th of January next. We now print an abstract of the prize list from which it will be seen that the prizes are liberal, and are given in cash, but should any exhibitor prefer to receive an article of some value, he will be at liberty to do so. In addition to the special prizes already announced, Alex. McComas, Esq., (gun store) of Baltimore, has offered to give a very splendid silver mounted Swiss shooting rifle, for the best couple of fox hounds, dogs or bitches; this no doubt will bring together a large collection of these valuable dogs. Chas. F. Bancroft, Esq., of Baltimore, has also very generously given a fine painting, costing \$10 for the best English setter bitch, either native or imported. Mr. Smith's gun prize is for the best native English setter dog, not dog or bitch, as previously announced.

The prize lists and forms of entry are now ready and will be sent on application to any one wishing them, on application to Chas. Lincoln, Superintendent, or G. O. Brown, Secretary, No. 1 Gay street, Baltimore. Messrs. Smith & Symington propose to make a raid on Baltimore for more specials this.

The entries close on December 20th, and it is suggested that they be sent in early so that the catalogue can be kept up. We would earnestly impress upon the projectors of this bench show the necessity of adhering strictly to their programme and receiving no entries after the date now advertised for closing them. By so doing they will be enabled to prepare a perfect catalogue, lighten the labors of the judges and enhance the pleasure of the spectators. We shall give our heartiest support to this show, in the hopes that the full representation which may be expected will in some measure counteract the ill effects of the Philadelphia fiasco. The date chosen is most appropriate. Dogs have now been worked throughout the season, and though there may be some absence of feather, the result of contact with cat-briars, those in careful hands should be in perfect condition. We hear already of several kennels which will be represented. The Westminster kennel will send the recently imported pointer Sensation, and also Whisky, Daisy, and others. Mr. Steele's Flake will be here and several of Mr. Schuchard's pointers. Mr. Tilton will send Lou and his brace of black pointers, Phil, Jr., and Dinah, (by Pete). In fact, the pointer class will be largely represented, and we hope to see present some of the fine stock owned in Prince Georges county by Mr. Chas. Coffin and others. The entrance fee will be \$2 for each dog, but this includes the dog's care and feed. If the Association can arrange with the railroad companies to have dogs transported without cost we can assure them of a large number of entries from hereabouts. The following is an abstract of the premium list:—

CLASS 1.—Imported English setters or their progeny. (Native setters of pure English blood, with an authenticated pedigree, traced back to imported sire and dam, may compete in this class.) For the best dog, \$25; second best, \$15. For the best bitch, \$25; second best, \$15. For the best dog puppy over six and under twelve months of age, \$10. For the best bitch puppy over six and under twelve months of age, \$10.

CLASS 2.—Native English setters, with or without pedigree. Classification and premiums as in class 1.

CLASS 3.—Imported red, or red and white Irish setters, or their progeny. (Native setters of pure blood, with an authenticated pedigree, tracing back to imported sire and dam, may compete in this class.) Classification and premiums as in class 1.

CLASS 4.—Native red, or red and white setters, either Irish or cross-bred. (Judges in this class will be governed by the standard for Irish setters.) Classification and premiums as in class 1.

CLASS 5.—Black and tan, or black, white and tan Gordon setters. (Other things being equal, any dog shown in this class, accompanied by a well authenticated pedigree, tracing back to pure Gordon blood, will have the preference.) Classification and premiums as above.

CLASS 6.—Pointers of fifty pounds weight or over. For the best dog, \$25; second best, \$15. For the best bitch, \$25; second best, \$10.

CLASS 7.—Pointers under fifty pounds weight. Classification and premiums as in class 6.

CLASS 8.—For best pointer puppy, dog or bitch under twelve months of age, \$15.

CLASS 9, 10, 11, and 12, are for fox-hounds, harriers, beagles, and dachshunds. The premiums in the first two being \$10 and \$5 for the best and second best couples, and in the others the same amounts for the best and second best dog or bitch.

CLASS 13.—Chesapeake Bay dogs.—For the best dog or bitch, \$25; second best, \$15.

CLASS 14.—Irish water spaniels.—For the best dog and bitch, \$10; second best, \$5.

CLASS 15.—Cocker spaniels.—For the best dog or bitch, \$10; second best, \$5.

CLASS 16.—Retrieving spaniels, (other than pure Irish).—For best dog or bitch, \$10; second best, \$5.

CLASS 17.—Fox terriers.—For the best dog or bitch, \$10; second best, \$5.

Similar classes and prizes as the last are provided for, Mastiffs, St. Bernards, Newfoundlands, Siberian, Dalmatian, shepherd dogs, bull dogs, bull terriers, black and tan terriers, skye terriers, Scotch terriers, Dandie Dimmont terriers, toy terriers, Pomeranians, poodles and miscellaneous.

DOG LOST.—A friend living at New Brighton, lost on Thursday last a skye terrier answering to the name of "Winks." There is \$10 ready for the finder if he will return him to this office.

[From our Special Correspondent.]

THE MEMPHIS FIELD TRIALS.

Arriving here three days before the meeting, I find a number of kennels represented, already prominent among sportsmen. Trainers were busy with the view of bringing their dogs in best possible shape on trial day; all arrangements for holding the trial were complete. Railroads have been liberal in reduced rates. Coming, as I did, by the Louisville, Nashville & Great Southern Railroad, I can heartily recommend it to those seeking sport in the field; a first-class road, and differing from most, in that it does not charge for transportation of dogs accompanied by sportsmen, fine hunting along the route, and being one of the roads doing a large share of the business of those seeking the sports of Florida and elsewhere. The genial Charles A. Atmore, General Ticket and Passenger Agent at Louisville, Kentucky, will give any information wanted to those asking it; and, being a sportsman, he knows how.

PUPPY STAKES.

Monday, first day of field trials, was an unfavorable day, being warm and very dry. At train time, 6:30 a. m., all interested—and many spectators not owning dogs—were at Memphis and Charleston depot. The train started promptly, arriving at the grounds in good season, and after preliminaries were settled, and judges and reporters were mounted, Rose, a Rufus-Duchess pup, 15 months old, was put down at 8:15 in a woods of scrub-oak and grass. Passing through into a corn-field she soon scored a point, well made on a covey; birds ordered flushed by judges, and dropped into woods above mentioned. Moving on to scattered birds she scored a second point; bird ordered flushed and killed, when she dropped to shot. Afterwards it was retrieved in good style. Third and fourth birds were flushed; fifth bird pointed in good style. Rose was then ordered up at 8:45 for points of merit and demerit. I refer to tabular statement, where best comparison of points can be made. Rose is a red Irish setter bitch, 15 months old, and owned by R. B. Morgan, Richmond, Indiana. She is under good command, with good pace and style. I would mark 3 points, 15; backing, 3; pace, 4, style, 3; quartering, 2; retrieving, 5; total, 32. Demerits, 6.

No. 2, Leo, chestnut-colored setter dog, owned by Mr. Morgan also, was ordered put down at 8:50; flushed first bird, and did not drop to wing. Second bird flushed, not dropping to wing. Same for third bird, but bird ordered killed, which was retrieved in good style, this being all placed to the good. Did not show any pace, style or nose, and not under good command. Mr. Morgan very properly withdrew from the contest at 9:10, when

No. 3, Khalif, red Irish setter dog—a Plunket-Kitty puppy—owned by F. Bierbower, Maysville, Kentucky, was sent forward, and worked by Mr. Edward Wallace, of Bartlett, Tennessee. While drawing cornfield a covey was flushed by the horsemen, which were marked down. First single bird well pointed; bird ordered flushed; dog dropping to wing. Second bird a questionable flush, dog going down wind. Fine point on third, flushed and killed by Mr. Wallace. Upon judges ordering bird retrieved, it was stated he did not retrieve, thus putting him at great disadvantage, and perhaps destroying his chances to win. His roading was excellent when opportunity offered. Four and fifth birds goods points. Our mark for Khalif would be 4 points, 20; backing, 3; pace, 6; style, 4; quartering, 4; total, 37; leaving one flush 3, and not retrieving to the bad. Ordered up at 9:50.

No. 4, Isabel (owned by Mr. John Davidson, of Monroe, Michigan), put down on scattering birds. First bird pointed well. Khalif then brought up backing in good style; bird ordered flushed; killed by Mr. Davidson, the bitch retrieving well. A new convey was then hunted, and one flushed by horsemen and lighting in cotton-field close by. Fourth and fifth birds pointed; birds flushed by Mr. D., but not shot at. Isabella I consider was lacking much in pace and style, quartering ground moderately well, and will mark her to the good; 5 points, 25; backing, 3; pace, 2; style, 3; quartering, 2; retrieving, 5; total, 40. She was ordered up at 11:04.

No. 5, Pride of the South, turned loose, and sent in sedge-grass on scattered birds. First bird flushed as he was going down wind, but he promptly dropped to wing, when afterwards all moved on to find a new covey. Passing through several fields and two pieces of woodland and finding no birds, all stopped to a bountiful lunch at 12:50, and the invitation, "Guido is spreading the lunch, come and eat," was instantly responded to, all doing justice to the bountiful spread. Lunch over, Pride was again put down at 1:45. Passing directly into a wood of scrub-oak and grass, he came to his third point on a covey, and being

urged on did splendid roading about 50 yards on running birds, finally making a firm stand, birds flushed 20 yards in advance. From this time to the end of his run he did the best work of the day; pointing his fourth bird in grand style, and retrieving in like manner. After bird was flushed and killed by Dr. Saunders, at report of gun balance of covey went up, dropping in woods, when the fifth and last point was made. His score I would place as follows: 4 points, 20; backing, 3; pace, 6; style, 5; quartering, 4; retrieving, 5; total, 43. Most of his work was in the woods and was well done, and would have been hard to surpass. Pride was taken up at 2:30.

No. 6, Lawson, lemon and white setter, owned by W. A. Wheatley, Memphis, was sent out on scattered birds in the woods. His first record the judges pronounced a flush. Crossing the railroad he was worked through another woodland, passing into a cornfield, where he was called upon to back, which he did in good style. Birds ordered flushed, and a brace killed, Lawson being ordered to retrieve; found "dead bird," but failed to fetch, as he does not retrieve. Passing down into adjoining corn-field another flush was charged to him, but on the next a good point was placed to his credit. Mr. Wheatley thinking it was beyond his power to win, and wishing to facilitate matters, wisely withdrew him, not running his chance through. He is not marked, but say to his credit he backed firmly, dropped to shot and wing, and showed good pace and fair style.

No. 7, Katty, owned by F. Bierbower, Maysville, Kentucky, was sent forward for scattered birds. Pointing well her first, it was flushed and killed by Mr. Wallace. Katty was ordered to retrieve, and while seeking dead birds pointed well on a second, but bird being flushed and shot, she broke shot, this occurring for the first time in the trial. She then failed to retrieve and was sent out again, soon coming down to a point, which proved to be a false one, and for which she received the penalty. Mr. Campbell was ordered to bring up Kate, that her backing qualities might be tested. She failed to back, and was so marked by the judges. Mr. Bierbower, after trying a short while to find another bird withdrew her; so her score not being finished we do not mark her, but say she shows good speed, fair style, and very good nose, and should improve wonderfully with handling.

No. 8, Kate, native Irish bitch, owned by Mr. Geo. W. Campbell, Carter's Creek, Pennsylvania, was called to the front at 4:20, and moving on to adjoining corn-field she found a fresh covey, pointing firmly and in good style. Birds ordered flushed, "Guido" bringing down two at first fire. Kate being ordered to retrieve soon found dead bird, but not starting in promptly Mr. Campbell blew his whistle. She brought bird, dropping it a few feet away, and thus did not score full merit. On to the scattered birds was ordered, Kate flushing two in succession, and while moving on fourth, nearly to point, Mr. Campbell called "to-ho," Kate responding, when, almost instantly, the bird got up. Mr. Whitford here protested against a point being allowed, claiming she was pointing; if at all, to command. The judges decided "a point." Soon afterwards she found her fifth and last bird, pointing it very firmly, and thus ended the first day of field trials. Kate showed fine speed, fair style, and I mark her 3 points 15; backing, 0; pace, 5; style, 4; retrieving, 3; quartering, 3; total, 30. Demerits, 2; flushes, 6; not backing, 3; total, 9. Credit, 21 points. The puppies throughout showed good handling, and behaved remarkably well, all wishing a better day for them. Ground very dry, and a large share of the hunting being in dry grass, too thick for the air stirring to pass through. The puppies were only half finished, and the remaining eight will be run first, and next in order will be the contest for a handsome water set, donated by Mr. Greenwood, of Cincinnati, imported Irish setters to compete. Three entries are made, two to start, Erin of St. Louis Club, and Friend.

On the returning train to Memphis, it was announced that entries would be received at Peabody Hotel, from 8:30 to 10:30, for the Champion Stakes free for all, and the Brace stakes, the first, closing with twelve entries, and the second with five Brace. Order of running being drawn, they will run as hereafter described: two amendments to rules to govern the trials in Champion and Brace stakes were concurred in by all, having entries in either. A few small pools were sold to find out who were favorites, which did not determine much.

TUESDAY, NOVEMBER 4TH—PUPPY STAKES CONTINUED.

The much wished for rain came this morning, promising better chance for work, and at 7:45, No. 9, Prince, owned by Luther Adams, and entered by St. Louis Kennel Club was ordered to the front, and was put down in woodland of scrub-oak and sedge grass. Passing through it into corn-field it was partially drawn, and a few birds flushed; going into woods first bird was flushed, and second bird pointed in good style. Ordered to be flushed, and was killed and well retrieved. Third bird was staunchly pointed; ordered flushed by judges. Prince dropped to wing. Fourth bird flushed; fifth bird flushed also; Prince was under good command, and showed good breaking throughout. He backed in capital style. Would mark him 2 points, 10; backing, 3; pace, 5, style, 4; quartering, 4; retrieving, 5. Taken up at 8:15, when

No. 10, Border, native setter, owned by A. C. Waddell, Edina, Missouri, was brought up, turned loose, and after one and one-half hour he was penalized for chasing rabbit after flushing his first bird, and chased it. Second bird flushed, and having no possible chance to win was withdrawn. The dog showed little training, and owner lack of confidence while working him. Border was taken up at 11:35; and,

No. 11, Draco, black pointer, owned by same, was sent into sedge-grass, soon pointing first bird, but broke shot. Second, third, and fourth birds flushed, when he was withdrawn, like Border. He failed to show much good.

At 12 o'clock No. 12, Countess, owned by Mr. W. A. Wheatley, Memphis, was put down on scattered birds, flushing first, when she settled to business, roading splendidly her second bird full 60 yards, and coming to staunch point. Bird flushed and killed by Mr. Wheatley, falling 35 yards away, and beyond log and brush. She was not ordered to retrieve. Passing on she soon pointed third bird in good style—and bird flushed and killed—when she was ordered to retrieve. Circling three or four times she found it, and not starting in instantly, the trainer, Mr. Winifred, blew whistle, certainly without thought, giving chance to penalize her, but which was not done. Fourth and fifth birds were pointed in beautiful style. Countess showed fine handling, and was hunted up and down wind, always dropping well to shot; backed in good style. Her

trainer seemed to have perfect confidence in her, and from her fine work he is entitled to much consideration for trainer's stake. I mark Countess 4 points, 20; backing, 3; pace, 5; style, 5; quartering, 4; retrieving, 5; total, 42. She only having lost a flush charged to the bad when she was ordered up. All adjourned to meet again around the lunch-table.

The next, No. 13, Clip, owned by Mr. L. H. Smith, Strathroy, Canada, was sent into the woods at 1:55, and hunting well soon pointed a single bird. One of the judges being considerably behind, the bird flushed before he was up. Those present decided not to charge it against her, but not giving credit for a point, another present thinking she was fairly entitled to credit for it. After passing through field after field, she made an excellent point on covey; bird ordered killed, and was, which she retrieved in good style. Second bird well pointed, and third flushed. Fourth and fifth birds pointed in good style. In pace and style I consider her perfect, never having seen her equal, some pronouncing her the best bitch in America; and she is sure to make her mark high in the future field trials, and but for her failure to back would have been in first ranks. I shall mark her 4 points, 20; pace, 7; style, 5; quartering, 4; retrieving, 5, total, 41. Charged against her 1 flush, 3; not backing, 3; total, 6.

Next, No. 14, Flirt, owned by W. W. Tucker, DeVall's Bluff, Ark., was started on and immediately made her first point, second bird also pointed; third flushed, and fourth well to her credit. It was ordered killed, and was well retrieved; no other birds near. This closed the second day, and she was entitled to a chance for another point, first in order for Wednesday morning. Two days now devoted to puppies; two entries yet to run. The trials have been retarded by a scarcity of birds.

Wednesday Morning—Third Day.—At 6.30 the conductor called "All aboard," and the train left the depot, reaching the grounds at 7 a. m., and at 7.15 Flirt was put down for a chance on the fifth and last point. Passing through the corn-field, stubble, and again to corn-field, she pointed on covey, doing her work well. My mark for her performance is: Point, 20; pace, 4; style, 4; quartering, 2; retrieving, 3. As she could not win she was not put down again to see if she would back.

No. 15, John, owner, Kemp Hughes, of Franklin, Tenn., being the next entry, was sent to work at 8.10. Soon flushed first bird—a hard one on him—in corn field; ground almost bare. Second bird a good point; bird flushed and killed and moderately well retrieved. Soon afterwards chasing a rabbit destroying his chance to win, he was withdrawn.

No. 16, Llewellyn, owned by L. H. Smith, Strathroy, Canada, was next and last in the puppy stakes. Making two consecutive flushes he was withdrawn. The first, a single bird, was a hard one on him; the second was a covey which he should have pointed.

GREENWOOD STAKES.

Prize, a gold water set, and very handsome. To be contended for by imported Irish setters. Conditions, three entries two to start. Requisite entries made, Friend, worked by G. M. Campbell, and Kate, entered by St. Louis Kennel Club, worked by Whitford—were first to start on scattered birds. Friend flushed first, second and third birds and making good point on fourth. The birds were in woodland, and a hard place to score well; fifth bird a point for Friend; bird flushed and killed by Mr. Morgan, Friend retrieving in fair style. Kate doing little to credit or otherwise, was then taken up, and Erin sent away with Friend, was soon in cotton field, making his first an excellent point. Friend, coming up behind, failed to back as she should; passed Erin, and made an inexcusable flush—a fine covey, and they went down close by in sedge grass. Friend soon made another flush, and Erin following example, both dropping to wing, and next a false point for Friend. Erin brought up and backed promptly. Some time elapsed before another bird was found, Erin finding and pointing it; bird flushed and killed by Mr. Whitford, and well retrieved by Erin. This closed the contest, Erin performing well, Friend showing good pace and style, but her seeming weak points are she does not back well, and flushed too often. Judges were unanimous in awarding prize to Erin.

Next in order was lunch, with the usual abundant supply. After lunch it was agreed upon by Mr. L. Smith, of Strathroy, Canada, and Mr. Waddell, of Edina, Mo., to run a trial of speed, former naming Leicester, latter Phil. Each having selected a judge, the night previous at Peabody's Hotel, they to select a third. Mr. Smith was promptly on time with Leicester. Mr. Waddell failing to put in an appearance, making a square back down. Capt. Pat Henry was anxious to run his Pride of the South, and he and Leicester were taken down a lawn 200 yards away and turned loose. Leicester first to winning post, Pride close up. Another trial was then had, Clip and others added to the number. This was a fine race, Leicester first in, Clip a very close second, and Pride half length behind, all showing wonderful speed.

Our correspondents report of the other stakes, which is very voluminous, reaches us too late to be published in this issue. The winners of the various events were as follows: Puppy Stakes—First, Isabella (native), owned by John Davidson, of Monroe, Mich. Pride of the South and Countess tied for second prize. Champion Stakes—First, Drake, owned by St. Louis Kennel Club. Second, Stafford, P. H. Bryson; third, Paris, L. H. Smith. The Greenwood cup was won by the St. Louis Kennel Club's Erin. Sweepstakes for braces—First, Drake and Erin, St. Louis Kennel Club; second, Maud and Stafford, P. H. Bryson; third, Paris and Pride of the South; fourth, Lily and Countess; fifth, Buck and Kate. The following is our correspondents summary of the meeting:—

In reviewing the trials of the week our judgment is that that the performances of the dogs far exceeded those of any previous trials. In the Puppy Stakes all showed fine handling, there being but one break shot in the sixteen entries, and two days of work—a wonderful performance, where many of the entries were from 12 to 14 months old, and those being in the field only from two to three weeks; and in justice to the puppies would add that the rules were changed after they had been worked, which accounts for the seemingly great disparagement compared with older dogs. In their case a failure to point, together with the flush, counted 8; in the aged dogs a flush was counted only, a lost opportunity for a point counting only 5 to aged dogs, 8 to puppies. In the Puppy Stakes

by rule, the judges were obliged to give first prize to a puppy, which could not otherwise have won it, as she was very deficient in space and style. Independent of rules, the award, in my judgment, should have been Pride of the South, first; Countess, second; Isabella, third. No complaint of the judges decision in this, or other contests, was heard—being in position to hear if any was made. I can say, from beginning to end, I did not hear a word that could be construed into dissatisfaction to the awards in all classes. The judges are well known gentlemen, and all were satisfied they had received honest judgment. In the beginning, the contest waxed warm between blue bloods and natives, but looking over the results, I find that the blues are credited with winning eight times; natives, twice; but in Greenwood Stakes no natives were eligible, leaving score 7 to 2, and but for rules would have been 8 to 1, with Countess the winning native. The St. Louis Kennel Club, and Mr. L. H. Smith, should be proud of their respective kennels, the former winning in every contest, excepting Prince in Puppy Stakes. In regard to Mr. L. H. Smith's kennel, Strathroy, Canada, it's a singular fact that, of the twelve winning dogs, excepting the Irish cup won by Erin in these trials, seven are from the Strathroy kennel, and out of nine dogs run from his kennel seven were winners, only two not being placed. Surely the owners of blue bloods should congratulate themselves. After the trials were over the following dogs were sold, and we hear brought the prices mentioned. Lily, pointer, sold to St. Louis Kennel Club at \$75; Stafford bought by same, at \$500; Duke, owned by Luther Adams, and Llewellyn, by Mr. Smith, were both sold at a price not made public. In comparing the record of each dog, given according to my judgment, it will be seen to differ little with the official statement of the judges.

Sea and River Fishing.

FISH IN SEASON IN NOVEMBER.

Black Bass, *Micropterus salmoides*; Weakfish, *Cynoscion regalis*.
M. *nigricans*. Bluefish, *Pomatomus saltatrix*.
Mascalouge, *Esox nobilior*. Spanish Mackerel, *Cybbium maculatum*.
Pike or Pickerel, *Esox lucius*.
Yellow Perch, *Perca flavescens*.
Sea Bass, *Sciaenops ocellatus*.
Striped Bass, *Morone americana*.
White Perch, *Morone americana*.

FISH IN MARKET.—The recent storms on the coast have interfered with the operations of the fishermen to such an extent as to make fish very scarce. Bluefish and bass are now being received from North Carolina. We quote:—Striped bass 20 to 25 cents per pound; smelts, 20 cents; bluefish, 12½ cents; salmon, 40 cents; mackerel, 15 cents each; white perch, 15 cents per pound; Spanish mackerel, 75 cents; green turtle, 18 cents; terrapin, \$15 per dozen; halibut, 18 cents per pound; haddock, 8 cents; codfish, 10 cents; blackfish, 15 cents; flounders, 12 cents; eels, 20 cents; lobsters, 10 cents; sheephead, 25 cents; scollops, \$1.50 per gallon; soft clams, 30 to 60 cents per hundred; whitefish, 20 cents per pound; pickerel, 18 cents; salmon trout, 15 cents; hardshell crabs, \$3.50 per 100.

—Mr. E. G. Blackford, of Fulton market, received on Tuesday, from Westhampton, Long Island, four splendid shad, weighing 3½ to 4½ pounds each. Last year, about the 25th of November, shad were taken in Florida waters, and also in Savannah river and in the Neuse river below Newburn, N. C. A week or two later nine fine fish were taken by a schooner while blue fishing, twenty miles north of Cape Hatteras. It is very unusual, however, to find shad as far north as Long Island at this season of the year.

See Mr. Leonard's advertisement of Bamboo Fly-Rods elsewhere.

—The Snow Hill (Maryland) *Messenger* says that "within the past week millions upon millions of dead fish of different species have been washed up from the sea and lie rotting in the sun. In one place on Cobb's Island there is a strip of the beach two miles long and seventy-five feet wide covered with them to a depth of from three to six feet. Several large vessels are engaged in collecting and transporting them to the farmers of Accomac county to be used for manure."

[We will accept from our readers with thanks, any intimation whatever, that will aid in assigning a reason for the great mortality of both salt and fresh water fish which is periodically brought to notice. The causes must be widespread and various.—ED.]

MARYLAND.—Large quantities of bass are being caught on the Potomac at Seneca, above Washington.

VIRGINIA.—*Blacksburg, Nov. 13th.*—Our bass fishing is about over. Mr. William F. Page, of Lynchburg, reports taking 300 red eyed perch from a pond near the salt works on the Holston, with pitchforks, by forking out the grass. These were transferred to James river, at Lynchburg, and Tye river in Nelson county. Several hundred had previously been transferred to New river by the same gentleman. These fish appear to be new to science, they are near the Rock bass of the north in size and game qualities, and immensely prolific. E.

Norfolk, Nov. 14th.—The fish market does not show as abundant and varied supply as last month, but there is a fair share of salt water fish, including bluefish, bass, grey trout (squeteague), perch, and tailors. Of fresh water fish we have pike, mud shad, bream, chub, raccoon, white and French perch. H.

TENNESSEE.—*Nashville, Nov. 13th.*—Charles E. Hillman, of this city, while on a recent expedition to Caney Fork, caught a jack fish, weighing fifteen pounds. The width of the mouth is five inches, and the measurement back of the gills, nine inches. It had long teeth, and very large eyes.

LARGE EELS.—An eel was taken about November 2d from a pond in Kingston, R. I., which was said to weigh over fifteen pounds. Your correspondent, who saw the fish, believes that it must have been near that weight. How large does the common fresh water eel grow in America? Frank Buckland, the English naturalist, who is in the habit of collecting and making plaster casts of the largest fish he can get, says in his notes to the "Natural History of Sel-

bourne," that his largest eel weighed seven pounds. Mr. Buckland gives the following as a good way to catch eels: "Take a corn sack, turn down a hem, and run a line round at the mouth. Drop a sheep's paunch into the sack, and fill up with straw as tight as possible. Sink it in the pond or river; the eels work through the straw to the end. By drawing the sack up by the cord, it is closed, and you have your eels bagged." S. C. C.

MOVEMENTS OF THE FISHING FLEET.—The fine weather of the present week has been favorable for the shore fishermen and they have done a good week's work. The demand has been active and the prices realized in this market, have been \$4.00 per hundred weight for cod and \$3.50 for haddock. There have been 39 arrivals from Georges and the Banks, and 1 from the Bay of St. Lawrence. The receipts have been 420,000 lbs. of Bank codfish; 175,000 lbs. Georges codfish, 135,000 lbs. Bank halibut, 85,000 lbs. Georges halibut, and 120 bbls. mackerel.—*Cape Ann Advertiser, November 17th.*

With regard to the well-authenticated habit of salmon to return habitually to their native streams, Mr. Wilkinson in his recent article, published in Scribner's Magazine, describing an angling excursion in Canada, incidentally remarks:—

"It is notable that although three Gaspé rivers flow into the same bay, and for long distances within a few miles of each other, yet the fish are so different as to be readily distinguished one from another by the natives. The fish run up earliest in the York, and those taken even in the lowest pools are of larger size than those of the other streams. Of course those that are strong enough to get to the upper pools early in the season before the river has run down, are extremely large. The last runs of fish in the York are perhaps a trifle smaller than the general average of the St. John, where the early and late runs are more nearly the same average size. So the fish of the Tay in Scotland, are a month earlier than those of the Tweed, and presumably in this case because the snow gets out of the former much the sooner. The fish of the St. John are slightly shorter and fuller than those of the York, resembling more nearly the *Salmo quinnat* of California. A few seasons since the St. John was so jammed with the logs of a broken-up lumber raft, that the fish were blocked out of it, and that year its peculiar fish were taken in the York. The next year the St. John was clear and its fish went back to it. A few seasons later, grise and young salmon were taken in the York which slightly resembled the St. John fish. The parent fish returned to their own stream. Their offspring, which were hatched in the York, remained in that river."

—A dog with an ear for music is owned by a man in Troy, in N. York. The man's daughter is taking lessons on the piano, and devotes several hours a day to practice. One day the dog was in the room, and showed great interest in the piano. He jumped upon the table and looked at it, ran under and around it, leaped upon it, and peered into it, as if trying to find out where the sounds came from. Soon after, when the young lady was playing, the dog tried to imitate the notes. Afterward, while she was practicing, the dog almost daily would try to sing; he did not bark nor howl, as dogs will often do, at the sound of bells. Although he could not pronounce fa, sol, la, mi, do, etc., he succeeded in a good imitation of the sounds, and could cause his voice to rise and fall with the notes. All this was at first only in the presence of the young lady. When she told her mother, and invited her to be present, the dog would not sing. By and by, however, his fondness for music overcame his bashfulness, and he would sing in the presence of the two ladies. Afterward other members of the family were called in, and now the dog, having conquered his modesty and gained confidence in his own power, will exhibit his musical talents in the presence of any company. He is certainly a wonderful dog, and if properly encouraged may learn to talk as well as to sing, and become a living proof of the Darwinian theory of evolution.—*Springfield Republican.*

Tiffany & Co., Silversmiths, Jewelers, and

Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes.

Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York.

Rational Pastimes.

FOOT BALL.

The Harvard Foot Ball team met the Yale Eleven at New Haven on Saturday to play the first of a probable series of three matches. The rules governing the contest were the Rugby rules modified somewhat to suit the Yale game, which is played ordinarily at that college, and eleven men were played to a side instead of fifteen, Harvard's usual number. The ball was the oblong, leather-covered bladder, used by the English and Canadians. The sides were made up as follows: Yale—Baker, Bigelow, Camp, Walker, Downer, Taylor, Wurts, Hatch, Thompson, Camp, Clark. Harvard—Falcon, Wetherbee, Herrick, Curtis, Leamans, Rollins, Cushing, L. Cushing, Keys, Jordan, Blanchard. The game was called about three o'clock, Yale having the kick-off. The playing was good all round, the Yale men having improved decidedly on their game since last year, but still showing a reckless disregard to the rules governing on and off-sides. For the first three-quarters of an hour neither side had gained any great advantage. Harvard by playing well together kept the ball uncomfortably near the Yale goal and succeeded in getting two touch-downs, but as both were very much to one side of the goal-posts, and as the wind was unfavorable no goal was kicked.

The second half of the game began with a kick-off by Herrick, of Harvard. The ball, after being roughly handled about the field was, by a lucky kick of Thompson, sent over the Harvard posts. At this exciting juncture the crowd, which at no time during the game kept the proper limits, broke in upon the field and used up twenty minutes of valuable time by carrying the Yale men around on their shoulders. Order being finally restored the game proceeded. A great many unnecessary delays were caused by the repeated appeals of the Yale men, upon points which an umpire is seldom called upon to decide, and by their continually demanding to "have it down." The Har-

vard men could, of course, do nothing to prevent this style of playing on the part of the Yale men, and played on with increased vigor. Finally Cushing obtained a touch-down and was just placing the ball for a kick at goal when time was called and the crowd rushed in upon the field. Harvard claimed a tie, but the referee, Mr. Bushnell, disallowed it. The score as it stands is one goal for Yale, three touch-downs for Harvard, which, by the Rugby rules, gives the game to Yale. The issue of the contest is very unsatisfactory, and the wearers of the crimson naturally desire another opportunity for retrieving their fortunes.

A match between the Freshman teams had been arranged, and the Harvard team accompanied the University eleven to New Haven. The Yale Freshman refused, however, to play, apparently because two of their men were to play on the University team. Mr. Jordan, the Captain of the Harvard Freshman, offered to play ten men to eleven, but was unable to get a game. The Harvard team, after partaking of refreshments at the Yale Restaurant, took the midnight train for Cambridge, arriving there early Sunday morning.

FOOTBALL CONVENTION.—To-day, delegates from Columbia, Harvard, Yale, and Princeton colleges will meet at Springfield, Mass., to consider and agree upon uniform rules for the game of football. It were advisable that the Convention accept the Rugby Union rules without alteration, as they govern the majority of the matches played in England. The Rugby rules are the result of years experience, and it would be very foolish, to say the least, for those who know but little of the game to attempt to improve or alter them.

CHAMPION RACQUET MATCH.—The annual match for the championship of the New York Racquet Club came off on Thursday last in their court at the corner of Twenty-sixth street and Sixth avenue. There were six entrants, who were paired as follows: Messrs. G. C. Allen and J. T. Loutter; Messrs. David Lydig and E. LaMontagne, and Messrs. A. S. Thorp and H. W. Miller. The winning of three games out of five decided the match. Mr. Loutter

disposed of his opponent in a straight rubber of three games, and his example was followed by Mr. LaMontagne. Mr. Thorp defeated his antagonist by three games to two. On coming to play off Mr. LaMontagne won straight rubbers in both matches, and thus carried off the championship. The play was admirable throughout. The prize consists of a gold breastpin, designed and made by Tiffany, the head of which is composed of a miniature racquet bat and ball of pearl. It was presented to the victor on Tuesday evening. That gentleman also receives the honor of having his name engraved on a tablet to be placed in a conspicuous position in the club. The annual handicap match for two prizes will be played on Thursday (to-day). There are twenty-five entrants, and some graceful and spirited play may be expected.

DANGERS OF BREATHING BY THE MOUTH.—D. Guye, in the London Medical Record, directs attention to the evils of breathing by the mouth. To appreciate these it must be remembered that the functions of the nose in respiration are threefold.

1. The olfactory sense secures it against the entrance of impure air.

2. The moisture of the nasal passages gives a certain degree of aqueous saturation to the inspired air, the contact of which is thus rendered less irritating to the mucous membrane of the throat and larynx.

3. The inequalities of the organ retain solid particles suspended in the air, which is proved by the quantity of dust sometimes found accumulated in the nostrils. These functions are all lost by breathing by the mouth. Further, the contact of dry air soon produces circulatory troubles in the pharyngeal region, and even an habitual catarrh, susceptible of easy transmission by continuity to the eustachian tube and cavity of the tympanum.

—A spirited and valuable horse, owned by Dr. Moore of Troy, was taken into a lot, shackled and clipped a few days ago. The animal caught cold while undergoing the clipping, and died Friday last from paralysis.

The Kennel.

Dogs and Birds.

THE UNDERSIGNED ARE REGULAR importers of Skye terriers, Pugs, King Charles Spaniels, and dogs of every breed. Also all kinds of birds and ferrets. Mocking bird food and cages, and seeds of all kinds. Dogs boarded and given the best of care. Orders from the country promptly replied to.

TUCKERTON, BEECH HAVEN, CAPE MAY, SQUAN, and points on the NEW JERSEY COAST renowned for SALT WATER SPORT AFTER FIN AND FEATHER.

D. M. BOYD, JR., Gen'l Pass. Agent.

FRANK THOMPSON, Gen'l Manager. Feb 17 1t

THE SPORTSMEN'S ROUTE.

Chicago & Northwestern Railway.

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago. Like the fingers in a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Nagaunee and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kameska, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, via the Illinois Central, reaches Warren, Galena and Dubuque, and the country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GEESE, AND BRANT SHOOTING. THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS

than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West.
MARVIN HUGHITT, W. H. STENNETT,
Gen. Supt., Chicago. Gen. Pass. Agt., Chicago.

Thomson's

Oil Finished Grain Leather Shoe- Pack or Moccasin.

With Sole, Price, \$7.50. Without Sole, \$5.50.

Made with heavy sole for land use; also without
sole for snow and canoe purposes. All hand sewed
and strongly made. Laced in front with hooks (over
English style of water-tight tongue), thereby securing
PERFECT FIT around ankle, thus preventing any
slipping at the heel. Made with broad soles and on
scientific principles.

Fills the want long felt by sportsmen for an easy
fitting and durable shoe.

In ordering, state size of boot worn. Sent by mail
on receipt of price, with 40 cents additional for post-
age, or by express C. O. D., everywhere. Manufactured
by THOMSON & SON, 301 Broadway, New York. jn27-tf

Good's Oil Tanned Moccasins

The best thing ever worn by
sportsmen. Not injured by wet-
ting and drying—always soft and
easy to the feet. Four differ-
ent styles. Prices to
suit the times. Send for
illustrated circular and

price list. (Successor to Frank Good). MARTIN S.
HUTCHINGS, P. O. Box 3,8 Dover, N. H. jn27 tf

WIND-PROOF

Leather Vest and Jackets, Flannel-Lined.

(Made and sold only by Messrs. G. W. SIMMONS &
Co., OAK HALL, BOSTON.) are considered the most
sensible protectors ever devised for winter wear. They
are especially adapted to the requirements of sporting
men, whose rapid walking is likely to be followed by
frequent halts in the cold wind. Price, Vest \$7;
Jacket \$9. Measurements required are Waist, Breast
and Inside Seam of Sleeve. Mention Height and
Weight.

LADIES LEATHER VESTS AND JACKETS

made to order. Indispensable to all who are in any
way exposed to the weather.

G. W. Simmons & Son,
32 to 38 North St., Oak Hall,
Boston, Mass.

WILD GOOSE

—AND—

BRANT SHOOTING

Begin this month. The Shooting Outfit which is
now recognized as the best in the country, is that
known as the "Boston Shooting Suit," waterproofed
and made only by G. W. SIMMONS & SON, Oak
Hall, Boston. Sold by dealers in Sportsmen's
Goods generally throughout the country. Price com-
plete \$13.

Our new Patent Decoy is light and compact (one
dozen occupying but little space), so that a sportsman
can conveniently carry a case of large-sized birds in
his carpet-bag.

The Boston Shooting Suit.

MANUFACTURED ONLY BY

G. W. SIMMONS & SON,
Boston, Mass.

Sold everywhere in the U. S. by all first-class
dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT,"
made by
G. W. Simmons & Son.

This new design of WATERPROOF SHOOTING SUIT,
made from extra quality duck, has attained such
popularity as to be called for from all parts of the
country, and even from England.

"Shipping clothing to England strikes us very much
like sending 'Coals to Newcastle,' but the merits
of the "BOSTON SHOOTING SUITS" have been
heard of in the Old Country, and that land of sports-
men has sent an order to Messrs. Simmons & Son,
which will doubtless be followed by many others."—
Boston Paper.

The design embraces the best points of the English
and French Suits, combined with the necessary re-
quirements for American service. Particular atten-
tion has been paid to color.

Each suit is water-proofed by a new patent process.
The seams and pocket corners are securely fastened,
and nothing neglected to render the suit perfect in
every respect.

THE PRICE HAS BEEN FIXED AT \$13, TO IN-
CLUDE HAT OR DOUBLE VISOURED CAP. DE-
TACHABLE HAVELOCK, COAT, VEST, AND
PANTALOONS.

One hundred suits will be kept ready in stock, so
that we can furnish to order any size required, at a
moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper)
the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof
suit, specially adapted for sportsmen, designed and
made up by Simmons & Son, of Boston, and to which
we call the attention of all brethren of the out-door
and shore-shooting fraternity, because it meets the
demand of personal comfort and convenience beyond
anything of home manufacture seen by us before.
As a sportsman, we give it our unqualified endorse-
ment, as combining the best points of the English
suits, and in addition skilfully adapted to the neces-
sities of the American service. It is a most admirable
and satisfactory contrivance in color, style, water-
proof quality and capacity. The coat is a marvel
in this latter respect."

PERSONS ORDERING FROM A DISTANCE NEED
SEND ONLY THE FOLLOWING TO BE SURE OF
A PERFECT FIT: BREAST MEASURE, WAIST
MEASURE, INSIDE SEAM COAT SLEEVE, IN-
SIDE SEAM PANTALOONS; MENTION HEIGHT
AND WEIGHT.

G. W. SIMMONS & SON,

"OAK HALL," BOSTON, MASS.

"THE BOSTON SHOOTING SUIT.—One of the most
successful manufacturers of Waterproof Shooting
Suits is the firm of G. W. Simmons & Son, Oak Hall,
Boston. We had one of their suits on duty at Hun-
ter's Camp at Philadelphia Centennial Exhibition.
It has grown gray in service, but is good
for use yet. This suit is known as the 'Boston
Shooting Suit,' in contradistinction no doubt, from
the garments which are manufactured out west and at
Washington, each of which has a local demand of its
own. It is said that the western prairie fowl can
distinguish any sportsman who visits their domain
by his clothes. They can tell him 'by the cut of his
jib,' and the old educated birds (which no one cares to
eat, by the way,) know exactly what distances to
keep from the rail shooters, the brant men, and the
chicken-killers respectively, to be safe. They have
'got them all down fine.' This used not to be so be-
fore the waterproof shooting suits were invented.
Bostonians, Hoosiers and Buckeyes all stood the same
chance then. But now it is—with a shrill pipe to lee-
ward by the old-weather cock—'here comes a Sim-
mons; cheese it!' or 'Ere's a 'Enning—lie low!' or
'Look out for Holabird! Scatter! you beggars, scat-
ter!'—FOREST AND STREAM.]

McBride Flies,

The Standard Flies for American Waters

These flies are imitations of American insects, or
combination of colors, that an experience of forty
years has proved most successful. Parties sup-
plied with casting lines and artificial flies for
Pennsylvania trout streams, Adirondacks, the Maine
Woods, Lake Superior, Thousand Islands, Canadian,
and other waters. Anglers not acquainted with the
nomenclature of these flies, by mentioning the local-
ity where they intend fishing, will have the varieties
best suited to those waters sent to them. Flies copied
from any natural insect or pattern desired. SARA

HURST'S

Stereoscopic Studies

OF

Natural History

FOR OBJECT TEACHING IN SCHOOLS

And

PARLOR ENTERTAINMENT.We are prepared to furnish the first sixty numbers of
the first series of**Animals and Birds of North America.**

To these will be added a second series of foreign
specimens, and various animals and birds in grotesque
attitudes, never, however, violating their natural in-
stincts.

We offer these views, not as pictures only, but as
studies from nature. One of the great moving ele-
ments in our modern system of education is object
teaching. The unerring fidelity of the stereoscope
transfers the animals and birds from their natural
habitat to the rooms of the student and the fireside
of our homes, where they cannot fail to have a last-
ing impression of the form, color, habits, and local-
ity of each specimen.

An experience of more than twenty-five years as
Taxidermist of the New York State Cabinet of Nat-
ural History, and in gathering his large collection of
native and foreign specimens, enables Mr. Hurst to
combine in every view the locality of the specimen,
with its appropriate rocks, woods, or water, and col-
oring from the originals.

CORNELL UNIVERSITY,
ITHACA, March 14th, 1870.

I must congratulate you upon your great success in
his new educational enterprise. If we can arrange
our amusements so as to make them impart instruc-
tion to the mind, it will be a step in advance in edu-
cation. EZRA CORNELL.

Prices: By the Dozen, \$3 00
By the Set of 5 Dozen, in Elegant Case, 16 00

THE

American Naturalist;**A POPULAR ILLUSTRATED MONTH-
LY MAGAZINE OF NATURAL
HISTORY AND TRAVEL.****Announcement for 1877.**

This journal of popular Natural Science will con-
tinue to be published by Messrs. H. O. HOUGHTON &
Co., Riverside Press, Cambridge, Mass., under the
editorial management of Dr. A. S. PACKARD, Jr.,
with the assistance of eminent men of science.

Since January, 1876, the amount of matter given in
each number has been increased over former volumes.
The typographical dress and illustrations which have
heretofore given character to this magazine have been
improved, and it is of a thoroughly popular nature, so
as to interest the general reader as well as well as
the young naturalist. It will continue to be a journal
of science-education and for the use of science-teach-
ers.

Its Features for 1877.

In 1876 the latter half of the magazine was entirely
remodeled, and a department of GEOGRAPHY AND
TRAVEL added. The department of BOTANY will
be edited as formerly by Prof. G. L. Goodale, of
Harvard University. That of MICROSCOPY will be
edited as heretofore by Dr. R. H. Ward, Troy, N. Y.
Arrangements have been made to report the
PROCEEDINGS OF SCIENTIFIC SOCIETIES with
great promptness. A digest of the CONTENTS OF
FOREIGN SCIENTIFIC JOURNALS AND TRANS-
ACTIONS will also be given each month, together
with the LATEST HOME AND FOREIGN SCIENTIFIC
NEWS.

The attention of publishers and teachers is called
to critical notices of scientific books, to which especial
attention will be given.

Articles for Vol. xi., 1877.

By Professors Asa Gray, J. D. Whitney, N. S.
Shaler, W. G. Farlow, G. L. Goodale, of Harvard
University; Professors O. C. Marsh, A. E. Verrill, of
Yale College; Mr. A. Agassiz, Hon. Lewis H. Morgan,
Col. Theodore Lyman, Mr. L. F. Pourtales, Mr. S.
H. Scudder; Professors E. D. Cope, F. V. Hayden,
A. Hyatt; Drs. Elliott Coues, W. H. Dall, C. C. Ab-
bott, Rev. S. Lockwood, J. A. Allen, H. Gillman, C.
C. Parry, R. E. C. Stearns, O. T. Mason, and other
leading naturalists, are either in hand or promised.
Notes from abroad will occasionally be contributed
by Mr. Alfred W. Bennett, the distinguished English
botanist.

TERMS: 35 cents a number; \$4.00 a year, postage
free. Bound volumes, \$5.00; vols. I.-X., \$40.00;
unbound \$30.00. Back numbers supplied.

Remittances by mail should be sent by money-
order, draft on New York or Boston, or registered
letter, to H. O. HOUGHTON & Co., Riverside Press,
Cambridge, Mass.

MANUFACTURERS OF

Gunpowder.**Hazard's "Electric" Powder.**

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of
strength and cleanliness. Packed in square canis-
ters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) 3 (coarse). In 1 lb. canisters and 3 1/2 lb.
kegs. A fine grain, quick and clean, for upland and
prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters
and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very
clean, shooting remarkably close, and with great
penetration. For field, forest and water shooting
it ranks any other brand, and it is equally servicea-
ble for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25
12 1/2, and 6 1/2 lbs. and cans of 5 lbs. FFG is also
packed in 1 and 1/2 lb. canisters. Burns strong and
moist. The FFG and FFG are favorite brands
for ordinary sporting, and the "Sea Shooting" FG
is the standard Rifle powder of the country.

SUPERIOR MINING AND BLASTING POWDER.

GOVERNMENT CANNON AND MUSKET POW-
DER; ALSO SPECIAL GRADES FOR EXPORT

CHALLENGE.

The undersigned is prepared to prove all the supe-
rior qualities he claims for his powder.

**Safety, Cleanliness, Strength, Little
Recoil, Little Smoke, Small Report,
Less Heating of the Barrel in Rapid
Firing, and its Regularity in Shooting.**

He challenges all riflemen to shoot against him with
black powder, 200 rounds, without wiping; 100 rounds
off-hand, at 200, 500 and 1,000 yards respectively, and
100 rounds in any position at same distances; the 200-
rounds equally divided at the three ranges; sighting
shots extra.

Will shoot for money if desired.
The powder is also well adapted for shot guns.

THANKSGIVING TURKEY.

VALLEYS lay in sunny vapor,
And a radiance mild was shed
From each tree that like a taper
At a feast stood. Then we said,
"Our feast, too, shall soon be spread,
Of good Thanksgiving turkey."

And already still November
Drapes her snowy table here,
Fetch a log, then; coax the ember;
Fill your hearts with old-time cheer;
Heaven be thanked for one more year,
And our Thanksgiving turkey!

Welcome, brothers—all our party
Gathered in the homestead old!
Shake the snow off, and with hearty
Hand-shakes drive away the cold;
Else your plate you'll hardly hold
Of good Thanksgiving turkey!

When the skies are sad and murky,
'Tis a cheerful thing to meet
Round this homely roast of turkey—
Pilgrims, pausing just to greet,
Then, with earnest grace, to eat
A new Thanksgiving turkey.

And the merry feast is freighted
With its meanings true and deep,
Those we've loved and those we've hated,
All, to-day, the rite will keep,
All, to-day, their dishes heap
With plump Thanksgiving turkey.

But how many hearts must tingle
Now with mournful memories!
In the festal wine shall mingle
Unseen tears, perhaps, from eyes
That look beyond the board where lies
Our plain Thanksgiving turkey?

See around us drawing nearer
Those faint yearning shapes of air—
Friends than whom earth holds none dearer!
No—alas! they are not there:
Have they, then, forgot to share
Our good Thanksgiving turkey?

Some have gone away and tarried
Strangely long by some strange wave;
Some have turned to foes; we carried
Some unto the pine-girt grave:
They'll come no more so joyous-brave
To take Thanksgiving turkey.

Nay, repine not. Let our laughter
Leap like fire-light up again.
Soon we touch the wide Hereafter,
Snow-field yet untrod of men:
Shall we meet once more—and when?—
To eat Thanksgiving turkey.

And though not, 'twere still ungrateful
'Mid such warm companionship;
To forecast the future fateful,
Finding there no balanced good.
'Tis but a type of finer food,
This plain Thanksgiving turkey;

Of higher gifts a quaint reminder.
Then let the bounty do its best
To make us gladder, stronger, kinder.
Bid no ghost to be our guest,
But eat as those now gone to rest
Once ate Thanksgiving turkey.

—Harper's Magazine.

The Old Gray Buck.

A REMINISCENCE OF FOLINGSBY, JR.

OUR camp was pitched upon a point of land jutting out into the calm waters of Folingsby Junior. A few days before we had left Paul Smith's, and by the way of the St. Regis river had paddled to the spot where our temporary home was now placed. At the time of which I write Paul's was a hunting house; the St. James of the wilderness had not reared its stately head with accommodations for a hundred or more guests, and Saratoga, with its silks and laces, and ladies' arks had not been transported bodily to the shores of St. Regis. A long, low, unpretending house, with its dozen rooms and a comfortable piazza, where the sportsman could sit in the evening and smoke his pipe, stood upon the well-known mound, and as the day declined a few chosen spirits would gather together to recount the varying fortunes of the hunt just finished, or tell how that old settler of a trout at the mouth of the spring brook in the bay around the point yonder had,

for the third or fourth time, twisted his line about the snag, or tangled it up among the lilies and got off scot free. It was a lovely spot in those days, before Fashion, with her arbitrary rules, had voyaged so far from the borders of civilization; when the number of hunters in the woods were not nearly equal to the deer in numbers as now, and when the guide was an assistant indeed in the hunt, and joined in the sport as much for the love he bore it as for the remuneration he received, which happily did not amount to more than double the value of all the game that was daily killed, as is frequently the case, if not indeed the rule, in these degenerate days.

We had been driving the morning of the day I have introduced the reader to our camp, but our hunt had been unsuccessful, and one after another the dogs had dropped in and coiled themselves up near the fire to sleep off the fatigue of their run. The sportsmen were engaged in various ways, and one, D., had taken his boat and gone a short distance to fish for trout for supper, and to keep himself steady in his chosen place had firmly tied his boat to a stake, while he stood on one of the seats to cast his flies in hopes of alluring one of the sly creatures below to the tempting bait.

Suddenly a slight splash in the lake close to the shore nearly opposite, caused every man to start to his feet, for there were men there who knew well the sound the deer makes when entering the water, and all eyes were earnestly looking for the first view of the game before starting in chase. The afternoon was far passed, so the lake along the opposite shore lay hid in the shadows of the overhanging woods. But a few moments of suspense were passed, and then the wide antlers and head of a gallant buck came into view, as the animal slowly swam out of the shadow into the light. A rush was made for the shore, each one to his own boat, such of the guides as could leave their occupations following rapidly. "Gently, boys, gently," said one; "make no noise, let him get well out and we are sure of him." By good luck my boat was not on the shore, having been left floating when I arrived at camp from my stand. My guide jumped in quickly, and taking the oars we were off, followed by George with his guide, his boat having been left next to mine. The others came straggling after, but it was evident that the race was going to be between us. As we passed where D. had gone to fish, we noticed that he was working manfully at the knot made in his rope when he fastened his boat to the stake, but he had tied himself up so securely that he only succeeded in getting released just before the deer received his quietus. Away we flew, each guide exerting himself to the utmost, George and I aiding all we could with the paddles. The boats were almost side by side, and the water curled up into a wave of foam as each sharp prow cut through the still lake. The deer had not perceived us, but as we drew nearer the noise of the oars told him of our approach, and then raising himself he turned his graceful head toward us with ears thrown well forward to catch the direction of the noise that was so rapidly increasing upon the water, and satisfying himself with one earnest look, he turned and struck out valiantly for the shore. It has always astonished me to witness the speed with which a deer can swim. It seems impossible that the slender legs can propel the heavy body so rapidly through the water. His broad throat was encircled by a wall of foam, and the waves followed in his wake like those raised by a boat sailing with speed. If possible our efforts were increased, and it was soon evident that we should overtake the deer before he could regain the longed-for shore. The paddles were now taken in and the rifles brought ready for the start. As the boats glided nearly abreast I admired the splendid antlers, as they stood out wide from the head, and I called to George to notice how large he seemed. "I think," I continued, "they are the biggest pair I have ever met with in the woods." "I think so, too," he replied, and I tell you what we'll do; you are nearest, you take the first shot, for there is no use in our both firing together, and if you miss then get out of line and give me a chance; but just mind, old boy, you had better shoot your best, for I don't mean to give you a second chance, and I think you had better begin shooting at once." "All right," I replied, and telling my guide to swing the boat a little out of line so as to give me a better chance, I put my rifle to my shoulder. As I did so I noticed George was going through the same maneuvers, and I knew I must hold straight if I wanted to call that head and horns mine. As I drew the bead on the neck of the plunging animal about fifteen yards ahead of

me the motion of my boat prevented me at first holding the rifle steady, but in a moment I sighted the right place just below the head, and pulled the trigger. When the smoke cleared away the deer's head was under water, and he was making his last struggles. The impetus the boat had gained soon brought us alongside of the animal, and I seized him by the horns. At this same moment George's boat came up. "It is lucky you held the rifle right, for I was ready for him if I had not seen his head go under when you fired," he said, and then we consulted how best to get the deer ashore. He was a very large buck, and although we could have taken him into the boat, we thought that as we were two of us in already, it would be better to tow him to camp; so grasping the horns I drew the head up to the stern, and passing an antler on each side of me (the spread was so wide as easily to permit my body to pass between the beams) we commenced our slow progress to the shore. We were soon joined by the other boats, D. having at last succeeded in getting away from his attached post, and we formed a triumphal procession to camp, where all the hounds met us barking and howling their welcome, they having become greatly excited by the chase they had seen; but could not join. The deer was soon hung up on poles, and various criticisms passed upon him.

"Yes," said George, "he is a big one; but he isn't anything like as big as the old fellow I saw this morning opposite to my stand. He was a big fellow, and as gray as a badger. He'd been hunted before this, as I knew by the way he bothered the dogs down the river, and the cunning old rascal, when he struck the lake opposite to where I was waiting for him, instead of swimming right out and over to me like a gentleman, only made a little turn, and went back to the shore, and ran along a little way, then into the water, and back on shore again about two rifle shots from me, and there went off into the woods. I put the dog on his track, and I think he went away to Quebec Pond. At all events this isn't he, for that buck was all gray, and bigger than this one, too."

"Well," I said, "if I draw the lot for first choice to-morrow, I'll go back to your stand and perhaps I may get a chance at your old gray buck."

Around the fire that evening we made the woods ring with song and story, and quizzed D. a good deal about fastening himself so tightly to a post that he could not get away, even with a deer under his nose, all of which he bore with undisturbed good humor. Those cheerful autumn evenings in the woods; how many pleasant recollections are brought to me, as separated by miles of sea and land, I think upon the camp fires, alas long since gone out (but to be kindled yet again it is hoped), and the merry companions gathered around them. Fighting our battles over o'er again, and looking forward to the time when we can engage in others, are among the happiest of the sportsman's memories and anticipations. Before the dawn of the next day we were summoned to prepare for breakfast, and on drawing lots for our positions during the morning's hunt, as luck would have it I gained the first choice. "I'll go down to the foot of the lake where George was yesterday," I said, "and I am going to bring back the gray buck." "You won't see him," answered George, "he isn't such a fool as to go over the same course twice in two days; however, here's good luck to you, and may you get him." And with that we all started for our different stands. As I rowed the light boat along towards my destination I thought over my chances of meeting a deer. It seemed probable to me that if this buck was an old hand at the business, as imagined by George, he possibly was accustomed to run over the same route, and as the river which formed the outlet of Folingsby, Jr., to the St. Regis, was very crooked, he probably had frequently succeeded in throwing off the dogs by swimming and wading its waters. At all events I had made my choice and must abide by it, let the result be what it might. I was not very long in reaching my stand, and drawing the stern of the boat slightly upon the shore, I prepared for my long watch. The sun was just rising above the tree-tops as I stepped on shore, and having filled my pipe, I sat down upon a fallen tree to enjoy the morning smoke and the beautiful scene before me. There was not a breath of air stirring, and the kind of bay on which I looked was without a ripple; the dew was glistening upon the leaves, and shining like diamond clusters in the sun's rays, while the trees of the forest as they rose before me on an opposite mountain were robed in all the hues of the rainbow, the bright yellows, orange and reds standing out clear and sharp against the deep green of the cedars. Occasionally a trout would la-

zily rise to the surface, breaking so indolently that the circles he made disappeared from view before they had widened to a diameter of fifty feet; then a muskrat would be seen swimming composedly along, his tail stretched out behind him, leaving a silvery wake, while a plunge along the shore, a rustling of wings, and a rolling note, like a sharp sound of the watchman's rattle, announced the presence of a kingfisher intent upon an early breakfast. As I remained perfectly still at my lookout, the smoke from my pipe sailed slowly upwards in many a fleecy fold, and first the Canada jay or moose bird (*Perisoreus canadensis*) would stop and descend to a branch close over my head and have a good look at me, wondering probably what I could possibly be waiting there for; then a small flock of busy, chattering tomtits (*Parus atricapillus*) would make me the subject of a few hasty remarks, while at length I became the object of examination for a grave and morose raven (*Corvus corax*) who, with many bows and sedate contortions, accompanied with much swelling of his throat, suggesting a severe case of *goitre*, croaked out in no unmeasured or tuneless accents his entire disapproval of my presence at that particular spot, at least so early in the morning.

My reveries and observations of what was passing about me were suddenly disturbed by the music of the dogs in full cry upon a neighboring hill. How finely their voices sounded, as the melodious notes roused the echoes of the woods, and were carried from point to point until lost in the far distance. The hounds seemed to be coming directly for us, and I kept a sharp lookout upon the shores hoping to see the deer emerge from the woods to take refuge in the water; but suddenly the chase led away in another direction, and the chorus of the pack grew fainter and fainter, as they followed the deer around a distant mountain, and again all was still. Nearly two hours now had passed away, the sun had mounted high in the heavens, and his rays still powerful, although the time was October, were beginning to make me feel very like indulging in a nap, when I was aroused to full attention again by the faint, distant bark of a solitary hound, that seemed to be following a trail down the river that led out of the lake. "Aha!" I said to myself, "that looks promising, if it only is the gray buck at his tricks again. I'll try and check-mate him this time." The barking was heard at long intervals, as though the dog was much perplexed, and found the trail difficult to follow, as there was much marshy ground and water holes where he was working, and so for a considerable time he made no progress in my direction, and after listening to him for about half an hour I heard him no longer. I waited another half hour without hearing a sound, and as midday was approaching and I had already seen several of our party return to camp, I concluded I would give it up also, as the deer had evidently thrown off the dog. I got quietly into my boat and pulled towards camp. The bay in which I was contracted to a kind of narrows before widening into the main body of the lake, and I had nearly passed through this, keeping a sharp watch still on all the shores, when suddenly I saw above the water near the bank opposite to my stand of the morning, the head and horns of a large buck. The distance was too far for me to tell exactly which way he was going, but he had evidently not observed me, and was swimming at his ease. I at once stopped rowing, and sat quietly watching him, for I saw at a glance my only chance to head him off was to let him get well out in the lake, if it only pleased him to take that course. In a little while it was clearly evident that he was going straight across the bay, and so I drew gradually into the shore to get behind him.

I had nearly succeeded in this when he discovered me, and started at his best gait for the shore I had lately quit. It was now a mere question of speed. I was a long way behind him, and I gathered myself together for my work. The deer was swimming very fast, and I pulled with all my strength, the water flew from the bow of my boat, and by looking occasionally over my shoulder I saw I was holding my own, and then that I was surely gaining on him. He seemed to see it, too, for he redoubled his efforts, and fairly flew through the water. The distance between him and the shore was becoming alarmingly short, and at last I saw that I could not catch him before he struck bottom and must risk a shot. At the same time I noticed D. with his guide who, having seen the chase, had started in their boat, and were coming rapidly on to have a hand in the kill. Looking once more over my shoulder to get the proper direction, I pulled five or six strokes with all my might, dropped the oars, and seizing my rifle whirled around on the seat for the shot. I had gained a little by my last effort, but as I put the rifle to my shoulder, the exertion I had been compelled to make had so unsteadied me that for a moment the muzzle danced about like a moth near a candle, and I could not keep it pointed in the right direction. At last I held it quiet for a second and pulled. The bullet, as I afterwards found, struck him near the right ear, traversed the side of his face, and passed out near the nose. I hastily put in another cartridge (my boat being still under good headway), to give him another ball. On receiving my shot the buck wheeled directly around, and seeing me close to him charged the boat without hesitation. He struck the thwart with his horns, and tilted the light skiff so much that I expected certainly to be thrown into the lake. I grasped the oar (as shooting with any certainty in my half upset position was impossible) and struck him a violent blow over the head, which fortunately knocked him away from the boat, and as he started to come at me again I seized the rifle and shot him through the neck. On receiving this bullet he swam

for the shore, near to which in our struggles we had drifted, and wading out on to the bank he stood and tossed his head at me, evidently anxious to renew the fight. I now sighted for his shoulder, and on the bullet striking directly in the center, passing through to the other side, he fell over, and with a few convulsive struggles lay dead.

Just at this moment D. came up, having seen the whole affair. I was pretty nearly as much *hors du combat* as the buck, and on reaching the bank my first action was to drop on a log and investigate the contents of my flask, carried only for just such emergencies, and after I had consulted this companion I felt much relieved, and turned to have a look at my late antagonist. It was, sure enough, the old gray buck—gray as a badger, as had been said—with a good head of horns, not so heavy as those of the deer I had killed the night before, but still wide spread, with four prongs on a side, evenly distributed. He had been at his old game playing the dog in the river, and had eventually thrown him off; but it had taken him so long to accomplish this feat (for the hound was a first-rate one) that when he had reached the lake he evidently had intended to take it quietly and cross at his leisure, and his tactics came very near being again successful. D. proposed that the guide should put him into his boat and row him to camp, and he would pull me up, as I was nearly used up, so he said. But I replied that I meant to see the old gentleman home myself, having already had a little walk in his company, and if they would help me provide him with a seat in my boat we would go together up the lake. The deer was very large and heavy, did not stand high, being short-legged rather, but very large in girth. It was as much as we three could well manage to lift him into the boat, and before starting I suggested to D. that it would be appropriate for us to solemnize the decease of this ancient friend by some suitable ceremony, and as my flask was of no further use for the present to any one that I knew of, it would afford me much gratification to be able to admire the shape of his. He handed it to me without a smile, and having looked into it with a seriousness befitting the occasion, I returned it to him. He then looked into it, inverted it, shook his head, and with increased solemnity and a sigh motioned to his guide to proceed. Slowly we passed along to our camping ground, and as we drew near the landing place the rest of our party were seen gathered together waiting our arrival. The deer was lifted out and hung up beside the one shot the night before, which he fairly eclipsed in size. George walked gravely around him, examining him at all points, and at length broke the silence: "Zoophilus, my feather weight, there isn't any doubt about it, it's the same venerable gentleman that gave me the slip yesterday, and you have had the honor of killing the old gray buck."

ZOOPHILUS.

For Forest and Stream.

STILL HUNTING ON BIG SARASOTA.

I SLEPT on board the sloop that night, so as not to disturb any one by my early start. I was up and took a look at my watch once or twice during the night, and at half-past two, decided to make a start. On going on deck I found it to be a clear, starlight morning, with a light wind from the northeast. As the island, and especially the hunting-ground I proposed to try, runs nearly north and south, I decided to run down the bay three miles to where the mangroves divide Big from Little Sarasota bay, land there and hunt back with the wind in my face. Every deer hunter, of course, understands the importance of this, for deer are more easily alarmed by the scent than by the appearance of a man, and in still hunting especially, it is all important that they do not have the wind blowing from you to them. I was soon under way, and gliding along so quietly through the still water that, if one could not see the banks rapidly passing by, it would be hard to believe that any headway was being made.

I was at the mangroves, the apparent end of the bay, before four o'clock, and as it was only just beginning to be red in the east, and altogether too dark to see the sights on my Ballard, I sat down in one corner of the stern sheets to wait for more light, which came in due season, and I pulled ashore at an old landing just at the foot of an ancient live oak. A small field was cultivated just back from the landing in years gone by, but now the pathway to it was quite grown up with tall reeds and grass. I was wet through as high as my waist from the heavy dew, long before I got out into the open, but that was part of the play and expected.

To make the situation well understood, I will explain the lay of the land upon this island. On the side towards the mainland, is a strip of dense cedar and live oak hammock of varying width. This is excellent cover for game of all kinds. After passing through this hammock, one comes out upon an ancient sea beach, but it must have been ages and ages ago since it was washed by the waves of the Gulf, for just across this beach is another hammock, quite as old apparently as the first, and then still another beach, and then another hammock, until in some places as many as five pairs of beaches and hammocks can be counted. With the exception of some scanty bunches of grass, there is no vegetation upon the old beaches, but the hammocks are filled up so thick with fallen cedars and cabbage palmetto as to be almost impassable. Occasionally you come to a clump of rather stunted sea pine, which with the smooth green grass beneath them, and the lack of underbrush of any kind, give quite a fresh like appearance to the piny woods parts. The island is some six miles long, shaped much like an hour-glass, the narrow

place in the middle being less than a hundred yards wide, while one of the ends is over two miles, and the other about one and a half. The center would be a splendid place for a party to take a stand and have the island driven with dogs. The deer would be driven right over them, and it would be their own fault if there were not venison in the larder. There are many islands quite as well adapted as this for a drive, but driving is seldom resorted to as far south as this.

I worked my way across the little old field and through a low strip of dense brush out on the first beach and took a look about me. The sun had not yet risen, and the little light there was, made more indistinct by a foggy haze which hung about the thick bunches of cabbage trees. Not a breath of air was stirring, but as outside the wind was from the southward, I walked slowly in that direction. I had not taken ten steps on the old beach, when up from behind a bunch of coarse grass jumps a "cotton tail"; he does not run over two rods before he stops to take a look at this early morning disturber of his revels. I accepted his presence as a good omen, for the island used to be literally alive with them. I never yet hunted them at daybreak, without having from twelve to twenty scurry away from under my feet, and they were always as tame as this one—would stop and look back as soon as their first alarm was over. I never used to shoot at them for fear of frightening nobler game. As they seemed still to be plenty and tame, it rather augured that the island had not been hunted to excess. I picked my way cautiously along, striving to make as little noise as possible, but some how, the old shells would crunch under my feet louder than I could wish. I had kept on in this way three or four yards without seeing a thing, except another "cotton tail" and a cock partridge, who strutted away rather hurriedly into the thicket, when all at once a young fawn broke from the hammock on my right, and darting nearly across the open, stopped just outside of the hammock on the left, along which I was skirting. I halted at once, and squatted down as close to a sheltering bush as I could, almost instinctively. What a beautiful little creature it was! Its spots were still bright and plain, and what was better still, I saw at once by the way it kept gamboling about that I had not alarmed it, and the same gambols, together with its frequent and earnest glances towards the same break in the hammock from which it had just come, led me to believe it was not alone, but was now trying to induce its dam, and perhaps others, to join in a frolic on the open beach. I remained perfectly quiet, watching the innocent little creature, and, honestly, the thought of shooting it never entered my head; but, I did think, how delighted the children would be with it for a pet, if I could only capture it unharmed. I did not have many minutes to spend in admiring its sleek, spotted sides, when out from the same opening in the hammock stepped a noble looking doe, and close at her heels still another fawn. They were not over thirty-five steps away, and she stopped and looked square at me. There was nothing to obstruct her view, for I was only covered from the first fawn. I remained perfectly still, and she became apparently satisfied, for she walked half way across before stopping to take another look at me. This also seemed satisfactory. It seems a very curious trait in deer, and is often taken advantage of, for I have walked up to them for a distance of over 200 yards when out on the open prairie, where there was not a particle of cover, the grass having just been burned. It seems best to dress in dark clothing. When the deer's head is at the ground feeding, the animal invariably gives its tail a flourish an instant before the head is to be raised. When this signal catches your eye, halt instantly and make a statue of yourself. The deer may gaze at you very intently, and look very much alarmed at first, but if the wind is in your face, or rather from the deer to you, the chances are ten to one, that after looking at you for a minute or so, it will come to the conclusion you are a stump, give its tail another flourish, and begin feeding again. Then walk quietly towards it until the signal is given, and halt again for another inspection. In this way a deer can often be approached to within 50 yards, but it is seldom one has the nerve to get nearer than 75 yards, as feeling sure at that distance with a good rifle, what is the use of imperilling the whole thing by trying to get too close. If there are more than one deer, it requires more patience to stalk them in this way, and sometimes it cannot be done at all, as they may not all feed at the same instant, one being on the look-out. But although this may work very nicely on deer, don't try it upon turkeys. When they look up at you, no matter how you may be dressed, they will never take you for a black stump. They will take one hurried glance, and with cries of "quit, quit, quit," will quit your vicinity in a hurry.

After this doe had looked me over as much as suited her, she joined her fawns in their frolic, and what a time they had together upon the sand. Neither seemed to have an idea that they had a spectator, and in one of the rushes which one of the fawns made, it almost came upon my hiding place. I was hoping all the time that they might be joined by a buck, for I couldn't think of breaking up this happy family. I was not quite short enough of meat to break our rule about shooting does, and in the present case, of course, the meat would have been almost worthless. But no other deer joined them. It is true I could have spent the whole morning in watching their frolic, and have enjoyed it highly, but I had got up early that morning with the firm determination to kill a deer, so I couldn't waste more time here. It would not be quite prudent to frighten them, as they might give the alarm to others; so

I quietly withdrew a little way, and then slipped through the hammock on my left out to another old beach, and then passed by them. I passed from one beach to another, wherever there was an opening in the hammock, giving the beaches as careful a looking over as I could. I had proceeded this way for over two miles without a sight of game. I had seen several fresh tracks, but they all went straight across from one thicket to another, so that nothing could be done at trailing them.

At one place I saw the trail of a sow and five pigs, the latter, by the tracks, three months old. These, most probably are wild, as no one would be likely to put tame hogs on an island when the panthers are so plenty as they are here. On an island about a mile north, called Long Key, there is a fine breed, which were put there thirty years ago, and have never been attended to since. They are now perfectly wild, and have stocked the other islands adjoining.

I began to be rather discouraged at my want of success. The sun was now well up, though not in sight over the trees from where I was. Perhaps I may have regretted the fine notions I held two miles further back, about shooting fawns. But it was too late to mourn over wasted opportunities. I must keep on, and hardly had I made up my mind to stick by my principle about shooting does, and had become reconciled to take whatever goods the gods should see fit to send in my way, if any, or none at all, when, as I stepped rather carelessly from behind a stunted cedar, what should be right before me, within 40 yards, but three noble deer! My heart almost stopped beating with the surprise, but in an instant more, there was a clear case of palpitation. I was back again behind the cedar bush so quick, that it was a matter of instinct, and not of volition. I peered cautiously through the branches. I had not alarmed them, that was sure, and I took a minute to look them over. All three were bucks; one was an immense fellow. He seemed through my peep-hole, more like a two-year old beef than a deer. His head of horns was more than half grown. The other two were good sized deer certainly, with horns out a little longer than their ears; but they were almost dwarfed by the large one. It of course took but an instant to decide that I "wanted" the large one. I cautiously pushed my Ballard over a limb of the cedar, cocked it noiselessly, and tried to take aim. I couldn't do it. I couldn't see a sight on my rifle to save myself. I could see nothing but deer, deer, deer. They covered the whole expanse of my vision. I had as clear a case of "buck ague" as the veriest greenhorn. I was ashamed of myself. I, who had killed with a rifle 27 deer, have the buck ague now! It was preposterous. What if it was over seven years since, I had looked through the sights at such lordly game? I would not have believed it of myself, if it had been prophesied of me before starting. But it was too true, and the only redeeming feature about it was that I knew it, realized the condition I was in, and did not fire. I did not dare lower the hammer of my rifle for fear that, in my nervousness, it might slip from my thumb and explode the charge. I sat back quietly upon the ground and took a look around at things in general, just to divert my mind if I could, and give my blood a chance to cool down. In spite of everything, however, back my gaze would come again to those deer. The two smaller ones were at play. They did not seem to care to butt one another—horns were probably too tender—but they would charge up to one another with fierceness, until almost touching foreheads, and then draw back a few feet, shaking their heads and stamping the ground. The large one was evidently acting as referee; he was prancing around them, shaking his head and pawing the sand in fine style. I became interested in their antics in a moment. There was nothing ludicrous about the play of the fawns; they were too perfectly graceful; but these grown ones were very comical. Indeed, I fail to see anything very graceful about any of the movements of a grown deer, as to me they seem stiff-legged at any gait. As soon as I became interested in watching their movements, the "ague" began to disappear. I could look at other things also. Carefully keeping my finger away from the trigger, I tried if I could sight my rifle again. Yes, I could find the sights now, and carefully bringing them in range of a spot about two inches behind the fore shoulder, as he stood a little quartering from me, I pressed gently on the trigger. It was done. Before the smoke obscured my vision I saw him reel, and in an instant afterwards I heard him crashing among the dead cedars and cabbage palmetto leaves in the hammock to the right. I felt sure that he was my venison, for if I had missed, I should have heard him further away as he ran. As the smoke opened, there were the other two, standing in the same spot, and looking wildly about to see what all that sudden interruption meant. They evidently had not the slightest idea of my whereabouts, for they looked in every other direction. Could I get another? The old shell was out, and a new one in instantly. I felt that I was getting excited, but there was no help for it. The deer were getting very nervous, and were liable to make a break at any instant, and twenty feet to either side, could be out of my sight for ever. It must be done. I nerved myself for the effort. I tried to "brace up, and have some style about me," but I fear it was of no use. I almost know I had the "ague" again, and I quite know that when I fired, both those bucks bounded into the hammock, passed by where their comrade lay, and "away they flew, over the hills and far away."

I reloaded as I walked along, and was soon beside my noble lord of the island. And he was a lord, indeed, for

after disemboweling him and taking his head off, I pinned his legs together in the usual hunter style, and getting them over my shoulder I tried to lift him, but could not. I drew the carcass up beside a small oak tree, and tried again by holding to the tree with one hand. I made out to straighten up, but as for taking two steps with such a load, I couldn't do it. Perhaps recent illness had left me a little weak, and had I been in more robust health, I might have wrestled with it to some purpose; but it won't alter the fact that it was a very heavy deer. Not only was he large, but also very fat. It was full two hundred yards through a thick hammock to the nearest water. I disliked to leave my game and go home for help, so I set to work to drag him on the ground. It was hard work, but after an hour spent in tugging at my load, in cutting away vines and brush, I landed him at the waters edge, and started back to my first landing place for the sloop, intending to run up alongside in deep water until opposite my deer, and then go in with the skiff to bring him out. As I went back, I followed the trail of the other two bucks; they had taken back down the island on a beach, parallel to the one I found them on. I looked carefully for some sign of a wound, but no drop of blood was to be seen for the whole two miles. I followed them, and through the whole distance they broke their gate but once. About fifty yards, or a little less, from where the large one fell, they had stopped a little to wait for him, probably, but when I came through on that side they went on.

When I reached the sloop, I found the wind had got back into the S. W. for the day, and as this gave me a fair wind, I was soon off the place where my buck was lying. The tide was so high that I could run the skiff clear across the sand flat, quite up to the hammock where he lay, and I soon had him on board and on the way home. My success was appreciated, and I thought I had good reason for feeling proud, certainly, as long as I did not go into particulars very much about the "ague" or my second shot. We had no means of weighing the carcass, but every one said few grew larger down there. He had been under fire before, for just under the skin of one of his hams was a low mould spot, which he had evidently carried for several years.

MAJOR SARASOTA.

[To be continued.]

A CHAPTER ON MICHIGAN FISH AND FISHING.

ABOUT five years ago, the interior of the northern half of the lower peninsula of Michigan was penetrated by a railroad, leading from Saginaw northward, and since that time health-seekers and sportsmen have found it an easy matter to reach the plateau which lies between the two great lakes—Michigan and Huron. Once there, a more healthy region can nowhere be found. It was in September, 1872, that I first found the way into that place, by traveling upon the construction trains which passed and repassed over the track as suited the convenience of the contractors, who were grading and laying iron about midway between Saginaw and Mackinaw. With my nervous system shattered, with my stomach worn out, and in the hourly fear of paralysis and all its attending trains of evils, I took the advice of a sensible physician, threw "physic to the dogs," and inquired for a more healthful region than was the one I was in. The Encyclopedia told me of the highlands, out of which the Au Sable and other waters ran down to the lakes, and a friend told me about the railroad, and with my little boy as a companion, I sought out the country, and on the shores of St. Helen's lake shot ducks and "partridge," and recovered my lost health for three weeks. The time was not very long, it is true, but a growling Bar called me back to my daily routine of motions and demurrers, and since then, with an annual pilgrimage during the summer vacation to that region, I have been able to perform forty and two week's toilsome labor in the court-room each year, and to become stouter and stouter all the time. But I did not sit down to write to the readers of the FOREST AND STREAM so much about the health-giving influences of the country as about its game, although I can scarcely refrain from calling upon the tired brain-workers—those, in a word, who can say of themselves "the whole head is sick"—to procure tent, shot gun, and fish-hook, and go at once to the woods. I know something now of the great number of these invalids in every community—editors, lawyers, judges, preachers, teachers—for sympathy brought them to me, and I know, moreover, how prone they are to suffer and endure in silence, for of all diseases not the result of shame, one is least apt to publish a brain trouble. If all such would only go to the woods in some elevated region where the air was pure, and spend a few weeks in roughing it—in fishing and hunting for "meat" as well as sport—I believe those sad announcements which we so often see to the effect that so-and-so—editor, lawyer, doctor or preacher, as the case may be—"was stricken down this morning with paralysis, and no hopes are entertained of his recovery" would be seen much less frequently than they are now.

The lower peninsula of Michigan resembles a huge flat-iron about as much as anything else I can liken it to, with the point terminating at Mackinaw. In the interior the land rises to a height of from 600 to 700 feet above the level of the lakes; and the Thunder bay, the Au Sable, the Au Gres, the Muskegon, Manistee and other little rivers of Michigan, fret and foam their way down the sides of this plateau into one or the other of the two great lakes which lie upon either side of it. This highland was once covered by a thick growth of pine timber, but during the past

hundred years, as I imagine, millions of acres of it have been swept away by the fires, and to-day there are vast areas covered only by the bush pine, and sometimes not even that. The places denuded of the timber are known as "plains," but no plain is so ancient as not to contain an abundance of pine knots and other evidences of the formerly existing forest.

The entire region is dotted over with little lakes and ponds, and with the fish found in these, and also in the running streams, together with the deer and bear in the woods, I know of no more profitable sporting ground accessible to the western man. Some of these lakes are land-locked, having no apparent inlet or outlet, while others are the sources of streams which ultimately find their way to the great lakes. Most of them are irregular in outline, and nearly all have their greatest length from north to south, from which last circumstance the geologist might argue that the great force which ploughed out these lake basins was moving in a north and south direction.

The principal fish found in the lakes are the pickerel, the black bass, the rock bass and yellow perch. In the Muskegon, Manistee, Au Sable and Au Gres rivers, I know from report in part, and observation in part, that the grayling abounds, and from report worthy of belief, I conclude it may be found in other streams also, and so may the brook trout in the vicinity of the Grand Traverse region. A few little towns have sprung up along the railroad, and an occasional lumber camp may be found along the stream; but beyond these, the tourist may spend weeks in the woods and never come within sight of the smoke from the chimney of a Mossback's cabin, as the few denizens of these parts are called.

It is no exaggeration to say that the lakes, as well as the running streams, fairly swarm with fish, but in the vicinity of the towns the waters have been cleared of their living treasures with a rapidity that is truly astonishing. The inhabitants of course go to the "nearest lake," but the destructive work is done by the outsiders, who come in for a few day's sport, and with spoon and hook catch and kill from very wantonness. In 1873 I spent some four or five weeks at Bradford's lake, a beautiful sheet of water, lying some two and a half miles south of Otsego, which was alive with rock bass, weighing from a half pound up to two pounds. The railroad had been opened to that point a little over a year, and there was a constant stream of visitors coming and going throughout the season. Most of them went on to Otsego lake, but enough stopped at Bradford's to keep the waters disturbed all the time. My boat was convenient, and so was my landing place, and daily I had to go and bury from a peck to a bushel of fish. The poor things bit savagely, and the greenhorns who came with hook and line imagined they were fishing, and fairly took boat loads of them to let gasp and die and then throw away. The result was, that two years after it was rather slow work to take enough rock bass out of Bradford's lake for a supper.

A half mile to the east of Bradford's lake there was another—a small, deep lake, covering some forty or fifty acres—and which was known as Banta lake. This was land-locked, and it contained a large supply of black bass. There were no minnows in it, and I do not remember to have ever seen but one yellow perch. The bass fed principally upon the frogs, that were very numerous along the margin, but when a lively minnow was dropped in there was sure to be a lively scramble for it. During the season already mentioned, I fished almost daily in Banta lake, and I never failed in taking eight or ten bass that would weigh from two and a half to four and a half pounds. But others got at it also, and by the next year, fishing in Banta lake was unprofitable sport. The bass were all gone, and its waters were a solitude.

But back from the railroad a few miles the bass may yet be found swarming in the waters. Five miles east of Otsego lake there is a cluster of small sheets of water, known as the Chub lakes. Two of these are formed by the widening and deepening of Chub creek, and they lie the one above the other, being connected by a natural canal. I once pushed my boat through this canal, and at the outlet of the upper one there was a cordon of large bass lying in an arc at different depths in the clear blue water, with heads to the outlet, ready to pounce upon any unlucky chub or shiner that might venture within reach. I did not stop to count the hungry rascals, and cannot say how many there were, but it seemed to me at the time that there must have been fifty; I only know that I took seven in less than as many minutes, and wanted no more.

A few days after that I visited a lumber camp at no great distance from the Chub lakes, and was shown a barrel half full of cleaned bass salted down for future use, which the lumbermen told me they had caught in a neighboring lake "one day last week with a spoon." The supply in these lakes is truly amazing, and back from the railroad a few miles it will not soon be exhausted. Those who will wantonly destroy fish by wholesale will seldom find their way very far out into the woods, and for all the legitimate purposes of food and sport the supply is inexhaustible. Last August I visited a region up near the headwaters of the Thunder bay river. How many lakes there may be scattered throughout one or two townships up there I do not know. I was not hunting for lakes after the first one was found, but I remember to have run across eight within a very few miles' range from camp. The largest of these would cover some twelve square miles, the next some nine, and so on down to an eighty-acre tract. I fished in one only, and I had no trouble in taking a mess

of fish in a few minutes at almost any time or place. Pancake Jack, a trapper of Au Sable, who was with me, took pleasure in the spoon, and could take a dozen or two in a half-mile row at any hour of the day. We made no effort in any other one of the lakes, but from appearances there was not one that was not well stocked, and from a report which reached us from the Indians the two larger contain mascalonge. Now, these lakes were only about twenty miles from the railroad, but ours was doubtless the first visit ever made to them by a party bent purely upon sport. Other visitors will, of course, follow, but it is scarcely probable that in this magnificent piscatorial region the catch will ever exceed the natural increase. Pickerel may be found in all the lakes having open outlets and inlets, but never in the land-locked. These are taken altogether with the spoon, and from my stand point the spoon is suitable to pickerel fishing only. I see no more sport in taking a foolish bass with the spoon than there is in shooting a beef.

But of all the fish in Michigan the grayling is most sought for. There are few persons who visit that country that do not long to catch a grayling, but there are many whose longing is never gratified. Of the streams in which the grayling may be found I actually know nothing, save the Au Sable; but I think I do know just where the angler must go to get them in that stream. Those who would take the fish must stop off at Crawford or Grayling, the county seat of Crawford county, located at the crossing of the railroad over the Au Sable. The Manistee may be reached at a distance of seven miles to the west, and there is good fishing ground. The fisherman can take his choice, wagon over to the Manistee and wagon back, or float down the Au Sable and wagon back. If he chooses the latter he must run down some twelve or fifteen miles, and from thence down as the crow flies, a distance of fifteen or twenty miles (but as the river runs forty or fifty), he will find the grayling in the greatest abundance. The water is very swift and he must be careful or he will pass over the ground more rapidly than he wishes. There is always a hope of something better beyond that lures the angler, as well as others on, and lest he beware, the swift water and that beckoning hope will have carried him over before he is aware of it.

The grayling, taken all in all, is a strange fish. It is the most voracious of fishes and the most abstemious; it is the shyest biter and the most reckless; it is one thing to-day and another to-morrow; in the morning it will take nothing but the brown hackle, and at noon it leaps only for a living red-winged grasshopper, while in the evening perhaps it sees the white-winged moth that so neatly conceals the hook, but sees no other thing. It is a fish of seasons, days, hours, whims and caprices. In the spring it will take a bit of venison or even of fat pork, and there is no time that it will not occasionally nibble at a worm. Sometimes it will never take a minnow, and sometimes it will take nothing at all. In only one thing is it certain. If it leaps for your fly and misses, it is sure to leap again and again, two, three, and even four times. Isaac Walton says the English grayling will come at the fly "above twenty times," but while this Michigan congener is not that importunate he is still famous for his returning to the charge.

The Au Sable, within the limits I have indicated, is well stocked with the grayling. Within that limit the south and north branches discharge their waters into the main stream, and for several miles up these tributaries they may be found. As we float along over the clear waters grayling may be seen in favorable spots lining the bottom for quite a space. Sometimes they appear to be packed in like cobble stones, and they will lie quietly while the boat passes over. In such places none will be seen leaping for fly or moth, and it is useless to expect either a rise in such a place or a bite at the most tempting bait. When they feed they scatter and lie around the rocks and rapids.

The grayling is really a most beautiful fish, and when with its superb fins set it comes fluttering into a boat at the end of a line. I think it is the finest appearing fish I ever saw. It does not seem to possess the strength of many other fish, but there is a certain delicate touch of gaminess about it that can easily be felt if not described, and when once felt will never be forgotten.

The past season there was by all odds a greater rain-fall in Michigan than I ever knew before, and while there was but a light rise in the river, yet the water was perceptibly warmer than the year previous, and I presume warmer than for many years before. The effect was apparent upon the fish. While the grayling was a capital table fish this year it was plainly not so good as the year before when I ate my first ones, and I fancied that I could perceive that they had lost something of their game quality.

D. D. BANTA.

THE WINTER DRIFT TOWARD FLORIDA.—The St. Augustine Press is pleased to note the arrival there of winter guests. It says that on the 18th instant forty passengers arrived via St. John's Railway. Among them we notice the arrival of Dr. E. M. Alba, wife and son, of Williamsport, Pa.; Capt. E. E. Vaill, with a number of his hotel assistants, including Mr. Myrack, the steward, and his pioneer porter, "Ben," also arrived on the above day, and Mr. Hale and family, of Watch Hill, R. I. He is the proprietor of the largest and principal hotel of that summer resort, and is now here to make arrangements for the speedy opening of the Florida House, which will be conducted by Mr. Hale this season. H. Ammidown, Esq., and family, and Mr. H. P. Ammidown, Mr. James Burt, and Mr. J. W. Allen were among the arrivals.

Fish Culture.

CHINESE PISCICULTURE AND METHOD OF TRANSPORTING LIVING FISH.

* * * "OVER the whole of the enormous Empire of China, every ounce of the vast aggregate of their sewerage is utilized. Even the *detritus* of Macao, Hong Kong, and other European settlements, is purchased and transported by night to the mainland, in large boats and sampans. There is no waste surface here; the steepest hill and mountain side are brought under cultivation, and by terracing and the application of this best of manures, are made to yield bountifully. Chinese wheat yields one hundred and twenty-five fold the sowing. The

Province of Ho-nam is but one vast and beautiful garden; and "Flowery Kingdom" is not, as we suppose, only a fond, fanciful epithet—dictated by Chinese vanity—but a literal truth.

Here are towns where we have only settlements; cities where we have but hamlets; villages where we have but the virgin forest; in a word, Londons, Parises, and New Yorks, as thick as second-rate towns are with us; no such thing as any considerable tract of land not equally as

densely populated as are average square miles of our oldest States. And yet, nowhere, do we find anything like a sewerage system in our acceptance of the term. Most emphatically, with the Chinese, is "dirt only matter in the wrong place." This axiom, which we are but just beginning in a dim way to comprehend, they have understood, and practically applied since over three thousand

years ago; and it is by this that the prolific soil of this great, great-grandfather among nations, is kept as vigorous and youthful as when "the stars sang together, and all the sons of God shouted for joy."

Hence all their rivers, streams and brooklets, ran sparkling to the sea, throwing off no putrescent gases, no miasmatic exhalation, but glide as pure and pellucid as the dew that falls upon the eyelids of night, waking her into morning. As a consequence they swarm from mouth to source with countless varieties of wholesome food-fish,

which are at once the sustenance and luxury of millions, the staple of a vast internal trade, and also of an immense exchange of living fish—diverse species peculiar to the many climates contained within the boundaries of the enormous empire, its sea coast and interior. For pisciculture is self-suggesting, so to speak; a spontaneous outgrowth (under the conditions that result from this purifying system of sewerage) from agriculture, with which, indeed, it is almost so co-eval in Chinese history. Consequently, no other nation has carried the art to such perfection, or to anything comparable in extent, for here every agriculturist is also a pisciculturist—a thorough one, too—who utilizes all water within his proprietorship; even to the irrigating ditch before his door, which is also his highway to market through its ultimate connection with the rivers, or that vast canal system for which his country is famous. Sea-fish are carried far inland, while inland fish are transferred to the coast—"all alive, oh"; carried over thousands of miles of rivers, canals or lakes, by means of the simplest, most inexpensive, and yet most effective contrivance I have ever seen.

Our infant pisciculture of the West already promises a growth and expansion that must soon yield a product of such bulk and consideration as will render cheap and ready distribution a grand desideratum; and I therefore pause here to give a more detailed account of the exceedingly simple, but all effective means by which it is secured among the Foh-kee.

Two tubs—any size from a butt to a bucket, according to requirements—are so placed that the bottom of one overlaps the top of the under, being partly supported thereby, and partly by a trestle. Each contains a fish, and each is nearly two-thirds filled with water. This water never requires change, being constantly aerated by means of a contrivance which might be whittled out in five minutes by any school-boy with a jack-knife. Near the base of the upper tub a short section of bamboo of large diameter is inserted. Into this another, one size smaller, is introduced, first having had the surface of its inserting end gouged or fluted, so as to form channels on all sides for the egress of thin streams of water when fixed into its intended position. Into this is placed another still smaller, and fluted in the same manner; this in turn receives another, that still another, and so on, until sometimes six or eight joints are used, when the last one is plugged up. The result is, that the water rushes out at all these joints, and along these many "flutes," until, striking against the "butt" left where each channel ends, it is thrown off and up, in broad thin flanges, eventually falling back in a rattling shower of thoroughly aerated drops into the tub beneath. When this becomes over full (which occurs about every two hours with the larger ones) the surplus is returned to the upper tub by means of a hand pump, and in some cases through a basket hung upon the spout, though I have generally seen the coolies traveling in charge using a basket without the pumps. This "straining," however, does not seem indispensable, the jointed tubes being amply sufficient for thorough aeration; it is perhaps more for the sake of clearing the water from the impurities constantly accumulating from the atmosphere. Two attendants are sufficient to look after a dozen of these aquaria in the rough. At night they relieve each other every four hours—"watch and watch," as the seaman's phrase is. But little obvious modification and improvement upon the idea embodied herein, will perform this purpose for which it is designed in all the perfection possible to things human."

N. W. BECKWITH.

CALEDONIA HATCHING HOUSE—California Trout, Blue Backed Trout and Grayling.—Seth Green, Esq., informs us that there are now in the State ponds at Caledonia, some yearling hybrids—a cross between the brook trout and the California salmon. They do not look like either of the parent fish, but look more like the salmon. He says:—

"We have some two-year old grayling of our own hatching. Some of them are eight inches long. They live in a pond with some two-year old California brook trout, and with two-year old blue backed trout from Maine. They all agree very well. The California brook trout are a much more shy fish than our native trout. They are not as tame, but they are a much hardier fish, and are a great deal more easily raised, and I think would do well in many of our streams in this State. The blue-backed trout do not do well, and I do not think much of them as a fish to stock our lakes with."

SALMON BREEDING IN GASPE.—The Department of Marine and Fisheries has a salmon breeding establishment on the North Arm, at Gaspi Basin, under the superintendence of Mr. Philip Vibert, Jr., who we hear has been very successful in his collection of salmon ova, having no less than 900,000 safely housed, no less than 600,000 more than have yet been secured in any previous year. It is to be hoped the ultimate result will be equally successful.

—The Aquarium at the corner of Broadway and Thirty-fifth street, is being made more attractive each week by the addition of new specimens of marine plants and creatures; and with the delightful surroundings of flowers and music really affords one of the most charming resorts in the city taking rank with Gilmore's Garden in everything but size. Those who visit it for the first time wonder why they have so long delayed, and having once entered, repeatedly go again.

—Several of the lakes among the Adirondack mountains, including Blue Mountain lake, will be stocked with salmon trout this fall.

—A large number of black bass have been placed in the upper portion of the Alleghany river by the Pennsylvania Fish Commission.

Natural History.

ADDRESS OF A. R. WALLACE BEFORE THE BRITISH ASSOCIATION

ON SOME RELATIONS OF LIVING THINGS TO THEIR ENVIRONMENT.

Continued.

PERSONS who are not acquainted with the important structural differences that distinguish these various genera of butterflies can hardly realize the importance and significance of such facts as I have now detailed. It may be well, therefore, to illustrate them by supposing parallel cases to occur among the mammalia. We might have, for example, in Africa, the gnus, the elands, and the buffaloes, all colored and marked like zebras, stripe for stripe over the whole body exactly corresponding. So the hares, marmots and squirrels of Europe might be all red with black feet, while the corresponding species of Central Asia might be all yellow with black heads. In North America we might have raccoons, squirrels and opossums in parti-colored livery of white and black, so as exactly to resemble the skunk of the same country; while in South America they might be black with a yellow throat patch, so as to resemble with equal closeness the tayra of the Brazilian forests. Were such resemblances to occur in anything like the number and with the wonderful accuracy of imitation met with among the Lepidoptera, they would certainly attract universal attention among naturalists, and would lead to the exhaustive study of the influence of local causes in producing such startling results.

One somewhat similar case does indeed occur among the mammalia, two singular African animals, the Aard-wolf (*Proteles*) and the hyæna dog (*Lycaon*), both strikingly resembling hyænas in their general form, as well as in their spotted markings. Belonging as they all do to the carnivora, though to three distinct families, it seems quite an analogous case to those we have imagined; but as the Aard-wolf and the hyæna dog are both weak animals compared with the hyæna, the resemblance may be useful, and in that case would come under the head of mimicry. This seems the more probable because, as a rule, the colors of the mammalia are protective, and are too little varied to allow of the influence of local causes producing any well-marked effects.

When we come to the birds, however, the case is different; for although they do not exhibit such distinct marks of the influence of locality as do butterflies—probably because the causes which determine color are in their cases more complex—yet there are distinct indications of some effect of the kind, and we must devote some little time to their consideration. One of the most curious cases is that of the parrots of the West Indian Islands and Central America, several of which have white heads or foreheads, occurring in two distinct genera, while none of the more numerous parrots of South America are so colored. In the small island of Dominica we have a very large and richly colored parrot, corresponding to a large and richly colored butterfly of Jamaica. Similar examples are to be drawn from the fauna of the Andaman Islands, the Philippines, and other islands of the West Pacific.

We cannot, however, lay any stress on isolated examples of white colors, since these occur in most of the great continents; but where we find a series of species of distinct genera, all differing from their continental allies in whiter coloration, as in the Andaman Islands and the West Indies, and among butterflies in the smaller Moluccas, the Andamans and Madagascar, we cannot avoid the conclusion that in these insular localities some general cause is at work.

There are other cases, however, in which local influences seem to favor the production or preservation of intense crimson or a very dark coloration. Thus in the Moluccas and New Guinea alone we have bright red parrots belonging to two distinct families, and which therefore most probably have been independently produced or preserved by some common cause. Here, too, and in Australia we have black parrots and pigeons; and it is a most curious and suggestive fact that in another insular sub-region—that of Madagascar and the Mascarene Islands—these same colors reappear in the same two groups.

Some very curious physiological facts bearing upon the presence or absence of white colors in the higher animals have lately been adduced by Dr. Ogle. It has been found that a colored or dark pigment in the olfactory region of the nostrils is essential to perfect smell, and this pigment is rarely deficient except when the whole animal is purely white. In these cases the creature is almost without smell or taste. This, Dr. Ogle believes, explains the curious case of the pigs in Virginia adduced by Mr. Darwin, white pigs being poisoned by a poisonous root which does not affect black pigs. Mr. Darwin imputed this to constitutional difference accompanying the dark color, which rendered what was poisonous to the white-colored animal quite innocuous to the black. Dr. Ogle, however, observes that there is no proof that the black pigs eat the root, and he believes the more probable explanation to be that it is distasteful to them, while the white pigs, being deficient in smell and taste, eat it and are killed. Analogous facts occur in several distinct families. White sheep are killed in the Tarentine by eating *Hypericum criscum*, while black sheep escape; white rhinoceros are said to perish from eating *Euphorbia candelabrum*, and white horses are said to suffer from poisonous food where colored ones escape. Now it

is very improbable that a constitutional immunity from poisoning by so many distinct plants should in the case of such widely different animals be always correlated with the same difference of color; but the facts are readily understood if the senses of smell and taste are dependent on the presence of a pigment which is deficient in wholly white animals. The explanation has, however, been carried a step further by experiments showing that the absorption of odor by dead matter, such as clothing, is greatly affected by color, black being the most powerful absorbent, then blue, red, yellow, and lastly white. We have here a physical cause for the sense-inferiority of totally white animals which may account for their rarity in nature. For few, if any, wild animals are wholly white; the head, the face, or at least the muzzle or the nose are generally black. The ears and eyes are also often black, and there is reason to believe that dark pigment is essential to good hearing as it certainly is to perfect vision. We can therefore understand why white cats with blue eyes are so often deaf—a peculiarity we notice more readily than their deficiency of smell or taste.

If, then, the prevalence of white coloration is generally accompanied with some deficiency in the acuteness of the most important senses, the color becomes doubly dangerous, for it not only renders its possessor more conspicuous to its enemies, but at the same time makes it less ready in detecting the presence of danger. Hence, perhaps, the reason why white appears more frequently in islands where competition is less severe and enemies less numerous and varied. Hence, also, a reason why albinism, although frequently occurring in captivity, never maintains itself in a wild state, while melanism does. The peculiarity of some islands in having all their inhabitants of dusky colors—as the Galapagos—may also perhaps be explained on the same principles, for poisonous fruits or seeds may there abound which weed out all white or light-colored varieties, owing to their deficiency of smell and taste. We can hardly believe, however, that this would apply to white colored butterflies, and this may be the reason why the effect of an insular habitat is more marked in these insects than in birds or mammals. But though inapplicable to the lower animals this curious relation of sense-acuteness with colors may have had some influence in the development of the higher human races. If light tints of the skin were generally accompanied by some deficiency in the sense of smell, hearing and vision, the white could never compete with the darker races, so long as man was in a very low or savage condition, and wholly dependent for existence on the acuteness of his senses. But as the mental faculties become more fully developed, and more important to his welfare than mere sense acuteness, the lighter tints of skin and hair and eyes would cease to be disadvantageous whenever they were accompanied by superior brain-power. Such variations would then be preserved; and thus may have arisen the Xanthochroic race of mankind, in which we find a high development of intellect accompanied by a slight deficiency in the acuteness of the senses as compared with the darker forms.

[To be continued.]

THE BASS OF NEW YORK WATERS.

We have received from a correspondent at Glen's Falls, N. Y., the following very intelligent article on the varieties of bass found in New York waters. We have seldom read an article that groups together so many interesting and trustworthy statements, bearing upon the habits, classification, and nomenclature of the species:—

In FOREST AND STREAM, October 12th, Seth Green is made to say, "there are two kinds of black bass—marsh and river black bass. The latter is also known as Oswego or lake bass, and is much the livelier and sharper fish of the two." If he had left out "known also as Oswego or lake bass," I should not have been all at sea as I now am; and, further, I should have said that "Seth Green told me that the bass in Lake George were Oswego bass, which I have always maintained, although they are frequently called black bass by local fishermen. The bass in the Hudson are called (properly, I supposed), black bass. When hooked, the first move is into the air, and it is continued, more or less, principally more, until the struggle ends in the death or escape of the fish. They are not so deep through the body as the lake bass, and when first caught have three or four dusky bars across the sides, although I have failed to see the carmine dot in the eye that Genio C. Scott speaks of. The first fishing for this bass in the spring or summer, is done on the "riffs" or rapids; from thence they work down to the foot of rough water, and later, as the weather is warmer, to the eddies and pools. These bass are said to have come from Efer lake, a small sheet of water seven or eight miles up the Sacandaga river, from its mouth or juncture with the Hudson at Luzerne. If this is true, they have changed much since their advent into swift water, as the Efer bass are very like what I call Oswego or lake bass. As regards size, Col. Jeptha Garrard, his brother, Gen. Garrard, and myself, were fishing in the Hudson river, near Luzerne, when the Colonel caught, on a fly, a bass weighing three pounds. The next year I caught one weighing a little over four and a half pounds. These are the largest river bass of which I have any knowledge.

The Lake George bass almost always when hooked go deeper, and my experience is, rarely appear above water until they near the boat or landing net, always excepting when you troll. In both instances, as regards the practice of the two fish when hooked, I refer to deep water fishing, for both will jump from the water after taking spoon or fly, the river bass, however, does so more than the other. As to size, the largest bass taken in Lake George, to my knowledge, was caught, I believe, by F. E. Ranger (your correspondent Fritz), and weighed seven pounds four ounces. Long Pond, about four miles from this place, was stocked in 1866 by having 13 small Lake George bass placed in its waters. During the summer just passed, there

was caught in this pond one bass weighing seven pounds ten ounces, besides several of about six and one half pounds. The river bass, too, is much the more fastidious as to its menu, and will one day prefer frogs to a fly, spoon, crawfish, minnow, grasshopper or dobson (local for Hellgramite), although in spring, I think, he inclines rather more to the last named, while the next day he turns up his lips at frogs, and says minnows or nothing. When fishing for river bass, I take all kinds of bait to be prepared, and often times find that there is still another bait he wishes on that particular day.

The lake bass will bite live bait (small fish); put on a yellow perch if you want large ones; he rather prefers black crickets to grasshoppers, but will bite either, day after day.

—In a recent publication Mr. Milligan gives a description of an interesting vine which resembles in many respects the carnivorous plants about which so much has recently been written. As this vine can easily be obtained of nursery men, it is to be hoped that ere long some careful observations may be made on its habits, and the results published. Mr. M. says: "Physianthus Alpinus is a curious and handsome vine, good for out-door decoration, where the Madeira vine will flourish. It is a native of California, of vigorous habit, growing in length from 15 to 20 feet in a season. Its flowers are white, fragrant, and about three-fourths of an inch across. It belongs to the Asclepiads, and, like some other members of this family, its flowers are so constructed that insects are caught by them. Around the central organs of the flower are arranged five trap-like processes, alternating with the five pairs of anther cells. These traps are formed of two parallel triangular pieces, approaching each other closely at the angle next the center of the flowers, and spreading apart slightly at their outer extremities. In the crevice thus formed the tongues of butterflies, and the legs and antennæ of ants are caught, the insects being attracted by the honey secreted on the inner surfaces of the trap. It is not uncommon to find as many as nine insects caught in a single flower, and occasionally three may be found in one trap. The object of this seemingly cruel arrangement in the flowers of the Physianthus is not well understood. Apparently there is no action of the plant in the matter. The insects are caught simply by their awkward manner of retreating from their honey feast. They get into the narrow part of the opening, and, finding themselves held, they struggle frantically toward the upper central part of the flowers, wedging themselves in more tightly with every motion in that direction. If fertilization is the object it is but very imperfectly attained by this method, as the pollen masses are seldom disengaged from their cells by the struggles of the insects. Food is evidently not the object, as the flowers wither and fall with the insects in them unappropriated, and if at any time before death the flowers are torn apart and the insect freed, they appear lively and uninjured. The Physianthus is not commonly cultivated."

"Piseco" sends from Little Falls, N. Y., a photograph of a female grouse, by Wm. H. Abbott, with the accompanying note:—

DEAR MR. EDITOR:—Please accept the inclosed little birdie, which foolishly abandoned the forest, and without ceremony dashed through a closed window in the Lyceum of this village. The finder's taste was not as good as that of the bird, for he cooked the latter, although it was but slightly injured by its misadventure. If you deem him worthy of a place in your paper admit him. L. A. B.

THE SHORT-EARED OWL.

EDITOR OF FOREST AND STREAM:—

We left Streator about 11 p. m. to have an evening with the water-fowl, on a marsh about three miles from town. The flight of ducks was by no means encouraging on account of the quietness of the weather. While musing behind my blind of bullrushes, and between dusk and, I observed in the faint moonlight a good sized bird approaching our hiding place, coming along over the marsh steadily but noiselessly. Having had but little recreation I brought this stranger to the sod.

On examination I found it to be a fine adult specimen of the *Strix brachyotos*, or short-eared owl, a bird of considerable rarity in the United States, though common in the far countries.

The length of this specimen was 15 inches; wing, 13½; plumage of a light amber cast, streaked with deep brown; tail feathers dark brown, transversely barred and tipped with reddish buff; general plumage same throughout. But the most striking peculiarity of this bird was its ear. Everything seems to have been sacrificed in the creation of this singular bird, in order to develop as much ear as could be crowded on a small head, for this bird runs to ear as much as a toad fish runs to mouth, and, literally speaking, the whole side of the head is laid open, seemingly for the purpose of detecting the faintest motion of a meadow mouse, or whatever else it may seek during the quiet hours of departing day. I think when Linn, Wilson, Audubon, et al., called this bird the short-eared owl they paid more respect to its exterior than to its anatomical peculiarities. To the student who pays but casual attention to the classification of birds, with an occasional eye to their form, the first impression is that a couple of extravagantly developed ears, with a small owl behind them.

THOMAS H. HOWELL.

Streator, Ill., November 1st, 1876.

THE SNOWY OWLS.

BOSTON, November 18th.

MESSRS. EDITORS:—We here, for the last two weeks, have seen such great numbers of the large white owl shot, that it reminds us of the like occurrence about ten years ago. At one taxidermist to-day, there were 30 fine specimens killed within a radius of 20 miles of Boston, in a few days' past; at another, 26 more like individuals. What causes this bird to come so near the city, and even enter the very heart of it, and quietly perch on houses, window sills, etc., in some cases, is a mystery, and causes much remark? CAU.

HOW EELS LIVE.—The eels travel up stream in the spring, and return down to the salt water in the fall, always going in large schools. There are a great many pe-

cularities connected with the eel that but few persons know of. For instance, there are some eight or ten kinds of them, of which several never enter into fresh water. Some of the varieties are, when full grown, ten or twelve feet in length, weighing one hundred pounds. The kind here, the common fresh and salt water eel, is usually from twelve to twenty inches in length. Eels, it has been proved, have both sexes in one, and spawn somewhat after the manner of other fish. Like the turtle, they can travel out of water for some distance, from stream to stream, so that in almost every rivulet, however small, they can be found. The gills, or breathing organs, are covered up by a most delicate curtain, which acts like a valve and a reservoir for water, thus enabling the fish to take in a quantity of water, so to speak, to keep its gills moist during the time it is out of the stream. It has a heart in its tail, the same as is known to exist in the salmon, with pulsations at about ninety-four to the minute.—*Pacific Life*.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDENS NOV. 23D.—One robin (*Turdus migratorius*), presented by Mr. Lewis W. Maxey, Philadelphia. One American barn owl (*Strix flammea*), and one badger (*Taxidea americana*), purchased. One barred owl (*Syrnium nebulosum*), presented by John Krider, Philadelphia. One mottled owl (*Scops asio*), presented by Mrs. Stewart, Philadelphia. One snowy owl (*Nyctea nivea*), presented by David Landreth & Sons, Philadelphia. One green monkey (*Cercopithecus callitrichus*), presented by Alex. Cattell, Jr., Philadelphia. One Spanish cock and hen, presented by A. B. Goodyear, Philadelphia. ARTHUR E. BROWN, General Superintendent

Woodland, Farm and Garden.

WINTER FLOWERING BULBS.

AMONG the many plants grown for the window garden, a few are held in higher estimation, or are better adapted to the requirements of amateurs, than the different kinds of bulbs that can be had in bloom during the winter and early spring months. They are easily managed, and are especially well adapted for blooming in rooms by those who have no green-house accommodation. All bulbs for winter decoration should be procured without delay, as the time has now arrived when all roots of this description should be in the soil. Hyacinths, Narcissus, Tulips, Crocuses, Snowdrops, and the beautiful blue Siberian Scillas, are all well adapted for growing in this way. They all require to be grown in pots, except Hyacinths, and although these look well in glasses, yet beginners had better restrain their practice for a time to pot culture. As nearly all depends upon the strength stored up in the bulb, compact heavy bulbs, rather than large ones, should be selected, many of the best varieties having much smaller bulbs than other varieties of not so much value. Many imagine that double flowers are superior to single ones; even the term seems to imply superiority. Such, however, in many cases, is far from correct, and, in the Hyacinth especially, the single varieties are by far the most desirable, both as regards color, size of spike, and general appearance. Pots five inches in diameter are large enough to grow one well. The soil should be moderately open and porous, and enriched with some well rotted manure. All bulbs flower better and stronger, if when potted, they are placed in a frame or cellar, and covered about four inches deep with sand or soil, thus enabling the bulb to get well rooted before the bud starts into growth. In from four to six weeks they will be ready for removal, and should be placed for a few days where only a limited amount of light can reach the young top, as, if suddenly and fully exposed to its influence, the leaves would not develop fully, and the plants be much injured both in appearance and bloom. Nothing is better for this purpose than a smaller pot inverted over the bulb, the light admitted through the hole in the bottom being sufficient to impart the natural green hue to the leaves. When placed in the window they must be liberally supplied with water, and turned regularly to the light. For Hyacinths and Narcissus a five inch pot is sufficient; three to five Tulips can be grown in the same sized pot, and from six to ten Snowdrops, Crocuses or Scillas. When done flowering in the spring the different sorts may be planted in groups in the open border, where they will continue to bloom each succeeding year; but for pot culture fresh bulb should be procured every autumn, as from the genial soil and climate in which they have been grown, and the special cultivation which they have received, imported roots flower much better than those grown in this country, and which have been subjected to the ordinary treatment we usually give such plants.

W. J. D.

PRESERVATION OF LAWNS.—Next in importance to sound walks is a level, well-managed green sward; not level in the strict sense of the word, but without hills and holes, or other irregularities that cause such a disfigurement, and are so offensive to the eye. Where such imperfections exist it is now a good time to rectify them, as the rain we have had has softened the ground, and will greatly facilitate the cutting of the sods necessary to obliterate the irregularities of the surface. All weeds, such as plantains, dandelions, crowfoots, and others of a kindred nature, are sure to show themselves after an abundance of rain, and attention should at once be turned to eradicate them, that their places may be occupied by natural grasses. It is only by an incessant war with them that a rich velvety turf can be secured. After such a dry spell, the worms are sure to force their way to the surface, and to save annoyance in future, it is a good plan to give them a dose or two of lime water, which will quickly bring them out, when they can be easily destroyed, and the lawn being afterwards well rolled, it will not only add to its present appearance, but greatly improve the texture and quality of the grass. The application of the lime water should be made imme-

diately after heavy rains, when the worms are near the surface, as it then reaches them at once, and a less quantity suffices than when they are lower down in the soil.

—We see by *The Garden*, that the Pampas Grass has flowered most luxuriantly in England this season, probably owing to the extraordinary hot, dry season: a correspondent says: "Travelers cannot fail to notice how beautiful the pampas grass is in the neighborhood of Reading (Berks). Just within the entrance to Messrs. Sutton's grounds, bordering the road on either side, run lines of this grass in large tussocks, each carrying apparently about fifty spikes of beautiful silvery inflorescence. Seen in this way the effect is greatly superior to that produced by a single plant. Charming as that is when in full beauty, within the inner grounds many later flowering plants of this grass are just pushing up their spikes. That there is a difference as regards the blooming period among varieties of Pampas grass has long been imagined, and that fact would seem to be very clearly established in the case under notice."

[What a beautiful grass this is: see the florists' or seedsmen's windows full of lovely plumes, grown in Santa Barbara county, California, and then imagine a row of plants as described above.—Ed.]

PLANTING AND CARE OF TREES.—The following condensed rules are given by F. K. Phoenix, of Bloomington, Ill.:

"Most planters are so careless! Friends, if you want trees to thrive, plant early; in dry deeply plowed ground. Keep roots from the sun, air and frost, burying in the ground again as soon as possible. If shriveled, bury the tops and all in moist ground for ten days. Thin out and shorten in tops before planting, to balance the loss of roots in digging. Dig large holes, three feet across and two feet deep, or better still, plow out a very deep furrow, filling up with the best soil, so that trees shall stand only as deep as in the nursery. Straighten out all roots in natural order, fill it with best, fine, moist earth, and then tread down thoroughly, watering well if dry, before filling up. Then mulch—that is cover the earth two feet each way from stems with coarse manure or straw six inches deep. Always put corn or some hoed crop, never grass or grain among young trees. All trees and plants in grassy yards, and dwarf trees also, must have special care. Wash bodies of apple trees in spring with strong soap suds. Kill off the caterpillars and leaf rollers. Let fruit trees head low—within three or four feet of the ground, and evergreens to the ground. Let everybody plant trees and take care of them!"

—An enterprising Californian, who four years ago planted 1,000 acres in walnuts and almonds, will net over \$250,000 from this year's crop.

[The inhabitants of the Blue Ridge, in North Carolina, Tennessee and Virginia, have a valuable source of revenue in the great crops of walnuts that grow at their very doors and are seldom gathered. We have seen bushels lying under a single tree which would bring at least \$2 cash in this market.]

FLOWERING HYACINTHS IN MOSS.—Most of our readers who have cultivated Hyacinths and other Dutch bulbs, know how to manage them when grown in ordinary soil in pots, or in glasses in water, but few are aware that they can be grown better in moss (*Sphagnum*), than in either. This moss is found in many of our swamps, and is largely used by florists and nurserymen for packing plants to send to a distance by mail or otherwise. Its light sponge-like qualities are such as the roots of Hyacinths and other bulbs delight to revel in, and in which they grow luxuriantly. The moss may be either used to fill pots, window-boxes, or wire, or other baskets. A wire basket in which four or five different varieties of Hyacinths are planted, presents a very attractive appearance when suspended in a window or other part of the room. In filling the moss into the pots, boxes, or baskets, it should be pressed moderately firm, and the Hyacinths planted with one-third of their thickness above the surface. After planting, the moss should be watered sufficiently to thoroughly saturate it, and after the surplus water has run off, the baskets or other receptacles are to be placed away in some dark cool place, such as a cellar, or dark closet, where the temperature does not exceed 50°. In five or six weeks after planting, the moss will be found to be filled with roots, and the bulbs may then be taken from their dark quarters into the light; and if kept in a temperature of 60° or 70°, they will flower abundantly in three or four weeks after; the moss must be kept moist at all times. The flowers of the Hyacinths will be greatly increased in size and brightness of coloring, if they are watered with guano water once a week. This should be very weak; one pound of guano to 15 or 20 gallons of water, or a pound of sulphate of ammonia may be used instead of the guano, in the same quantity of water. The advantage of using moss for Hyacinths, etc., is in its lightness and cleanliness in handling. The wire baskets, especially when filled with moss, present a much more pleasing appearance than they would if filled with soil. The bulbs may be planted from October to January, and by planting at intervals of two or three weeks, a succession of bloom may be had from January to May.—*Peter Henderson, in American Agriculturist*.

—The preparation of Linden Bark for matting and other purposes forms quite an important branch of Russian industry, more especially in the governments of Wiotka, Kostroma, Kasan, and Nischni-Novgorod. A large amount, observes the *English Mechanic*, is exported to England and Germany; and some of the inland uses to which the material is put are grain sacks, box covers, wagon-covers, carpets, selves, sails for canal boats, shoes. In May and June, when the flow of sap facilitates the separation of the bark, the peasants repair, with wives and children, to the forest. The lower part of the bark is generally prepared for roofing purposes, being heated and pressed into the form of plates. That of the upper stem and the branches is bound in bundles and put in water, where it is left till September. Then it is dried in heat, divided into thin bands, and woven into mats of various strength, weighing from 1 to 3 kilogrammes. The strongest of them are sold in Nischni-Novgorod at about 120 fr. the 100. The yearly

production of mats is estimated at 14,000,000, representing a value of 8,000,000 fr. Adding other articles manufactured from Linden bark, we have a sum of 12,000,000 fr. For this no fewer than 1,000,000 Linden trees are hewn annually, a fact rather unpromising for Russian forests.—*Gardener's Chronicle, London*.

ASHES.—Many farmers have no convenient place in which to store their ashes, and consequently they put them in barrels out of doors. Too often these are left uncovered, or the covers blow off, leaving the ashes exposed to the damaging influence of rain and dew. Evidently they do not realize the great value which ashes possess as a fertilizing agent. If they did they would apply them to their crops. If a man has a good place in which to put them, one in which they cannot be injured by rain, and in which there is no danger from fire, it is well enough to let a year's stock accumulate and then apply them in the spring. This, however, in case part of them are not needed for crops in the summer. Some of our readers who have ashes which they think they ought to dispose of in order to prevent loss, may here inquire to what special crops they should be applied at this season of the year. We reply that for onions, ashes are among the very best of fertilizers. Applied to Indian corn, a handful to each hill, immediately before the crop is hoed, they give good returns. They are also very good for vines in the garden. In moist seasons the application of ashes to grass land immediately after the first crop of hay has been removed, has a very fine effect. There are ways enough in which all the ashes that are made can be profitably used on the farm and they certainly ought to be saved and used to the best possible advantage.—*N. E. Homestead*.

THE USE OF FALLEN LEAVES.—In the *Gardener's Monthly*, Mr. Meehan says: "These have to be gathered up. They are excellent to mix with hot-bed material, and, where practicable, should be saved for this purpose. They do not heat so rapidly as stable manure, and in this have the advantage as tempering its violence, making it last longer, and maintaining a more regular heat. They are excellent material to put round cold frames to protect half-hardy plants. A board is put up the height of the frame boards, and about a foot or more from them, and the leaves filled in between. If the plants are somewhat tender, the bottom of the frames may be filled in a few feet with the leaves. Much heat is thrown off during the decomposition of the leaves, which, though not enough to keep out severe frost, yet modifies somewhat the temperature. These leaves after they have been two or three years decaying, make admirable stuff for potting and flowers in general."

POULTRY.—Our domestic animals derived as they are from wild ancestors, require a certain amount of exercise to keep them in sound and vigorous health. Poultry cannot be kept in large numbers in confined areas without detriment to their constitution. Col. Taggart of Pennsylvania provides food and exercise for his fowls at the same time. The editor found in his poultry yard several beds about thirty feet square each, in which Col. Taggart buries oats, several bushels to the bed. The grains begin of course at once to swell and germinate, and the fowls have free access, scratching and eating the tender sprouts to their heart's content. While the fowls are thus busy on one bed, a new one is prepared, which is in readiness for them by the time it is required. The idea is a good one, and we are glad to call attention to it. In our own yards we have found the benefit of it, and we are glad to learn that we are not alone in the practice.—*Fancier's Journal*.

—How little we think of the prodigious activity manifested in the Growth of Plants during a few weeks. The process is gradual and noiseless, moreover it is of everyday occurrence, and hence is disregarded. How much water must be absorbed and exhaled, how much air inhaled and exhaled, how much carbon fixed during the process? Here, by way of illustration of our remarks, are some measurements of an ordinary plant of *Abies Nordmanniana*, which we took a day or two since. The shrub is only 2 feet 6 inches in height, the number of young shoots of this year's growth upon it is 585; the shoots vary in length from half an inch to 6 inches, their aggregate length is 1171 inches, or nearly 98 feet. Dividing the aggregate length of the shoots (1171 inches), by their number (585), we find the mean length of the shoots to be about 2 inches. The average number of leaves on each inch of a number of shoots taken at random was 34, so that the total number of leaves on these 585 shoots may be set down at 39,814. Assuming each leaf to be only one inch in length, which is considerably under the mark, even when all the small undeveloped leaves are taken into consideration, we should have for the leaves a length of about 3,501 feet. In round numbers, we may say that, including the shoots and leaves, the growth in length alone of this very moderate-sized young tree, during this season, has amounted to the prodigious number of 3,600 feet; so that if the shoots of the year and the leaves could all be placed end to end in a continuous line they would occupy considerably more than half a mile!—*Gardener's Chronicle, London*.

—What is described as an "International potato exhibition, for the encouragement of the best methods of potato culture and diffusion of improved varieties," was recently opened at the Alexandria Palace, in London. It is stated that there were over twenty-two hundred dishes of potatoes exhibited and they covered six long tables in the concert hall of the building.

"HANS VON PELTON'S TRIP TO GOTHAM."—We have just received a pamphlet of 64 pages under the above title, by Palmer Cox, issued by the New York Printing Establishment. It is very comically illustrated on every page, and divided into five cantos. Price, 25 cents. Considering the many mishaps Hans fell into while on his trip, we are glad to learn that he arrived safe home at last to his good frow, and again "Smoked his meerschaum, drank his beer" in peace.

—Cane grindings are now in order in Florida, and during the next few weeks sugar will be abundant, and Florida syrup and slap jacks will tickle the palate of the tourist.

—Daniel Edgar, Esq., has sold his yacht "Arrow," of the New York Yacht Club fleet, to Ross Winans, of Baltimore for \$9,000.

—The yacht Atlanta, of the New York Yacht Squadron, with Wm. B. Astor and a party of friends on board, grounded on Hampton Bar on Tuesday, was hauled off by Baker's wrecking steamer and taken to Norfolk for repairs.

NEW ENGLAND ROWING ASSOCIATION.—On the 25th inst., pursuant to a call, delegates from Brown, Dartmouth, and Trinity Colleges, assembled at Worcester, Mass., and organized a new rowing association, to be known as the New England College Rowing Association. The call was signed by Bowdoin also, but her delegates failed to put in an appearance.

The delegates present were E. C. Carrigan and Nathaniel Niles, of Dartmouth; S. W. Nickerson H. F. Lippitt, of Brown, Sidney D. Hooker and E. D. Appleton, of Trinity.

A temporary organization was effected by the nomination of Mr. Lippitt, of Brown, as President, and Sidney D. Hooker, of Trinity, Secretary *pro tem*. The Committee reported in favor of the old constitution, with such amendments as may be suggested.

Subsequently E. C. Carrigan was chosen permanent President of the Association; Nickerson, of Brown, Vice-President; Sidney D. Hooker, of Trinity, Secretary; A. C. Crocker, of Bowdoin, Treasurer.

It was moved by Mr. Appleton that the Regatta Committee have the power to appoint the time for holding the regatta of 1876, and to notify the colleges six weeks before the selected day.

It was decided to hold the regatta at New London, and that the race should be for fours without coxswain. Messrs. S. W. McCall, of Dartmouth; Hooker, of Trinity; and such person as Bowdoin might select were appointed a Regatta Committee, with the latter as Treasurer. The constitution and by-laws as adopted, are very nearly the same as those of the Rowing Association of American Colleges. One material change was effected. Article second, section second, now reads: Any college boat club or navy desiring to be represented in this Association, shall present to the Society at least ten days previous to the annual meeting of the Association, a written official notice to that effect. But during the first year, any New England college boat club or navy desiring it may be admitted to the Association by a two-thirds vote of the Regatta Committee, providing said notice is officially made to the Regatta Committee at least thirty days prior to the annual regatta.

The following letter, received from Harvard, was read. It shows the position of the crimson, and promises much:

HARVARD UNIVERSITY BOAT CLUB,
CAMBRIDGE, MASS., Nov. 21, 1876.

To the Secretary of the New England Rowing Association:

Dear Sir:—Owing to the fact that we are compelled to row a race with Yale this year, and also that we could not row two races on account of the expense, we find it impossible to join the New England Association. Wishing you, in behalf of our Boat Club, every success in your project, I remain,
Very truly yours,
ARTHUR M. SHERWOOD,
Secretary H. U. B. C.

The prospects seem good for a fine regatta. Bowdoin will surely be on hand, with Brown, Dartmouth and Trinity. Princeton is warming up, and will no doubt join the Association, and Columbia is said to be favorable to the New London course. Wesleyan collegians have almost assured the movers in this enterprise that they will be represented, and if the Sophomore class at Williams, which comprises the active men of her navy, is reinstated, that college will send a good crew. The regatta could be held about the same time as the Harvard-Yale race, which would give two days rowing.

SAIL-BOAT BUILDING.—A correspondent recently suggested that the value of a boat's keel would be augmented were the same double, one part being affixed on each side of the boat just below the water-line, in lieu of the single keel on the bottom. Other readers interested in nautical matters have written to us with apparently a like belief. As we do not coincide therein, and as the allied subject of the construction of sail-boats is just now of timely interest, we offer the following remarks:—

The keel may be determined by theoretical considerations. The primary object of the keel is to give weatherliness through the augmented resistance of the vessel to leeway owing to increase of depth, or more strictly of area of longitudinal section. If a vessel is not of suitable dimensions the architects adds timber (deadwood) to increase her longitudinal section. He adds it to the bottom of the keel first. If this is not enough he affixes more in the stern and cut-water, and balances it by more in the run before the rudder; and thus it happens that small vessels with a very small body obtain a great weatherly section. This, in fact, is carried to extremes in the construction of racing vessels, but is, of course, accompanied with a sacrifice of capacity.

Now, if the keel be taken from the bottom, split, and fastened half on each side, it is obvious that nothing is gained in point of increased longitudinal section. The weather keel certainly has no influence whatever in retarding the vessel's drift to leeward, since it lies in what would be dead water did the ship drift so fast as to leave a wake. The leeward keel would, of course, oppose some resistance, but it would be but little more than were the side keel absent altogether, since the gain to resistance would be equal only to the excess encountered by a body presented perpendicularly to the line of resistance over one of like area presented in angular direction thereto. Therefore it is obvious that, instead of being superior in adding to

weatherly qualities, side keels in comparison with the bottom keel are inferior.

There are other expedients for securing weatherliness often applied to small boats. The Dutch, on account of the shoal water along the coast of Holland, are obliged to use boats of very light draft of water. Deep keels are impossible; but the want is supplied by large flat boards of enormous area, carried on each side of the vessel. The board on the lee side of the boat is let down so that the whole of it must be driven flatwise through the water before the vessel can drift to leeward. This is a simple substitute for windwardly section, and is applied to the "center-board" commonly used in this country on small craft.

In sail-boats, however—and here we refer rather to the skiffs and cat-boats used for fishing and pleasure purposes than to yachts—the elements of stability, which is most important of all is very frequently neglected, and, as a result, capsizing under unskillful management or by accident is common.

Probably the safest small boat is that known as the "cat-boat," peculiar to Newport, Rhode Island, and vicinity. It is extremely broad, and sometimes has a keel, sometimes a center-board—more commonly, we believe, the former. The marked feature of these craft is the broad shoulders, this name being technically given to the part of the vessel just at the water line, which as the boat rolls, is above or below the water, as the case may be. By adding to the shoulders of a vessel the builder makes use of the fluidity of the water as a substitute for the dead weight of ballast, and thus gains greatly in stability. The bottom of the boat is always the upsetting, and the shoulders the righting power, so that on the predominance of one over the other the craft is stable or crank. The Newport boats—in which sea excursions, even in moderately rough weather, are safely made—combine, nearer than any other we now recall, the advantages of large longitudinal section, broad shoulders, small under-water body, and fine lines; and in these respects it is in marked contrast with the flat-bottomed, narrow-shouldered skiffs common to Long Island Sound.

As there are expedients for gaining in weatherly qualities, so there are for gaining in stability. The most notable one is that based on the principle of the Malayan proa, namely, the double hull. The Malay lashes a couple of stout spars, thwartships his boat, and fastens to their extremities another and smaller boat. The large vessel to upset must either raise its auxiliary boat out of water or force it under—in both cases meeting a strong resistance, and acting under a very poor mechanical advantage. The consequence is that almost unlimited sail can be carried on these vessels, and speed is gained in accordance therewith. A device of this description recently vanquished several crack yachts in a fair race in this vicinity. The same principle has likewise been applied to the twin steamer Castalia, which now plies across the English Channel, and the stability gained is such as greatly to preclude the uneasy rolling which made the voyage in smaller vessels so excessively disagreeable.—*Scientific American*.

—Thursday, a queer looking craft tied up at the dock. It was a sail boat, about twenty feet long, made with rough lumber, and in the rudest possible style, and insufficiently safe for navigation upon a placid lake, much less the ocean. It came from the Georgia coast, with two men, bound for the Halifax river, where they intend to settle. In consequence of want of provisions, they crossed the bar and remained here a few hours, then proceeded to Matanzas, where they will re-enter the ocean for the final run to Smyrna.

Alex. Iwanowski is building a new yacht for Mr. D. R. Morrison, of the St. Augustine Yacht Club. It is a flat-bottom boat, and about the size of the "America."

The yacht "Rover," by schooner from New York, now lying in the basin, is to convey a pleasure and hunting party south, about the 1st of December.

We do not yet hear of the bringing of any new yachts here this season. Mr. R. F. Armstrong, Sec. and Treasurer of the St. Augustine Yacht Club, a few days since showed us a copy of the constitution, by-laws, sailing regulations, &c., of the Club, recently published in New York, by the said Club. It is expected that all the active members of the Club will this season wear this uniform. The first meeting of the club will soon be held, although it is not expected that there will be a sufficient number present for a quorum.—*St. Augustine Press Nov. 18th*.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

A. D. M., Concord, N. H.—Will you please tell me where I can get a copy of Arnold Burgess's "American Kennel and Sporting Field," and at what price? Ans. Four dollars. We can furnish it.

OPENKIRCHEN, New Haven, Conn.—I have a very nice gray bird dog (setter) which is a little gun shy, could you oblige me by telling me what would cure this shyness, if so you would greatly oblige me? Ans. See article on "Gun Shy Dogs," in our Kennel Columns this week.

C. J. G., Lebanon Springs.—Do you know whether the "American" gun made by Hyde & Shattuck, Springfield, Mass., is a very good gun? Ans. We know nothing of the qualities of the gun.

D. H., Brooklyn.—What will rid my dog of fleas? Ans. Steadman's Flea Powder, sold by Holberton & Beemer, No. 102 Nassau street, this city.

A. W., Rhinebeck.—Will you oblige me by sending the address of the veteran trap maker, Mr. Newhouse? Ans. Sewell Newhouse, Esq., Oneida Community, Oneida, N. Y.

G. C. P., New York.—Please give me your opinion as to the use of English chilled shot for field shooting, as I would like to learn whether it is more effective in killing game than the ordinary soft shot? Ans. The chilled shot being harder retains its spherical shape much better than the soft, and the result is increased penetration. It is possible, however, that it may be harder on the gun. English chilled shot is imported by H. C. Squires, No. 1 Courtland street.

C. H. S., Chelsea.—Will you be so kind as to inform me where I can obtain a good boarding place in some private family in the counties of Accomac or Northampton on the eastern shore of Virginia, and also which is the best shooting country? Ans. We do not know of any private boarding houses at present, but by going to the locality you can easily ascertain in a day's time. The whole of Accomac and Northampton counties afford good sport. See our issue of Nov. 16th.

W. L. A., Chestnut Hill, Philadelphia.—1. Has there not been a book on North America Bats by Dr. Cones, published lately? If so where can I get it, and at what price? Ans. A monographic account of the "Bats of North America," by Dr. Cones and Dr. H. C. Yarrow, forms part of Chap. III of Vol. V of the 4 to reports of the Geographical Sur-

veys West of the 100th Meridian (Wheeler's), published by the War Department. The work we believe is not generally accessible. Better write to Dr. Cones, (address 509, 7th street, Washington, D. C.)

Y., St. Paul, Minn.—What is the best work on taxidermy? Ans. "Field Ornithology" by Coues. Jesse Haney & Co., 119 Nassau street, N. Y., publish a small Taxidermist's Manual. Is your Editor-in-Chief, Mr. Hallock, a Yale man? and if so, of what class? Ans. Entered Yale, class '50. An alumnus of Amherst. Thanks for your reminders.

G. B. G., New Haven.—Please inform me where the "Oologist" is printed? Ans. At Utica, N. Y., by S. L. Willard & Co., Editors. It is a small eight-page publication, but quite useful to ornithologists, who all ought to take the paper and use its columns.

W. L. J., Menasha, Wisconsin.—Can you give me the address of the Ward Burton Rifle Manufacturing Company? Ans. No such company formed that we are aware of, but a letter addressed to Mr. Ward Burton, care of the Laffin & Rand Powder Co., No. 26 Murray street, would probably reach him.

C. W., Philadelphia.—Would you recommend duck as equal to corduroy, beaver-teen, &c., for shooting suits, especially sea and river shooting? Ans. We much prefer duck when water-proofed. For additional warmth wear a Cardigan jacket under the coat.

W. J. W., Duxbury, Mass.—I send you a gold fish; please notice the peculiarity of the tail, and state in your next issue whether it is a distinct specie or a monstrosity? Ans. This is a three-tailed fish, illustrating a quite common freak of nature.

O. P. H., Franklin, Pa.—Which can you recommend as the best for running rabbits over a rough and hilly country, a beagle or harrier? Can you tell me where I can obtain such a dog, either trained or a pup? Ans. Either are good. By addressing J. H. B., at this office, you may purchase a good beagle hound.

W. F. R., Cincinnati.—2. Will a pointer dog and a King Charles cross make good bird dogs? 2. Will a King Charles stand birds? Ans. 1. Dogs bred as you state might be broken to point birds, but we would not recommend such breeding. 2. Spaniels have been broken to stand birds.

R. R. M., Ferrisburgh, Vt.—Some time since, while shooting with a friend who during the day used up his supply of shells, I loaned him some brass ones. I now find that although we both used No. 10's his bore was a trifle larger than mine, so that the discharge enlarged the shells so much that I cannot insert them in my gun. Is there any remedy to be applied to this case? Ans. We fear you will have to get new shells.

E. W. S., South Haven, Mich.—Can you tell of a good place on Grand Rapids & Indiana Railroad, in Michigan, for a three or four day's hunt for deer; also give name of some party in that vicinity that could be got to show me through the woods and drive when necessary? Ans. We do not know of such a place or party, but if you address J. D. Page, Grand Rapids, you may ascertain.

H. G., New York.—Please inform me if it is advisable to go deer shooting in Lewis county, N. Y., at Glendale station, or vicinity, or to go to Virginia; and what part for deer and other game, route and expense etc.? Ans. We should recommend Virginia in preference; Brunswick county for instance. Go via Norfolk. Isaac M. Bradley, Eldred, Sullivan county, this State, guarantees good deer shooting.

HOLLY, Philadelphia.—I have a spaniel pup about five months old; since she shed her first teeth she has acquired the habit of lolling her tongue out of one side of her mouth. Is there any way of breaking her of the habit, or do you think she will outgrow it? Ans. Dogs sometimes loll their tongues out in consequence of defective teeth. If this is not the cause, have a wire muzzle made to fit close up to the jaw so that she cannot thrust her tongue out, and in a short time she will give up the habit.

R. M. L., Scranton, Penn.—Can you inform me if two days good sport could be got either at quail, ruffed grouse, or duck, any where on the route between New York and Boston, by way of Fall River steamer, or train by Lake Shore, or Springfield route, where the services of a reliable guide could be had? Ans. Rather late for quail or grouse, but at Stoney Creek, a station on the Shore Line, you will find some good duck shooting. Guides and information can be had at Frink's Hotel.

A. B. C., N. Y.—Is it too late to plant wild rice, and would it grow in the Shrewsbury river, N. J.? Where could I get it quickest, of reliable quality? What is the *modus operandi* of planting it and probable cost of the seed, and quantity necessary to sow to attract the birds? Ans. It should be planted in fall and spring to insure a crop, and should do well in your locality. Chop a strip ten feet wide along the margin of the stream and sow broadcast, a bushel of seed to the acre. The seed can be had from Richard Vacantino, Janesville, Wisconsin. See page 39 Vol. IV.

C. E. J., East Templeton, Mass.—Gibson, in his "Complete American Trapper," in speaking of "fish oil," says it can be bought ready for use, but neglects to tell us where it can be obtained, or under what name. I have inquired for it at the drug stores and they "laugh at me" and say they know of no such substance. Will you be kind enough to supply the necessary information? Ans. Fish oil is an article of commerce, extracted in immense quantities from the menhaden or mossbunker. You can obtain it from almost any dealer in oils. Try Bliven & Carrington, No. 263 South street, this city. Your druggists must be brilliant people. Don't they keep "cod liver oil?"

S. A. C., Laconia, N. H.—1. How should a gun be bored to do the best work in shooting Kay's or Eley's improved cartridges at long range? 2. For ruffed grouse what number of shot would you advise me to use? 3. In shooting Kay's or Eley's No. 7 at a 30-inch circle at 40 yards, 1 1/2 oz., what would be a good average pattern? 4. At 60 yards, which will do the best work, a choke-bore, or with Kay's or Eley's cartridges? 5. Can as coarse shot as B B be used successfully in cartridges? 1. A cylinder bored gun is best for shooting concentrating cartridges. 2. No. 6. 3. From 150 to 200 pellets. 4. We have compared the shooting of Kay's concentrating cartridges with a full choke-bored gun, and find that they shoot just about equal. 5. Yes.

J. N. R., Rushton, N. Y.—1. Can you inform me what the best book on "canoe building" is, and where obtained? also price? 2. Can you tell me where I can get the rubber cloth used for apron and by what particular name, if any, it is known to the trade? Why would not water-proof canvas be just as good? Ans. There is no book published devoted to canoeing, unless it is Mr. Powell's, and we do not know the publishers of that. There has been more printed in this paper than you could find in any book. We can send you for \$1.00, ten numbers as follows: March 5, 12, 19, 26, April 23, May 7, June 11, July 16, Aug. 6; all in 1874, containing exhaustive articles with diagrams, on canoe building. 2. The rubber cloth can be had of D. Hodgeman & Co., No. 27 Maiden Lane but we should think that water-proofed canvas would answer as well.

CURTIS, Ogdensburgh, N. Y.—1. What is the best way to clean brass shells that are corroded with powder and have been so for some time? 2. Are paper shells "turned over" proving as effective in close shooting as those left full length of chamber and fastened by crimping or glueing? 3. Is the rifle ball tipped at the end supposed to be as accurate in every respect as the pointed ball? Can you tell me if the tipped ball is claimed to be more accurate and preferable by many marksmen and the reasons in support of the claim? Ans. 1. Vinegar will brighten the shells, or a weak solution of oxalic acid; but for cleaning the inside of the shells, use Ronall's metal shell cleaner. 2. Yes, providing they are not cut. We should prefer using extra wads and filling the shell until only enough paper is left to turn; providing the shell, when unloaded just fits the chamber. 3. The tipped ball is more accurate, from the fact of its being affected less by the wind and less likely to be turned from the line of fire.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

NEW YORK, THURSDAY, NOVEMBER 30, 1876.

To Correspondents.

* All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published objection being made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

Trade supplied by American News Company.

CHARLES HALLOCK,

Editor and Business Manager.

THANKSGIVING.

ONE of the most beautiful customs handed down to us by our Puritan forefathers is the observance of a stated day as a day of Thanksgiving. Undoubtedly intended originally as a day of prayer and praise, it has come to be, with the growth of a general spirit of liberality and toleration, not only a day of thanksgiving but a day of feasting as well; when a subtle influence softens the heart and opens the pocket; when the poor are remembered, and in byways and backways an influx of unwanted good things find its way. As sportsmen have we not much to be thankful for? In the midst of all this turmoil, when politics seem to have turned the world topsy-turvy, we have to be thankful for one of the most bountiful game seasons known for years; thankful that we can turn from the former to the field. From every direction our reports teem with accounts of large bags of quail, grouse and woodcock. The fall flight of ducks is upon us, and promises to excel that of past seasons. And we who are blessed with health to enjoy that most beautiful part of God's world, the fields and forests, should we not to-day be thankful to the Giver of all, not forgetting good St. Hubert, the patron saint of sportsmen?

And now that the spirit of Charity, "the greatest of these," has gone forth, let us open wide our hands to the poor and needy, returning in some manner the gifts to us, not from the pocket alone, but in forgiveness and sympathy. May your turkey sit lightly, and may you "live long and prosper," is our greeting to the reader, whatever may befall the tribe in the barnyard.

FOREIGN SPORTING CORRESPONDENCE.—We resume this week the publication of our Sporting Notes from Abroad, which we promise will be as reliable and interesting to our readers as the weekly welcome letters of our quondam correspondent IDSTONE, JR., who served our columns so acceptably for so long a time. We shall endeavor to keep up with the current topics of trans-Atlantic sporting intelligence, which are as interesting to many Americans as their own home news.

St. Nicholas.—We are gratified to learn that Mr. Ernest Ingersoll, who for a long time rendered us valuable service as editor of the Natural History Department of this paper, has become first assistant editor of Scribner's popular magazine for young people, known as the *St. Nicholas*. We feel that this publication will gain by the acquisition,

THOUGHTS AND SUGGESTIONS ON AVIARIES.

SEVERAL years since, we were so situated as to be able to rear from the nest some of our native birds, and the experience so obtained gave us ideas which may be useful and interesting to our readers. The occupation is not only most-delightful, but is useful as well. Pleasant it must prove to all, and useful to many. In no way can an incipient naturalist better acquire correct ideas of the habits of many of our feathered friends, and aside from its usefulness in this respect, a more pleasant engagement, and more sympathetic and affectionate pets it would be hard to find. Of course time and place are important factors, which oppose themselves to many who may be desirous to start on such a venture. One must be a rural inhabitant in the first place; no successful private aviary could be kept up in a city, fresh air, sunshine, and nearness of healthy food, being such essential requisites. Time to devote to your birds, particularly while growing, is especially necessary. We have sometimes given food to very young birds as often as every hour of the day. This is, perhaps, not absolutely essential, but the aim should be to follow nature as closely as possible, and parent birds in their native state, devote almost their whole day to their progeny when quite young, excepting perhaps the two hours of noonday heat. You must remember that you stand wholly in *loco parentis* to the nestlings, and should make yourself entirely familiar to them. As to the construction of the abode, naturally its size depends on your allotted space. Of course the larger the better. The sides and top of the aviary should be of wire netting, that of half inch square much the best; the shape square, built on a wooden platform, elevated an inch or more from the floor of the room, and placed on wooden castors so as to be movable for purposes of cleaning away the dust which will accumulate underneath it. The platform or floor should extend beyond the sides of wire a foot at least, we are speaking of an aviary seven or eight feet square—to catch sand and feathers which are scattered about; the floor should be covered with sheet zinc, and coarse sand strewn upon this to the depth of an inch. It seems to us hardly practicable in so small an affair, costing not more than \$40 to make arrangements for nesting, and more elaborate provision would be necessary for such an undertaking. No deciduous trees can be kept alive in an indoor aviary, as the birds will soon strip them entirely of their leaves. We should suggest a full branched, leafless tree of small size, for a center piece, and as many evergreen shrubs, arbor-vitæ, spruce, etc., as possible, both within and without upon the projection of the platform, to give seclusion and places of concealment for the inmates. A low door, say four feet in height, should be cut on one side for ingress and exit. Now, with what birds can we populate their future home? Those most easily reared are such as we see, most abundant about us. The robin, blue-bird, wood-thrush, brown-thrasher or red-thrush, golden-winged woodpecker, Baltimore oriole, orchard oriole, red-winged blackbird, bobolink, and various birds of the finch tribe. All of the above are reared from the nest with but little difficulty. While young, the greater variety of food given the birds the better they will thrive. For the thrushes some portion should be animal food. Worms and minced meat together, with biscuit-crackers soaked in milk or water, Indian meal, fruit and vegetables in season, strawberries, cherries, young green peas, etc. For the orioles, bits of raisins, figs, green peas and fruits. Prepared mocking-bird food can be purchased at any druggists, and is a good diet for almost any bird. During the winter worms and fruit are scarce or wanting, and at this season your birds may be fed on minced meat, Indian meal, the prepared food and canary seed, for any finches you may have, as indigo-birds or song-sparrows; raisins and figs should never be wanting. The blue-birds, thrushes, hi-holes, make the most congenial pets, and often in years gone by, have we stood the delighted center of an interesting circle of the above birds, performing in most approved fashion the office of parent to them; woodpecker's creeping up the quasi-tree trunk, our body, blue-birds sitting jauntily on shoulder, head or arm, robins and thrushes clinging to whatever foothold they could reach, and all with quivering wings and plaintive appeal beseeching for a mouthful of their morning fare.

THE CAPERCAILLIE.

"GONE to meet the dodo and the great auk," was very nearly written as the epitaph of the capercaillie or capercaillie, (*ptarmica urogallus*) the largest game bird of the British Islands and the prototype of our wild turkey. We should perhaps qualify our statement regarding his probable total extinction by saying that it referred to Great Britain alone, for even after it had totally disappeared from the United Kingdom, specimens were still found in Sweden and Norway. Even in these countries, however, the bird was being rapidly killed off.

Wood describes the capercaillie, cock of the woods, mountain cock, or a uerhahn, as he is variously called, as a bird nearly equalling the turkey in size. The color of the adult male bird is chestnut-brown, covered with a number of black lines irregularly dispersed; the breast is black with a gloss of green, and the abdomen is simply black, as are the lengthened feathers of the throat and tail. The female is easily known by the bars of red and black which traverse the head and neck, and the reddish yellow barred with black of the under surface. Many capercaillie are killed

in the spring (in Sweden and Norway) contrary to law, as each bird has his *lek* or play ground, from whence his call to the hens is heard for a great distance. The mode of killing them is as follows: It being first ascertained where the *lek* is situated the sportsman proceeds to the spot and listens in profound silence until he hears the call of the cock. So long, however, as the bird only repeats his cunning sound, he must, if he be at all near to him, remain stationary; but the instant the capercaillie comes to the wind up, during which he gives a gulp, his eyes close and he appears absorbed with passion, the hunter advances a little. The instant it rises he stops again, as during the interval the bird is extremely wary. If undisturbed, however, he soon commences again, and the sportsman creeps within shot.

Naturalists place the capercaillie in the same family as the grouse and black cock. A hundred years ago they were common in the United Kingdom, but toward the end of the last century they became extinct. The last shot in Ireland was in 1760 and the last in Scotland was killed ten years later. From that time none were seen, but in 1838 the Marquis of Breadalbane dispatched envoys to Norway, with orders to collect as many specimens as possible of the adult bird, and bring them over alive. About fifty were procured, of which some were retained in a large aviary, while others were turned out into his Lordship's forests at Taymouth Castle. In the autumn of 1839 several fine young birds were introduced; and in 1840, although Lord Breadalbane gave strict orders that none whatever were to be shot, two males in full plumage found their way into the London market. The great Scotch nobleman persevered in his attempt to re-naturalize the bird with keen assiduity. The eggs which were laid in his aviary were hatched out under domestic fowls, or put into the nests of black grouse; and the result was, after several years of patience and labor, that the capercaillie has at last taken a firm hold in the Highlands, and, unless it is again exterminated by the rapacity of sportsmen, promises to become once more indigenous.

From Taymouth, these splendid birds, increasing in numbers where they could obtain a footing, and were not systematically "potted," spread over the country in a southeasterly direction to Perth. In the beautiful woods of Dupplin Castle, in 1860-64 an hundred were sometimes seen in a single day's beat. Since about 1860, this game has met with various receptions where it has endeavored to make itself a home. At the present time it is found in various districts far away from the scene of its re-establishment in Scotland, but it is far from being general.

The modern practice of planting large districts in the Highlands with fir will doubtless aid largely in increasing the stock of birds, but to produce them in any quantity it is necessary that they should be spared by sportsmen for some years to come.

Notwithstanding his great size, the capercaillie is not an easy bird to shoot in a legitimate manner, while on the wing. The mode of shooting them in Scotland is thus described in *Land and Water*:—

"The generality of covert shooting in Scotland is done in line, and as the birds perch high up in the tree-tops, they get a good view of the advancing enemy. They therefore rarely allow the latter to approach within fair gunshot, but take their flight in time, and always from the 'other side' of the tree. Whether there is a special Providence to guide the capercaillie to perch on the reverse side of the tree to that which the gunner is approaching, or whether they take the precaution to move there on the first sound or sight of danger, seems doubtful, but it is believed that an instance of one departing from this very sensible practice is not within the ken of man. Very few are consequently killed in the ordinary drive, and even if they take flight within gunshot, the swoop downwards which they always make at starting gives them such an impetus that they skim off on the 'other side' at a pace that often carries them off at long range before a trigger can be pulled; then firing had better be left alone, as it takes a good deal to bring these giants down. As they are polygamous, it is desirable, even whilst endeavors are being made to increase the number of the species, to kill off a good many of the cocks. A special arrangement, not altogether for the benefit of the latter, is on this account made: by sending a gun or two in front to wait in a concealed spot in a favorable position while the beaters and the other guns drive up towards them from the other end of the beat. This is the only way in which a capercaillie can be fairly 'circumvented,' and although his trick of dodging out on the 'other side' saves him from his approaching enemies, he has to 'run the gauntlet' of his foes in ambush. These watch him as he comes swiftly skimming along between the trunks of the tall pines, looking, with his hooked beak, more like a large bird of prey than anything else, and salute him at twenty or thirty yards with a charge of No. 1, or, better still, of B B shot. Down he comes with a ponderous thud on the ground, or if there is deep snow, his great weight plunges him into the drift, completely burying him therein—a truly royal burial for such royal game."

The fate of the capercaillie should be a warning to sportsmen in this country. We have no wealthy landed proprietors who will send abroad for birds with which to re-stock our depleted forests. When the wild turkey has disappeared, and the grouse has followed him, we may bid them a last and long adieu, as we never shall look upon their like again.

THE BAHAMAS.—In another column will be found the advertisement of Messrs. Murray, Ferris & Co., agents of the New York, Nassau & Savannah Steamship Line. This is the season when invalids are thinking of a more congenial climate, and the Bahamas hold out unusual inducements to such. Messrs. Murray, Ferris & Co., issue a pamphlet giving all requisite information.

CANADIAN FISHING LEASES.

THE PREROGATIVES OF LESSEES.

WE have received from D. G. Smith, Esq., of Chatham, N. B., Canada, the following resume of the case between the lessee of the Southwest Miramichi salmon angling privileges and the anglers who took the liberty of fishing within its limits against his wishes and in defiance of his guardians. It would have been forwarded more promptly but for an accident which happened to the writer on the 10th instant, and through which he is still reposing in splints.—

"The Southwest Miramichi river, between Price's Bend and the headwaters, better known as the 'Burnt Hill' district, has been leased by the Dominion Government to Chris. Robertson, Esq., of St. John, for fly-fishing for salmon, etc. Mr. Robertson has had Messrs. Robert Orr, of Fredericton, John Dyer, of Boston, and other anglers associated with him in carrying the responsibilities and enjoying the privileges of the lease.

The lease, which like all others for salmon angling in Canada was issued by the Minister of Marine and Fisheries, bears date the 31st of October, 1873, and is to continue in force nine years from the 1st of January, 1874, to 31st December, 1882. The rental is to be paid annually in advance, and the Lessee is bound to conform to all the provisions of the fishery laws of Canada, and observe all the regulations of the Department existing at the time the lease was made, or to be issued thereafter by the Department. The privilege of fly-fishing in front of their own lands is reserved to actual settlers, and the Lessee is bound to establish and maintain efficient private guardianship upon the stream throughout each season to the satisfaction of the Department, which reserves to itself the right of four rods.

Before Mr. Robertson had obtained the lease a number of Fredericton gentlemen, including His Honor Judge Steadman, J. H. Phair, and Mr. Hanson, Secretary to the Receiver General, had been frequenters of the Burnt Hill pools, and they determined that they would continue to fish them, lease or no lease. They carried out their intention, and after they had trespassed several times, in spite of wardens and overseers, Mr. Robertson determined to bring them to book. He accordingly brought an action for trespass late in the season of 1875 against Messrs. Steadman and Phair, they at the same time consenting to the proceedings, in order to have the question involved tested. The case of the plaintiff, (Robertson) after quoting the lease, which I have sufficiently outlined above, was stated as follows:—

"Under his lease the plaintiff has claimed to be in the occupation of the said fishery station, and the right to prevent parties fishing therein contrary to the act under which it was granted. The defendants being British subjects during the year 1875, and during the season in which fly surface fishing for salmon was lawful, entered upon a portion of that part of said river so leased to the plaintiff, and fished for and caught salmon in the manner known as surface fly-fishing, against the will of the plaintiff and without his consent, which is the alleged trespass."

"That part of the river in which the alleged trespass was committed is situated above the ebb and flow of the tide (as in fact is the whole of that part of the river so leased to the plaintiff) and is navigable for canoes and small boats to pass and repass thereon, and has been used since the earliest settlement of the country by the public as a highway for such canoes and small boats, and to float down loose timber and logs to market in very large quantities."

"The lands bordering on both sides of the said part of the river in which the alleged trespass was committed were granted by the Crown to the New Brunswick and Nova Scotia Land Company, who have conveyed a portion thereof to different persons. The bed of the river was, however, in the grant to the New Brunswick and Nova Scotia Land Company, expressly excepted therefrom and reserved. For the purpose of this case neither of the parties claim as Riparian owners."

QUESTION.

"The question for the consideration of the Court is: 'Has the Dominion Government power under the British North American Act 1867 and the Fisheries Act power to grant the lease in question? If the Court are of the opinion that they have such power, judgment to be given for the plaintiff for \$50 damages and costs. If the Court are of the opinion that no such power is given, judgment to be given for the defendants with costs.'"

"In December last the defendants put in their first plea, in which they set forth that the part of the river where the trespass was claimed to have been made, having been always a public and common river navigable for canoes, etc., and used for the driving thereon of logs, timber, etc., every subject of the realm had and ought to have the liberty and privilege of fishing therein at all lawful times and seasons; that acting upon the common right they, the defendants, did enter into and upon the part of the river leased to the plaintiff, and did catch salmon and other fish in the manner known as fly surface fishing, as it was lawful for them to do; that at the time the alleged trespass was committed the plaintiff had no right of occupation in that part of the river, which was not a fishing station at all, and as set forth in plaintiff's declaration."

"In his replication the plaintiff set forth, that while admitting he (plaintiff) was the lessee and thus in possession, defendants did not show any justification for their entering upon and fishing said river; the assertion and fact that the river is a public one for the floating down of timber, passing and repassing of canoes, etc., is no answer to the cause of action; the Dominion Government have the right to declare the fishing for salmon in Canada exclusive; the Fisheries Act of Canada is not *ultra vires*, and there is no

right in any subject to fish for salmon in contravention or violation of an act of Parliament.

"To the replication the defendants pleaded that a river navigable in the manner set forth is a navigable river in which the right of fishing exists in the same manner as if the tide ebb and flowed therein, and therefore the right to fish therein is common to all subjects. The defendants, in conclusion, relied, among other things, in the following in the cause: The Government of Canada, or the Minister of Marine and Fisheries, has no right to declare a public navigable river in New Brunswick to be a Fishing Station; no right to lease such river or any part thereof to one to the exclusion of the rest of Her Majesty's subjects; no right to grant a right of fishing, either in a public navigable river or a private river in New Brunswick; no right to declare salmon or other fishing in such rivers exclusive; the Dominion Fisheries Act is *protanto ultra vires*; a river cannot be a fishing station.

THE ARGUMENTS AND JUDGMENT.

"The case was argued in Trinity Term last by Chas. W. Weldon, Esq., Queen's Counsel, for the plaintiff, and by E. L. Wetmore, Esq., (Mayor of Fredericton) for the defendants. The latter relied principally upon the point that under the ninety-second section of the British North American Act general power was given to the Provincial or Local Legislature over property and civil rights within the respective provinces, and that fly-fishing in public rivers such as the Southwest Miramichi, being a civil right within the Province of New Brunswick, it could not be interfered with by legislation of the Dominion Parliament under the ninety-first section of the same act, which gives the Dominion Parliament the exclusive power of legislation in regard to inland fisheries. Mr. Wetmore argued the defendant's case ably, and Mr. Weldon, in his argument for the plaintiff, met the points of opposing counsel, going into the subject at great length, and with a thoroughness that was exhaustive.

"Our Supreme Court is composed of five judges, viz.: Hon. John C. Allen, Chief Justice of the Province; Judges Weldon, Fisher, Wetmore and Duff, and these gentlemen (with exception of Judge Wetmore, who did not act on account of being related to one of the parties to the suit) gave the judgment of the Court in Michaelmas Term (October) last in favor of the plaintiff.

"The judgment is not, I believe, to be appealed from, although that course is open to Messrs. Steadman and Phair. It was not, however, come to by the Court unanimously, so I will refer to it sufficiently to show the views held by the Court, as well as by the dissenting Judge.

"The Chief Justice and Judges Weldon and Duff held that the particular and exclusive power of legislation respecting the Inland Fisheries, given to the Dominion Parliament by the ninety-first section of the British North American Act, is not controlled by the general power given to the Local Legislature over property and civil rights by the ninety-second section, and, therefore, the Fisheries Act, which authorizes the Minister of Marine and Fisheries to issue fishery leases is not *ultra vires*; where 'property and civil rights' relate to 'matters over which the exclusive legislative authority is given to the Dominion Parliament the general power given to the Local Legislature must yield; if the Dominion Parliament had the power to legislate on the subject of inland fisheries, it must be the judge of the extent of legislation necessary; its power could not be limited to the time and manner of fishing, but it had the right to prohibit fishing without a license in a non-tidal river.

"All the judges were of opinion that where there were riparian proprietors the right of fishing to the middle of the river would be vested in the owner of either bank, as incident of ownership, but in this case, the bed of the river being expressly excepted in the Crown grants of the lands on either side, the rule did not apply.

"Judge Fisher, in his opinion dissenting from the judgment of the Court, held that the power vested by the ninety-first section of the British North American Act was merely for the regulation of the fisheries, and gave no authority to lease or sell; that the Crown lands in the province were vested in the Crown in trust for the people of the province, and that the right of fishery, being incidental to the proprietorship of the land, it was held as the land was held, and could not be granted or leased to the exclusion of the public.

"The judgment of the Court, notwithstanding Judge Fisher's opinion, is in accord with the sentiment of the angling fraternity in Canada, and should the points in issue ever be carried to the Dominion Court of Appeal, or even to the final tribunal, the Privy Council of Great Britain, it is not probable that it will be altered. It confirms Lessees of salmon angling privileges in the exclusive right to waters leased by them from the Department of Marine and Fisheries, as against the general public, and it also establishes the right of the owner of lands bordering on our rivers to fish from such lands without hinderance from anyone."

MASSACHUSETTS.—Our correspondents who have lately complained so bitterly of the inefficiency of the game laws will be pleased to learn that the Massachusetts State Sportsman's Association will hold its annual convention at the Bay State House, Worcester, at 10 o'clock on December 7th. As all sportsmen and sportsmen's clubs of the State are invited to be present, an opportunity is offered for the ventilation of grievances and for proposing such amendments to the game laws as may be found necessary.

—An owl was shot in Windham, Vermont, last week, whose wings measured 4 feet 10½ inches from tip to tip.

Reported exclusively for Forest and Stream.

IN RESPECT TO THE POLAR DISCOVERIES.—"The Polar Region," remarked Professor Pericord, in one of his sublime elucidations before his advanced classes, "though not yet practically discovered, may be said to be well known. Its precise location is indicated in the heavens by the constellation called the 'Great Bear.' Hence the expression 'bare poles,' in technical use by Arctic sailors." Here the Professor abstractedly laid the palm of his hand upon the bald spot on his occiput, while he ran his eye over his pupils to discover the visible effect of this astounding revelation upon their minds. Appearing perfectly satisfied with the impression made, he continued: "I do not approve," he said, "of the persistent efforts to reach this sublime region, any more than I approve of the attempts of theologians and transcendentalists to climb to heaven by the tenets they hold. Lives and souls are continually lost in the endeavor. Yet I should much like to learn—our curiosity is naturally stimulated to inquire—if there is really an area of tropical heat and luxuriant vegetation within the drear belt of extreme cold, and of ice 160 feet thick, that surrounds the Pole; just as men would fain solve the mysterious problem of a 'lake of fire' within the cooler and more genial precincts of the celestial sphere, or spheres.

"That opinions vary on these cognate topics is not inconsistent with the workings of human logic; but the differences that obtain, as to whether the Pole itself is a region of extreme heat or of extreme cold, show how easy it is for any of us to go from one extreme to the other; and it is the effort to make these extremes meet—or, I might say, in the case of famishing Arctic voyagers, bread and meat, (ha! ha!) that costs the world so much of money and valuable brain." Just here the Professor complained of vertigo, or dizziness in his head, although he persisted feebly that he could not be regarded as a dizzy-pated man, never being subjected to "merry-go-rounds" and all that sort of thing. "You will excuse me, young gentlemen," he said, "I intend to pursue this subject of the North Pole until I reach the end of it, although I may have far to go."

Scarcely had his words been concluded, as the breath leaves the lips of a dying man who has left a legacy, when the classes broke up in a tumult; some of the students declaring that the grave Professor was innocent of any intended ambiguity, distinctly saying "vertigo," while others maintained that he deliberately perpetrated a pun—upon which the Schism still obtained.—From Professor Pericord's *Spasms of Wisdom*.

THE ROD AND GUN CLUB of Springfield, Mass., had its regular annual game supper on Wednesday evening the 22d inst. From the menu we have received we judge it to have been a most elaborate affair. No description of game appears to have been wanting; from the lordly buffalo to the delicate woodcock, all were provided. We acknowledge an invitation to the feast, and from having before experienced the hospitality of the club are fully aware of what we have lost. But that little word, duty, held us as tightly as a chain cable, and while mourning the past we can only look hopefully to the future, when the April Bench Show of the Rod and Gun Club will again put us in communion with its kindred spirits.

A SIMPLE DISINFECTANT.—In our last issue we published among our miscellany a clipping from an exchange with the above heading regarding which a correspondent writes:—

"In the first place the article recommended is of a very poisonous character when left standing about carelessly in vessels as would naturally occur in such use. Secondly, it will not remove unpleasant smells from water closets, hospitals, fish markets, slaughter-houses, sinks, etc., etc., unless, as the article states, it is left a few days, for the smell to pass away." Of what use is a disinfectant that takes a 'few days' to effect a remedy? For removing the nuisance or offensiveness of 'dead cat, rat or mouse about the house,' placing some of it as directed, will have no more effect than placing so much rain water in like manner. Copperas has been tried and found wanting; it has but the very slightest property as a disinfectant, as all health authorities are able and willing to testify to from repeated and abundant opportunities for testing. But if you desire to furnish reliable information to your thousands of readers for this most important purpose, viz., of suggesting an effectual and instantaneous disinfectant, one which never fails in destroying contagion, putrefaction, deodorizing offensive gasses of decomposition of animal or vegetable matter of whatever kind, then it may be found in the Gironde Disinfectant, and at a cost equally as cheap, with results much more satisfactory. One quart of this fluid added to five to nine quarts of water poured down water closets, in small quantities or sprinkled about places where offensive odors are present, or used as spray in hospitals or sick rooms, not only destroys and disinfects, but it does it almost instantly. And it leaves no odor behind, as many so-called disinfectants do. It is not poisonous nor injurious to articles or fabrics of any-kind with which it may come in contact. It is truly a simple, safe, certain, prompt disinfectant, and its cost places it within the reach of all, being from seven to twelve cents per quart when diluted."

ACKNOWLEDGMENT.—We acknowledge with a befitting degree of humility the numerous congratulations of newspaper contemporaries and persons, that we have received concerning our enlarged and improved paper.

COCA.—Some of our sportsmen friends have been experimenting with Coca, the South American nervine, of which much has been written. We shall give the results in our next issue.

—We note the return of Prof. E. D. Cope's Scientific Expedition from the Upper Missouri, and shall refer to its investigations and the results of its labors.

WE are almost weekly in receipt of letters from our correspondents asking for information as to the best mode of curing the defect of gun shyness in dogs. This difficulty has increased very much within the past few years, in consequence of breeding much more than heretofore from imported dogs, too many of which are inbred to such an extent as to make their progeny delicate and of a nervous temperament, and very liable to be gun shy. Yet that so many dogs are gun shy is frequently in consequence of bad management of their owners, or those who first take them to the field. In former times, when dogs were not so finely bred, and inbreeding was an exception to the general rule, gun shy dogs were seldom met with. It is, however, owing frequently to the careless manner in which pups are raised, and then taken to the field to be shot over that they are gun shy. When pups are three or four months old they should be taken out for exercise frequently, taught to get over fences, and where they may hear distant guns fired, and other noises, and then when taken to the field to be shot over, a few shot with light loads should be fired at the distance of two or three hundred yards, and then gradually shortening the distance, and with heavier load; this will convince the pup or young dog that the gun will not hurt him, and gun shyness seldom follows. But when a dog has become gun shy it is in consequence of his fear that the gun, or the report thereof, will in some way hurt him. To convince him what the gun is for, and that it will not hurt him, is the only way to effectually cure him of the defect. Many years ago we owned a very beautiful thoroughbred milk-white pointer about eighteen months old which, although a good worker in the field and quite staunch on game, was gun shy, and after the first shot he would invariably come to heel and remain until the gun was laid aside. This dog we cured at the first trial in this way: We loaded the gun with barely powder enough to wound a small bird sitting at fifteen or twenty yards distance, so as to make just as slight a noise as possible, then placed the gun in the hands of a friend, and taking the dog along a hedge where cat-birds and other small birds are found, and inducing the dog to notice them, watching him carefully to see when

his eyes were on a bird, the shooter as far from the dog as he could get, would shoot at and wound it. Beppo, after the second shot with so little noise, seeing the wounded bird fluttering down was at once convinced that the gun intended to kill the bird and not to hurt him, and from that moment he was no longer gun shy.

THE MEMPHIS FIELD TRIALS.

Continued from our last issue.

FREE FOR ALL—CHAMPION STAKES.

Five hundred dollars to be paid in full; first prize cash \$250; second prize, cash, \$150; third prize, cash, \$100. Twelve entries—see tabular statement. Fine work was now expected, and fully seen in the first pair put down—Drake and Duke, each to have five chances for point. Both were sent away in a corn field; both showing good pace, Drake the superior, and could not have been excelled. Drake first finding covey; pointing in grand style. Drake was ordered up but did not back in good style; birds were flushed, dropping in woods close by, a hard place, deep leaves and dry, and a severe test on the dogs, but they were equal to the task. Finer work than Drake's I have never witnessed. Each dog scoring four points, one flush. Duke has an uncertain style of pointing I do not like, mostly keeping his tail in motion. I mark this pair, Drake: 4 points 20; backing, 3; pace, 7; style, 5; quartering, 5; retrieving, 5, total, 45. Duke: 4 points 20; backing, 3; pace, 6; style, 4; quartering, 5, total, 41. Both Mr. Whitford and Wallace, handled their dogs well. The former showing Drake's training quite perfection, and I predict Mr. Whitford winner of the \$25 gold prize, as "trainer of the best trained dog."

Next in order drawn, Kate and Lily, put down at 145. Kate soon finding birds made a staunch point, Lily backing; birds flushed and marked down in woods near by. When Kate made this record, good points on first second and fourth birds, and flushing third and fifth, then failing to retrieve. Lily making three points, here and afterwards; two false points and two good, showing no pace and little style, and I give them record: Lily, 5 points, 25; pace, 2; backing, 3; quartering, 2; retrieving, 5; total, 39. Kate, 3 points, 15; pace, 4; style, 3; backing, 3; quartering, 3; retrieving, 0; total, 28. Lily's two false points, four, reducing her total to 34. Having had five chances each they were taken up and Pride of the South and Friend were cast off, Pride soon finding in cover. Friend was brought up and failed to back; birds flushed, Capt. Bogardus killing two. Pride was ordered to retrieve, and it was well done. Friend was then sent and retrieved the second bird, after Mr. Campbell moved up. Going into woods near by, Friend flushed, afterwards passing through two cornfields to depot; dogs were taken up and all returned to Memphis. The day was cool and cloudy, and the birds hard to find. All met at Peabody Hotel at 10 p. m. to hear report in puppy stakes. The awards in statement I send were then read off.

Kate and Lilly were next put down, and Kate soon made her score, pointing first and second birds well, and flushing third and fourth—a good point. Judges ordered bird killed, and Kate failed to retrieve it, her score standing: three points, 15; backing, 3; pace, 4; style, 3; quartering, 3; total, 28. Lilly made five points—the only one in this stake making this record—but making two false points, counting four against her, and not having much of either—pace and style—I predict she does not get a place. I mark for her five points, 25; backing, 2; pace, 3; style, 4; quartering, 3; retrieving, 3; total, 43. Demerits, 2; false points, 4; score, 39.

The next brace were "Pride of the South" and "Friend." Pride made a good point on first, but flushing the next two chances he could not win, so Capt. Henry withdrew him. Friend scored a point each on first and second bird, flushing third and fourth. She was retired, not being able to score enough to win; her backing and retrieving was not good. Capt. Henry was awarded the prize, \$25, for best trained puppy. The Captain deserves great praise for the manner in which he handled his dogs, never breaking any dogs but those for his own use. When the prize was announced, Capt. H. ordered up champagne for the party.

At 9:20 a. m., Maude and Buck, Jr., were sent off to see what they could do. Maude's performance was not up to the expectation of her friends, but her condition—ready to breed—should be taken into account. Her score, I would say, three points, 15; backing, 3; pace, 6; style 5; quartering, 5; retrieving, 5; total, 39. Buck, Jr., after making a false point, flushed first bird, pointing second and third, fourth and fifth, then another false point, this destroying any chance to win. She is a bitch of fine speed—a better covey than single bird dog; is a lemon-color, with little white mark. As record for her: four points, 20; backing, 3; pace, 7; style, 5; quartering, 4; retrieving, 4—43; score, 39; and two false points to the bad, 4.

Stafford and Phil, next in order, were drawn, Phil not on the ground. Stafford was put down, and made his run and work within 150 yards, and quicker than any yet run, making four points, one flush and full. In my judgment, for all the balance except retrieving, he is a grand dog, and for pace and style—and none consider he has no superior—his mark should always be very high in any trial. I mark him for four points, 20; backing, 3; pace, 7; style, 5; quartering, 5; retrieving, 4; total, 44.

Paris and Erin, last of the Free For All, were sent away. Erin was first to run out his score; turned loose on scattered birds in cornfield he soon pointed very staunchly, as he always does. Soon after made his first flush, when Mr. Whitford was ordered to another cornfield to find first covey, which was soon done, Erin pointing well—birds ordered flush. He then made two flushes, ending his run and making this record: two points, 10; backing, 3; pace, 6; style, 5; quartering, 5; retrieving, 5—34; Paris made three successive points, doing his work well. The third, made on a supposed wounded bird, was protested; but judges, after consideration, gave him the point, as they should have done. It now being too late, Paris was taken up to finish his next morning.

Friday, 17th.—Paris first put down to finish, he soon found a covey—a good point. He had but one more to make, which would make him champion, but the seeming fatality for all, one flush, followed him, and his last bird being flushed destroyed his chance for first. I think Mr. Smith, like all others who preceded him, hunted his dog with too much caution. Paris, score four points, 20;

backing, 3; pace, 5; style, 5; quartering, 5; retrieving, 5; total, 43.

This ended the champion Free For All class, and the Braces were called up in the drawing. Mr. Campbell's entries, Buck, Jr., and Kate, were first, and were put to their work at 9:15 a. m., birds being scarce. They had a long run. Buck, Jr., flushed first bird, next finding a small covey—birds ordered flush—when two were killed, which were retrieved. Next a point for Buck, Kate backing. Next bird pushed by Buck. Kate did little in this run to credit or discredit; then ordered up, and Drake and Erin started, field after field was hunted and no birds until for two hours, when Drake and Erin were each scored a point, Drake afterwards making a second, each backing and retrieving always when opportunity offered. The judges satisfied with their performance, they were taken up and all went to lunch, there being three Braces yet to run, with birds very scarce, and but three hours left. It was then agreed by all that each of the Braces should have one hour or less, and that all should be judged by their present and past performances.

The trials had held over two days longer than time published, and the judges were anxious to get through. After lunch Stafford and Maud were first put down, soon finding covey, while both were moving very fast, and dropping instantaneously to point; birds were flushed. One killed; retrieved by Maud. Soon after both again pointed independently of each other, when they were taken in and Pride and Paris put down. Their work was good, Paris first pointing, well backed by Pride. Afterwards Pride pointed, Paris not backing as well as he should. They were then taken up to give Countess and Lily a chance, Countess first pointing a bird, when, not being backed by Lily, she flushed, both chasing. Afterwards Lily pointed, and she was beautifully backed by Countess 40 yards away. Stafford and Maud were again down, Stafford again dropping to point, Maud backing, and both were held some time, until all dogs were brought up, each backing in turn—a grand sight, and a fitting finale to the Field Trial of 1876.

After an hour's deliberation at Peabody Hotel in the evening, the judges rendered the following decisions in Free for All. Champions: Drake, of St. Louis Kennel Club, first; Stafford, owned by P. H. Bryson, Memphis, second; Paris, owned by L. H. Smith, Strathroy, Canada, third. In Braces: Drake and Erie first; Maud and Stafford, second; Paris and Pride of the South, third.

Mr. Luther Adams' prize of \$25 gold for the best broken puppy in the puppy stakes was awarded to Captain Patrick Henry.

Mr. H. P. Bryson's prize of \$25 gold for the best broken dog in the champion stakes, and Mr. Luther Adams' prize of \$25 gold for the best broken brace in the brace stakes, were awarded to Mr. C. B. Whitford, the breaker for the St. Louis Kennel Club.

—Mr. J. T. Sheaver, of Troutman Farm, Butler county, Pa., writes us that his English setter bitch Kate dropped ten whelps on the 14th instant, five dogs and five gyps, by Pride of the Border. Mother and family doing well. Kate is a remarkably handsome orange and white setter, and a credit and ornament to any kennel.

BALTIMORE BENCH SHOW.

BALTIMORE, Nov. 25th, 1876.

EDITOR FOREST AND STREAM.—

At a large and enthusiastic meeting of the Dog Fanciers, held last night, Mr. J. Addison Smith in the Chair, the following committees were appointed: On hotel prizes, Mr. Broadhead, Mr. Zell, and Mr. L. R. Cassard; on Railroad arrangements, Mr. J. A. Smith, Mr. Malcomb, and Dr. Bear; on special prizes, Mr. J. J. Turner, Jr., Mr. A. K. Shriner, and Mr. Chas. Bancroft; on Governor and Mayor prizes, Mr. Stewart Latrobe, and Mr. J. A. Robb. The hotel committee have reported to me that four of the principal hotels, had contributed towards giving a special, the others would do so on Monday; the result will be announced next week.

On Railroad arrangements, the committee report from conversation held with the managers this morning, that there is not the slightest doubt dogs will be carried free both ways, and very probably special cars put on from New York, Brooklyn, and Washington. The committee on special prizes report the following additional prizes offered: Edward Melchiar, dealer in fine guns, 116 W. Pratt street, Baltimore, offers a valuable Smith & Wesson pistol, to be given to the best stud pointer dog, under 50 pounds weight, to be shown with not less than two of his get. Messrs. Wagner's "Green House Restaurant," offer a silver cup for the best Chesapeake Bay duck dog or bitch. Messrs. Clark & Snider,

manufacturers of the Snider breech-loading shot gun, offer a silver cup, suitably engraved, to be given to any class of dogs, the Association may direct, (this will be decided next meeting). Dr. W. H. Keener, Baltimore, offers \$25. cash to be given as the Association may direct. S. R. Scaggins, dealer in fish and game, offers a gold medal, embossed and engraved, for the best Chesapeake Bay dog or bitch. Henry D. Harvey, Pres. Merchants Shot Co., offers eight bags of duck shot for the best Chesapeake Bay dog or bitch, also eight bags of bird shot for the best native black and tan Gordon setter dog. Mr. Schumaker, dealer in fine guns, &c., gives a handsome Parlor Rifle for the best pointer dog under 50 pounds weight. Messrs. Smith & Whiting, Agents, Oriental Powder Co., give a handsome prize, consisting of a case of assorted powder of their manufacture, to be given as the Association may direct. Col. Geo. P. Kane, has also promised a special, which he will decide on next week.

Surely after these numerous specials are announced, and the interest displayed in this show, we will receive the support of all dog breeders and fanciers. Already I have received notice that the most prominent kennels will be represented. Everything that possibly can be done to make the show a success, will be done; one most important thing is to make entries early, as none will be received for competition after 20th Dec. CHAS. LINCOLN, Superintendent.

Sea and River Fishing.

FISH IN SEASON IN NOVEMBER.

Black Bass, *Micropterus salmoides*; Weakfish, *Cynoscion regalis*.
M. nigricans. Bluefish, *Pomatomus saltatrix*.
Mascalonge, *Esox nobilior*. Spanish Mackerel, *Cybbium maculatum*.
Pike or Pickerel, *Esox lucius*.
Yellow Perch, *Perca flavescens*.
Sea Bass, *Sciaenops ocellatus*.
Striped Bass, *Morone americana*.
White Perch, *Morone americana*.
Cero, *Cybbium regale*.
Bonito, *Sarda pelamys*.
Kingfish, *Menticirrhus nebulosus*.

FISH IN MARKET.—The supply of fish to be found on the slabs at the various markets this week has been liberal, but owing to the greater demand for game and poultry business has been quite light. We quote:—Striped bass 20 to 25 cents per pound; smelts, 25 cents; bluefish, 12½ cents; salmon, 40 cents; mackerel, 15 to 25 cents each; white perch, 15 cents per pound; Spanish mackerel, 75 cents; green turtle, 20 cents; terrapin, \$15 per dozen; halibut, 18 cents per pound; haddock, 8 cents; codfish, 10 cents; blackfish, 15 cents; flounders, 10 cents; eels, 20 cents; lobsters, 10 cents; sheephead, 20 cents; scallops, \$1.50 per gallon; soft clams, 30 to 60 cents per hundred; whitefish, 18 cents per pound; pickerel, 20 cents; sunfish, 12 cents; yellow perch, 10 cents; salmon trout, 20 cents; black bass, 20 cents; yellow pike, 15 cents; ciscoes, 10 cents; hardshell crabs, \$3.50 per 100.

—A fish car has been attached to the night train from Boston to New York for a month past, which reaches the city at 7 o'clock a. m., and delivers its daily supply of fish to the multitudes whom, it would seem, our resources nearer at hand are unable to furnish.

—Shad have been received in the St. John river, Florida, for a week past. Fresh shad every day now on the hotel tables.

—We hasten to congratulate our friend and naturalist, Miss Sara J. McBride, upon the very high compliment paid to her skill in dressing artificial flies, by the Centennial award to her of a bronze medal, and diploma. Her artistic work received the only bronze medal awarded by the judges in this specialty. Without doubt, Miss McBride's success is attributable in great degree to her intimate acquaintance with Entomology, which enables her not only to dress her old patterns after nature, but to discover and prepare new ones at those seasons when her study teaches her they are the most killing.

MOVEMENTS OF THE FISHING FLEET.—The stormy weather of the week put an effectual quietus on the movements of the shore fishermen, and they have been lying at anchor, patiently waiting for more propitious skies. As a consequence, there has been a great scarcity of fresh fish in the market. A few were brought in on Monday, and sold for \$3 per cwt., for cod and haddock. There have been 13 arrivals of the fishing fleet. 9 from Georges and 4 from the Banks. The receipts have been 63,000 lbs. of Georges codfish, 195,000 Bank codfish, 2,000 lbs. Bank halibut, and 45,000 lbs. Georges halibut. There are 5 salt Bankers yet to come, which will wind up the business for the season.—Cape Ann Advertiser, November 24th.

CAVIARE.—Oregon, it seems, has added another and important branch to her already numerous industries, the manufacture of that highly esteemed delicacy among epicures—caviare. This article is made from the eggs of fish, and it has been discovered recently that the unhatched spawn of the sturgeon, which frequent the waters of the Columbia and its larger tributaries in great numbers, can be manufactured into caviare of a very superior character. We understand that some parties in Astoria are engaged in manufacturing this delicious article of food. A large number of sturgeon are being captured in the Cowlitz river and taken to Astoria, the eggs removed and made into caviare. The article manufactured compares very favorably with the best brands in the market.—Oregonian

—At present there are in the whaling business in this country only 180 vessels altogether, of which 130 belong to New Bedford, 21 to Provincetown, 12 to New London, 6 to Boston, and the rest to other points in New England and to San Francisco, with the exception of one which sails from New York. The average value of whaling vessels fitted out is about \$40,000, and it is estimated that the total capital invested in New Bedford in the vessels, the handling of their oil and bone, &c., is not far from \$5,000,000, probably rather over than under that figure.

The taking of the walrus is an important branch of the business of the "right" whalers in the Arctic ocean, in the seasons when they are not at their legitimate work. These animals are shot with rifles. They are often found in such countless herds, that men shooting them with breech-loading guns, frequently get their weapons so hot they have to plunge them into the water to cool them. Each walrus yields on an average 20 gallons of oil, and three or four pounds of tusk ivory. The oil is worth about as much as whale oil. It is found in a surrounding envelope of blubber.

ber like that of the whale. The ivory is worth about 75 cents per pound. The Esquimaux and Alaska Indians view with great disfavor the destruction of the walrus, which is their main dependence for meat; but it does not appear from reports received this season that the slaughter of countless thousands of these animals in years past, has in any perceptible degree diminished their numbers.

SALMON FISHING AT OAKLAND, LONG WHARF, NEAR SAN FRANCISCO, CALIFORNIA.

EDITOR FOREST AND STREAM:—

We have again this winter our grilse bonanza in our harbor. For the last two weeks, that is to say, since the opening of the salmon season, there have been captured on an average thirty fish per day. Thus early they are running quite small in weight, with an average of three-quarters of a pound, although a few larger have been captured from two to seven pounds. The prospect is good for their biting about four months. They are nearly all the true Sacramento and San Joaquin river fish, with here and there one which some person calls salmon trout, with longer bodies, squarer tails and blunter noses, but which are nothing more than another of the many varieties of the *salmo* family, that we have all along our coast from the most southern part of the State to the most northern, extending also to Oregon and Washington Territory, Columbia and Alaska. The Sacramento fish, when young, is most delicious for the table, being tender, most delicate in flavor, and free from the oily richness of the full grown salmon. These salmon will neither take the fly nor the spinning trolling spoon in the bay, for both have been effectively tried for several years. Early in the spring season some have been taken with the fly in some portions of the fresh waters of the Sacramento and McCloud rivers far in the interior or up the coast, by skillful sportsmen. But the roe-bait is chiefly used there, especially in the beginning of winter, and found quite successful with the salmon, as well as the "Dolly Varden" and other species of brook trout. Our brook trout, however, rise well to the fly.

Some of these salmon have been found in our bay during the whole of this year, having become fastened out of season to the trol lines set out by the professional fishermen for smelts, and the bait being often gorged by them. They have also sometimes been taken in the nets set out for many other fish in our harbor.

As I have before informed you, we fish for these grilse from the Oakland wharf, with rod and line, using for bait our wharf or mussel worm, with a slip of herring or smelt, or a small fish at the end of the hook. The lead on the line is allowed to sink about three or four feet from the surface of the water, and the rod may be allowed to remain resting on the railing of the wharf, as the fish nearly always hook themselves, and the motion of the line through the water does not appear to be necessary, although sometimes a snap bite is taken advantage of by the angler, when he has his rod in hand, and he is then apt to hook his fish in its jaw, without, as in the other case of a stationary rod, the fish swallowing the bait completely.

Our weather is generally at this season most charming, with a bright sun and mild breezes. We have had one plentiful rain about two weeks, since which always favors the advent of the salmon in the bays and rivers. We now want some more abundant showers to fetch more fish in, as the weather, for the last five days, has been too calm and warm to induce the young fish upon which the salmon feed to seek the shelter of the wharf. We want some strong gales with colder air to arouse to excitement and appetite all the finny tribes, and particularly the salmon family in and about our seas, rivers and bays. But we have nothing to complain of in our climate in other respects, as it is probably the very finest in the whole of the United States. Our winters are more enjoyable in this city than our summers, as in the latter seasons we have too many violent trade winds, which bring dust and sand and unpleasant coolness with them (in the interior it is different), while our winters are genial and temperate, like the Eastern weather verging on summer, when we can fish and shoot and enjoy all out-door recreations to their utmost extent, only interrupted by some mild rains of a day or two's duration at intervals. E. J. HOOPER.

THE SPECKLED TROUT OF JAPAN.

BOSTON, November 21st,

EDITOR FOREST AND STREAM:—

Query—Why is it that in Japan fish will not take the fly?

I have failed myself, and others likewise, during repeated trials to tempt, or even obtain the slightest indication of an offer with varied hued flies, the small trout that inhabit by thousands the inland streams which abound in some parts of Japan. The natives capture these fish by casting a hand net over them when collected in shoal water and where they are visible.

The trout I have reference to are about three or four inches long, and of the brook trout species, or of close affinity, handsome little fish, and when properly cooked are simply delicious. These fish rarely, if ever, exceed this size, although I remember seeing at a place called Mi-yo-noshita, a magnificent specimen of trout weighing fifteen pounds. This sounds a little piscatorial, but I know whereof I speak, as the fish in question had been netted and weighed, after which he was returned to his native element (which consisted of a small pond in front of the tea house), until on an unlucky day a foreign vandal hooked the fish, left him on the ground, forgot to replace him in the water, and as a matter of course killed him, and I am under the impression that he even went so far in this disgraceful procedure as to devour him for his dinner. The natives claimed this trout to be over one hundred and fifty years of age; at all events, for one hundred years the proprietor of the house said that it had been handed down in his family, and that for nearly four generations he had its authentic history, one of the most remarkable features of which was that it had never varied in size during his existence, or that of his father or grandfather. Whether from age or constant association with natives this celebrated fish was remarkably tame, and an object of great curiosity to visitors in that region, and especially well known to foreign residents of Japan.

Will some of your pisciculturists or devotees of the rod, kindly offer any reasonable theory regarding the cause of fish in Japan rejecting the fly?

SAKURA.

Rational Pastimes.

BILLIARDS.

A tournament has been in progress at Tammany Hall for the past week or so, in which the most prominent of the experts of the metropolis have been engaged. The tourney has been run in the interests of Wm. Delaney, a well known billiard table manufacturer, who gives the purses and pockets the proceeds of the enterprise. The contestants include the two Canadians, Joe and Cyrille Dion; the Frenchmen, Garnier and Rudolphe; the Americans, Daly and Slosson, and the German Shaeffer. The latter being a new man, hailing as champion of Indiana. Sexton, the American champion did not enter the lists. The result up to the 27th inst showed Joe Dion and Rudolphe to be in the van with Slosson as third. Thanksgiving day will see the close of the tourney, and our next issue will contain the final result of the games played. Thus far the record is as follows:—

The single figures represent victories, the cyphers defeats, and the dashes that games have yet to be played:—

Players.	J. Dion.	Rudolphe.	Slosson.	Daly.	Garnier.	Shaeffer.	C. Dion.	Games won.
J. Dion.....	—	—	—	—	1	1	1	3
Rudolphe.....	—	—	1	—	0	1	1	3
Slosson.....	—	0	—	1	0	1	1	3
Daly.....	1	—	0	—	1	0	—	2
Garnier.....	0	1	1	0	—	—	0	2
Shaeffer.....	0	0	0	1	—	—	1	2
C. Dion.....	0	0	0	—	1	0	—	1
Games lost.....	1	1	2	2	3	3	4	16

Pool selling has a great deal to do with the contests; but little confidence being felt in regard to the integrity of play as a general thing, the best patrons of the game almost ignoring the tourney.

BASE BALL—THE CLOSE OF THE SEASON.

Thanksgiving Day ended the base ball season of 1876, and in one respect it has been the most noteworthy in the history of the game, more clubs engaging in contests and more games played than ever before recorded. North, south, east and west has the game flourished to an extent hitherto unknown. Professional play, too, has been peculiarly successful in the face of drawbacks well calculated to bankrupt prominent organizations; but where honest play and low prices have prevailed, success has been achieved. About thirty regular professional organizations took part in the season, play exclusive of the clubs belonging to the League monopoly, and all of the best managed of the co operative class of clubs "put money in their purses." The League Association, which was organized to insure club engagements being fulfilled, and to prevent "crooked" play "revolving"—the two prominent abuses connected with professional base ball playing—partially failed in its objects, inasmuch as two of the eight clubs which entered the League arena, failed to play their full complement of games, and a minority of the eight were open to the charge of too intimate a connection with pool gambling influences known as "crooked" play. The season's experience, in fact, showed pretty clearly that the policy of the League in several respects, was a faulty one. They erred, in the first place, in adapting too high a tariff of admission to their contests, the League losing sight of the important fact that hard times prevail and that retrenchment was the order of the day and the time. Another mistake they committed was that of employing suspected players in some of their teams, thereby creating a doubt of the integrity of play at the club teams as a class. In excluding professional organizations from their Association which could not give guarantees to fulfil engagements they again erred, for assuredly it is the policy of a wise legislation by an Association the object of which is to govern the professional class, to include every club which is of that class. It is not at all necessary that while admitting all professionals to the benefit of the League laws and regulations that they should be obliged to give all the entree to the championship arena. That can still be kept to the count of thoroughly responsible clubs. But there is no need of making the League a class monopoly. To the extent therefore of the drawbacks of these mistakes the season was not as successful as it might have been. In 1877, however, better counsels will no doubt prevail, and a more liberal policy will be introduced, and under circumstances which will bring the professional class under the influence of one controlling association governed by one code of playing rules, there can be little doubt of a more successful season in this respect in 1877, than marked the season of 1876.

FOOT BALL.—At a game of foot ball played at Princeton, N. J., on the 25th inst., between twentys representing the University of Pennsylvania and Princeton College, the latter were victorious, winning the six straight goals in seven, ten, two and one-half, twenty-nine, twenty-seven and one and one-half minutes respectively. The game was played under association rules.

ATHLETICS.—The Scottish-American Athletic Club holds its second annual games to-day at Washington Park (adjoining Jones' Wood Colosseum), East side Boulevard and Sixty-ninth street. The events comprise 100 yards run, quarter mile run, half mile run, one mile walk, three mile walk, throwing the hammer, running high leap, putting the shot, vaulting with pole, throwing 56 pounds weight (all handicaps), for members—120 entries. Also quarter mile run, one mile run and three mile walk (open to all amateurs), for which some of the leading athletes of this vicinity have entered.

CARLETON HOUSE, Jacksonville, Fla.—At last Jacksonville has been supplied with a first-class hotel unequalled by any south of Washington. It has been erected by Messrs. Stimpson, Devnell & Davis, of Massachusetts, and is located on the corner of Bay and Market streets, one of the most pleasant portions of the city. It has a frontage on Bay street of 135 feet, on Market of 85 feet, and the west wing is 85 feet long, making an entire frontage of 305 feet. It is four stories high, built of pressed brick, and the exterior neatly finished. A spacious and handsome verandah protects the building on Bay and Market streets. The main entrance on Bay street is 42x21 feet, with a neat office to the left. In the office is a Creighton's Oral Enun-

ciator communicating with each room in the house thereby avoiding the necessity of dependence upon dilatory bell boys. To the right is the grand staircase with an elaborate novel post surmounted by a classic Sir Knight supporting a highly ornamented gas burner. Entering a side hall to the left a cosy smoking room 18x18 feet is reached, and nearly opposite is an elevator communicating with the various stories. At the end of the hall, and within a few feet of the elevator is the entrance to the dining room, a spacious apartment 40x60 feet. The location of the dining room and elevator will enable ladies to reach the former without traversing the halls, and subjecting their toilets to a too careful inspection. If they wish to expose their laces, furbelows and pin-backs to the admiring gaze of the opposite sex they can descend the grand or ladies stair-case, and traverse the spacious halls to reach the apartment where choice viands will be distributed *ad lib*.

Turning to the right from the main entrance a wide hall is entered, to the right of which is the reading room, 21x18 feet; and at the end and to the right is the ladies' parlor, 38x40 feet. This room opens on Bay and Market streets, and affords a fine view of the river, and the massive old oaks and orange trees on the opposite side of Market street. The parlor opens into the ladies' entrance, a hall nine feet wide, from which starts a private staircase leading to the various stories. A spacious hall leads from the private entrance to the end of the Market street wing. To the left of the hall and near the entrance is a ladies' reception room, designed for the accommodation of lady guests until they can be assigned rooms. In this wing, in addition to the reception room, are seven commodious sleeping apartments for the benefit of those who prefer accommodation on the lower floor.

Ascending the spacious main staircase the second, third and fourth stories are reached, where 97 commodious and comfortable bedrooms will be found. On the second story the furniture is walnut; on the third ash with walnut trimmings; and on the fourth neat and good cottage furniture with marble tops. Bath rooms and water closets are on all the stories. On each floor stand-pipes have been provided, with a sufficiency of hose to reach to the end of each wing. The supply of water is obtained from the river, and head obtained by a powerful force pump worked by the steam engine. The building is lighted by coal gas, and the fixtures are chaste and handsome.

The steam laundry is on the second floor, and the drying room is provided with 1,200 lineal feet of clothes line. Clothes are washed and mangled by steam. This convenience alone is a great accommodation to a Florida hotel, for it avoids the necessity of travelers employing irresponsible washerwomen.

Leaving the dining-room, the carving, dish and plate room is reached; an apartment 22x45, containing every convenience. Leaving the carving room the kitchen is entered, where a Walker & Prall range fifteen feet long has been erected. Adjoining the range is a machine intended to steam a barrel of oysters at a charge. In a building adjoining the kitchen is a high pressure engine capable of working up to eighteen horse power, the duties of which will be to wash clothes, make ice cream, work the elevator, steam oysters, and in the event of fire, deluge the house with water. In the yard is a spacious brick cistern containing 30,000 gallons of filtered rain water for the use of guests.

The cuisine department possesses all the modern improvements, and is under the charge of a competent gentleman (one of the proprietors), who has had a long experience in a leading Boston hotel. The waiters have been selected in Philadelphia, and will be found gentlemanly and obliging. In addition to the attractions of the hotel we may remark that Mr. Ludkins has a boat yard within fifty yards of the house, where those who are fond of aquatic sports may obtain anything from a shell to thirty-foot yachts.

It is the intention of the proprietors to make the "Carleton" a first-class house, and from personal knowledge and examination we have no hesitation in recommending it to the favorable notice of tourists, invalids and sportsmen.

AL FRESCO.

Tiffany & Co., Silversmiths, Jewelers, and

Importers, have always a large stock of sil-

ver articles for prizes for shooting, yachting,

THE SPORTSMEN'S ROUTE.**Chicago & Northwestern Railway.**This great corporation now owns and operates over
two thousand miles of road, radiating from Chicago.
Like the fingers in a man's hand, its lines reach in all
directions, and cover about all the country north,
northwest, and west of Chicago. With one branch it
reaches Racine, Kenosha, Milwaukee, and the coun-
try north thereof; with another line it pushes through
Janesville, Watertown, Oshkosh, Fond du Lac, Green
Bay, Escanaba, to Nagaunee and Marquette; with an-
other line it passes through Madison, Elroy, and for
St. Paul and Minneapolis; branching westward from
Elroy, it runs to and through Winona, Owatonna, St.
Peter, Mankato, New Ulm, and stops not until Lake
Kameska, Dakota, is reached; another line starts from
Chicago and runs through Elgin and Rockford to Free-
port, and *via* the Illinois Central, reaches Warren,
Galena and Dubuque, and the country beyond. Still
another line runs almost due westward, and passes
through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar
Rapids, Marshalltown, Grand Junction, to Council
Bluffs and Omaha. This last named is the "GREAT
TRANS-CONTINENTAL ROUTE," and the pioneer
overland line for Nebraska, Colorado, Utah, Idaho,
Montana, Nevada, California, and the Pacific Coast.
It runs through the Garden of Illinois and Iowa, and
is the safest, shortest, and best route to Omaha, Lin-
coln, and other points in Nebraska, and for Cheyenne,
Denver, Salt Lake City, Virginia City, Carson, Sacra-
mento, San Francisco, and all other points west of
the Missouri River.**TO SPORTSMEN:**THIS LINE PRESENTS PECULIAR ADVAN-
TAGES—FOR PRAIRIE CHICKEN, DUCK,
GEESE, AND BRANT SHOOTING. THE
IOWA LINE TO-DAY OFFERS MORE
FAVORABLE POINTSthan any other road in the country, while for Deer and
Bear Hunting, and for Brook Trout, Lake Salmon,
Pike, Pickerel, and Bass Fishing a hundred points on
the Northern and Northwestern lines of this company
will be found unsurpassed by any in the West.**MARVIN HUGHITT,** W. H. STENNETT,

Thomson's

Oil Finished Grain Leather Shoe-Pack or Moccasin.

With Sole, Price, \$7.50. Without Sole, \$5.50

Made with heavy sole for land use; also without sole for snow and canoe purposes. All hand sewed and strongly made. Laced in front with hooks (over English style of water-tight tongue), thereby securing PERFECT FIT around ankle, thus preventing all slipping at the heel. Made with broad soles and on scientific principles.

Fits the want long fel by sportsmen for an easy fitting and durable shoe.

In ordering, state size of boot worn. Sent by mail on receipt of price, with 40 cents additional for postage, or by express C. O. D., everywhere. Manufactured by **THOMSON & SON, 301 Broadway, New York.** ju27-1

Sportsmen's Goods.**The Boston Shooting Suit.**

MANUFACTURED ONLY BY

G. W. SIMMONS & SON,
Boston, Mass.

SOLD everywhere in the U. S. by all first-class dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT,"
made by
G. W. Simmons & Son.

This new design of **WATERPROOF SHOOTING SUIT**, made from extra quality duck, has attained such popularity as to be called for from all parts of the country, and even from England.

"Shipping clothing to England strikes us very much like sending 'Coals to Newcastle,' but the merits of the 'BOSTON SHOOTING SUITS' have been heard of in the Old Country, and that land of sports men has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—*Boston Paper.*

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is water-proofed by a new patent process. The seams and pocket corners are securely fastened, and nothing neglected to render the suit perfect in every respect.

THE PRICE HAS BEEN FIXED AT \$13, TO INCLUDE HAT OR DOUBLE VISOURED CAP, DETACHABLE HAVELOCK, COAT, VEST, AND PANTALOONS.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skillfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

PERSONS ORDERING FROM A DISTANCE NEED SEND ONLY THE FOLLOWING TO BE SURE OF A PERFECT FIT: BREAST MEASURE, WAIST MEASURE, INSIDE SEAM COAT SLEEVE, INSIDE SEAM PANTALOONS; MENTION HEIGHT AND WEIGHT.

G. W. SIMMONS & SON,
"OAK HALL," BOSTON, MASS.

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of Waterproof Shooting Suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp at Philadelphia Centennial Exhibition. It has crown gray in service, but is good for use yet. This suit is known as the 'Boston Shooting Suit,' in contradistinction no doubt, from the garments which are manufactured out west and at Washington, each of which has a local demand of its own. It is said that the western prairie fowl can distinguish any sportsman who visits their domain by his clothes. They can tell him 'by the cut of his jib,' and the old educated birds (which no one cares to eat, by the way,) know exactly what distances to keep from the rail shooters, the brant men, and the chicken-killers respectively, to be safe. They have 'got them all down fine.' This used not to be so before the waterproof shooting suits were invented. Bostonians, Hoosiers and Buckeyes all stood the same chance then. But now it is—with a sarill pipe to leeward by the old-weather cock—'here comes a Simmons; cheese it!' or, 'Ere's a 'Enning—lie low!' or, 'Look out for Holbird! Scatter! you beggars, scatter!'—FOREST AND STREAM]

WILD GOOSE

—AND—

BRANT SHOOTING

Begin this month. The Shooting Outfit which is now recognized as the best in the country, is that known as the "Boston Shooting Suit," waterproofed and made only by **G. W. SIMMONS & SON, Oak Hall, Boston.** Sold by dealers in Sportsmen's Goods generally throughout the country. Price complete \$13.

Our new Patent Decoy is light and compact (one dozen occupying but little space), so that a sportsman can conveniently carry a case of large-sized birds in his carpet-bag.

WIND-PROOF**Leather Vest and Jackets, Flannel-Lined.**

(Made and sold only by Messrs. G. W. SIMMONS & Co., OAK HALL, BOSTON.) are considered the most sensible protectors ever devised for winter wear. They are especially adapted to the requirements of sporting men, whose rapid walking is likely to be followed by frequent halts in the cold wind. Price, Vest \$7; Jacket \$9. Measurements required are Waist, Breast and Inside Seam of Sleeve. Mention Height and Weight.

LADIES' LEATHER VESTS AND JACKETS made to order. Indispensable to all who are in any way exposed to the weather.

G. W. Simmons & Son,
32 to 38 North St., Oak Hall,
Boston, Mass.

McBride Flies,

The Standard Flies for American Waters

These flies are imitations of American insects, or combination of colors, that an experience of forty years has proved most successful. Parties supplied with casting lines and artificial flies for Pennsylvania trout streams, Adirondacks, the Maine Woods, Lake Superior, Thousand Islands, Canadian, and other waters. Anglers not acquainted with the nomenclature of these flies, by mentioning the locality where they intend fishing, will have the varieties best suited to those waters sent to them. Flies copied from any natural insect or pattern desired. **SARA J. McBRIDE**, (Successor to John McBride) Mumford, Monroe county, N. Y.

HURST'S**Stereoscopic Studies**

OF

Natural History

FOR OBJECT TEACHING IN SCHOOLS

And

PARLOR ENTERTAINMENT.

We are prepared to furnish the first sixty numbers of
the first series of

Animals and Birds of North America.

To these will be added a second series of foreign
specimens, and various animals and birds in grotesque
attitudes, never, however, violating their natural in-
stincts.

We offer these views, not as pictures only, but as
studies from nature. One of the great moving ele-
ments in our modern system of education is object
teaching. The unerring fidelity of the stereoscope
transfers the animals and birds from their natural
habitat to the rooms of the student and the fireside
of our homes, where they cannot fail to have a last-
ing impression of the form, color, habits, and local-
ity of each specimen.

An experience of more than twenty-five years as
Taxidermist of the New York State Cabinet of Nat-
ural History, and in gathering his large collection of
native and foreign specimens, enables Mr. Hurst to
combine in every view the locality of the specimen,
with its appropriate rocks, woods, or water, and col-
oring from the originals.

CORNELL UNIVERSITY,

ITHACA, March 14th, 1870.

I must congratulate you upon your great success in
his new educational enterprise. If we can arrange
our amusements so as to make them impart instruc-
tion to the mind, it will be a step in advance in edu-
cation. EZRA CORNELL.

THE

American Naturalist;

A POPULAR ILLUSTRATED MONTH-
LY MAGAZINE OF NATURAL

HISTORY AND TRAVEL.

Announcement for 1877.

This journal of popular Natural Science will con-
tinue to be published by Messrs. H. O. HOUGHTON &
Co., Riverside Press, Cambridge, Mass., under the
editorial management of Dr. A. S. PACKARD, Jr.,
with the assistance of eminent men of science.

Since January, 1876, the amount of matter given in
each number has been increased over former volumes.
The typographical dress and illustrations which have
heretofore given character to this magazine have been
improved, and it is of a thoroughly popular nature, so
as to interest the general reader as well as well as
the young naturalist. It will continue to be a journal
of science-education and for the use of science-teach-
ers.

Its Features for 1877.

In 1876 the latter half of the magazine was entirely
remodeled, and a department of GEOGRAPHY AND
TRAVEL added. The department of BOTANY will
be edited as formerly by Prof. G. L. Goodale, of
Harvard University. That of MICROSCOPY will be
edited as heretofore by Dr. R. H. Ward, Troy, N. Y.
Arrangements have been made to report the
PROCEEDINGS OF SCIENTIFIC SOCIETIES with
great promptness. A digest of the CONTENTS OF
FOREIGN SCIENTIFIC JOURNALS AND TRANS-
ACTIONS will also be given each month, together
with the LATEST HOME AND FOREIGN SCIENTIFIC
NEWS.

The attention of publishers and teachers is called
to critical notices of scientific books, to which especial
attention will be given.

Articles for Vol. xi., 1877.

By Professors Asa Gray, J. D. Whitney, N. S.
Shaler, W. G. Farlow, G. L. Goodale, of Harvard
University; Professors O. C. Marsh, A. E. Verrill, of
Yale College; Mr. A. Agassiz, Hon. Lewis H. Morgan,
Col. Theodore Lyman, Mr. L. F. Pourtales, Mr. S.
H. Scudder; Professors E. D. Cope, F. V. Hayden,
A. Hyatt; Drs. Elliott Coues, W. H. Dall, C. C. Ab-
bott, Rev. S. Lockwood, J. A. Allen, H. Gillman, C.
C. Parry, R. E. C. Stearns, O. T. Mason, and other
leading naturalists, are either in hand or promised.
Notes from abroad will occasionally be contributed
by Mr. Alfred W. Bennett, the distinguished English
botanist.

TERMS: 35 cents a number; \$4.00 a year, postage
free. Bound volumes, \$5.00; vols. I.-X., \$40.00;
unbound \$30.00. Back numbers supplied.

Remittances by mail should be sent by money-
order, draft on New York or Boston, or registered
letter, to H. O. HOUGHTON & Co., Riverside Press,
Cambridge, Mass.

H. O. HOUGHTON & CO., cor. Beacon and
Somerset Sts., Boston.

Gunpowder.**The Hazard Powder Co.,**

MANUFACTURERS OF

Gunpowder.**Hazard's "Electric" Powder.**

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of
strength and cleanliness. Packed in square canis-
ters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) 3 (coarse). In 1 lb. canisters and 3 1/2 lb.
kegs. A fine grain, quick and clean, for upland and
prairie shooting. Well adapted to short gun.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters
and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very
clean, shooting remarkably close, and with great
penetration. For field, forest and water shooting
it ranks any other brand, and it is equally service-
able for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25
12 1/2, and 6 1/2 lbs. and cans of 5 lbs. FFG is also
packed in 1 and 1/2 lb. canisters. Burns strong and
moist. The FFG and FFG are favorite brands
for ordinary sporting, and the "Sea Shooting" FG
is the standard Rifle powder of the country.

SUPERIOR MINING AND BLASTING POWDER.

GOVERNMENT CANNON AND MUSKET POW-
DER; ALSO SPECIAL GRADES FOR EXPORT
OF ANY REQUIRED GRAIN OR PROOF MAN-
UFACTURED TO ORDER.

The above can be had of dealers, or of the Compa-
ny's agents in every prominent city, or wholesale at
our office

88 Wall Street, New York.

GUNPOWDER.**Dupont's**

SPORTING, SHIPPING AND MINING

POWDER.**DUPONT'S GUNPOWDER MILLS**

(ESTABLISHED IN 1801),

Have maintained their great reputation for 75 years
Manufacture the Celebrated

EAGLE DUCKING, EAGLE RIFLE, AND DIA-

MOND GRAIN POWDER.

The most Popular Powder in Use. Also,

Sporting, Mining, Shipping and Blast-

ing Powder

Of all kinds and descriptions.

For sale in all parts of the country. Represented
by

F. L. Kneeland,

Feb 10-1y

70 Wall Street, New York.

Orange Sporting Powder.**ORANGE LIGHTNING POWDER,**

The strongest and cleanest Powder made. Nos.
to 7, packed only in sealed 1 lb. canisters. The coarsest
sizes (higher numbers) especially are recommended
to owners of fine breech-loading guns, giving great
penetration with very slight recoil.

ORANGE DUCKING POWDER,

For water fowl. Very strong and clean. Nos. 1 to
5. Packed in metal kegs of 6 1/2 lbs. each, and in canis-
ters of 1 and 5 lbs.

ORANGE RIFLE POWDER,

The best for rifles and for all ordinary purposes.
Sizes F.g. FFG, FFGg, the last being the finest.
Packed in wood and metal kegs of 25 lbs., 12 1/2
and 6 1/2 lbs., and in canisters of 1 lb. and 1/2 lb.

All of the above give high velocities and less residu-
um than any other brands made.

BLASTING, MINING, AND SHIPPING POW-
DER OF ALL GRADES AND SIZES PACKED IN
WOOD OR METAL KEGS OF 25 LBS.

SAFETY FUSE AND ELECTRICAL BLASTING
APPARATUS.

LAFLIN & RAND POWDER Co.,

26 Murray St., N. Y.

FOREST AND STREAM

Devoted To
Out-door Recreation and Study.

GAME PROTECTION, FISH CULTURE, NATURAL HISTORY, PRESERVATION OF FORESTS, RIFLE PRACTICE, YACHTING, BOATING,
THE KENNEL, AND SPORTS OF ALL KINDS.

Terms, Four Dollars a Year.
Ten Cents a Copy.

NEW YORK, THURSDAY, DECEMBER 7, 1876.

Volume 7, Number 18.
17 Chatham St. (City Hall Sq.)

For Forest and Stream.
TO P. C. B.

MY Boyhood's friend, where'er thou art,
O'er many a mile of sea and land,
Accept this greeting of the heart
I may not offer with the hand.

A Southern sun beats hot and strong
With you to-day on Texan plains;
With me the dead leaves drive along
On blasts of cold November rains.

Our schoolboy days are past and gone,
I would not wish them here,
'Twas little gain to lose the charm
That makes them doubly dear:

The charm that distance ever throws
O'er all familiar scenes,
That lends each pleasure brighter glows,
And every sorrow screens.

The future vast before us lies,
Replete with hopes and fears,
Pray with me that its triumphs be
The record of its years.

So Northern rain and Southern sun
The same portent may bring,
And each may end how'er begun
In fullness of the spring.

—W. S. A.

For Forest and Stream.

A Lonely Night in Mosquito Pass.

I HAD left one of the divisions of the United States Geological Survey at Montgomery that Tuesday morning, the 11th day of August, to go through South Park and across to the Arkansas at Trout creek, intending myself first to ascend Mt. Lincoln and thence to go through Mosquito Pass to Granite, on the Arkansas, and follow the river down until I overtook the party some where about Poncho Pass—all included in the heart of that most mountainous of our States, Colorado.

Mt. Lincoln is the pivot upon which all the lines of elevation in this region would revolve if they should take a "walk 'round." Speaking precisely, it is the beginning of the Blue River Mountains, extending from it to Mt. Powell, which, viewed from the middle Park side at least, is the most "mountainous" of all the mountains I have seen. The whole range is ragged and inaccessible in the extreme and of a deep blue tint whether seen one or one hundred miles away. The peaks are isolated by great gulfs and are all bare and ragged and bleak, save the long thin locks of snow blown back from their ancient foreheads. While we were passing in sight of them, the changing scenery they presented was of singular grandeur; snow storms drifted through, banks of clouds filled their gorges, rain came from them and scudded across the intervening valley to dash itself in our faces, their pinnacles swam one moment in sunlit haze, and stood out the next, sharp and cold against a steel-gray winter sky.

Although reaching an altitude of about 14,300 feet, and thus towering not a little over its neighbors, Mt. Lincoln is easy of ascent—so easy that a carriage road has been made even to the summit, where, under the shelter of the very brow of this monarch of mountains seams of gold and silver, and take them as one would pluck the jewels from the crown of a dead emperor. Standing on the highest pinnacle, after a severe struggle across snow banks and slopes of lightning riven, stony debris, the effort made ten times more hard by the difficulty with which I filled my lungs with this rare air, my eyes took in at a glance, enough territory for a dozen German principalities, and the transcendent purity of the atmosphere plainly revealed outlines a hundred miles away. South Park was but a play-ground at my feet. Pike's Peak seemed so near that by inclining my ear I might hear its thunders, while Long's was nodding familiarly to it from where it and the black heights about Grand Lake were bravely holding up the opposite side of the sky. Westward the Mount of the Holy Cross lifted high its revered symbol, southward Harvard and Yale, and Princeton, stood in Indian file, and beyond, the Buffalo Peaks were stooping to drink at their plentiful springs. The Blues were a broken chaotic mass at my feet—Silverheels looking like the farther abutment of some celestial bridge which might span the miles of width and depth between us—and all around me

were gray old fellows manfully withstanding the meteoric forces which slowly but surely were leveling their haughty heads. The far away horizon ragged with mountain crests; the nearer heights whose terrific countenances had grimly smiled at me as I gazed upward from the sunny valley, but now frowned at me with awful severity; representing my invasion of their solitudes; the solid billows which seemed to surge up toward me on every hand; the absolute serenity and quiet, amounting almost to suspense, as though the universe held its breath; impressed me more than I care to tell. I thought of Thoreau's lines:—

"With frontier strength ye stand your ground,
With grand content ye circle round,
Tumultuous silence for all sound."

Tumultuous silence—that's it! His theme was only "Monadnock and the Peterboro hills;" but the idea was so great that this congress of mountain monarchs was not too large to fill it.

I got down from Mt. Lincoln about noon. The descent was by the carriage road, winding between it and Mt. Broes, its neighbor, and the coral rocks by the side of the road were full of marmots and skunk-ing conies. (The "little chief hares," *Lagomy princess*) so near the color of the rocks and so shy that one might pass up and squeak between your very feet and you would not see him. Once or twice white ptarmigans strutted away from my path, as tame as chickens. From the limit of timber growth, which begins—or ends—in bushes and dwarf firs, the descent was easy and enchanting. The uppermost trees that were trees had their limbs all on one side, having been nurtured in such fierce steady winds, that every branch and twig and needle stood straight to leeward, reminding me of the famous picture by John Leech of the man caught out in a gale. Below this began a dense forest of gigantic spruces and the like, about whose dank roots innumerable flowers bloomed, yet not such beauties as studded the bleak heights above—the celestial pastures—enlivening the dull plush-like sheep grass and lichenized rocks with their brilliant colors and exquisite tracery. Those fiery scarlet and Prussian blue, royal purple and crimson, golden yellow and silvery flashing gray vied with each other in adorning the frowning summits by their lovely contrasts. Here under the trees the mosses and fungi asserted themselves, and always, where little snow-fed threads of torrents came tumbling down, you might be sure of finding delicate ferns. Half way down I passed through a belt of pines, and then met the aspens which are a constant feature in Rocky mountain landscapes. Just here at the foot I discovered that in truth I had descended "from the sublime to the ridiculous," for I had to turn out of the way to let pass a poor little jackass loaded with gnarled pieces of firewood for the mines, having such a serio-comic expression of weak despair in his long face, that I preserve his picture as my illustration of the much-quoted phrase.

At Alma, a "mushroom city," five miles below, I took dinner at a "first-class hotel," in a log shanty, and enjoyed the meal to my fullest capacity for which I soon had reason to congratulate myself. A bright-eyed little woman with a bright-eyed little terrier at her dilapidated heels, and an abundance of tobacco in her mouth, told me the road after offering congratulations upon the fact that I was "well heeled," referring to my arms—I hold this little woman in grateful remembrance, asking no questions.

Then I tightened anew my horses' reins, pulled my revolver into a little more ready position, and settling in the saddle for a long ride, swung off over the low hills toward the mountains at an easy gallop. It was now between 2 and 3 o'clock, and the Range must be crossed before night, so I went at the best speed possible until the trail became too steep for anything more than walking, when I resigned myself to the enjoyment of the wayside. I was approaching mountains lying in a general northwest and southeast direction, which were really a portion of the great oceanic divide—"the backbone of the continent"—although just here actually separating only the waters of the South Platte from those of the Arkansas. The Pass I was making for led across into the head of California Gulch, down which there was a mere trail to the Arkansas. The sun shone unclouded, the trail wandered about among trees that seemed never to have been any younger, while occasionally a clear space along the hillside, or a little marsh-bottom, would open out, permitting a glimpse of the blue sky and the summits beyond. Flowers were blooming everywhere of the most vivid colors and intricate patterns; restless chipmunks ran and snickered at my approach; chickadees, long-crested blue-jays and western whisky-jacks, (our rare Canada jay) which seem a combination of the other two,

flew about; little fluttering flocks of sparrows sprang up before me, alighted for an instant on the top of a bush and then dived into the protecting foliage. Two or three log cabins were scattered along the road, but only one seemed to be occupied, and its owner was not at home.

Gradually the trees grew less and less, the crags closer together, and finally the trail emerged above the woods, and I found myself in a rather narrow valley fast becoming a rocky gorge, along which flowed a small creek with boggy banks. Here was a tumble-down cabin, of which I knew this bit of history: Several years ago, somebody created a great furor with respect to certain marvellously rich silver lodes said to lie somewhere about here, and two or three of the leading spirits among the men who flocked in, living in this old cabin, took measures to have the various "claims" organized into a "mineral district," from which procedure all would derive certain legal advantages and a greater appearance of importance; so they drew up the papers, but not at once agreeing upon a name, left it blank. It was early summer and certain small, cheerful insects abounded, one of which, at the last moment alighting upon the place left for the name in the document, met his death. The omen was accepted. The insect's body was left to fill the blank, and this region has ever since been known as the "Mosquito District." It was not long, however, before it was discovered that El Dorado was not bounded by this gulch, and the big-booted, red-shirted population chased elsewhere the shining *ignis fatuus* of sudden fortune.

From this point the road wound up upon a bench of rocks from which I was able to study the strange geology of the cañon; yet all the while I had one eye watching for the diverging trail which the little woman had told me I must take, but none appeared and I followed straight on toward the head of the gulch which ended in a great horse-shoe of almost perpendicular cliffs hundreds of feet high, out of which escape seemed impossible. The rocks were gneisses and schists, on my right dipping in the west and following in perfect order around the horse-shoe until on my left, of course, they dipped to the east. Then there were whole mountain-tops of trachyte, brown and green like old bronze; beds of limestone full of crannies and ragged ledges; masses of disintegrated rock, poised on the edge of some great precipice where the jar of a thunder-clap would shake them down.

By this time I had attained the very head of the gulch and had begun to be considerably anxious about that trail, when the road suddenly crossed a hillock, and descended plump into a miner's camp, where it stopped against a vertical face of rock. Clearly this was not the Pass, unless I was a bird or an angel, or some other volatile creature. So I made my presence known vociferously, whereupon a man lifted his head out of a "prospect-hole," like one rising from the dead, and gruffly inquired, "What the devil's the row?" He then proceeded curtly to inform me that the trail I wanted led along the base of an opposite bluff, and returned with feverish haste to his digging. So I rode over there, picking my way gingerly among bogs and sharp rocks, and searched until at last I found a slender pathway, which I followed with infinite pains, where I am devoutly thankful I need not go again, and proved it only a donkey trail to an old mine. I gave up finding any trail there, and turning my jaded horse, pushed back at break-neck pace to reiterate my inquiries. This time there were two men and a dog, and all three giving me to understand that I was a short-sighted idiot, repeated the former direction, adding that "it was rather dim." The dog went with me a little ways, as if to show me, but soon returned to his masters, and I retraced my steps to the bluff. Starting on the theory that there certainly was a trail there, and not a plain one, I soon found it—as I supposed; but precious time had been lost, and already the sun was disappearing behind the mountains, over whose gilded edge I longed to follow. This theoretical trail of mine was not only "rather dim," but "rather" rough; but with a prayer to the Guardian Spirit of horses, I walked ahead leading my animal by his long lariat. The first hundred yards was a smooth, steep incline of rock; the next hundred was a tumult of square blocks of gneiss, each as big as a dry-goods box, and each standing on its corner with a few small pieces to fill up the interstices. How my poor horse ever got over this chaos without breaking his neck and all his legs is a marvel to me yet! Of course I now realized that there really was no trail here, and there was a reasonable expectation of finding no better way back. Still we worked ahead over nearly as bad going till we had climbed five or six hundred feet, and then found ourselves on the serrated

rim of a vast basin scooped out of the side of the mountain. A cold damp wind swept across from the snow-banks on the other side; the heavy twilight was fast condensing into darkness here in the shadow of the mountains; the scream of a far-away hawk, just reached me, and a chilling sense of utter loneliness in the midst of this wild inaccessible desolation struck deep home, and, for an instant almost unnerved me. It was only for an instant though, when, shaking off fears which interfered with the alertness and vigor that alone could aid, I sprang into the saddle again and scanned closely the landmarks and bearings. In so doing I noticed at the eastern edge of the basin a certain depression, and it immediately occurred to me that the miners might have pointed out the wrong bluff, as the one underneath which the trail to the Pass ran, and that it came up over there, as the little woman had told me, instead of where I had attempted to outdo General Putnam. It was a happy thought, and my spirits rose as I spurred my horse across this terrible moor. After five minutes perilous riding I discerned a wavering line running across the landscape. Jumping down I could just make out footprints. It was a trail! and it led straight toward the lofty summit I wanted to cross. It was always rough and always steep. I walked wherever I could save my horse and not lose time, which was the price of my life, and at last was at the top, panting and foot-sore.

Were you ever 13,000 feet above the sea in the Rocky Mountains at sunset? Yes! Then I need not tell you how gloriously burst upon my vision, as I came up out of the gloom, that gorgeous panorama floating in vapory amber. I could better have described, no doubt, I could better have appreciated, all the wondrous beauty of the scene, had I been less weary and hungry, and cold; yet I believe I did jot down in my note book something about the magnificence of color, and turn over a few stones to see if there were any luckless alpine bugs under them, while my faithful friend nibbled the few forlorn bunches of sere grass that had escaped being blown off this high combing, so sharp that you might stand astride of it. If this was really Mosquito Pass, I thought it was a pass not in the sense of a depression through the Range, but merely a place where it was possible to reach the top of precipitous cliffs, and get down again on the other side. I no longer wondered at the dimness of the trail.

But the fading glow of the setting sun and the deepening indigo which was obliterating all but the outlines of the opposite range of mountains, admonished me to hasten. Fifteen hundred feet below I could faintly see great patches of forest, toward which I hurried, glad that my night was to be spent under the shelter of trees rather than on these bleak barrens, where numbing cold would probably lure me into a sleep from which there would be no awakening. I had no ambition to be the hero of a second "Excelsior." The western slope of the mountain was of loose gravel, and so steep that riding down was out of the question; a mountain horse cannot be led beyond a snail's pace, so that much haste was impossible down the zig-zag path, and it was almost dark again when the more gentle grassy slope was reached, and quite so when I struck the spruce timber, and came to a fork in the trail. All you can do in such a case is to let your horse decide for you. Buckskin took to the left and plunged across a little stream through rushes and alder bushes, entirely regardless of the comfort of his rider. Indeed, the whole situation seemed constructed with like disregard, and I am not ashamed to confess that the mercury in my spirit thermometer (if a bull may be excused) was down almost to zero. The cold air from the snowy peaks around settled down like an icy blanket; a chilling breeze swept up the valley and penetrated to my very bones; the bushes which scratched my legs and whipped my face were saturated with recent rain; fallen trees and deep-worn water-gullies obstructed the obscure trail; and it was very dark. Still no signs of mankind appeared, and after many times losing the trail and finding it again, I was at last brought to a stand still in the midst of a patch of burnt stubs, where prostrate and tangled logs effectually barred further progress.

Judging it was now as late as 10 o'clock, it seemed so useless to try to get further, and the hanging head of my all-but exhausted horse pleaded so hard for rest, that I turned back to a little open space and unsaddled; Buckskin thanking me with a great sigh. Securing him by his lariat, I dragged the heavy Ranger saddle to an evergreen, and searched the saddle-bags for matches, for if one is warm, being hungry does not much matter. Alas! there were none! For the first (and last) time during that summer in Colorado I found myself without those little indispensables. I did not really know enough at that time to light a fire with my revolver, and though it did occur to me as a possible expedient, I was a little doubtful as to the prudence of the experiment, lest the report might awaken the unwelcome curiosity of some wandering wolves or cougars, which I knew were not uncommon in that region. (Now, I think, I should make the noise, and certainly the fire to keep them away.) Then I took an inventory of my goods: First there were my saddle and saddle-bags, which contained nothing but useless things—such as a flask, from which all but odor had departed in my struggles on the other side of the "divide," and a pipe, the sight of which was tantalizing—second a pair of woolen socks which I pulled on.

The saddle was my pillow. Its *tientos* held a rubber blanket which, with a thin worn-out saddle-blanket, constituted my bed. I spread my rubber blanket under the sloping roof of the lower branches of an isolated spruce, gathered the other ragged one about my legs, belted my army overcoat tighter about me, and laid down. I was

very weary; my horse's steady crouching was the only disturbing sound, and I soon fell asleep. My nap was not a long one, though the cold was intense, but rearranging my blankets a little better I again slept an hour or two. This time I awoke so thoroughly chilled, that gather myself as closely together as I might, it was no use; I got colder and colder until I shook in every member, and the fatal languor of declining animation began to steal over my senses. I had just moral strength enough left to rouse myself and move slowly around until my torpid blood renewed somewhat the vivacity of its circulation. I went over to my horse: he was standing head down, the picture of cold and lonesome misery. With a low neigh, as I approached, he came to meet me, and followed me with his nose resting on my shoulder as I walked back and forth within the limits of his tether.

What a night it was! I was in a little glade, walled in by a sombre forest of black spruces, except where, on one side, a group of burned trunks stretched aloft their white skeleton arms,—spectres of trees. The grass was white and crisp with frost which crunched under my feet as I paced my beat. Overhead the stars seemed fairly to project from their jetty background like spear-points aimed at my head. I noted the slow wheeling of that platoon of nebulae—the milky way. I studied the constellations but got little comfort; Corona only suggested

"That a sorrow's crown of sorrow is remembering happier things,"

and the Pleiades seemed to beg me to sympathize with their lost sister. At one side a bit of the creek valley was visible, over which the whitish snow-crest of some mountains gleamed faintly. It was profoundly still; the icy water gurgled under the alders; the tall muffled trees swayed stiffly as though their sap was congealed; there was an occasional ringing snap of frost, like fairies clinking glasses, but these sounds were so consonant with the whole scene that they did not disturb the stillness, serving rather to make my mind more sensible of it. There was no particular credit in the fact that I felt no fear, for there was nothing to alarm me, and the apprehension of the previous evening had settled into a certainty where my mind rested calmly. My walking warmed me, and giving myself up to imaginative thought I really came to enjoy the novelty of the experience, and to receive with serene delight the sweet influences of the night. Thus quieting myself, fatigue and drowsiness gradually weighted my eyelids, till, scarcely feeling what I did, I again laid my head on the saddle and did not awake until the blue ridges were grandly and sharply outlined against a glowing background of auroral light.

I was much refreshed, and throwing off my blanket, which was frozen as stiff as sheet-iron, saddled and pushed on. That I had got so far the night before was surprising, for I could hardly follow the unused trail by daylight. But the stage-road, which after a while appeared, was the end of all my difficulties, and a few miles further down I took breakfast at Oro City, whence I pursued my journey, riding 40 miles before night.

Thus ended my night in Mosquito Pass, the remembrance of which is probably more agreeable to the traveler himself than likely to prove interesting when narrated.

ERNEST INGERSOLL.

A DEER CHASE ON THE OTTAWA.

EDITOR FOREST AND STREAM:—

ON Saturday morning, September the 30th, I and my friend C. left here on the steamer Peerless for Thurso. Our baggage consisted of a well filled provision bag, a pair of blankets each, a can of powder, 40 pounds of shot, two shot guns, two small axes, our tent, and a bark canoe. We arrived at Thurso at 12 o'clock, got into the canoe and ran for an island down the river, where we landed and pitched the tent. On Monday we started out and saw a good many ducks, very wild; there were also a good many cranes. In the afternoon we crossed over to the main land and found a good swamp, with some ducks, which we did not get a chance to fire at. Tuesday till Thursday it rained so that we had to stay under canvas. On Thursday morning we woke up about six, and I started to make the fire. C. came out of the tent just as I had it ready for the match, and happening to glance over his shoulder said: "Wat, there's a deer on the island."

I jumped to my feet and looked over, and saw the deer just disappearing behind a clump of bushes. Seizing my gun I rushed out to the sand bar, and there was the deer half way across the river making for the main land. Running back, I called for C. to come, for we must chase it in the canoe. Back he came, and snatching the lightest axe and one knife as he passed the tent, put them in the canoe, which we ran down to the beach. The waves were running pretty high and we had to go in the trough, but we did not mind that, but paddled our best after the deer. We headed it off about twenty-five yards from shore. I took my gun, which was loaded with shot, and, taking aim, fired, but the water we had shipped had wet the charge so it did not go off. Bending down in the bow C. then fired over my shoulder with better luck, for the shot struck him behind the left ear; but the shot being fine they did not do much damage. So, after him we went again, our only resource being the axe and knife. We headed him off from shore again and ran up alongside of him, when I rose up in the bow with the axe and aimed a blow at its head; but he dodged and it took effect in his right shoulder, going in so deep that I was unable to pull it out, and so had to let it go. He soon shook it out, however, and it disappeared in the water. But that cut told

on him, for his stroke commenced to get weaker, so we ran him right up shore till his feet touched bottom, then C. sprang out of the stern and alighted astride of his back, and catching him by the ears, drew his knife across his throat, cutting the windpipe right through. I ran the canoe on shore, and we both pulled him out of the water. He was in splendid condition, and so were we, as we had not a dry tack on us. The water we had shipped in the canoe was about four inches deep from bow to stern. We then carried the deer to camp, lighted a fire, dried our clothes, and got breakfast, after which we skinned and quartered the deer and made preparations for starting the next morning for home. We had to make two loads up to Thurso as the deer weighed 250 pounds. At last we got on board the steamer and reached home about 8 p. m., all safe, but very cold, and so ended our first hunt. W.

For Forest and Stream.

BOB AND THE BEAR.

A PANORAMA of forest and cloud, with sparkling lakes distant and near, and ahead of us, waving in the crisp afternoon breeze a flag; we have nearly reached our camp, and the D. L. Club-House is ready to receive us. And who are we? Why, there are three of us Club fellows, and one guest, and the familiarity bred of camp life has long ago given them short nick-names born of circumstances, and held to with that persistence often appertaining to trifles. "Old Bob" and "Old Smudge" are jolly good fellows, always laboring under the impression that they can give odds to the "Doctor" and "St. Louis" at "Seven up," or kindred games, and laboring honestly and severely at other tasks, yet brimming with excuse and explanation. "St. Louis," of wide experience in western sports, but seeking the new in eastern waters.

So here we are, for a week of September sport, on the edge of the wilderness, yet with the comfort of civilization. In one camp the conveniences and comforts. At the landing at Duck lake are birches, which are to convey us to our pleasures. And what a scene we have before us! The forest, old and primeval, stretching in rounded billows as far as eye can reach, the maples just commencing to turn, and enlivening with their crimson coloring the sombreness born of the foliage of the spruce. At distant intervals the towering pine, the remnant of the noble tree long since cut, hauled and floated with toilsome effort down the water courses to the mills, and thence for the needs of civilized and destructive man. The waters are low, and the water-grasses in places form a green lining to our lake. The white sand beaches, and the rocks blackened and weather-worn offer agreeable contrast. Here and there protruding rocks, even in mid-lake, offering to the imagination recesses for the hiding of fish, and convenient footing-place for the fly fisherman. The cry of the loon echoes from the surrounding shores; the piping of birds, and the chatter of the squirrel, greet our ears in a pleasing harmony of sound, and unconsciously we become part of that untamed nature about us; our very wantonness of song and merry rejoinder seems but part and parcel of the wood notes. We may emulate the cries of the children of the wood, but neither as harsh as the scolding jay, nor as resonant as the loud-voiced loon, our feeble attempts seem but fitting to the quietness of the sylvan and watery scene, and as harmonious to the distant ear as our several canoes are to the eye. The canoe, the most graceful and wildest boat which floats, and one which is always redolent of fragrant birch wood, and pleasant memoirs of sports of the past. We are fishermen—true disciples of old Isaac—lovers of the rod and reel, of woodland, lake, and the social amenities which come of good success and good companionship. We love the haunts of the speckled trout, and delight much in the streams of Rangely; we are familiar with moose head; we speak slightly of the Adirondacks; we of the cream will take, and what precedes is but skim milk. We, therefore, haven't chosen the land locked salmon for our love, and in this quiet place, unknown to the cockney fisherman, we have builded our camp, and here we recreate, and are satisfied.

In a morning up we rise,
'Ere Aurora's peeping;
Drink a cup to wash our eyes,
Leave the sluggard sleeping.

Then for breakfast; and such an appetite. We eat, a looker-on would suppose, for the whole week, and then we start for our birches. In our hands the rod; in our rear are guides with net, bundles and lunch. "Old Bob" takes the lead always, while "Old Smudge" usually brings up the rear. We meet the lake all smiling with ripples; or, as was once the case, like a mirror.

The wide lake, edged with sand and grass,
Was burnished to a floor of glass,
Painted with shadows, green and proud,
Of the tree, and of the cloud.

Smudge sighed for a wind; St. Louis wanted a west wind. Old Bob said, or would have said, if he had thought of it:—

When the wind is south,
It blows your bait into a fish's mouth,

while the "Doctor," who usually takes the world as it goes, professed himself lazy enough to be satisfied with things as they were.

So the four birches started on the lake, and the flies were unconcernedly allowed to drop into the water, while the canoes progressed like a boy on his way to school. A start, and an exclamation of delight, a burring of the reel, and the Doctor's rod bends, and at the end of the line, flip, flip—a fish of two pounds and over out of water. He soon tires of this and is slowly reeled home, but a second

and a third burst brings music from the reel; but slowly and surely he nears his end, and soon raised in the net, pants his life away, his silvery sides heaving in the sunlight. And so the day wore on; now one, then another, and still again more, while about us could be seen the swirl, and heard the swash of the feeding hundreds. It was in the midst of this excitement that the Doctor heard a sound coming from the forest, as of a bear rending a log or stump, and left the fish to see whether "his majesty" could be seen. So his canoe was paddled quietly from the fish, and when curiosity was satisfied, but no bruin seen, it was dinner time, and all hands rendezvoused at the Point and filled the inner man. The afternoon passed agreeably, and the descending sun shone aslant on a happy four. How many fish did you catch? Ah! this is our business; we do not propose to admit the public into the secrets of Duck Lake Camp.

Bear! well, yes; why not end off our trip by getting one. It was a good idea. We knew where was a hound, and we knew that a bear might be found, so it was decided. We took a drink on it—of milk, of course—and turned in. The morrow came in, all too soon, but Old Bob could never let well enough alone, and insisted upon disturbing the camp by building a fire. We could stand this disturbance if the old sinner hadn't done worse. He clicked the glasses and uncorked a bottle. We could not see him thus injure himself without remonstrance, and so out we turned to remonstrate, and so we all hands remonstrated each in his peculiar way. Of course, after such a wakening, we were up for good, and so, in due course, we found our way to the lake, and the dog and our man were put ashore. Soon the canoe separated, and "Old Bob" made tracks for a distant fishing ground.

Soon "Chief," a young Indian all eyes for game, said "bear," and Old Bob turning saw bruin composedly sitting on the beach surveying. So not to be outdone in politeness, off comes Bob's hat, and "Good morning, old fellow, you're my meat," cheerfully rings out. Bruin, feeling modest probably at such a situation from a stranger, turns back into the foliage. "What me do?" says "Chief." But for "Smudge" and the dog as quick as the Lord will let you, says Bob. The canoe flies, Smudge is reached, the dog recalled from his beat, and embarking, all hands proceed to the islands whereon Mr. Bear was left. With but two guns—one a shot gun—was given to Bob, and he makes for the point of the island where both shores can be seen. Smudge and the dog, and his guide carrying the rifle, land and follow the track. The bear is seen and chased, but the guide cannot get a certain sight and refrains from shooting, while Smudge keeps "locked-step," for being without fire-arms, he is not as much of a bear hunter as he at first supposed, and preferred to watch the guide rather than to leave for his canoe, for he knew the bear was making for the beach. Soon a halloo from Bob. The bear has taken to the water. Hoop! hoop! hurrah! He has half a mile the start of the canoe, but Chief huddles the paddle as only an Indian can, and quickly the distance lessens, and the bear is headed back to where he first took water. "Shoot! why don't you shoot," implores Chief. Imperturbable Bob thinks it will save work to let bear do his own swimming, so he lays down his gun, and takes up his flies. The first cast the fly hooks in bruin's nose, but is shook out with an angry "swish"; other casts fix in the hair, and bruin frequently turns toward the birch. But the Indian is quick, and easily avoids him, and thus the procession goes on, the bear heading his own funeral, and working hard for the pleasure of his following. When shoal water is reached, Bob fires. The three buckshot penetrated behind the ear, and without a struggle the animal dies. Bob takes hold of the ears, and he is dragged ashore. His skin, now in the hands of a taxidermist, will decorate Duck Lake Camp.

So thus we tapered off our fishing, and as we passed homeward, the skin in a meal bag, and smelling strongly of bear, we felt the heroes that we were. For had we not met the savage denizen of the wilds, and "slew" him? He had no chance; we had all, so we all shot him. Yes, all! The Doctor loaded the shells, or aided in the operation. Smudge owned the gun, Old Bob shot, and St. Louis looked on. Happy hearts! Unfortunately, the majority of our heads are so well polished, that the bears grease will be of no avail. Would that we were younger, and were nursing a mustache! Just think! How could—how did we ever succeed in life without this experience? We are heroes—all of us, but especially "Bob." He knows it, and rests under it like a man. He says it was not much of a day for bears either.

May we keep our camp safe from discovery from all but good fellows. May we ever be true sportsmen, and not only obey the laws of the land, but even those higher laws which correct the desire to do well, with the desire of telling of it, in a modest way to the world, is the desire of one at least of the D. L. C's.

DEATH OF OLD TEJUNGA*.

I've hunted here with old Tejunga and hope beyond the eternal river to camp with him again. In the mountains, at the head of the river wearing his name, the old chief's body and weapons are lying, but his life went out as the moon came up, changing the evening into night, and changing the shadows under the pines which had darkened and deepened as the sun went down. A sweet, warm wind came out of the east, moaned in the pines a

*Tejunga means "Great Grizzly Bear."

moment or two, then, lightly laden with the old man's breath, flew out into the night on its way to the West, where his people had gone before. His head drooped on his quiet breast, one hand fell open from a nerveless knee, his white hair drifted into my eyes as I laid the dead at the foot of the rock from which we had seen his last sun go down. He believed that his dead beyond the West watched for his coming with the dying sun, and thought that after a night with death he'd rise like a sun, in good hunting ground. The night was bright till the sea fog came to hang a pall on that mountain top and shroud the dead from the moon and stars. I thought that death, like the fog, had come between my friend and me; that the stars still shone in the sky above, only I couldn't see; that the night would pass, and in daylight how thin that fog would be.

Fish Culture.

CALIFORNIA FISH CULTURE.

EDITOR FOREST AND STREAM:—

I enclose a statement of the results of our work in California this summer. We will observe that we had extraordinary success in the transportation of the common eggs. There was not a failure with a single lot, and there was hardly an instance of a loss of over three per cent.

Very truly yours, LIVINGSTON STONE.

TABLE OF SALMON EGGS DISTRIBUTION FROM THE UNITED STATES SALMON BREEDING STATION IN CALIFORNIA DURING THE SEASON OF 1876.

Date of Shipment	Consignee.	No. of eggs.	Condition on arrival as reported by the parties. Condition on receiving the eggs.
Sept. 21.	Prof. Baird, Centennial Grounds, Philadelphia, Pa.	5,000	Fair.
Sept. 21.	State Hatching House, Madison, Wisconsin.	100,000	Came nicely.
"	Dr. W. A. Pratt, Elgin, Illinois.	150,000	Not heard from.
"	A. P. Rockwood, Salt Lake City, Utah.	50,000	Nine tenths of one per cent. loss.
"	Lewis C. Starkel, Belleville, Illinois.	100,000	In excellent order.
"	T. N. Clark, Northville, Mich.	500,000	Two and one-quarter per cent. dead.
"	Pack Thomas, Louisville, Ky.	200,000	Two and three-quarter per cent. dead.
"	T. B. Ferguson, Baltimore, Md.	1,000,000	Better condition than last year.
"	Dr. R. O. Sweeney, St. Paul, Minn.	300,000	In fine condition.
"	E. M. Lees, Westport, Conn.	500,000	Less than two per cent. dead.
"	James Duffy, Marietta, Pennsylvania.	400,000	In fine condition; very slight loss.
"	E. B. Brackett, Winchester, Mass.	200,000	In good condition.
"	S. P. Thompson, Newhope, Bucks County, Pa.	100,000	Splendid order—less than two per cent. loss.
"	M. S. Hodger, Knoxville, Tenn.	100,000	Less than one per cent. loss.
"	S. Wilnot, Ontario, Canada.	10,000	Not heard from.
"	New York Aquarium, Thirty-fifth st. and Broadway, N. Y.	50,000	Fair condition.
"	Boston Aquarium, 13 West st., Boston, Mass.	10,000	Arrived in the best condition.
"	Prof. Baird, Centennial Grounds, Philadelphia, Pa.	10,000	In good order.
Sept. 27.	Sportsman's Club, San Francisco, Cal.	300,000	In fine order.
Oct. 2.	W. H. Cushman, Georgetown, Cal.	300,000	Not heard from.
Oct. 8.	A. W. Bush, Honolulu, Sandwich Island.	30,000	"
"	Dr. James Hector, Wellington, New Zealand.	80,000	"
"	Province of Napier, New Zealand.	80,000	"
"	Province of Auckland, New Zealand.	80,000	"
"	Province of Canterbury, New Zealand.	80,000	"
"	Province of Maryanna, New Zealand.	80,000	"
"	New York Aquarium, New York.	40,000	Splendid order.
"	S. B. Ferguson, Baltimore, Maryland.	210,000	Not heard from.

For Forest and Stream.

SALMON CULTURE IN CANADA.

The successful breeding of salmon in Canada being no longer a matter of doubt, and large sums of money being yearly expended in protecting and increasing this valuable and important branch of our fisheries, it appears to me that something more is wanted to secure still greater benefits.

Under the present system the young fry are removed from their nursery to the rivers, when only six weeks old, and are consequently too small to escape the voracity of their numerous enemies. Many thousands are doubtless devoured by the legions of trout, which abound in all our rivers, and on their arrival at the mouth of each estuary another formidable enemy presents itself to bar the passage to the sea—smelts—which are also abundant. They have, no doubt, many other enemies, but the two above named are, I believe, the most formidable. If the young fish were protected for a year, they would then be large and strong, and able to elude their foes.

If my views are correct, and I believe they are, why not establish breeding ponds on streams on which there are no trout, and there are plenty such in which to deposit the young fry until the following year and then distribute them. There are many streams that I could name, where, by the erection of dams, a depth of twenty to thirty feet of water could be obtained, and in many localities several smaller dams could be erected, creating a series of ponds above the main one. If the freezing of the ponds is likely to be injurious, let the ice be broken daily, and thus give air holes. Could not the dams at the breeding establishments be utilized for this purpose?

A few thousand dollars devoted to some such experiment would, I think, be a wise expenditure, and in the event of failure, these ponds could be advantageously employed for other fish culture. Could not bass, so extensively bred in the United States, be profitably raised here?

I do not pretend, by any means, to be Sir Oracle in such matters, but my suggestions may possibly have a beneficial tendency. The old French proverb, "That fools make fashions, and wise men follow them," may apply in this case. I do not know how far my remarks are applicable to the plan adopted in the United States, but I shall be much obliged to any of the many correspondents or readers of FOREST AND STREAM, versed in such matters, if they will kindly publish their experience and correct my errors.

In years past, the wholesale destruction of salmon by the Indians has been such that they had all but exterminated the species in the Gaspé rivers. The late Dr. La Billois, of Maquasha Point, at the mouth of the Restigouche, once told me, that when he first came to the country, salmon were so plentiful that six or seven schooners were loaded with pickled salmon every season for the Halifax market. This

gentleman was an army surgeon under the first Napoleon, and accompanied the grand army in the Russian campaign, being one of those who had the good fortune to survive the dreadful horrors of the retreat from Moscow, and came to Canada after Napoleon's banishment to Elba. In 1851 I remember going to see the Messrs. Boiss-onault, who have a fishing establishment at the mouth of the main Bonaventure river. During my visit, two Indians came down the river with a canoe-load of salmon roes, having, according to their own account, speared no less than eighty-five fish in the spawning pools for the sake of the roes. The work of extermination was also carried on by the pale faces, but in a different manner; they took nets up the rivers and swept the pools clean, not a fish escaping.

Perce, November 20th, 1876.

PHILIP VIBERT.

COMMISSIONERS' REPORTS.—State Fish Commissioners have sadly neglected us this year by not sending their annual reports. Gentlemen: If you wish to have the most use made of the valuable information you furnish, let us see your reports that we may make our customary abstracts. We devote more attention and space to FISH CULTURE than all other publications in this country together. The matter we have printed within the past four years would, if collected, make a duodecimo volume of 750 pages. This we have ascertained by actual measurement, and upon this base our assertion as to the extent and importance of our work.

WHITE FISH FOR ENGLAND.—A large quantity of white fish eggs from the Government fish-breeding establishment at Sandwich, Ontario, have been sent to England for the purpose of introducing white fish into the waters of Great Britain.

—The salmon ova in the hatching house on the northwest Miramichi, has passed through its first danger—the fall freshet—safely, and is in promising condition. W. H. Venning, Esq., Inspector, has just returned from a visit to the establishment, and we are glad he is enabled to report so favorably.—*St. Lawrence Advance, Chatham, N. B., Canada, Nov. 30th.*

SALMON IN MARYLAND WATERS.—Major Ferguson, fish commissioner, after the successful hatching, at Druid Hill Park, of one million of salmon eggs brought from the St. Cloud River, in Oregon, has commenced the distribution of the small fish in the waters of the State of Maryland. He commenced on the 6th of November, and up to the 22d instant he had distributed 364,000 as follows: 30,000 in the Gunpowder, near Parkton; 25,000 in Owings' creek, a branch of the Monocacy, near Mechanicstown, Western Maryland railroad; 10,000 in the North branch of the Patapsco, at Tank station; 15,000 in Pike creek, near Wakefield, Western Maryland railroad; 3,000 in Deer creek, near the Pennsylvania line; 43,000 in the Patuxent, at Savage station, Baltimore and Ohio railroad; 48,000 in the Patapsco river, at Sykesville; 58,000 in the north fork of the Patuxent, near Mount Airy; 42,000 in Little Gunpowder, east of Moncton; 13,000 in the North Branch of the Patapsco, at Tank station; 37,000 in the Antietam, near Chewsville, and 40,000 in the Conococheague, west of Hagerstown. Since the 22d instant 200,000 of the small fish have been distributed at various points in the waters of the Eastern Shore of Maryland. The fish are carried in large tin cans to the different points, and are deposited in the rivers by the fish commissioner and his assistants. A number of cans were shipped last night by the Baltimore and Ohio railroad.—*Baltimore Sun 28th.*

HOW TO CATCH BEAVERS.—We know of scarce any animal possessing more instinct than the beaver. A very small pond they dam up in such a way as to render approach to their habitations almost impossible. A house is constructed of rafts laid across a main beam and covered with bushes and turf. It is divided into two compartments, one for the animal to dry itself in after coming out of the pond, and another to cat and sleep in. It is entered through a passage way communicating with the outer edge of the pond (but in such a way as not to admit of water entering the house) and about midway between the surface and the bottom. On the least indication of danger, he leaves his house by this subterranean passage, and does not rise to the surface till far beyond the reach of danger on the other side of the pond. The only plan, therefore, is to cut a number of stakes, drive them closely together in the bottom of the pond and close to the bank; then take the roof off the house, and in some part of the passage way, the family, which consists of three or four, may be found. In this way a man from Nackawick, got four a few days ago.—*St. John (N. B.) Telegraph.*

MUCH SOUGHT, BUT HARD TO FIND.—The Golden Fleas and the Philosophers Tone.

Natural History.

ADDRESS OF A. R. WALLACE BEFORE THE BRITISH ASSOCIATION

ON SOME RELATIONS OF LIVING THINGS TO THEIR ENVIRONMENT.

Continued.

I HAVE now to ask your attention to a few remarks on the peculiar relations of plants and insects as exhibited in these islands. Ever since Mr. Darwin showed the immense importance of insects in the fertilization of flowers, great attention has been paid to the subject, and the relation of these two very different classes of natural objects has been found to be more universal and more complete than could have been anticipated. Whole genera and families of plants have been so modified as first to attract, and then to be fertilized by certain groups of insects, and this special adaptation seems in many cases to have determined the more or less wide range of the plants in question. It is also known that some species of plants can be fertilized only by particular species of insects, and the absence of these from any locality would necessarily prevent the continued existence of plants in that area. Here, I believe, will be found the clue to much of the peculiarity of the floras of oceanic islands, since the methods by which they have been stocked with plants and insects will be often quite different. Many seeds are no doubt carried by oceanic currents, others probably by aquatic birds. Mr. H. A. Moseley informs me that the albatrosses, gulls, puffins, tropic birds and many others, nest inland, often amidst dense vegetation, and he believes they often carry seeds attached to their feathers from island to island for great distances. In the tropics they often meet on the mountains far inland, and may thus aid in the distribution even of mountain plants. Insects, on the other hand, are mostly conveyed by aerial currents, especially by violent gales; and it may thus often happen that totally unrelated plants and insects may be brought together, in which case the former must often perish for want of suitable insects to fertilize them. This will, I think, account for the strangely fragmentary nature of these insular floras, and the great distances that often exist between those which are situated in the same ocean, as well as for the preponderance of certain orders and genera. In Mr. Pickering's valuable work on the Geographical Distribution of Animals and Plants he gives a list of no less than sixty-six natural orders of plants unexpectedly absent from Tahiti, or which occur in many of the surrounding islands, some being abundant in other islands, as the Labiatae at the Sandwich Islands. In these latter islands the flora is much richer, yet a large number of families which abound in other parts of Polynesia are totally wanting. Now, much of the poverty and exceptional distribution of the plants of these islands is probably due to the great scarcity of flower-frequenting insects. Lepidoptera (butterflies) and Hymenoptera (bees, etc.) are exceedingly scarce in the eastern islands of the Pacific, and it is almost certain that many plants which require these insects for their fertilization have been thereby prevented from establishing themselves. In the western islands, such as the Fijis, several species of butterflies occur in tolerable abundance, and no doubt some flower-haunting Hymenoptera accompany them, and in these islands the flora appears to be much more varied, and especially to be characterized by a much greater variety of showy flowers, as may be seen by examining the plates of Dr. Seeman's "Flora Vitiensis."

Darwin and Pickering both speak of the great preponderance of ferns at Tahiti, and Mr. Mosely, who spent several days in the interior of the island, informs me that "at an elevation of from 2,000 to 3,000 feet the dense vegetation is composed almost entirely of ferns. A tree fern (*Alsophila tahitensis*) forms a sort of forest to the exclusion of almost every other tree, and, with huge plants of the other ferns, (*Angiopteris erecta* and *Asplenium nidus*) forms the main mass of the vegetation." And he adds "I have nowhere seen ferns in so great proportionate abundance." This unusual proportion of ferns is a general feature of insular as compared with continental floras, but it has, I believe, been generally attributed to favorable conditions, especially to equable climate and perennial moisture. In this respect, however, Tahiti can hardly differ greatly from many other islands, which yet have no such vast preponderance of ferns. This is a question which cannot be decided by mere lists of species, since it is probable that in Tahiti they are less numerous than in some other islands where they form a far less conspicuous feature in the vegetation. The island most comparable with Tahiti in that respect is Juan Fernandez. Mr. Mosely writes to me: "In a general view of any wide stretch of densely clothed mountainous surface of the islands, the ferns, both tree-ferns and the unstemmed forms, are seen at once to compose a very large proportion of the mass of foliage." As to the insects of Juan Fernandez, Mr. Edwyn C. Reed, who made two visits and spent several weeks there, has kindly furnished me with some exact information. Of butterflies there is only one, and that one—a Chilean species, and probably an accidental straggler. Four species of moths of moderate size were observed—all Chilean—and a few larvae and pupae. Of bees there were none, except one very minute species; and of other Hymenoptera a single specimen of *Ophion luteus*, a cosmopolitan ichneumon. About twenty species of flies were observed, and these formed the most prominent features of the entomology of the island.

Now as far as we know, this extreme entomological poverty agrees closely with that of Tahiti; and there are probably no other portions of the globe equally favored in soil and climate, and with an equally luxuriant vegetation, where insect life is so scantily developed. It is curious to find that these two islands also agree in the wonderful preponderance of ferns over the flowering plants, in individuals even more than in species, and there is no difficulty in connecting the two facts. The excessive minuteness and great abundance of fern-spores causes them to be far more easily distributed by winds than the seeds of flowering plants, and they are thus always ready to occupy any vacant places in suitable localities, and to compete with the less vigorous flowering plants. But where insects are so scarce, all plants which require insect fertilization, whether constantly to enable them to produce seed at all, or occasionally to keep up their constitutional vigor by crossing, must be at a very great disadvantage; and thus the scanty flora which oceanic islands must always possess, peopled as they usually are by waifs and strays from other lands, is rendered still more scanty by the weeding out of all such as depend largely on insect fertilization for their full development. It seems probable, therefore, that the preponderance of ferns in islands (considered in mass of individuals, rather than in number of species) is largely due to the absence of competing phenogamous plants, and that this is in great part due to the scarcity of insects. In other oceanic islands, such as New Zealand and the Galapagos, where ferns, although tolerably abundant, form no such predominant feature in the vegetation, but where the scarcity of flower-haunting insects is almost equally marked, we find a great preponderance of small green or otherwise inconspicuous flowers, indicating that only such plants have been enabled to flourish there as are independent of insect fertilization. In the Galapagos, which are perhaps even more deficient in flying insects than Juan Fernandez, this is so striking a feature that Mr. Darwin speaks of the vegetation as consisting in great part of "wretched looking weeds," and states that "it was some time before he discovered that almost every plant was in flower at the time of his visit." He also says that he "did not see one beautiful flower in the islands." It appears, however, that Composite, Leguminosae, Rubiaceae and Solanaceae, form a large proportion of the flowering plants, and as these are orders which usually require insect fertilization, we must suppose either that they have become modified so as to be self-fertilized, or that they are fertilized by the visits of the minute Diptera and Hymenoptera, which are the only insects recorded from these islands.

[To be continued.]

MORE ABOUT THE BARNACLE GOOSE.

In our issue of November 23d, in answer to a query from the west, we commented upon the Barnacle Goose referred to in the following note, stating that it was probably the *Branta leucopsis*. If this conjecture be correct, the fact is most interesting, as the bird is known to have been taken but twice before on this continent. The first specimen is in the Museum of the Smithsonian Institution (See Am. Nat. II., p. 49), and the second was for a time at least the property of Mr. E. Wade, Jr. (Am. Nat. V., p. 10). It is perhaps the one referred to below.

Further particulars in reference to the capture of the present individual are given in the following letter, which we have received from Mr. Kendall, dated:—

NEW YORK, November 18th.

EDITOR FOREST AND STREAM:—

In your issue of October 26th (I think), you published an account of a Barnacle goose, which I discovered hanging up in Schedler's restaurant, in Church street, and which can be seen at Conway's, in Carmine street. I have since seen the parties who sold it to Mr. Schedler, and they report that it was bought by them from a Long Island farmer, who said it was shot by a boy. Unfortunately they never saw the farmer before, nor have they seen him since, so I can trace it no further at present. There is but one specimen in the Museum at Central Park among the birds of North America, and that one was shot at Currituck, and I am told is perhaps the only authenticated instance of one being killed in this country previous to this. Several gentlemen have called on me in relation to this bird, and as much interest has been manifested, I would again ask through your columns for further information from any of your readers who may have met with it.

J. R. KENDALL.

BIRDS OF LOWER MICHIGAN.

BY A. B. COVERT, OF ANN ARBOR.

(Concluded from Page 164.)

The following list has been sent us by Mr. Covert, the species included in it, having been overlooked in the preparation of his interesting catalogue of the Birds of Lower Michigan. The publication of this and other lists of a like character, cannot fail to be of value to ornithologists at large, and the great number of interesting facts contained in them speaks volumes for the painstaking energy of the authors. As remarked in a previous number of this Journal, we hope before long to be enabled to lay before our readers the results of further investigations into the animal life of Lower Michigan by the same careful observer:—

Anorthura troglodytes. Winter wren. Common in spring and fall migrations.

Dendroica tigrina. Cape May warbler. Very rare; one specimen taken May 12th, 1876.

Vireo philadelphicus. Brotherly-love vireo. Common in migrations. One nest taken June 2d, 1873.

Aegithus linarius. Red-poll linnet. Quite common in winter.

Var. Ezilipes. American mealy red-poll. Not common, and always found with the preceding.

Chrysomitris pinus. Pine linnet. Sometimes common in winter.

Chaulelasmus streperus. Gadwall or grey duck. Not common.

Mareca americana. American widgeon. Very common in migrations.

Podiceps cristatus. Crested grebe. An occasional specimen taken.

Podiceps griseigena. Red-necked grebe. Quite common in the fall.

THE PIPE FISH.—The New York Aquarium has a Pipe fish that is attracting a great deal of attention from its rare and curious habitation. We do not refer to the common Pipe fish, the *Syngnathus peckianus* of Storer, but to the common little hermit crab, a specimen of which was recently captured by Mr. Fred Mather while dredging for specimens in Long Island Sound for the Aquarium, and which, instead of inhabiting the shell of a periwinkle, snail, or covering of some other mollusk, was found occupying the bowl of a common clay pipe.

We believe this is the first instance on record of a pipe being used as a house, instead of its original object as a cremator of the fragrant "Vanity Fair."

—Snowy owls have been captured in Norfolk, Va., within a week. We have known of their being taken in South Carolina, which is a pretty warm latitude for fur caps.

—Mr. T. C. Egan of Halifax, Nova Scotia, has been awarded a special medal by the judges of the Philadelphia Centennial Exhibition, for his collection of specimens of taxidermy.

LOCAL NOMENCLATURE.

ITHACA, N. Y., Nov. 12th.

EDITOR FOREST AND STREAM:—

Being interested in the list of local names of birds, waterfowl, etc., of Plymouth Bay, Mass., given last week in FOREST AND STREAM, many of which names were quite different from those which I had known, I send the names of the same class of birds for the Connecticut shore, along which I have shot for a number of years, hoping that it may prove of interest to other gunners.

ROBERT T. MORRIS.

Anas obscura. Black duck; dusky duck.

Fulix marila. Scaup; big black-head; blue-bill; broad-bill.

Fulix affinis. Little black-head; scaup; blue-bill; broad-bill.

Pelionetta perspicillata. Surf duck; skunk-head.

Pelionetta perspicillata. Female and young of the year; gray coot.

Melanetta velutina. White wing; bell tongue.

Oidemia americana. Scoter; butter bill.

Somateria mollissima. Eider; sea coot.

Bucephala americana. Golden eye; whistler.

Bucephala albeola. Buffel head; butter ball.

Harelda glacialis. Old squaw; south southerly; old wife; long tail.

Spatula clypeata. shoveller; spoonbill.

Mergus merganser, *Mergus serrator*. Sheldrake; saw bill; merganser.

Colymbus torquatus, *Colymbus arcticus*, *Colymbus septentrionalis*. Loon.

Podiceps. All varieties. Devil diver.

Graculus carbo. Cormorant. shag.

Sterna. All varieties. Mackerel gull.

Larus marinus. Black-backed gull.

Larus. All other varieties. Gull. (Young) grey gull.

For Forest and Stream.

FISH HAWKS AND EAGLES.

On the southeast coast of Florida, owing perhaps to the abundance of fish and the scanty population, the Osprey or Fish Hawk is very abundant, and his tyrant, the White Headed Eagle, is equally so. Of the late species, I have observed six or eight in sight at one time, on the lower part of Spruce creek, where it joins the Halifax river in a wide estuary. Here may at any time be witnessed, that scene so vividly described by Wilson, the ornithologist, which a person might never see in a life time in the northern States, where eagles are scarce and shy—I mean the robbery of the honest and painstaking Osprey by the predatory eagle. Scarcely can the former get his prey from the water, when the scream of the eagle is heard in pursuit. A stern-chase is proverbially a long chase, but the great power of wing of the eagle generally prevails, and the poor fisherman loses his fish.

Once, fishing on the Halifax, I caught a sea cat of three or four pounds weight. It was killed in recovering the hook, and having plenty of better fish I threw it overboard, and it floated up the river into the tide. An Osprey saw and seized it; as he flew away, he was pursued and robbed by an eagle, who was watching for booty from a pine tree top. This robber in turn was attacked by another eagle, who forced him to drop the fish, which he carried away out of sight into the woods, so that the cat fish passed through the hands of at least four captors before it was eaten.

S. C. C.

A MUSICAL PARROT.—Noticing your article upon a musical dog in last issue, brings to mind a short story recently told me by a lady whose word may be relied upon. Some years ago, a Miss Burr, of this city, had a parrot which would perch upon the piano and render the air of "Home Sweet Home," in a remarkable manner, the lady playing the accompaniment. I also once owned a dog that would "howl" very loud and steady if a person sang any tune near him, and there is a large dog belonging to a neighbor of mine that takes no notice of the bells ringing for church on Sundays, but when they ring for fire and the bell in the engine house joins in, will bark incessantly.

"TEAL."

ENGLISH SPARROWS IN MINNESOTA.

MINNEAPOLIS, Minn., Nov. 26th.

EDITOR OF FOREST AND STREAM:—

Since the English House Sparrow (*Passer domesticus*) was introduced into America, it has been gradually spreading over the country, and we have now to report it as in Minnesota. A flock of ten or twelve individuals has taken up its abode in the business portion of this city. I first noticed them on October 19th of the present year, and have since seen them frequently. Whether they came here of their own accord, or were imported by some enterprising citizen, I cannot say. They seem to have a particular fancy for the surroundings of a certain dwelling house, but the man living there says that he did not introduce them. I look forward with considerable interest to see how they will stand the winter in this locality. If the mercury falls to 80 degrees below zero, as it occasionally does here, it will probably be a new experience in their lives.

BOB.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDENS DEC. 2.—

One alligator (*A. mississippiensis*), presented by Samuel F. Keely, Roxborough, Pa.; one horned toad (*Phryno. oma cornuta*), presented by Wm. N. Farnous, Philadelphia; one black spider monkey (*Ateles ater*), presented by Robert Kevin, Philadelphia; one bald eagle (*Haliaeetus leucocephalus*), and one snowy owl (*Nyctea nivea*), purchased; one loon (*Colymbus storquatus*), presented; one common gannet (*Lula bassana*), presented by W. H. Zern, Atlantic City, N. J. ARTHUR E. BROWN, General Superintendent.

Woodland, Farm and Garden.

FERNERIES.

FERNS are plants which give little trouble to grow, and yet they are seldom found in the parlor or sitting-room. For those who do not possess a large Fernery, there can be no more interesting or pleasing occupation than attending to and watching the growth of these in their miniature house. Wardian cases can be purchased at a reasonable figure, and plain cases are just as suitable as those that are more ornamental and costly. Where there is room a large-sized case is more desirable, as larger growing ferns can be used, more variety introduced, and a few small suspended baskets used to great advantage. As regards cultivation, the first thing to be considered is drainage, for if this is defective neither flowers nor any other plants can be successfully cultivated. Probably the best method is to have a false zinc bottom to the fernery, with a little tap fixed in one corner of it, so that the surplus water that drains from the upper perforated zinc bottom may be drawn off without any danger of spoiling the carpet. For large ferneries free ventilation is also desirable, and the plants will thrive much better if the upper portion of the case is left open, more especially in the middle of the day. A fence of rock work looks well in the center, and when planted tastefully, adds much to the charm of such a fernery. For soil, ferns being impatient of manure, a mixture of good turfy loam, peat leaf mould (well decayed) and sand is most desirable, always trying to have the soil free and porous, as ferns, of all plants, delight in plenty of water, a free soil and good drainage. If the case is large it might be advisable to have an arch from end to end, on which could be trained two plants of the Japanese Climbing Fern (*Lygodium scandens*); from the center of the arch a tiny basket of Maiden Hair Fern, or some neat growing fern, could be suspended. In planting the ferns care should be taken to plant the dark green varieties next the light—in fact to produce light and shade—and not to plant them as they come to hand. The same remarks apply to the smaller round ferneries, care being taken when they are first planted to remove any decaying leaves at once, and to give them all the light possible without, of course, placing them in the strong sunlight. For suitable varieties the following can be recommended, and can be had of almost any florist: *Pteris serrulata*, *P. cretica alba lineata*, *P. hastata*, *P. tremula* and other Brakes, *Adiantum* or Maiden's Hair Fern, almost any variety; *Aspidium carvotoides*, and *A. falcatum*; the various Lycopods and Selaginellas, and in fact anything of the Fern family except the Golden and Silver Gynogrammas and Notholaenas, will thrive admirably. The latter are too impatient of moisture on the ponds to be of any service.

W. J. D.

ROMAN HYACINTHS.—We see quite a number of the beautiful Roman Hyacinths in the florist's windows already, and do not remember to have seen them so soon in market. Its lovely congener, the Lily of the Valley, will soon be had also, and with a few Marie Louise violets and Bon Selene roses, what bunch of flowers could be sweeter or more attractive?

THE DARK NEAPOLITAN VIOLET—MARIE LOUISE.—This variety has much larger flowers than the common Neapolitan violet, and as a bouquet violet is much superior to it. It also possesses a rich dark violet color peculiarly its own and is a decided acquisition.

A USEFUL LESSON.—The theory of "winter-killing" of vegetation is imperfectly understood, and even among those who have paid more or less attention to the science of the subject there seems to be diversity of opinion. A close observance of facts bearing on the matter will convey many a useful hint in regard to protection, not necessarily from extreme cold, but from the combined influence of a low temperature and excessive dryness both in the air and soil. We may lay it down as a reasonable hypothesis that

more trees and plants are fatally injured during the winter by a severe drouth than by extreme cold, and this we are aware is the especial point upon which the doctors differ. Many of our readers have unpleasant recollection of that fatal winter a few years since, when all kinds of vegetation suffered so severely without regard to previous record of hardness; when such iron-clad trees as the Norway spruce, Scotch pine, and American arbor vitae were either killed outright or irreparably damaged. The mercury did not mark a low average nor did it fall in most localities to an unusually low degree, and yet the damage caused by the combined action of the elements was more severe on vegetation than that of any winter on record.

The facts of the case were these: Little or no rain fell for several weeks, the ground was dry and dusty all winter long, there was no snow to act as a mulch, and then when the "cold snaps" did appear the moisture contained in the plants was evaporated and the tissues injured beyond redemption. In but few instances did the plants show at once how badly they were affected, but as the mild days of early spring exerted an influence upon vegetation, stimulating the growth, then on every hand, appeared the conspicuous evidences of the destructive winter. The cone-bearing evergreens first told the tale of disaster by a gradual change from the usual tint of green to a brownish tinge. The deciduous trees and shrubs that had fallen under the ban quickly began to shrivel, the bark in many instances standing in ridges along the younger shoots, and the herbaceous perennials had the appearance of being dried up entirely. Such was the fearful record, and to guard against the possibility of even a comparatively similar winter we should use such precautions as suggest themselves to every careful orchardist and gardener.

What strikes us as of paramount importance, is to retain the moisture in the soil and to guard against the strong drying winds. There is no mystery in the case, and nothing but what may be partially guarded against by adopting the simplest plans known to horticulturists. A thorough mulching over the surface of the soil, and any slight barrier placed around the plant will, in most cases, prove highly beneficial, not unfrequently to the extent of saving its life. It is time to cease talking about certain species as not hardy because they have suffered from the winter, as the situations and surroundings cast an influence for good or evil upon particular plants whose constitutions are adapted to our climate when a few precautions are taken to preserve them. There are many species, however, that will not survive, no matter where set or how much care is exercised in their behalf, and these constitute the class which enthusiasts are endeavoring to "acclimate." It would be as well, perhaps, if we had no such word in our vocabulary, so far as arboriculture is concerned, for a tender tree or plant cannot be made to change its nature more than the leopard its spots. The whole question will naturally resolve itself into this shape: those who dislike trouble will plant only the few species which are positively known to be hardy, while a few will continue to test those of doubtful character.—N. Y. Tribune.

A HORSE'S COUNTENANCE.—In conformity with the uniform condition of the Creator's works, it will be found that there is a direct relation between the development and shape of the horse's forehead and his disposition and qualities. A head that is narrow between the eyes, and narrow on the side of the jaw, is disagreeable to the eye of every judge. However ornamental it may be to the human face, a Roman nose certainly does not improve the appearance of the horse. The line of beauty in the one case is very different from the other. A dish-faced horse is admired on all hands, but a pug-nosed man, with a projecting, up-turned chin, will have some difficulty in carrying off the prize for beauty. The face must be very broad between the eyes, but it should taper a little as it approaches the ears. If the breadth is carried all the way upwards, the top of the head will be too wide, the ears ill set, and the horse probably sulky.

As in the human being, so in the horse, a great deal of the expression of the countenance depends on the eye. It is a most marvelous index to the working of the mind within. A glance at it will often reveal the benevolent feeling, the sulky disposition, or the vicious propensity that is about to manifest itself. The reason of all this must be obvious, when we remember that it is in direct communication with the brain—the material instrument through which the mind operates. The eye of the horse should be kindly, strong, bold, and fiery, yet gentle-looking. It should not show much white, as that often indicates a vicious disposition. A horse that is looking back so far as to expose the white of his eye, is generally on the alert for mischief, and is not to be trusted with his heels. The absolute size of the eye is said to be nearly the same in all full-size horses; but its apparent size differs greatly in different cases. This difference is owing chiefly to its forward or backward position in the socket, together with the thinness and openness of the eyelids. The eye gives a strong indication both of the temper and temperament of the animal; and it is easy to judge from it whether activity or sluggishness prevails most.

PLANT GROWING IN GLAZED POTS.—It is generally believed that plants succeed best in pots which are most porous. Mr. Thompson, gardener at Drumlanrig Castle, Scotland, (the Duke of Buccleugh's) entertains, however, a different opinion. More than half the orchids, stove plants, ferns, and even hard-wooded plants grown there, are in pots which are thickly glazed from top to bottom, and the growth of one and all is wonderfully fine. The five foliage plants are indeed marvels of health and bright color, and many of the orchids are unequalled in the country. Mr. Thompson informed me that, as the other plants which are in common clay pots require shifting, he intends substituting glazed ones. The latter never become green or dirty-looking, and all they require to renew their original gloss, when soiled in any way, is a rub with a sponge or rough cloth.—J. Muir in "The Garden," London.

KEEPING APPLES.—It is worth while to try experiments now in keeping apples, as they are easily performed, and the results may prove valuable. We have found by long repeated experiment, that apples stored in an out-house opening north till nearly the first of December, will keep several weeks, and sometimes even months, longer than if taken at once to the cellar as soon as picked from the trees. They are kept cool through the last half of autumn. Much may be gained as well as learned, by keeping one or more thermometers in the fruit room, and swinging the

windows open wide enough to bring the temperature nearly down to freezing at all times. At the same time, the exclusion of air-currents is an important assistance. One hundred apples, wrapped merely in tissue paper, kept longer for this reason than a hundred exposed. Hence, also, the great advantage of packing in dry sawdust or in pulverized plaster. The temperature is thus kept more uniform, and the fruit may be placed in a colder room without danger of freezing. Wrapping each specimen in thin paper first would be useful. Where dry sawdust is easily obtained, it is well worth trying, either in open barrels or boxes. It is the exclusion of air that keeps apples better in barrels, and this would be one of the best modes, if the first decaying specimens could be seen and removed before tainting all the rest.

—Speaking of sheep now arriving at New York, the American Agriculturist says: "A marked improvement is noticeable in the quality of sheep which come to the market. Whole flocks of sheep, which will average over 100 lbs. may now be seen in pens in place of poor animals weighing but 60 to 70 lbs. This is the effect of the rapid introduction of pure bred sheep of the different varieties, but chiefly of Cotswold. In good time the American mutton will be equal to that of England; it is nearly so now in weight of carcass, and will be so in quality and flavor of the meat, if farmers will raise roots upon which to feed their sheep. One acre of turnips or mangels is equal to ten of grass for fodder, and when fed with straw, and helped out with a little bran or oil cakes, roots are certainly the cheapest food that can be produced.

CHINESE BIG TREES.—China has its big trees as well as California. About thirty miles from Nikko, an avenue of sugi, or cedar trees, begins, and, with an occasional break where there is a village, it reaches the whole distance to the shrines of Lycias—he longest avenue of shade in the world. These great trees are from five to seven feet in diameter at the base, and tower without a branch for fifty or eighty feet, and then lift their heads forty or fifty feet higher. They resemble the giants of the Yosemite. The trunks are faultlessly straight and the bark is deeply veined. There are about 30,000 trees on this avenue, and all of them were planted after the foundation of the shrine, about 250 years ago.

DANIEL IN SEARCH OF A DOG.

[Fill the fifteen blanks with the names of as many varieties of dogs.]

There was a man whose name was Daniel.

1. He had a very handsome —.
 2. He thought he'd change it for a better;
 3. So he bought, instead, a splendid —;
 4. Though soon he sold it for a farrier,
 5. And tried to buy a well-trained —;
 6. But found the salesman a deceiver,
 7. And took instead a black —;
 8. And then, to make him all the merrier,
 9. He purchased a most lively —;
 10. Then stepped aside and bought an eagle,
 11. Yet fancied he should like a —,
 12. Which undesirable he found,
 13. So changed it for a young —;
 14. Then saw upon a crimson rug
 15. What he declared "a lovely —."
- He wished to own it when his eye
Fell on a little dog from —;
But as he whistled "Yankee Doodle,"
Up sprang a very clever —;
While close beside him there did stand
A huge black-coated —;
And yet to purchase it was folly;
He'd rather have a faithful —;
Or, thought to get one might be hard,
He'd like to have a — — — — —
Just then a man like an Albanian
Led by a snowy — — — — —
But how the little creature snarled!
'Tis snappish as a small — — — — —
So many dogs did quite confuse,
And Daniel found it hard to choose,
And quite impossible to find
One that was suited to his mind;
Some were too large and some too small,
And so he'd have no dog at all.

FEEDING PUPPIES.

FROM one of our correspondents, Mr. T. D. G., of Louisville, Ky., we have the following inquiry:—"Please give me your opinion as to the feeding of puppies. I have a brace, and my friend says they should have all the meat they can eat; that meat is far better than any other food. I contend that corn-bread and soup boiled together for small puppies is better. He also states that puppies should be pushed in their growth while small."

In answer let us say that no animal can be expected to attain his full size and form unless he has a full supply of wholesome food. Only those breeders who have given the matter close attention can realize how much food a healthy, growing puppy will consume, consequently very many puppies are stunted in their growth for want of a sufficient quantity of the proper kind of nourishment.

Some bitches will supply ample nourishment for nine or ten puppies until they are four or five weeks old. Others have very little milk, and cannot sustain more than four or five for but a short time. Our course has been to watch closely what the bitch is doing for her progeny, and to supply the deficiency if it is required. Even when the bitch appears to have an ample supply of milk to keep the pups in good condition it is decidedly better to commence feeding the litter with other food when they are, say about four weeks old, in order to avoid the sudden change of food when they are taken from the mother; and about the best food to give them is sweet cow's milk with the addition of a little scalding hot water; and then, after a few days, add to this some well-cooked corn meal or oat meal, and then, when the puppies get to be seven or eight weeks old, give

them some beef or mutton soup with mush and milk, and after they get to be four or five months old the scraps from the table—meat, bones, bread, vegetables, gravy, etc., constitutes excellent food for growing puppies, and, also, for dogs after they are fully grown, provided they get enough of it to keep them in proper condition. One of the most important matters in rearing puppies in order that they may be kept in proper form is that they should be frequently fed, and be given about as much food as they will cleanly eat. If puppies are only fed, say twice a day, they become almost famished for food, and eat so ravenously that they become "pot-bellied" and out of shape, and frequently out of health, consequently they should be fed when first taken from the bitch (until they are two or three months old), not less than five times a day, and by all means late in the evening and early in the morning. After they get to be over three months old three times a day will answer.

Grown dogs do not require feeding more than twice a day, and we have found from long experience that dogs properly fed once a day, in the evening, can be kept in first rate condition for the field.

In regard to raising pups wholly upon animal food we can say that, having repeatedly tried the experiment, we have found it by no means the proper course to pursue. Youngsters thus fed will, if not overtaken by disease, grow to be an unreasonable and undesirable size, and then, having become habituated to eat meat only, it is difficult to induce them to eat sufficient vegetable food to keep them in proper condition for work. All growing pups and grown hunting dogs require more or less meat with their food, but in the case of the former it is better that it should be in the form of broth mixed with their mush.

RED IRISH SETTERS.—In our kennel column of advertisements will be found that of Mr. C. Z. Miley, of Lancaster, Pa., offering for stud purposes the services of the recent addition to his kennel in the purchase from Horace Smith, our Field Editor, the red setter Buck, one of two braces of deep red Irish setters exported by J. C. Cooper, of Cooper Hall, Limerick, Ireland, for exhibition at the late Centennial Bench Show at Philadelphia, where they not only were awarded medals, but were very highly commended for breeding, size, form and color. After these dogs were exhibited at the Centennial show they were sent to the St. Louis Bench Show, where they were awarded first and second prizes. Mr. Miley has secured, through same source, the bitch Floss which took the second prize, although she was out of form, being heavy with pup at the time. Mr. Miley also purchased with Buck and Floss three of her puppies by Buck.

Buck, Joe, Rock and Floss, the two brace alluded to, are, in our opinion, and in the judgment of several of the best judges of such dogs we know of, quite equal, if not superior, in size and color to any yet imported to this country. Rock and Joe belong to the "Squire" and Mr. A. L. Phillips. The latter is now shooting over them in Illinois, where they are said to be doing wonderfully well; and Mr. P. being a very skillful breaker will shoot several hundred birds to them before the season ends.

We find that Mr. Miley has fixed the rate of service of Buck at the moderate rate of \$25, and we have no doubt that many of the best breeders in the country will see the importance of breeding to such a splendid specimen of the pure-bred imported deep red Irish setter.

THE BALTIMORE BENCH SHOW.—We have received the programme and premium lists of the Maryland Poultry and Fanciers Association for their Bench Show of Dogs to be held on the 2d, 3rd, 4th, and 5th January, 1877, and the same can be had at this office, or we will forward them when requested. Mr. Lincoln writes us that the Baltimore & Ohio Railroad will carry dogs free, and if the Pennsylvania Railroad will show equal liberality it will be a great inducement to owners at a distance to send their dogs.

Mr. Chas. Lincoln, Superintendent, writes under date of 2d inst., as follows:—

I beg to announce to you, that the Committee have selected for judges Mr. John Davidson, Monroe, Michigan, on sporting dogs; Capt. J. M. Taylor, Bellefonte, Virginia, on non-sporting dogs. The Committee held a meeting last night, when more special prizes were announced, which I give you below. The interest and enthusiasm in Baltimore over the dog show knows no bounds. I had intended to have got the specials all numbered, but just this moment received notice that one gentleman has got a list of half a dozen to hand in; however, we shall get them into shape on Monday, and printed in circular form. The Committee on Railroads, reports that the Baltimore & Ohio Railroad will carry dogs free to and from the show from all stations on their lines. Mr. Malcolm also reports through Charles R. Clement, Esq., General Baggage Agent of the Pennsylvania Central Railroad, that they will carry all dogs free on their road east of Pittsburg.

The following additional special prizes will be given in addition to those already announced:—

Grand prize of \$100, cash, given by the hotels and private subscription, for the best dogs or bitch in the show of any breed.

Dr. J. D. Logan offers \$25 for the best setter dog or bitch exhibited, either imported or native, to be determined by its breeding, form and apparent qualities, denoting excellence.

Messrs. Courtney Brothers & Co., give a case of champagne for the best beagle dog or bitch.

The United States Lounge Company give a camp lounge (combined with pillow and fly net in valise form) for the best Gordon setter puppy, dog or bitch, under twelve months old.

F. O. de Luze, agent for Spratt's dog biscuits, New York,

offers three cases of Spratt's dog biscuits, weight 112 pounds each, one to the best native Irish setter bitch; one to the best native garden setter bitch.

W. H. Holabird, sportsman's clothier, Valparaiso, Indiana, offers a shooting coat, value \$10, for the best Irish setter dog, native or imported, entered by a resident of Maryland. Messrs. May & Farral, grocers, etc., offers a case of champagne, to be given to the best retrieving spaniel (other than pure Irish), dog or bitch.

W. A. Lilly, Esq., offers a handsome dog house, to be given to the best setter or pointer in the show, to be entered and owned by a resident of Baltimore.

Charles F. Bancroft, Esq., offers a handsome parlor pistol for the best Italian greyhound, dog or bitch. In addition to this, H. Brodhead, Esq., has very generously given a handsome silver collar, to be given to the same class.

You will see by the above, we are progressing very favorably, and now rely upon all dog fanciers and breeders to enter and support the show. I beg to again remind your readers of the date of closing the entries, namely: 20th December.

MASTIFFS IN COLORADO.—A correspondent writes us, that two years ago Mr. W. H. Churchill brought from Tasmania a pair of thoroughbred mastiff pups. He took them to his ranch in the South Park, Colorado. Recently the slut "Juno" gave birth to a litter of (14) fourteen pups. This pair of dogs have been the wonder of that part of the country, as the dog "Old Tas" weighs upwards of 150 pounds, and "Juno" 100 pounds. They were presented to Mr. Churchill by Mr. S. S. Travers, a wealthy gentleman of Hobart Town. The father of "Old Tas" cost eighty pounds sterling. True bred mastiffs are becoming rare even in England, and fine specimens always command high prices.

MINKS KILLING PUPPIES.

A correspondent sends us from Port Richmond the following account of the singular killing of puppies by some animal, supposed to be a mink.

"Mr. Louis Rath, who lives on Columbia street, West Brighton, had in one of his kennels, nine foxhound pups belonging to Mr. J. F. Rathen and myself, six of them being only six weeks' old, and only taken from the bitch two days before, but all of them healthy and in good condition. On the morning of the 23d November, when Mr. Rath opened the kennel door to breakfast his little pack, he was greatly astonished to find two of the pups dead and all besmeared with blood. Upon a close examination he found a small hole on the side of the neck, and close to the head on each one, where they had been bitten by their destroyer. A Mr. Houseman, next door neighbour to Mr. Rath, lost a number of chickens the same night; they were bitten in the same manner and left lying on the floor of the house. It is a common occurrence for minks to kill chicken, rats, &c., but I never heard of any dogs being killed by them. Of course, it is only supposition on our part, but if it was not a mink, what was it? Some of your readers may be ready to doubt this statement; to those I would say, call on Mr. Rath and be satisfied.

Yours, &c., C. TRANTOR."

A DOG'S ANTIPATHY TO BURRS.

OTTERVILLE, Ill., November 22.

EDITOR FOREST AND STREAM:—

An incident of a singular nature has occurred to one of my dogs, and I venture to write to ascertain if any other sportsmen have noticed a similar occurrence in their experience. I have a very fine setter now being used the second season in the field. He is small, but finely made and of a very nervous and sensitive disposition. He is white in color, except his two ears, which are dark orange. While hunting with him a few days ago, in crossing a patch of corn in the creek bottom, the dog's fine coat became covered with burrs. He refused to hunt and acted as if he was sick, and I returned home. The next day I crossed this same field, the dog again became covered with burrs, grew sick again, and actually had a spasm or prostration of the nervous system. He recovered in a few moments, to be utterly prostrate again in five minutes after. On his recovery the second time he commenced pulling the burrs from his coat with his teeth, nor did he desist until every burr was removed, and he seemed as well as ever. We have hunted with him since, but away from the burrs, and the dog seems all right.

I have two young pointer dogs just breaking on quail, one of them has a white matter discharge from the eyes, and is thin, notwithstanding a ravenous appetite. Do you think he has worms? If so, what shall I give him?"

Ans. Your dog undoubtedly has worms, areca nut will cure him.

—Mr. S. J. Hughes claims the name of "Artful Dodger" for his red pup by Squire Smith's Monarch, prize winner at Springfield and out of his bitch May, bred by Waddell, of Edua, Knox County, Mo.

Furs and Trapping.

MUSKRAT TRAPPING.

TURNING a deaf ear to the mild protests of the mother of my nephew, I proceeded to initiate the youngster, so far as I can, into the mysteries of muskrat trapping.

This trapping them in the fall is all wrong, but I will tell you how it is done, and then—don't you do it.

Let us take a hatchet, and a few traps like those we set for minks, only they need not be so stiff, and find a burrow in the bank of the brook. Here is one, betrayed by the oily water and the sub-aqueous path leading from the shore to the deeper water of the channel. If the water is not too deep, so that the rat can swim safely over the trap, set it at the mouth of the burrow, the pan about an inch and a half or two inches under water, and thrust your tally-pole pretty firmly into the bottom, as far from shore as your trap-chain will reach, where the water is deep enough to drown the rat. If the burrow opens into deep

water, and you cannot reach up into it far enough to give you water shallow enough, you must carefully uncover the burrow a little back from the shore by chopping out a sod with your hatchet. Here you will find a dry path, in which set your trap, cover it with withered grass or leaves, stick your tally-pole firmly, letting the top of it come up at one side of the opening you made, which you now carefully cover with the sod. When your trap is set in this way, there is no chance for the muskrat to drown, and if you are not at hand, soon after he is caught, you will find nothing but his foot to reward you for your trouble.

There, under that overhanging bank, are some freshly gnawed sedge-roots and a few empty mussel shells, both the work of the muskrat. That is a "feed-bed," and you may set your trap on it, covering lightly with some of the sedge at hand, or, at the side, where the rat comes on to the bed, so that your trap will be under water. Plant your tally-pole in water at least a foot deep. The muskrat will pretty surely get caught the next time he comes there to feed.

The burrows and "feed-beds" are about the only places you will find in which to set your traps along the brook; so, now, we will go to the marshes of the larger stream, where this miniature beaver builds his winter lodge, and finds food, plentier and of greater variety than this narrow brook affords.

The sluggish stream moves with a scarcely perceptible flow between broad marshes, a rank growth of succulent rooted water-plants, arrowhead, pickerel weed, white and yellow water lilies, marsh marigold, sedges, and rushes of many kinds, furnishing a supply of food so endless that, with half a chance for their lives, the muskrats would fairly swarm in these marshes. As it is, in spite of the war waged upon them three-fourths of the year, there are enough left for a young trapper to learn on.

For trapping here, we must have a boat, a sharp, narrow one, of high draught, in which we stow our traps, each with its chain-rod slipped on to its tally stick. You see what all the tally-sticks are: slender sapplings with a fork at the top, and a hook a foot or two from the butt. A trap-hook, our hatchet, or an axe, and a couple of paddles, complete the furniture of our craft, and seating ourselves in her, off we go down the winding channel.

This hay-cock-looking structure of sedges, sticks and mud, set in a nook of the marsh, is an unfinished muskrat "house." Here is material so lately put on that it is not yet dry, and here, or at the least finished part, we might set a trap if this "feed-bed" at one side did not show a surer place. Whichever we choose, we will set our trap under water, cover it slightly, perhaps, and stick our tally in deep water if we can. If we could look inside this house, we should see a sunny little chamber, the passage to and from which is a hole in its floor, leading to the water. If the marsh were frozen, so that the muskrats could only get above the ice in their homes and the corresponding burrows in the bank, we should have to set our trap in this chamber and cover it with a little of the loose material in it, fastening our tally-pole inside, with the upper end sticking up through the top. Of course, to set the trap thus, we must first carefully remove a portion of the wall, which, when all is ready, we as carefully replace. Indians and Kanucks often spear the muskrats in the houses in winter, using a one-tined, strongly barbed spear. They approach the house noiselessly, and drive this spear with a strong, sudden thrust, through the wall into the chamber, sometimes transfixing two or three of the occupants at once.

Continuing our voyage along the stream, we shortly espy a "feed-bed" in the edge of the marsh—a small, raft-like collection of weeds—on which are scattered the crumbs of a recent feast. We set a trap here, and at every house and feed-bed we find, and such are all the available places there are at this season. To enable us to find our traps readily when we come around to them again, we tie a white rag to the top of each tally-pole, or slip a strip of white birch bark in a cleft at the end; or, if we wish a blinder mark, tie a knot in the rushes near by. Many of the muskrats caught now are "kits"—young ones so small as to be almost worthless—hence, as I said in the beginning, trapping them at this season is all wrong.

As I told you, winter trapping is done in the houses. Spring trapping differs considerably from the methods I have described. We shall use the same boat, traps and tally-poles, but a good axe will then be one of the most important parts of our outfit, as you will see, and we shall use a setting-pole more than a paddle to propel our skiff, for these broad marshes—our trapping ground—then, will be covered with water. The lower end of the setting-pole is armed with a crescent-shaped piece of iron, like a very widely spread two-tined pitchfork, to prevent its sinking too deeply into the soft bottom. We will also have a gun on board, for toward nightfall we may get a few shots at the desired furries.

Coasting along the shore, we shall find on certain logs and pieces of drift-wood, "sign" or the excrement of the muskrat. Wherever we find much of it, and that, or most of it, fresh, we may be sure is a good place to set a trap; so with our axe we chop a notch in the log, broad enough for the trap and deep enough, so that, when set, it will be the right depth under water; that is, one to two inches. If the notch shows the fresh wood conspicuously, cover it with a handful of dead weeds dragged up from the bottom with the trap-hook, and set the trap thereon, the tally-pole stuck in the bottom a foot or two away. Sometimes it is handy to fasten the trap by a strip of leather passed through the ring, nailing the ends to the log with a shingle nail.

Clear away all suspicious looking chips from the neighborhood of the traps, and go on in search of another such place, or it may be we shall come next to an almost submerged house, uninhabitable now, but its top a favorite resort as a feeding and trysting place for its old inmates and thus friends. You will need no instruction how to set your trap here, and all the places we shall find will be nearly like this, or the one described just before it. Some trappers put near the trap a drop of musk prepared in alcohol, which they think attracts the animal; others bait their trap with a bit of carrot or sweet apple. Neither will do any harm if it does no good.

As "there are more ways than one to skin a cat," so there are two ways to skin a muskrat. If you wish to stretch the skin on a bow, rip from the chin to between the fore legs, skin out the head, strip out the fore legs as low as furred, then to hind legs, stripping them out the same, and then to tail, cutting off there, where fur ends and scales begin. Trim flesh and fat from the skin, and holding the ends of the bow between your knees, draw the skin on to it, wrong side out, as far as you can. With your knife cut through the skin into the bone, near the ends, making a cleft in it, into which the skin draws. Now serve the other side the same, and your skin is ready to hang up to dry. "Nanny bush," hickory, and the red willows, found in swamps, are good for bows, using the shoots three-eighths of an inch to half an inch thick at the but.

If you prefer to stretch your skins on boards, which it is said makes the most saleable skin, begin at the other end of the rat, ripping from one gambrel to the other, and stripping towards the head. The shape of the board is like an elongated flat-iron. The skin, when drawn on, is fastened with a few tacks. ANANUSOOS.

—Beavers are now said to be plenty on the Blackwater, in Virginia, and trappers who have had their lines in Nottoway county, and vicinity, have gone up there to try their "medicine."

OTTAWA FUR MARKET.—The fur market is unusually dull for this season of the year. Very few skins are being sent in. Trappers are holding their lots in anticipation of advanced rates when winter sets in. The fine open fall was most favorable for trapping, and the furs are of excellent quality. Quotations are very low, and Leipsic and London are not very encouraging. A gentleman writing from Leipsic to a fur dealer in this city, says: "There is no demand for skins of any kind excepting racoon, and I would advise you to be careful in buying, for the London and Leipsic markets are unprecedentedly dull."

The following are the quotations here:—Mink, \$1 to \$2.50; martin, \$1.25 to \$1.50; otter, \$5 to \$7; beaver, \$1.50 to \$1.80; fisher, \$1 to \$7; rats, 12¢; lynx, \$1.25 to \$1.50; bear, \$5 to \$10; fox (red), \$1.25; fox (silver gray), \$20 to \$50; skunk, 50¢; racoon, 60¢.

BOOKS RECEIVED.

THE RIME OF THE ANCIENT MARINER. By S. T. Coleridge. Illustrated by Gustave Dore. New York, Harper & Brothers. This beautiful work, recently issued by the Harper's, forms one of the handsomest volumes which have come to our table. It reaches us as an elegantly bound folio, in the first part of which is Coleridge's poem, the French artist's illustrations following, with the appropriate passage from the poem under each. Everything that taste and skill could do to embellish the volume has been done. It has, in fact, been prepared, to use the well known phrase, "utterly regardless of expense," and is so marvellously cheap at its price—ten dollars—that the manner in which such a venture can be made remunerative is a mystery even to experts in the publishing business. As great a mystery is Coleridge's wonderful Rime. At times we take it to be the foundation of the phrase "with neither rhyme nor reason," that is to say, reason is so entirely distant from rhyme that the two may be employed as opposites. At other times we have regarded it as a mere poetical frenzy. At still others we have hunted for its moral, and offer, though with some diffidence, the two following for the consideration of yachtsmen and boating men generally; firstly, never shoot an albatross; secondly, never employ spirits to quicken the keel. The Ancient of the Rime seems to be a kind of Wandering Jew, and now that Dore has given us his portrait, we can more easily avoid the danger of being held by "his glittering eye."

When Coleridge wrote his poem his aim was to impart a certain amount of human feeling into the supernatural. He succeeded in that, and also in mystifying his readers as to the meaning of his story as a whole. With such an aim and such success it is a wonder that Dore did not turn earlier to his work, and especially to the particular work now under notice, for the exercise of his pencil. No poet could either rise or fall to heights or depths into which Dore could not follow him. Between the poet and the artist there is a singular harmony. Dore excels in the grotesque and terrible. His first characteristic is strength. But having the true artistic instinct he is equally capable of producing a picture of more simple beauty, or of a semi-humorous pathetic character. In Coleridge's supernatural world he appears to be in his native element, and in portraying its beings he robs them of some of their aerial appearance, the error is to be attributed rather to the vividness than the coarseness of his conceptions.

The illustrations of the Rime are as varied as the feelings excited by the poem. In one scene, "The moving moon went up the sky," we have a picture of peacefulness and beauty which contains no suggestion of the agony of the hapless mariner. In a similar vein is that illustration of the lines:—

"So lovely 'twas that God himself
Scarce seemed there to be,"

in which we see the solitary sufferer high up on the shrouds, and the sea beyond.

It is unnecessary to specify further. There are, in all, thirty-eight full-page illustrations. The poem must necessarily be differently interpreted by different minds. Dore has given us his version of it. He nowhere shows hesitation, but giving the rein to an imagination closely akin to that of Coleridge, has boldly given that form to the poet's creation which it assumed in his own mind. His boldness, moreover, never offends. To say that he has succeeded in the work he has undertaken, means more than that he has come very near a realization of our own ideas of the Rime. It implies that he has helped many others, who have regarded the poem as a hopeless mystery, to follow the poet from stage to stage of his fantastic composition.

MAGAZINES.

—The most important article in the current number of the *Sanitarian* is that entitled "Florida as a Health Resort," by Prof. F. D. Seale, A. M., M. D., etc., a Representative from Florida on the Ex-

ecutive Committee of the Centennial Medical Commission. Dr. Leete's long experience in Florida and perfect familiarity with every phase of its climate enables him to handle his subject with perfect success, and his paper will be found of great value to those who contemplate a change from the vigor of our northern winter to the balmy climate of the south. The Doctor ascribes the peculiar climate of Florida when one can be comfortable, even when the thermometer shows 95°, if at rest, to its insular position, with the proximity of the Gulf Stream flowing north and the cold Arctic current flowing south. Being but a comparatively narrow strip of land separating the Atlantic from the Gulf of Mexico, and having numerous small bodies of water distributed over its surface, the prevailing winds always sweeping over water of uniform temperature, modify the heat of summer and the cold of winter. In addition to the full descriptions regarding climate, etc., we are told how to go to Florida, where and when to go, and also who should go.

Lippincott's for December is at hand "and contents noted." We find in it a continuation of "The Century—its Fruits and its Festival," an illustrated article descriptive of the Centennial exhibition. The artist has chosen for his illustration some of the most interesting of the detached exhibits. "Walks and Visits in Wordsworth County" is continued, with sketches of scenery. Jennie J. Young, one of our correspondents, who has lately occupied much space in various papers and periodicals with the discussion of that branch of decorative art known as Cerniaises, has quite an exhaustive article, embellished with numerous illustrations of the exhibits at the Centennial exposition. Miss Young is one of our most diligent students and painstaking writers, and is rapidly earning a position among the foremost of those who devote their time to current literature. Mr. George Macdonald's story, "The Marquis of Lossie," is continued, and promises to equal any of the author's previous efforts. Lady Barker's charming "Letters from South Africa" are continued, and there are several short stories of interest.

The *Eclectic* for December has for a frontispiece a fine engraving of Gen. Joseph R. Haxley, of Connecticut, a gentleman well known at Oreadmoor as an expert with the rifle, and late President of the Centennial Commission. The articles in the *Eclectic* are as usual the best selections from the leading foreign magazines and reviews. Perhaps the most important is a critical review of George Eliot's last work, "Daniel Deronda," from the *Contemporary Review*. Another novelist, Charlotte Brontë, is also reviewed, the "Monograph," as it is called, being from the pen of T. Wemyss Reid, and the pages of Macmillan's Magazine. Two of Professor Proctor's papers are given, one from the *Popular Science Review* on Astronomy in America, and the other on Saturn's Dark Ring from the *Spectator*. A very interesting paper is that from *Blackwood*, "The Two Chancellors, Prince Gortschakoff and Prince Bismarck." The other papers and sketches are from *Chamber's Journal*, *Temple Bar*, *Cornhill*, and other magazines.

The broad band across the title page of *St. Nicholas*, announcing a Christmas number was scarcely necessary, as a first glance at the contents shows that it has been especially and carefully prepared for the holiday season. Miss Lucy Larcom, the gifted poetess, contributes the opening article, entitled "Poems and Carols of Winter," illustrated with appropriate sketches pertaining to the birth of our Saviour. E. Muller has a very funny little sketch descriptive of the woes of poor old Chuck-a-luck, a biddy hen who raised a brood of ducks. "The Horse Hotel" by Mr. Chas. Bernard tells all about our great horse-car stables, where horses by the thousands are cared for. The picture of the "Chambermaid" is particularly good. Mr. Trowbridge's new story, "His Own Master," is commenced, and promises to prove as interesting as others by the same pleasant writer. "The Kingdom of the Greedy" is concluded, and the moral of the story is found to be that greed only leads to misery. The list of contents in *St. Nicholas* is always long and varied, and the children should be well satisfied with all the good things Mrs. Dodge has prepared for their amusement and instruction.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

G. A. S., Toledo, Ohio.—Where is the *Red and Gun* published? Ans. 33 Park Row, New York city.

DAN, Port Dickinson, N. Y.—I am going to Florida, and I want to know the cheapest route from New York to Mellonville. Ans. Steamer to Fernandina direct, fare \$20, and thence river boat to Mellonville, Florida, fare \$9.

TEAL, Salem, Mass.—Has Coca for steadying the nerves the remarkable properties ascribed to it? What is your honest opinion? Ans. This question is answered in our editorial columns this week.

R. Baltimore.—Can you tell me where I can get greenheart wood, first quality for a trout pole? or can I get two pieces, for but and end joint, through you? Ans. You can obtain greenheart from J. B. Crook & Co., No. 59 Fulton street, this city.

GENERAL, N. Y.—What is the best time in which ten miles has been run? Ans. In 1863, at London, L. Bennet, alias "Deerfoot," ran ten miles in 51m. 48s. The same man ran in February of the same year eleven and a half miles in 59m. and 44s.

A. R. STE, Baltimore.—There is a demand for white labor, skilled and unskilled, in all parts of the south, to take the place of the thrifless and indolent. We have written to you and mailed you letters to a friend who will write you, if he sees fit to accept your overtures.

H. G. B., Nashua, N. H.—Can you give me the address of any parties who train or break pups? Should prefer that they should be in New England. I answered the advertisement in your columns from Bridgeport, Conn., but can get no reply. Ans. Franklin Sumner, Blue Hill, Mass., if still at his old place, would be a good trainer for your puppies.

E. C. R., Fishkill, N. Y.—I have a Scotch terrier pup which is afflicted with canker in the ear. Will you be so kind as to advise me as to the best remedy? Ans. Make a solution of sulphate of copper, eight grains to the ounce of water—after washing the ears out thoroughly with Castile soap and warm water pour into them some of the solution, twice a day for two or three days; carefully wash out the ears every day; feed no meat and give the dog exercise.

T. T., New York.—A dispute having arisen with regard to the habits of the canvass-back and red head while feeding on the wild celery beds, will you please decide whether it is the red-head which steals from the canvass-back the roots of the plant after they have been brought to the surface, or *vice versa*. Ans. The canvass-back is a great diver and the red-head and other ducks which feed with him, watch their opportunity when he reaches the surface and seize the celery with which they swim rapidly away and at their leisure.

R. E. S., Newark.—1. I have a fine English breech-loading gun of Cogswell & Harrison make, 10 bore, 32 in., choked at the muzzle. Could I not have two inches taken off, and rechoke without effecting the shooting qualities of the gun? 2. In the same gun I have noticed small spots near the chamber, I have tried almost every thing, including kerosene oil. Could you recommend anything to remove them? Ans. 1. It could be done but we would not advocate it with a fine gun. 2. They are probably rust marks and could only be removed by a gunsmith who would repolish the barrels.

W. W., Pittsburgh, Pa.—Please let me know what is the matter with my gun stock. When shooting I fire the instant the but of my gun touches my shoulder and sometimes the but of the gun does not come up square, too low on my shoulder. The stock has drop enough. Do you think the stock too long? Ans. Probably it is too long, or perhaps too light in the trigger pull. By going to a gun store and trying some guns

which come up properly and then comparing them with your own you can ascertain where the difficulty lies.

S. W. M., Roslindale.—In your last issue I notice an answer to "F. K. G.," who inquires what is the charge for a 12-gauge 8½-pound gun for ducks. You say about 4 drs. powder to 1½ oz. shot, and that some guns of same weight will bear more powder. Do you mean by bear that more powder would be unsafe? I never supposed a drachm or two of powder made any difference in regard to safety, but thought that over charge of shot and in not getting the wads down was the great danger. Ans. We meant that the 4 drs. was the charge the gun would bear without unpleasant effect to the shooter. It might bear double the quantity without bursting, but there would be an increased demand for sticking plaster.

H. R., Philadelphia.—Can you tell me whether the Waltonian Library of Thos. Westward was sold entire, and if so, who was the purchaser? Your correspondent "A. G. W.," refers to this library in his interesting articles in the first volume of *FOREST AND STREAM* on "Ancient Angling Lore and Literature," and it was on sale at J. W. Bouton's, Broadway, N. Y. Ans. The collection of angling books you allude to were bought by a collector, and not one of the books will ever be again offered for sale, as the entire library of the said person has been willed to a public institution which will probably be opened to the public during the coming year. For further particulars inquiry may be made of J. W. Bouton, Book Dealer, 706 Broadway, N. Y.

J. McK., Philadelphia.—I have a fine setter pup 14 months old; he has a husky cough when he is out exercising and he keeps thin, no matter how I feed him. I gave him some areca nut, but don't appear to do him any good. Some of my friends thought he was getting the distemper but he has had this cough for several months. What can I do for him? Ans. Try the following remedy: Barbadoes tar 2 drachms, powdered squills, 4 drachms, extract of belladonna, 1 scruple, liquorice powder sufficient. Beat into a mass and make into twenty pills, give four daily. Give the dog gentle exercise, feed little or no solid meat, and keep his bowels open with gentle laxatives.

J. McL., Jr., Halifax, Nova Scotia.—The following question I believe you can answer, having seen the shooting grounds of Nova Scotia. What shooting I have done has been over spaniels. The question is, don't you think a good staunch setter would be far ahead of a spaniel even in our thick covert? They tell me here that setters don't suit in thick cover. Ans. A setter, if not too large and of the proper color would suit your shooting as well if not better than a spaniel. In cock shooting and where the birds are very abundant and the cover very thick, a spaniel may be used to flush them, but the pleasure is greatly enhanced when the birds are killed over a dogs points. A setter is also of use in your snipe shooting, where a spaniel, except as a retriever, would be useless.

C. E. J., Templeton, Mass.—We did not fully understand the nature of our correspondent's query last week, and answered him under the impression that he meant the menhaden oil, which is manufactured on Long Island in immense quantities. Mr. Norman Elmore, of Granby, Ct., however, seems to have appreciated his requirements, and informs us that he does not want the commercial oil, but an oil that is obtained "by cutting trout into small pieces and putting them in a loosely corked bottle and hanging in the sun until they change to oil, which will take about ten days in warm weather. It is the oil referred to in the "Complete American Trapper," and I can furnish your correspondent with a small quantity if he cannot obtain it elsewhere." We and our correspondent are indebted to Mr. Elmore.

LOUISE, Farmington.—You will possibly find the best prepared food for pocking-birds at the shops of the bird dealers. We offer the following recipe from an unknown source: Mocking-bird's food should be mixed with grated carrot, and the supply should always be limited. A few angle-worms, or a little raw beet, cut up fine with a pair of scissors, may be given occasionally. They should not have animal food and prepared food at the same time. Grapes, and almost all kinds of ripe fruit, the yolk of a boiled egg, flies, etc., are good for them; but don't feed them too much if you wish them to sing, and never give them anything containing salt or grease. There is not much difference in the various preparations for food. They are all too rich unless mixed with something.

E., New York.—Can you tell me in the brief space allotted to answers to correspondents, what is the difference between twist, laminated or Damascus steel barrels; which is the best, and whether the patterns on fine barrels can be put on the cheaper grades, or if something in the barrel itself is necessary to produce the beautiful wavy lines seen on fine guns. Also which is most convenient and economical to use, brass or paper shell, and the best loading apparatus? Ans. We cannot give space for a full description of metals for gun barrels, but you will find it in Mr. Greener's work, "Modern Breech-Loaders." There are a large number of metals known to the gun trade, and the wavy lines of Damascus steel are imitated in some of them. We prefer paper shells, but for duck shooting, or if you are going to inaccessible localities, take metal. A Dixon's measure and a rammer are the only necessary implements required, but there are a number of loaders in the market, regarding the comparative merits of which we cannot speak.

J. H. N., Menomone, Wis.—1st. Is the areca nut given to dogs the same as sold by druggists and known as the "Beet nut"? 2. Is it good for horses also? 3. What is the best kind of a dog for a "family dog," where there are children, and to be a guardian of the household? 4. How would the Scotch collie do? 5. Where can they be obtained in the West, and can they be easily taught to retrieve? 6. Where in Texas can I find best wild turkey and deer shooting? Where also in Florida? 7. What is the best gun to take for turkeys—a rifle or shot gun? 8. What is the best foot-gear to wear hunting in Florida—boots, moccasins, shoe-packs or rubber boots? Ans. 1. It is said to be the same as the beet nut. 2. Yes. 3. A Newfoundland or a setter. 4. Very well. 5. We do not know. 6. You could hardly go wrong in Northwestern Texas. In Florida, Gulf Hammock, near Cedar Keys or the country west of Apalachicola. 7. A breech loading shot gun. 8. Stout hunting boots or shoes, with a pair of light India rubber boots if much wading is to be done.

ROB., Philadelphia.—In your edition of November 2d, was a description of trapping in Virginia. Will you please tell me when the trapping season closes in that State, and if it would be too late to start now on such an expedition? Would it be well to take a hound and spaniel both, and a gun and rifle both? What stream would you advise me to locate on, and what would be the best route to go from New York? or could we start from here cheaper? Ans. Mr. Newhouse, the celebrated trapper and trap maker, did not return from Greenville county last season until about the 1st of April. Best trapping months are January and February, as the kits have become grown by that time. Take both dogs and both guns, although you can get meat enough for daily use without dogs and with a shot gun only. A good watch dog is desirable to guard camp, as the negroes will certainly rob you. Take Dominion steamer hence to Norfolk and rail from thence to the trapping ground. Better write to Mr. Newhouse, Onida, New York, for directions where to camp. No other man knows so well.

—Mr. E. W. Robinson, of Baltimore, who brought back fifty-five canvas-backs from a Currituck trip last week, reports having seen a flock of swans in the bay six miles long and one-hundred feet wide. They were in close connection and moving gracefully over the waves.

HINT FOR SPORTSMEN.—An aim in life will make a name in life.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCTRINATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2892.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 50 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

NEW YORK, THURSDAY, DECEMBER 7, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

Trade supplied by American News Company.

CHARLES HALLOCK,

Editor and Business Manager.

ROUTES OF SOUTHERN TRAVEL WITH FLORIDA CONNECTIONS.—The visitor to Florida is now provided with a direct means for reaching his destination from almost every port of the United States. First, from this port, we have the two great steamship lines; one starting vessels on Tuesdays and Thursdays for Savannah, where connection is made with the Central Railroad of Georgia and Atlantic and Gulf Railroad, and the other sailing on Wednesdays and Saturdays for Charleston, where connection is made with the Florida packets for Fernandina, Jacksonville, St. Augustine, Palatka, Enterprise, and all points in Florida. The advertisement of both these lines will be found in our columns. But the western sportsman or traveler, particularly if he dislikes a sea voyage, has an advantage over his eastern brother. The Louisville and Great Southern Railway line is now running Pullman sleeping cars through from Louisville to Jacksonville without change, the day line passing through Montgomery, Eufaula, Albany and Live Oak, and the night line via Nashville, Chattanooga, Atlanta, Macon, Jesup, etc. Tourists tickets are sold at three cents per mile, good going and returning by a different route. This is a most luxurious and direct way of reaching Florida, and one that will be largely availed of, the enterprise of the Louisville and Great Southern Railroad Line, bringing the "Italy of America" in direct communication with the west.

OBITUARY.—Michael Schwyer departed this life November 29th, 1876, in the seventy-fourth year of his age. He was one of those who from early age entered into the pursuit of field sports with all the vim and esprit of a true and noble sportsman, and even but a few days before his death he was engaged on Long Island at his favorite pastime that he followed so enthusiastically for sixty years. This notice is specially intended for his numerous old sporting friends all over the country, who will indeed miss his pleasant, kindly words and advice. As tranquil and as pleasant as he lived so passed away his spirit to the happy hunting grounds.

—A national convention of whip manufacturers at Westfall, Mass., have advanced the price of common goods 30 per cent., and of fine goods 50 per cent.—*Ex.*

Is it that whips have been "placed into every honest man's hand, to whip the rascals through the world?" Then, indeed, there is hope of a millenium.

TARGET SHOOTING is now in vogue, and the man with the big auger who heads the column of sharpshooters, will henceforth prove himself a steady bore. The amply perforated bullseye is a *riddle* that none can better solve than he.

THE BRITISH ARCTIC EXPEDITION.

OUR English exchanges are full of accounts of the memorable undertaking *apropos* of the recent return of the explorers. The articles in most of the papers are highly gratifying, the London *Times*, perhaps, alone assuming a lugubrious tone, and lamenting the "failure" of the expedition, simply because it did not reach the pole, as if that were the sole object in view. The *Times* article is severely denounced by *Nature*, which calls it "simply an impertinence" resulting from sheer ignorance, real or feigned. The instructions to the leaders of the expedition were in substance to reach the pole if possible, but in any event make all possible observations in the light of modern science upon the physical phenomena of the Arctic regions. The papers pay the highest tribute, no doubt deserved, to the intrepidity and fidelity of the *personnel* of the exhibition, as well as to the manner in which the scientific duties devolving upon the leaders and staff were performed, and we may expect a rich harvest of information when the observations in the various departments of science come to be worked up by the specialists engaged for such service, since it is claimed that an "unprecedentedly rich" collection of observations has been obtained, including many positive discoveries. The expedition met with obstacles which seem to have been without precedent, and if it did nothing else, it proved that the pole could not be gained at the time it was sought from that quarter. Ice 100 and even 200 feet thick was encountered, more resembling a collection of icebergs than ordinary floes. It was not to be expected such an expedition should be free from casualties, and four of the members perished—three from the scourge of the Arctic regions, scurvy, and one from frost bite—while on one occasion the *Discovery* was "within a minute" of being crushed by a berg, and had it not been for a providential accident to the *Alert* she would have pushed into a position whence extrication would have been impossible.

Commander Markham's daring attempt to carry out his instructions to the letter by penetrating, led him to such lengths that he found the ice piled so that progress at the rate of more than a mile a day was impracticable, he wisely returned, though not until he had splendidly reached the highest authentic latitude ever yet attained, 85 deg. 20 min. Capt. Parry only made 82 deg. 45 min.; the Austro-Hungarian expedition of 1872-'4 reached 82 deg. 5 min, and saw 83 deg., while the *Polaris* sailed without difficulty to 82 deg. 16 min., meeting no such ice barrier as the English encountered. It is supposed that round the poles lies a barrier of impenetrable ice, since such thickness of ice as the English saw could not annually melt and be reformed, the point being that in consequence of an unusually cold season the barrier of ice was further south than usual. A cold of 104 degrees of frost was recorded. The dearth of animal life was a noticeable feature of the results of this expedition; it ceased altogether at a short distance north of the *Alert's* quarters, while the American (*Polaris*) and the Austro-Hungarian expeditions both saw the cliffs swarming with life at their northernmost points.

Among the positive additions to Arctic geography may be mentioned the mapping of the whole coast from Cape Farwell to the northern end of Robeson Channel, excepting Hayes Inlet, and the advances made west along the American coast to 86 deg. 30 min. longitude, and east along the North Greenland coast to 48 deg. 33 min. W. longitude. The so-called "President's Land" is said not to exist, no land having been seen north of Cape Columbia in 83 deg. 7 min. N. It is considered most probable that Greenland is an island, not extending across to Wrangell Land, as Petermann conjectured. In the selection of names for points discovered, Capt. Nares is complimented upon his graceful good taste, and reference to the map will show how steadily the courtesy due Americans has been kept in view. Capt. Nares also paid a deserved tribute to the memory of the lamented Hall by affixing to his no longer lonely grave a commemorative brass tablet.

Excellent results were obtained by the Naturalist of the expedition, Capt. Fielden, whose exertions are spoken of as "beyond all praise." Ancient Eskimo remains were traced on the west side of Smith's Sound to lat. 81 deg. 52 min., where the people had evidently crossed the narrowest part of the channel to Greenland, as the most diligent search further north revealed no trace of their former presence. A few musk oxen were shot at the *Alert's* winter quarters, and over fifty at *Discovery Bay*. Ermines were seen, and snowy owls found on the Greenland shore opposite the *Discovery's* quarters, the young being mostly devoured by wolves (?). Game items from the *Alert's* list at her northern station show a few hares, and about a hundred birds of various kinds, the latter shot only in July. The birds are said to certainly not migrate beyond Cape Joseph Henry, at lat. 82 deg. 50 min. Very few seals were seen north of Cape Union, and no bears, dovekeys, or loons, it is stated, ever reach the Polar Sea. The knots, a species of sandpiper, *Tringa canutus*, are among the birds that visit this country, but do not proceed beyond the point mentioned; they breed there, young in all stages of growth having been observed. Among the plants noticed by the *Alert* were saxifrage, sorrel, dwarf oak, and a few poppies late in the summer. Near the *Discovery's* winter quarters a good seam of coal, readily worked, was found, but unfortunately too late to be of any service during the winter, when the supply was necessarily limited. Fosset corals were procured from the extreme northern hills, and among the general natural history collections those procur-

ed from the sea by dredge and trawl seem likely to prove of great interest. The cairns of the *Polaris* were visited, and at the boat depot in Newman's Bay a chronometer was found in perfect order after four years' exposure. Wheat sent out to ascertain whether it would deteriorate with the extreme cold, has been successfully grown under a glass shade.

The ice on the Polar Sea remained firm until July 20th, when there was a movement, increasing with each tide; on the 31st the *Alert* left her winter quarters, and she joined the *Discovery* August 12th. It was not, however, until September 20th, after toilsome, tedious and uncertain progress, that both ships gained "open water" past the mouth of Hayes Sound, and hopes of ultimate safety were converted into the glad reality. Both ships reached Queenstown October 29th.

COCA.

EVEN should coca possess the wonderful properties claimed for it, it is questionable whether its invigorating influence is more than temporary, and the after effects are very similar to those following the use of any stimulant. Indeed, the letter which we print below points directly to this conclusion. The results are the same as those attending the use of opium or any of its kindred drugs; a constantly recurring desire for increasing doses until the whole system is disarranged and vitality kept up only through its means. The effect of opium, after the use of the drug has become established, is not intoxicating, nor does it produce immediate sleep. It is more like the morning cocktail to the confirmed tippler; an eye-opener, which becomes a necessity, before the machine can be got to work, and kept running only as long as its influence lasts. The opium smoker satisfies a craving for stimulant in the same manner as the drinker, with an increasing appetite and more dreadful results. There is no conviviality about opium smoking, and its effects become much more apparent in the livid complexion and sunken eye. That similar results would follow the habitual use of coca we do not doubt. Our correspondent says that even so soon as the third day he felt the want of it and longed for it as the drunkard does for his dram. It stands to reason that this is so. No artificial strength can be infused into the system without a corresponding depression, and while the use of coca might be perfectly justifiable under certain circumstances, we should deprecate its use as much we should that of any deleterious drug or artificial stimulant. It is a notable fact that the first use of coca produces totally different effects upon different persons; or rather on some it produces none at all, while others are stimulated as described below. Opium, when smoked, rarely affects the smoker in any manner at first, unless an immoderate quantity is consumed. We have tried it frequently without experiencing any unusual sensations whatever. It is the persistent use which soon creates an appetite never satisfied, but which, like the horse leech's daughter, cries constantly, "more," "more":—

PHILADELPHIA, Nov. 25th.

EDITOR FOREST AND STREAM:—

"Seeing an account of the use of coca in your paper, and being a very bad shot on account of my nerves, I concluded to give it a trial. The first day I took one tea spoonful, and it acted like a charm. I killed my birds right and left; I was happy with the world, and proud of myself. As to eating or fatigue, I did not know what they were. The second day, I repeated the dose, with the same result, only felt the need of it, with a slight giddiness, and no appetite, but no fatigue. I felt I could walk for ever. The third day I repeated the dose with results the same, and felt the want of the coca; it took the place of meat and drink; I depended upon it, and longed for it, as a drunkard looks for his dram. I do not know the effects upon others, but thought my experience might be of use to those who should be tempted to try it. Mose.

WOLVES IN RUSSIA.

TO those who are familiar with the rapid extermination of the wolf in this country, the account of the ravages of this animal in Russia will be read with some interest and surprise. A pamphlet has been published by Mr. Lazarewsky which contains some interesting and curious details in regard to the damage done recently by this carnivore. According to this statement, of which the *Bulletin de la Societe de Agriculteur de France* gives an analysis, the wolves devoured during 1873, in forty-five provinces of Russia, from which number Poland and the Baltic provinces are excluded, 179,000 head of large domestic animals, *i. e.*, horses and horned cattle; and 662,900 sheep, pigs, etc. This loss equals in money 7,573,000 roubles (nearly \$5,700,000) or nearly 2 roubles per hectare (2.47 acres). To this amount must be added the value of the poultry and the dogs which have been devoured. We are told that during the same year, in the province of Kalouga alone, there were destroyed 8,200 geese, and more than 2,000 dogs. For the fifty provinces of Russia this loss alone amounts to nearly a million roubles, and the entire tribute paid by the empire to the ravagers is not less than 15,000,000, leaving out of account the men who have perished from the same cause, the number of whom is believed to be at least 200 each year.

Wolf hunting, practiced only by the wealthy classes, has shown itself up to this time powerless to arrest the progress of the evil, and to accomplish successful results. Mr. Lazarewsky proposes to replace the fire-arm by poison. He places much confidence in the advantages of the latter method, among which its cheapness occupies the first place. He asserts that the most simple and easy way of getting rid of these animals is to poison the carcasses of

birds or dogs, and to distribute these through the woods, especially near the drinking places of the wolves, where a single carcass might suffice to destroy all the wolves of a forest.

In our western country the pursuit of the wolf for its skin has long been carried on. In the localities where these animals are at all plentiful the hunter and trapper cannot afford to use his ammunition for wolves, for the distance which it must be transported before it reaches him makes it so costly that each cartridge must be expended only to secure food or to protect life in his not infrequent encounters with the Indians. Besides this a rifle ball would injure the skin, and then, too, wolves rarely show themselves during the day in sufficient numbers to make it worth while to try to shoot them. The hunter, therefore, has recourse to the use of poison, and with it is most successful. His method is simple and very effective. Having killed some large animal, a deer for example, or a buffalo, he makes a number of long cuts in the flesh, in which he places more or less of the strychnine; a few pieces of meat thoroughly poisoned are strewn about the carcass, and it is then left to take care of itself. At the end of two or three days it is visited, and about it are often found from one to a dozen coyotes, gray wolves and foxes. As wolf skins large and small, *i. e.*, gray wolves and coyote, bring \$2.50 each at the traders store, it can readily be believed that the business is a profitable one as long as the animals are abundant.

Wolfing, as it is called, is carried on only in winter, and in this way in Dakota, Montana and Idaho, employment is furnished to a large number of teamsters, miners, steamboat hands and others—men who, but for this pursuit, would necessarily be idle during the long winters of the northwest. It is no uncommon thing for two men to clear during a winter's work the neat sum of \$1,500 to \$2,000. We see no reason why the method for dealing with these destructive pests suggested by Mr. Lazarewsky should not be as successful in the Slav provinces as it has proved in this country, and should this course be pursued our Russian friends may not only save their cattle, but may also in some measure repay themselves for the losses which they have experienced heretofore.

GAME PROTECTION.

NEW YORK.—A correspondent asks if we think that the coming Legislature will dabble with the game laws, and adds:—

"Our laws regarding the taking of trout are sufficiently stringent, only enforce them. Local game constables are a nuisance. What we want are State Commissioners, with an order to visit the Adirondacks twice or thrice during the season of hunting and fishing, and with power to arrest all offenders. The law for the preservation of deer is too loose. Forbid transportation for five years, allow shooting from September 1st until December 1st, but no transportation, and at the end of the five years deer will be as plenty as sheep. Ah! too much red tape exists in legislation. For twenty-five years I have traversed the Adirondacks nearly one-half of every summer, and have seen the disregard of the present law on nearly every lake, and speak from experience as to the real want to protect trout and deer. We need authority, and that authority applied during the entire season."

Undoubtedly the next Legislature will have strong pressure brought to bear upon it, the result of which we trust will be a satisfactory revision of our game laws. If the Game Committees of the Senate and Assembly will only confer with those of New Jersey and Pennsylvania, a general system of close seasons could be arranged which would at once put at rest all our troubles in this direction. As it is at present, a sportsman residing in New York is obliged to have almost a library of State laws, and even then, what with the constant changes and local enactments, is as likely as not to violate some of them and risk being fined.

OHIO.—Judging from a paragraph we find in the Hillsboro *Gazette*, law-breakers were not having an easy time of it in Ohio. Two sportsmen (?) were arrested at Lynden recently for killing quail contrary to law, and in default of the fifty dollars fine for each bird were incarcerated in the Chillicothe jail. The same journal suggests that if scining the streams in Highland county were stopped for three or four years, bass fishing would be excellent, and there would be sport and fish for everybody.

The Association for the protection of Game, of the city of New York, will meet at the house of the President, No. 22 East Sixteenth street, on the 11th inst. (the 2d Monday in December), and it is hoped that the members will all attend.

THE "SPIRIT."—The Christmas number of our enterprising contemporary, the *Spirit of the Times*, the pioneer of sporting literature in this country, promises to be far ahead of anything of the kind ever before offered to the public. It is to comprise forty pages, illustrated, with 100 portraits of celebrated oarsmen, riflemen, actors and actresses, horses, and a fine picture by the celebrated artist Jas. H. Beard. Mr. Wilkie Collins, the novelist, contributes an original Christmas story, and a host of other popular writers will help to perfect this unique departure in American journalism. "Devoted Yachtsman," the popular writer on aquatic matters, will drop his *incognito*, and give not only his name but his portrait. John W. Forney will contribute a characteristic paper, and the list includes also Rev. W. H. H. Murray, of Adirondack fame; Genio C. Scott, the modern Walton; E. L. Blanchard, the playwright; Capt. Ostrom, of the Cornell navy, and others. Mr. E. O. Buck, the Editor of the *Spirit*, is to be congrat-

ulated upon the enterprise which he has displayed in the whole management of his paper, the result of which cannot but be satisfactory, in a pecuniary as well as every other sense. We believe there is more reading matter in this Christmas number of the *Spirit* than in any single issue of any weekly paper hitherto published.

A TURKEY CALL.—We feel much indebted to a Michigan correspondent for informing us of a certain style of Turkey Call in general use in that section, which is considered far ahead of the wing bone. It consists of a box about three inches long, one and one-half inches wide, and one and one-half inches deep, the end and bottom made from one quarter inch stuff; the sides or box scant one-eighth inch stuff. Rub the open edge of the box with resin, and use a slate pencil or narrow piece of slate, and draw across one edge of box, taking short strokes. A very little practice will soon make a man expert. Rubbing lightly or heavily, and near the end or centre of the box, will give the notes of either old or young turkeys.

Sporting Notes From Abroad.

FROM OUR OWN CORRESPONDENT.

LONDON, November 20th.

SO after all we are to have no Kennel Club Show. Mr. G. Lowe, the Secretary of the club, sends to several of last week's sporting papers a letter announcing that the Alexandra Palace Company at the very last moment declined to allow the use of their building, notwithstanding that the Kennel Club were fully prepared to carry out their agreement. All entries and subscriptions are to be returned, but the club will in all probability immediately commence preparations for holding another show. It is not an easy matter however, even in London, to find a building suitably arranged for the successful display of a thousand or more dogs. The previous shows of the Kennel Club had been so successful; the Alexandra Palace is so convenient of access and this show had been so looked forward to by breeders and owners, that the disappointment is general and very great. Among the disappointed ones are many of our countrymen, who had so timed their itineraries as to be present. The growing interest on your side of the pond in canine matters is duly noted on this, and some persons fear that the best dog breeding stock of Great Britain may follow the lead of the racing stock and go out of the country. The results of selling the best equine blood to foreigners have been two-fold; not only have breeders here had to repurchase at high figures but the French and German bred horses are no longer to be dispensed either across country or on the flat.

I mentioned in my last that the fox hunting season had fairly opened. A frost in the early part of the following week somewhat interfered but later reports from nearly all quarters indicate fair sport. One of the London dailies contains some interesting statistics regarding this pursuit, which convey an idea of the magnitude with which hunting (*anglice*) is carried on. For the present season there are no less than 342 packs of fox-hounds, stag-hounds, harriers, and beagles, advertised in the United Kingdom. And in addition to these, which may be called public packs, there are a number of others, private packs, whose meetings are not advertised. The total number of dogs comprising them amounts to about 20,000, divided into, 6,826 couples of fox-hounds, 2,266 couples of harriers, 371 couples of stag-hounds and 296 couples of beagles. These dogs provide amusement for fifty thousand persons who hunt regularly, and employment for nearly four thousand more, and are kept up at an annual expense of over three and a half million dollars. To calculate the value of the horses used in the sport would bring what Mr. Mantilini would call the "demnition total" up to a prodigious figure. It would do the heart of Mr. Bergh good to see some of the kennels in which those hounds are housed, with their paved courtyards, running water and every convenience for health and comfort. But, by the bye, although we often read of Mr. Bergh's interference in behalf of ill treated horses and cattle, and sometimes even cats, I can not recall an instance of his having come to the rescue of the dogs. I may be misinformed, but I believe there is no institution in your city where lost and homeless dogs are cared for. Now here in London there is a Home, where even the poor cur of the gutter can find at least a temporary refuge. Many valuable animals are picked up and sent to the Home from whence they are restored to their masters or are sold. In one year 3,200 dogs were thus provided for. But your city fathers have, or at least had a much more summary mode of disposing of stray dogs, and the authorities of Glasgow appear to have taken a leaf from their book, as recently a raid was made on dogs in that city and over a thousand were destroyed by being drowned gradually in a sewer. And the street gamins who assisted in their capture, only received three pence per head, a sum at which a New York newsboy would turn up his nose in disgust. Now it appears that the action of the Glasgow authorities was contrary to law, and the massacre has been stopped, but not until after many a pet poodle had been torn from the arms of a wailing mistress. And yet, a Glasgow man, or at least a man in Glasgow, has brought out some interesting facts regarding the size of the brain in the dog. A Mr. Garner recently read before the British Association at Glasgow, a paper from which it seems that the size of the brain in the dog does not correspond very closely with the size of the animal. No dog has so large a brain as the wolf, nor one so small as the jackal.

The brain of a Newfoundland dog is very little larger than that of a terrier. Professor Macalister, of Dublin, gave an account of the brain of Master Magrath, the celebrated grayhound. He had weighed the brain of many others, but Master Magrath's was the heaviest of all, and the convolutions were much more complex. He has found that the brains of dogs vary in the complexity of their convolutions as much as those of human beings.

But enough about dogs. Horses come next, although racing, at least on the flat, is almost over. Two meetings this week, one at Warwick and one at Manchester, wind up the season. Then comes steeple chasing, and the weights for some of the principal events are out. On dit that the French horses are going to be particularly strong at the "lepping" this season. Many well known flat racers are to be introduced to the jumping business, particularly hurdling, where a turn of speed comes in so handily at the finish. The list of winning mounts for the year is nearly completed and F. Archer, who heads the list, wants but three more to complete two hundred, a feat hitherto unaccomplished. As he has a number of mounts this week, the chances are in his favor. Archer has ridden in all, 625 races during 1876. Constable comes next with 294 mounts and 72 wins. Fordham, the popular jockey, is in retirement this season for the benefit of his health. The life of a successful jockey is a peculiar one. Perhaps cuffed and kicked about the stable until showing some indications of judgment and the possession of "hands," and afterwards petted by gentlemen and given large sums of money, he either loses his health, through wasting and training, or, as is too frequently the case, succumbs to temptation and sinks into oblivion. There are many, however, who save their earnings, and after marrying, settle down to life in a "public," or become trainers. Next to the jockeys perhaps the book-makers are the most important appendages to the British turf. Through them most of the betting is done and their business is as systematically conducted as many occupations or professions of a more legitimate character. Their transactions are sometimes colossal and they are not inaptly termed "leviathans" of the turf. Whether the term is intended to be synonymous with whale, as indicating capacity, or shark, as meaning rapacity, I do not know, but the word as used in its sense of immensity would apply to the operations of a Mr. Steel, who very appropriately hails from Sheffield, and who, by judiciously making his "book" has cleared one hundred thousand pounds during the present racing season, and will now "retire." To show the magnitude of this book-maker's operations, he won about one hundred thousand pounds by the double victory of Roseberry in the Cesarewitch and Cambridge-shire, forty thousand on the Liverpool Cup, and thirty thousand on the Lincolnshire Handicap. Of course he lost on other races, but was left with the handsome balance above mentioned.

In the last number of the *Volunteer Service Gazette* considerable space is devoted to the scores made in the late International rifle match at Creedmoor, as a complete record of what it terms "the most important Any Rifle Match and the most magnificent Team shooting that has ever taken place." The same journal has a leader upon the grave situation in which England finds herself in the threatening appearance of Eastern politics. In the event of a war in which England should be called upon to take a part, her regular army would probably be all engaged abroad, and the services of the Volunteer forces would then most likely be called upon. The value of the organization and the practice at Wimbledon would then be felt. Apropos of a report of the meeting of the London Athletic Club, Volunteers are impressed with the importance of something more than a mere proficiency in drill. Marching power can only be acquired by constant development of the natural strength of various parts of the body, and to this end the formation of Athletic Associations is earnestly advocated. By the bye, a very interesting case was tried in Ireland the other day at the Wicklow sessions, in which those popular riflemen and gunmakers, Messrs. John and William Rigby were the defendants. The prosecution was for carrying arms without a license, and the offence occurred in June last at the meeting of the Irish Rifle Association at Wicklow. According to a *Times* correspondent, Mr. John Rigby, who represented the firm, in defence, contended that he was present at the match in order to try experiments with a new invention, and that a range was specially set apart for the purpose. He had done so at different places for six years without being prosecuted. He had gone to Wimbledon, to Curragh, and elsewhere for the same purpose as that for which he had gone to Wicklow—namely, to try whether a particular experiment which he had made was an improvement. One of the magistrates stated that if it could be shown that Mr. Rigby attended at Wicklow only in discharge of his business the case would be decided in his favor, but that as he did not deny, however, that he took prizes at Wicklow, the Bench held that they were bound to inflict a fine of £2 10s. and costs. Notice of appeal was given.

The Pigeon Shooting season has fairly commenced and most of the old clubs and some new ones have gotten to work. On Saturday week one of the most fashionable, the Gun Club held its initial meeting at Notting Hill. One of the best shots and most popular members of the club is Mr. Howard S. Jaffray, of New York. In this match he was handicapped at 29½ yards, rather a severe test before five traps. At Monaco, that petty principality on the Mediterranean, in which one has almost one foot in France and one in Italy, and which may be said to be the home of gambling since the decadence of Baden Baden and Hom-

bourg, pigeon shooting begins on the 23d of next month. The Grand International Meeting will take place on Jan. 24th, 27th, 30th, 31st, and Feb. 2d, and 3rd, with valuable works of art, and about 1,400 sovereigns in specie. Shooting will take place every week up to March 24th.

The great "walkist," Weston, is still here, and as his rival, O'Leary, has arrived, efforts are being made to make a match between them. In fact, O'Leary accepts a challenge issued by Weston to walk six days from December 18th, for the large sum of five hundred pounds, but makes a stipulation which I fear will cause the affair to drop, that is that no music of any kind shall be allowed on the premises when the walk takes place. What would Weston do without his cornet and his band? blowing his own trumpet afterwards would scarcely suffice. Besides, Weston's challenge looks very "thin," when it is well known that O'Leary has a match with Howes for December 26th. He, O'Leary, commences a walk of 300 miles against Peter Crossland at Manchester to night. He appears to have made many friends on this side already, by his straightforward conduct, a virtue so rare among professionals here that it is fully appreciated.

The old "Amateur" question is being revived and if International contests, particularly those of an aquatic description are to continue the rules will need some revision. At present the distinction in use here is totally different from that in force with you and the rowing men who recently visited Philadelphia were horrified at having to meet "artisans." Here the distinction is not one of muscle but purely of social position. The tradesman or mechanic cannot be an amateur at rowing it appears. That is, the gentleman of leisure who devotes his whole time to the development of his muscles can not meet on an equality the clerk who can only steal an occasional hour from other occupations to practice rowing. Not because his muscles are susceptible of a greater amount of development, but because of his social position. The *Morning Advertiser* has a very sensible editorial on the subject with the heading "Sport Levels all Distinctions," from which I quote:—

"The attempt to define social classes which are in a state of transition is really impossible. Would it not, then, be far better to class our athletes according to those simple rules which are obvious to any one? A professional is one who seeks pecuniary gain; an amateur is one who does not. Let public amateur competitions, then, be open to all who are not professionals, and let the prizes consist of simple acknowledgments of victory, such as printed or illuminated cards. For, by the bye, while gentlemen amateurs see so many faults in others, it is hardly fair for them to forget that their largest fields are always to be found where the most valuable plate is the prize, and that before now gentlemen amateurs have been found who have turned their silver "pots" into hard cash. Of course, clubs could always hold private competitions open only to such persons as they chose to admit, just as the Gun Club and similar institutions do. Our objections point solely to those "national" and "international" meetings, the expenses of which are provided by public subscriptions. In a nation of shopkeepers it is surely absurd to find the great trading community virtually excluded from the national sports in order that no offence may be given to those gentlemen who think that no man can be an amateur unless he is one of themselves."

You will perceive how much nearer the proposed definition comes to the one now in force with you. For my part I have always claimed that the "gentleman" who makes rowing or any kindred sport the business—or pleasure if you will—of his life, is much less of an amateur than the business man or mechanic who can only occasionally find time to follow a favorite pastime. VAQUERO.

OUR WASHINGTON LETTER.

PARTRIDGE SHOOTING IN THAT LOCALITY—SALMON AND BLACK BASS IN THE POTOMAC.

WASHINGTON, D. C., Nov. 2d.

THE excitement and suspense attending the late election, which has kept politicians at fever heat since that time, has not deterred the sportsmen in this vicinity from enjoying the excellent partridge shooting afforded in the neighboring counties of Maryland and Virginia. The season has been one of the most favorable which we have had for several years, and birds are abundant, owing, no doubt, to the exceedingly mild weather of last winter, which caused the birds to remain in this locality instead of going south, and the absence of heavy rains last summer, which so often drown the young broods before they are able to take care of themselves. So plentiful have the birds been this season that an ordinary shot with an indifferent dog found no trouble in making a respectable bag during a single day's shooting, while a more practiced sportsman with a well-broken dog could easily bag from twenty-five to forty birds in the same time. Several instances have come to my knowledge where large numbers have been killed in a day or two, and it is not every season that the birds are so numerous as to afford such sport.

Though we are having rare sport this season, unless something is done soon to protect the birds by the enactment and enforcement of stringent game laws, I fear that partridge shooting, before many years, will almost be a thing of the past. The Maryland authorities, I am glad to say, have already taken cognizance of the matter, and are enforcing their game laws. If the Virginia authorities, both State and county, will do the same they will receive the thanks of all true sportsmen. Let us have your valuable aid to this end, that the trapping of the birds may be stopped, as well as their destruction out of season. Pot-hunters are numerous, and it is but a short time ago that I heard of a case where a small wagon load of trapped birds were brought to market from Virginia. This may seem

incredible, but I am assured of its truth by the most reliable authority.

With proper game laws in the neighboring States, and their strict enforcement, there will be good shooting every season. In both Virginia and Maryland the farmers in many instances have their lands posted, which is done to keep off pot-hunters, but they never object to gentlemen shooting on their places, and numerous sportsmen here will bear testimony of the many times where they have been most heartily welcomed by the residents in those States upon being properly introduced. There are no more hospitable people in the world than the farmers of Virginia and Maryland, and when a guest is received it not only seems a pleasure to the host to entertain him, but his neighbors join him in contributing to the entertainment of the visitors.

There are a good many pheasants and wild turkeys in Virginia this season, but the partridge shooting affords sport so much superior that they are not hunted, especially to any great extent. Squirrels and rabbits are plentiful everywhere, and many are killed by those fond of hunting them.

SALMON AND BASS IN THE POTOMAC.

Our fishing season is about over, but owing to the frequent rains of last August and early in the fall the Potomac has been kept muddy a great portion of the time, and as a consequence comparatively few bass have been taken. In September and October we usually have magnificent bass fishing, but this season the muddy water destroyed the sport.

In addition to the game and ravenous black bass, which are now so abundant in the Potomac, we may expect soon to have the California salmon, with which the river was stocked by Prof. Spencer F. Baird, the efficient United States Fish Commissioner, about three years ago. This officer, it will be remembered, established a salmon hatchery establishment on the McCloud river, a tributary of the Sacramento, four or five years ago, for the purpose of obtaining eggs and young fish to stock various rivers of New York, Pennsylvania, Maryland and Virginia. In 1873 2,000,300 eggs were shipped east, about one-half of which were hatched out and placed in various rivers in the States named above. During the summer of that year the first lot of these young salmon, about 30,000, were placed in the Conecogue, a small tributary of the Potomac, near Chambersburg, Pa., and later in the same season 35,000 were turned loose in a small branch of the Shenandoah near Winchester, Va. They were placed in the extreme headwaters of the river because there were no black bass there to destroy them, and secondly to induce them to ascend the river as high as possible upon their return from the sea in subsequent years, as the salmon, like the shad, endeavors to return to its spawning ground. Another reason was that the waters of these tributaries are cool and clear and well adapted to the growth of the young fish. The young salmon did not descend the river until they had attained sufficient size to protect themselves against the ravenous appetites of the black bass. When they were put in the Potomac in 1873 it was expected they would return from the sea in three or four years, and it having been three years since the river was stocked we may soon expect to hear of salmon in the Potomac weighing from ten to fifteen pounds, as they usually attain that weight in the period named. It is the habit of this fish to remain in the river upon returning to its spawning ground about three months. The Little Falls of the Potomac nor any of the rapids of that river will offer any obstruction to the ascent of the fish until it reaches the Great Falls, and it is contemplated to erect a fish ladder at these falls. The California salmon at certain seasons rise readily to a fly, and in a few years the Potomac with its salmon and black bass will afford rare sport to the angler.

OCCASIONAL.

Rifle.

MORSEMERE.—The Frost medal was won on Friday last by Mr. Morse upon the total of 208 in 45 shots. Distance 500 yards. The last day was a very bad one for good scores, as a comparison with previous ones will show. The weather was very cold, the wind strong and gusty, and of the kind known as a "fish-tail" wind. The result was as follows:—

Names.	Nov. 17.	Nov. 24.	Dec. 1.	Total.
G. L. Morse.....	73	74	61	208

MILITARY MATCH; POSSIBLE 25.

Name.	Total.	Name.	Total.
D. F. Davids.....	22	George Ferguson.....	18
John W. Coburn.....	18	Lieut. Embury.....	16

The regular season closed with these matches. The next matches will be held, probably, on Christmas day next, at which time the Executive Committee contemplate offering the De Peyster badge. Mr. J. Frank Wright has presented the association a very pretty badge, a 500 yards target upon a circular field, encircled with the laurel wreath, and surmounted by two crossed rifles, all suspended from a bar bearing the monogram of the association. It will soon be offered for competition, and duly announced.

GALLERY MATCHES.—Last Saturday evening, December 2d, a return match was shot between a team of eight from Arnold, Constable & Co., of New York, and a team of the same number from Journeay & Burnham, of Brooklyn, at Miley's shooting gallery, 26 Court st., Brooklyn. The first match was shot October 21st, at Conlin's gallery, 930 Broadway, resulting in a defeat for the New York men by three points, 235 to 232. The victors were immediately challenged for a return match, which was accepted, and the following is the result:—

Name.	Total.	Name.	Total.
Brown.....	42	Long.....	35
Oats.....	41	Nicholson.....	34
Bishop.....	40	March.....	29

Lockwood.....	40	Jurmain.....	34
Gallaher.....	37	Dunn.....	23
Bruyn.....	36		
Ragan.....	36	Grand total.....	292

New York victorious by five points. This shows an improvement of 60 points per team, and the shooting is a credit for both sides. The conditions were as follows: The teams to consist of eight men each; to shoot ten shots; rifle .22 calibre; off-hand; 200 yards; target reduced in proportion for the range (100 feet); Creedmoor rules to govern the match. After the contest the losing team gave a supper, and after a jovial time, singing and speech making, they all adjourned with prospects of another challenge from the Brooklynites.

MASSACHUSETTS.—Below are the scores made recently for a Remington revolver, at Lincoln's shooting gallery, 655 Washington st., Boston. Shots—possible 40. Range—50 feet. Targets adjusted for 200 yards:—

CONNECTICUT.—A match was shot on Friday the 24th ult. on the Silver Glenn range between teams representing the Middletown Rifle Association and the Mansfield Guard, the former shooting eight men against ten of the latter. The conditions of the match were seven shots at 200 yards, standing, and a like number at 500 yards in any position. The following are the scores:—

MIDDLETOWN RIFLE CLUB TEAM.

RHODE ISLAND.—Some interesting competitions in rifle shooting took place at Newport, on Thanksgiving day, at the new range near the Maitland Place. Although the sun was obscured and the light favorable for shooting, the day was far from being agreeable and pleasant. A raw, fresh wind from the northeast, prevented any very good scores from being made in the off-hand matches. Owing to the lateness of the hour, the match for rapidity and accuracy did not occur. The three competitions and scores made were as follow:—

No. 1.—Conditions: Any rifle within the rules. Distance 200 yards. Position, off-hand. Two sighting and seven scoring shots. Entrance, \$3. First prize, double action revolver, value, \$15; second, \$4; third, \$1; fourth, short and mid-range score book.

Name.	Total.	Name.	Total.
E. H. Totten.....	35	W. M. Farrow.....	30
H. Bull, Jr.....	24	C. M. Bull.....	25
L. R. Blackman.....	23	W. R. Landers.....	16
M. Bull.....	23	R. H. Powel.....	26
J. G. Stevens.....	21	R. S. Barker.....	13
C. Reigle.....	26		

The four prizes being taken respectively by W. M. Farrow, R. H. Powel, C. Reigle and C. M. Bull.

No. 3.—For Champion Marksman's Gold Badge.—Conditions: Any rifle within the rules. Distance 200 yards. Position, off-hand; two sighting and 10 scoring shots. The badge to become the property of any competitor winning it three times, and only those who originally enter will be allowed to contest for it in future trials.

Name.	Total.	Name.	Total.
E. H. Totten.....	35	Ira B. Brightman.....	25
H. Bull, Jr.....	35	H. W. Powel.....	41
C. Reigle.....	35	W. R. Landers.....	34
W. M. Farrow.....	30	Thos. Farrow.....	31
R. H. Powel.....	30	M. Bull.....	36
C. M. Bull.....	24		

The badge is of solid gold and appropriately marked. Mr. H. W. Powel, of the Harvard Rifle Club, became the possessor of it, and announced Saturday, December 2d, as the day for the next competition.

No. 4.—Conditions: Any rifle (except Creedmoor's, and those having magnifying or telescopic sights). No restrictions as to position or rest. Distance, 150 yards. 10 shots. Smallest group to win. A separate target furnished for each competitor, (bull's eye 8 in. Target 2½ x 2½ feet). Entrance, \$1. First prize, new improved air rifle, value, \$11; second, cash, \$3; third, \$1; fourth, short and mid-range score book.

The four prizes were awarded respectively for four smallest circles, as follows:

Wm. M. Farrow, 6½ inches; Henry Bull, Jr., 8 1-16 inches; E. H. Totten, 11½ inches; W. R. Landers, 11½ inches.

December 2d, 1874.—The second competition at 200 yards, for the champion marksmen gold badge, took place this day. The day was bright and clear but quite cool, with a strong westerly wind. Mr. Wm. M. Farrow was the winner, and announced Friday, December 8th, for the next competition. The scores were as follows:

Name.	Total.	Name.	Total.
W. M. Farrow.....	42	W. R. Landers.....	37
H. Bull, Jr.....	42	H. W. Powell.....	37
R. H. Powell.....	40	M. Bull.....	32
E. H. Totten.....	38	Ira B. Brightman.....	31

MARYLAND.—The Maryland Rifle Club, composed of about thirty members, has been incorporated with Gen. James R. Herbert President, Dr. Wm. H. Keener, R. Stuart Latrobe, Douglas H. Thomas, and Wm. Davison Corporators. The Patapsco rifle range, on the Baltimore and Ohio Railroad, near the Relay station, has been put in order for the Club, with targets at 200, 600, 800, 900 and 1,000 yards range. A club house will be fitted up for the accommodation of the members next spring, when it is expected that more interest will be manifested in rifle shooting.

THE FILED SIGHTS.—We noticed in our last that the Board of Directors of N. R. A. have decided to support the decision of the Executive Committee in the matter of the protest of the 7th Regiment against the scores of the team of the 48th (Oswego) Regiment, made in the "State" "Galling Gun" and "Army and Navy Journal" matches, at the late fall meeting at Creedmoor, thus throwing out the scores. The following is an abstract of the most important testimony on both sides.

Sergt. John Le Boutiller, 7th regiment, testified to having examined the sights of some of the guns used by the team of the 48th while they were firing in the *Army and Navy Journal* Match. "They appeared to have been filled or otherwise altered."

Capt. Jos. C. Abrahamis testified that, having his attention called to the matter by Sergt. Le Boutiller, he also examined one of the rifles and "saw that the rear sight had been filed down so that the bar could be lowered considerably lower than ours. I should judge about 1-8 of an inch."

Capt. Chas. F. Robbins, 7th regiment, testified to having reported the alteration to Capt. Story, who sent for one of the rifles of the 48th team. "One was brought which was examined by himself, myself, and several others. Capt. Story said he was satisfied, and the rifle was taken back." Subsequently went with several others to the camp of the 48th and examined a rifle that had been altered. "Should say that more than half the shoulder had been cut away. I did not measure it, but that is my impression. By measurement that would be 3-16 of an inch, I should say: Made a memorandum on the written protest drawn up of the gun examined. It was 'A 49.'"

Capt. J. G. Story corroborated the testimony of Capt. Robbins, and stated that one piece he examined, "A 49," "was altered fully 1-8 to 3-16 of an inch. I saw two pieces that I considered altered; one at my tent and one at the 48th.

Adjutant Murphy, of the 12th, and Captain Loomis, of the 23d, testified substantially the same.

Col. Geo. W. Wingate, G. I. R. P., measured with a pair of callipers the gun carried by Mr. White, of the 48th team, and which he threw out in the Inter-State match. "Found the shoulder of the sight of that gun cut away as far as I remember, 1-8 of an inch." "Col. Houghton did not deny that the sights were filed. Understood him to admit it."

For the defence Sergt. J. S. Barton, Co. A, 48th, identified a gun shown him as the one he used in the contested matches. "Have not filed or altered it. That is the same sight that I used, as well as the same gun." "I claim that filing the shoulder was not altering the sight." The guns sent to Remington's were not sent to have the elevations changed; they were sent because most of the guns had natural tendencies to draw to the right. The guns sent away were never altered in the shoulder at all."

Capt. Curtis, 48th, identified a gun and sight as the same he used: "I never filed that sight, the point or the rear, or any part of it; never touched a file on it;" "should think that altering the shoulder would be an infringement of the rules." Told Capt. Loomis "that several guns were sent to Ilion to be resighted; but didn't say that any of those were shot in the match."

Sergt. Major Geo. White, 48th, identified a gun and sight shown as the one he used. "A 49." "Would not swear positively that I used that sight in the matches, because it has been in Col. Houghton's possession for a month and a half." I never filed the rear or the sight of the gun or altered it at all; I have no doubt that the gun is in the same condition as when I used it in the matches." "Mr. Hepburn examined the sights and advised Col. Houghton to keep them in his possession until there was an examination, and he kept them; and when he shot for the Nevada Badge he had to borrow sights."

Sergt. L. L. Barnes, A, 48th, testified to the same effect. L. L. Hepburn examined the twelve guns, and testified that "None of these have been lowered in that part to any appreciable degree. I know they have not." "Should think inserting the bar and filing away the shoulder, so as to shoot over the straight bar with the same elevation, as he shot through the match, an alteration according to the rules." "There were some guns sent to Ilion to have the sights adjusted to different ranges, from one to five hundred yards. The Superintendent of the Military Department said that they were the 48th Regiment. That is all I know. I don't remember altering the shoulder on any of these guns, except to get it down to 400 yards."

Col. Houghton's evidence was to the effect, that he had never altered his rifle in any way, and had returned the sights sent to Ilion to the guns from which he had taken them. Other evidence both direct and in rebuttal was offered, and after it was all in and duly considered in private, the Board passed unanimously the following resolution:

Resolved, That the filing of the shoulders of the rear sight of the State rifle as alleged to have been done by the Oswego team, if done was a violation of the rules of the N. R. A.

Resolved, That it is the sense of the Board of Directors that one or more sights which had been altered contrary to the rules of the National Rifle Association were used by

the team of the 48th Regiment, N. G. S. N. Y., at Creedmoor during the fall meeting of this Association of 1874; therefore

Resolved, That the decision of the Executive Committee be confirmed.

The whole question turned upon a point of veracity, whether the sights now presented were those used in the matches. The Board evidently thought they had been changed.

REST VERSUS OFF HAND.—Thanksgiving was nigh at hand, and turkeys were in demand, so Ira Lumberchild gave an invitation to the people of Mohawk Valley to rendezvous at his "Hotel" two days in advance, and furnish themselves with "good turkeys, good fare, and good times," at ten cents a shot. It struck me that I'd like to invest, so furnishing up a little old-fashioned Sharp & Harkins leather covered cavalry carbine, I wrapped myself up in the robes, and plodded my way over the hills, through mud up to the hub, and after a tedious ride arrived at the little white tavern, where the "shoot" was going on.

A dozen men were on hand, each with his enormous rifle-telescopic sights, and all sorts of contrivances for elevating and sighting. As I jumped from my wagon with my little breech-loader in hand, an acquaintance rose from a board, one end of which rested on a barrel, and from which he had just pulled the trigger, with his gun blocked fore and aft as in a vice, and remarked:—

"What are you going to do with that pop gun?"

"I thought I might see a chipmunk on the way," I answered, "and thought I'd be ready for him."

"Chips, the devil," taking the weapon and sighting through, or rather over its sight, "you couldn't hit a chicken at thirty yards."

"Why, I thought perhaps I might hit a turkey."

"Put a turkey, a big one, upon the fence there, Ira, and give the man a chance."

I compromised with Ira, that the turkey should be placed on a knoll, some distance off, I to shoot off-hand. A little five-pound bird was tied to a stake, and squatted on the ground in apparent safety, while my friend occupied himself wiping and loading, and getting "in the turkey" at the hundred rod range, and firing once with no disturbance to the boys, who "took off and put on" the bird. I had fired rapidly five or six shots; the first sighted for 200 yards, over, and a source of much amusement to the veteran, who laughed at the idea of getting a turkey in thirty years with that thing. Pretty soon, though, the turkey jumped; my ball had gone under him close enough to scare. The next shot and away he went, with the string cut. I was "on him" now at 150 yards, and firing again got that turkey. Another was put up, and the fourth shot brought him too. It was getting close work for the proprietor, and he begun to weaken. It was a new feature at a turkey shoot, and apparently not a profitable one. However, I took home three turkeys, at a very small number of shots compared with my friend's work with his telescope, and you may tell Mr. Holberton that I've changed my mind about selling that carbine.

PISCO.

Game Bag and Gun.

GAME NOW IN SEASON.

Moose, *Alces machilis*. Pinnated grouse or prairie chicken, *Cupidonia cupido*. Caribou, *Tarandus rangifer*. Elk or wapiti, *Cervus canadensis*. Ruffed grouse or pheasant, *Bonasa umbellus*. Red or Virginia deer, *C. virginianus*. Squirrels, red, black and gray. Quail or partridge, *Oryz virginianus*. Hares, brown and gray. Wild turkey, *Meleagris gallopavo*. Woodcock, *Philohela minor*.

"Bay-birds" generally, including various species of plover, sand-pipers, spile, curlews, oyster-catchers, surf-birds, phalaropes, avocets, etc., coming under the group *Limicola* or Shore Birds.

CURRITUCK PROPERTY FOR SALE.—We have in this office the title deeds for about two hundred acres of land, comprising some of the finest shooting points on Currituck Sound, a half interest of which will be sold very low. This is an excellent opportunity for any gentleman who may desire to form a club for the purpose of enjoying the best wild fowl shooting to be found in the United States.

THE FOX GUN.—We have in our office a fine specimen of this new gun, which we will be happy to show all who are interested in inspecting fine workmanship and novelties in the gun line.

—The correspondent who infers, from reading our Sinapuxent letter of two weeks ago, that sink-box shooting is practiced in the waters of the Bay, will perceive by examining the context, that our reference to sink-boxes applied to goose shooting in its general practice, and not to that or any other specified locality. Sink-boxes are not allowed in Sinapuxent Bay and contiguous waters, and the dwellers in that region are jealous of their reputation as game protecting and law-abiding citizens.

—Our correspondent "Triangle" has let a little light upon a subject referred to in his letter of October 12th, which mystified ourselves and many readers. "El Cazador" tried to make the writer's meaning plain, but without satisfactory results. The subject referred to dressing and carrying deer carcasses, and "Triangle" wrote "anus," which the printers changed to "arms." The explanation makes the case clear.

—Some parts of Virginia swarm with deer. A correspondent of the Richmond *Whig* gives an interesting account of a deer hunt in Dinwiddie county, in which a number of gentlemen participated. The hunt lasted four days, and the party were in camp most of the time. Among the gentlemen engaged in the hunt were Mr. Warner Lewis, of Brunswick, Capt. R. G. Pegram and Mr. John M. Wayne, of Petersburg, and Messrs. Colin Neblett, Thomas Epes and John Bragg, of Lunenburg, and a number from Nottoway and Dinwiddie counties. Fifty deer were started and twelve killed. Mr. Thomas Epes killed three deer from the same stand with a single barrel gun.

KEEPING LOADED SHELLS.—Editor *Forest and Stream*.—You referred lately in your paper to loaded shells keeping good for long periods of time. Last week Mr. Sidney Keith found and fired some paper pin fire shells that had been loaded by his father, who has been dead for over thirteen years. There was no perceptible difference in penetration and pattern from shells lately loaded.—C. W. McM.

[We have frequently used shells that have been loaded for two years or more, but the instance mentioned by our correspondent is remarkable. Powder when kept dry will undoubtedly retain its properties for a long time.—Ed.]

—Calculations have been published showing that over twenty-three millions of animals and birds were wounded without being captured, by the licensed sportsmen and poachers of the British Islands during the year ending March 31st, 1876.

—Large numbers of wild ducks have made their appearance in the marshes at the head of Lake Monroe, St. John river, Florida.

MAINE.—*Machias*, December 2.—Close season for grouse commenced yesterday. But little lumbering going on and the woods are alive with hunters. Although deer are abundant, but few have been killed in this vicinity as yet. A 9 oz. woodcock killed here November 17th was preserved in oil in a portrait of the setter "Guy," known in Portland as "the \$1,000 dollar dog." Season for deer closes January 1st.

ROAMER.

MASSACHUSETTS.—*Boston*, Dec. 2d.—Our coast shooting is wound up for the season. The ponds are frozen, so nothing is left now but a few partridges. I have been to the vicinity of New Bedford this last week, and fully agree with Concha that the best shooting in the State for quail and woodcock is near there.

S. K., JR.

Salem, December 4th.—Actual sport in the field the past week has been but little. There are a good many whistlers and old squaws in our harbor, with other kinds of water birds, but they are not much molested. Other work keeps me away, but for that I'd "haze 'em." There was a turkey shoot last week in Beverly. I can get at no score, but am told there was some good rifle shooting down there by Salem parties. A friend, who is reliable, says that at the Light Station, in the upper end of Plum Island, he saw three (3) barrels of white owls that were shot about there lately. The station is kept by Bob Floyd, of Newburyport, who is the best shore gunner in that locality. Arthur Russell, of Ipswich, got two geese last week in the "Hundred"; they have not been very plenty, mostly keeping right along. Herring fishermen say, that outside of Plum Island and Ipswich Bay, the old squaws are in big flocks and tame. There was a pigeon shoot by Salem amateurs, who never shot from the trap before, at Rial side, Beverly, on the 30th. The scores were not first-class, but the contestants, if game, were willing.

NEW YORK.—*Keeseville*, Nov. 30th.—Nothing especially new from the Adirondacks. The season thus far has been very mild. No snow to speak of yet. Slaughtering deer, *a la mode*, not indulged in.

Ithaca, Nov. 28th.—We are having some good grouse shooting now, having had a few light falls of snow. Twenty-seven were bagged by one man last Friday and Saturday. Quail are also found quite plenty within four miles, though they seem to be continually moving, seldom being found twice in the same place. Two snow geese (*Anser hyperboreus*) were shot here on the lake a short time ago. They were young, and seemed much fatigued from flight, as they made no effort to escape. Ducks have not stopped with us enough to make very good shooting, although there has been a good flight, but very high.

NIMROD.

PENNSYLVANIA.—*Slippery Rock*, Butler County, Dec. 2d.—Have had three days of delightful hunting this week. Will tell you all about it next week.

M. H. B.

VIRGINIA.—The Camp Armistead Deer-Hunting Company, of Albemarle, Va., assembled at their grounds ready for their annual hunt, October 27th. The party consisted of twenty hunters, forty-two dogs, eighteen horses, and eight servants. It was organized by the election of that veteran hunter and former President, as President of the hunt, P. S. Coles, Esq. The party hunted five days, and succeeded in killing thirteen deer, also a large quantity of small game, such as turkeys, pheasants, partridges, squirrels, etc.

SOUTH CAROLINA.—*Port Royal*, Nov. 27th.—We are having a fair northern, and what may fairly be termed elegant winter weather—cool and bracing—and not at all of the shivery, shaky sort. About dusk every day I hear black ducks quacking, and marsh hens calling in the salt marshes close at hand. Shall accept their invitation before long. The Sea Island orange crop is a success this season, and I shall be likely to have "a few more left" on the trees for friends and visitors all winter long. Next month comes mallard and widgeon shooting among and near the Combahee rice fields. Should I be able to indulge in a little of this sport, I will tabulate results for your especial benefit. Partridges are as abundant as usual on my premises.

As I came over to the mainland just now to mail this, with the oyster beds along the creeks just uncovering, I passed a dozen or more sickle-bills, some twenty black breast plover, and two or three hundred sanderlings. The latter double up close to my boat, affording a magnificent shot (for quantity), but I had no gun with me. A fine chance here for incipient Nimrods, as the game is comparatively tame.

RUSTICUS.

OHIO.—*Jefferson*, Nov. 28th.—We have small game, consisting of squirrels and quails, but the latter we are not allowed to shoot this year as they were growing scarce, and our Legislature passed a law on them, but next fall we expect to have a plenty. Partridge are quite plenty, and there are some woodcock. Rabbits—the common grey—are reported very plenty. There are some white rabbits, but they are seldom shot. We have good sport with the red fox every winter. We may not have as high bred hounds as some, but we have several good dogs which we follow with good success. Wild turkeys have been very plenty here this winter, and quite a number of good ones

shot. Two miles east of town there is a heavy field of woods, in which there are some deer. I have heard of three being shot by parties from town the past week, but they are getting scarce, and we talk of trying to get a bill through this winter prohibiting the shooting of deer in this county—Ashtubula—for a number of years.

W. D. HOWEL, JR.

KENTUCKY—*Louisville, Nov. 27th.*—All game more plentiful than for years past. Our market is overstocked. Woodcock very common. Snipe (jack) also common. Deer and ducks are in extra fine condition.

L. W. NOEL.

—ARKANSAS—*Jacksonport, Nov. 27th.*—Weather warm for the season. Game not plenty. Deer have died off with black tongue. Several fine bags of turkeys. Ducks coming in in better quantity. A few geese. Swan reported arriving at Swan lake in large numbers. A few woodcock and quails in small droves. Squirrels not as plenty as a month ago. Plenty of bear in the bottoms.

YELL.

MICHIGAN—*Ann Harbor, Nov. 20th.*—I wrote you last Monday at three o'clock p. m., and at four we started for quail. Result of the day's shoot 105 quail, 19 partridges, 1 woodcock; all shot over Cocker spaniels. On Tuesday three inches of snow fell. Thursday out for ducks; at five p. m. the bag counted 87 ducks, 2 quail, 1 partridge. This game was shot by two would-be shots, who do not claim to kill every time. A fine buck deer was taken 14 miles from here last week. Rabbits plenty, selling for eight cents apiece in the market.

A. B. C.

WISCONSIN—*Fond du Lac, Nov. 30th.*—I am just in from a six week's sojourn in the woods. Have had a fine time, plenty of game, and the grand old rocks and pines look healthy and vigorous as ever, and in their atmosphere I have acquired sufficient to carry me through another year at the desk.

TRIANGLE.

MISSISSIPPI—*Corinth, Nov. 28th.*—Quail were never more plenty, fatter, or finer; never lay more stubbornly to the dogs—flew straighter, or kept out of impenetrable thickets better than now—and the dogs have behaved in the best possible manner. There are not as many hunters in the field this season as usual, and the birds are found nearer town. I have been out twice a week since October 15th, never longer than two hours in the field, and have made bags of from ten to sixteen birds each time. The weather has been mild and favorable for hunting and shooting. Have not seen a wild goose, duck or pigeon, this fall. Weather has been too mild as yet to bring them down. Please say to the gentlemen who wrote me about the turkey feathers, and whose letter I misplaced, that I will send him some without money and without price—like the gospel—the first one that is brought to bag from this town. I think his name was Dodge, and that he belonged to the Knickerbocker Knitting Machine Company.

GUYON.

CANADA—*Montreal, Dec. 1st.*—We have had a spell of most beautiful weather, with slight frosts but no snow. A steamer has just left for Berthle, forty-five miles below here, and in all probability it will be the last steamer down of the season, which is a month later than last year. Ducks and geese were very scarce on the Lake St. Peter this fall, though snipe and plover were plenty. Look out for cold weather this winter, arctic owls are putting in an appearance in great numbers.

P.

THE EXTERMINATION OF THE ANTELOPE.—The Kansas City Times complains that the antelope is being exterminated on the plains in the same ruthless way that characterized the destruction of the buffalo. The ever extending limit of Western settlement and the extension of cattle ranches from the west concentrate the herds of antelope and gives the impression that they are increasing rather than decreasing. The "saddle of antelope" sells, delivered on the line, for \$1 to \$2, and to obtain this a steady business is carried on, resulting in the rapid decrease of the once numerous herds of antelope. Just now the best antelope hunting district is west of Dodge City, on the Atchison, Topeka and Santa Fe Railroad, and east of Pueblo and Trinidad, Colorado. On the Kansas Pacific Railroad the finest herds of antelope are found west of Kit Carson and east of Denver. The animals are killed in great numbers by ambushed hunters, who take the saddle—i. e., the two hind quarters of the animal, together with any portion they may require for their own immediate use—and leaves the rest of the carcass to be eaten by the coyotes. The saddle, as cut by them, weighs eighteen or twenty pounds, and is sold in the Kansas market at eight cents a pound, the hide in which it is wrapped being thrown into the bargain by the hunter. The Kansas Pacific Railway brings in great quantities of this meat, and the antelope, unless in some way protected, will be speedily exterminated.

FIGHT WITH A WILDCAT.—On the 9th November, two sons of Prosper Le Duke, residing some six miles from Port Huron, Michigan, aged respectively thirteen and sixteen years, started out hunting, accompanied by a couple of mongrels, such as are "staple" to the region, and dignified by the title of "hounds." Just after leaving the Lapeer plank road, the curs began to bark, when the boys rushed to the spot and discovered what they supposed to be a very large coon, which was keeping the dogs at a very respectful distance. On the advent of the new-comers the cat commenced a retreat, the boys meantime attempting to make the dogs lay hold of the beast; but the cowardly brutes expended all their energies in barking. Fearing the animal would escape, the younger ran to head it off, but a closer inspection terrified the boy, and he turned to run, when, the cat giving a scream, sprang upon his back, burying her claws in his scalp and forehead. The elder sprang to the rescue. His movements disconcerting the cat, she raised her head, whereupon he planted a charge of B. B. shot in the throat of the animal, killing it instantly. The escape of the younger savors of the miraculous, as the shot must have passed within an inch of his head. An old musket, in the hands of a boy sixteen years of age, shooting at a distance of twenty yards, would place, we should judge, the brother's life in considerable jeopardy—more so than from the attacks of his assailant. The boys are rather jubilant over the adventure, and say they could not coax or drive the dogs within six feet of her feline majesty and she undoubtedly would have escaped had it not been for the imprudence of the younger, for in their excitement, the fact of the possession of a gun was entirely forgotten, being only remembered when the brute attacked the younger. The little fellow escaped without serious injury, his forehead being somewhat scratched, and losing some hair, his shock head preserving him from further injury.

ARONER.

LOADING PAPER SHELLS.

PHILADELPHIA, Pa., Nov. 18th.

EDITOR FOREST AND STREAM:—

Since the recent accident to Dr. Theabaud I have noticed several articles on the subject of loading shells, and it seems to me that the cause of it is quite misunderstood, and does not lay in a direction to be avoided by the precautionary measures advised by some of your correspondents. If we are correctly informed, he was loading the Eley blue paper shells, and had loaded nearly one hundred successfully, using the identical counter bored block to prevent the cap coming in contact with anything. He also used a brass cup-mouthed tool made by Dixon & Son. A very good thing to prevent the shells bulging, and also to place evenly on the charge wads, larger than the bore of the gun if persons wish to use them. So far all went well and would have continued to do so, probably had simply the pressure of the hand been employed, which is quite sufficient to place the wads instead of driving them with a mallet. True, the fact of merely one hundred being charged in this manner, without accident, would seem to refute my argument, but on general principles we hold it to be correct, and that the use of the mallet—at all times unnecessary and dangerous—led in this instance to fatal results; forcing the anvils against the fulminate, the lower base of the chamber being weak and defective. It is much to be regretted that this particular shell was not preserved, as it would at once determine the real cause of the accident, though sportsmen generally will cheerfully bear witness to the general excellence of those made by the Messrs. Eley, and considering the vast number of them used in this country every season, and used too, by many, in the most careless manner, it is really wonderful that we hear of so few accidents.

As to the recapping of loaded shells, suggested by some one, and protested against by others, we should say, that where a man was tired of the cares and anxieties of this life, and was desirous of obtaining reliable information concerning the next, no better plan could be pursued than the recapping process. True, a number of shells may be prepared before the funerals train makes a start, but start it will, and quite soon enough for the most enthusiastic recapper, and in this connection we would ask you, Messrs. Editors, the same question that has been propounded to me many times: "Have you used the St. Louis shell?" and do you find them to be the *par excellence* claimed the manufacturers? We have suggested to the St. Louis Co. the propriety of instituting a trial with 34 drs. in their shell against 5 in any other. Said trial to be public, or at all events in presence of persons chosen by disinterested parties. They claim to give us good penetration with 34 drs. as can be obtained in any other with 5, but so far we have only their statement to rely upon. Certainly we can try the experiment ourselves, but to demonstrate it fully, is not the result of a few random shots, and many have not the time to spare or proper means at hand, so we will again say, gentlemen of the St. Louis Co., give the Eley shell for example, a haze, and publish the results. "Engineer" is quite near you and would no doubt witness the trial and give us the results. By the way, we notice that in "Choke bores and How to Load," Mr. Greener pays quite a compliment to the brass shell, and we have always regretted that at the late *Trial* trial no guns using them were entered for comparison, for while admitting the greater convenience of the paper ones, we hold that for regularity of pattern and penetration, there is no shell equal to the metallic. Where guns are bored especially for them, and taking the muzzle-loader as a standard of excellence, they approach its conditions more closely than the crimped paper ones possibly can. We notice also in the same book that Mr. Greener is perfectly delighted with "American or Kay concentrator," and the compliments he showers upon it must be refreshing to the manufacturer, for there is nothing like a good word to encourage men in well doing in times like these, when no one knows who is to be President, and trade is so much depressed.

We have always felt sure that the day was not far distant when American genius would be above par in Birmingham, and these graceful acknowledgements of our skill even in the matter of concentrators, rejoices the American bird beyond description. "W. W." will no doubt receive an order for one of his best guns from the Kay Co., and every man in the United States by the name of Kay will place "Choke-bores and How to Load," in his library at once. By the way, Messrs. Editors, did it ever occur to you that the English government are very slack in allowing Mr. Greener to send guns to us that are sure death anywhere from 40 to 140 yards with Newcastle chilled shot. Suppose that England should again attempt to capture the colonies, do you suppose we would stand idly by and see the British lion walk over our native fowl when such destructive weapons are within reach? By no means, but look for us in the "las ditch;" at least look for me in one, providing it is dry and deep enough to be safe, and in that "ditch" will we not only descend to the villainy of hollow wads, but call to our aid the more potent charm of wire cartridges and "How to Load for all kinds of Game."

H.

Sea and River Fishing.

FISH IN SEASON IN DECEMBER.

Black Bass, *Micropterus salmoides*; Yellow Perch, *Perca flavescens*.
M. nigricans. Sea Bass, *Sciaenops ocellatus*.
Pike or Pickerel, *Esox lucius*. White Perch, *Morone americana*.

FISH IN MARKET.—The first shad of the season was received by Mr. E. G. Blackford, of Fulton Market, on Tuesday last, having come up from Savannah, per steamer Magnolia. Most varieties of fish are abundant and prices lower. We quote:—Striped bass 25 cents; smelts, 18 to 25 cents; bluefish, 12½ cents; salmon, 35 to 50 cents; mackerel, 15 to 25 cents each; weakfish, 15 cents per pound; white perch, 12½ cents; Spanish mackerel, 75 cents; green turtle, 18 cents; terrapin, \$12 to \$15 per dozen; halibut, 20 cents per pound; haddock, 8 cents; codfish, 8 cents; blackfish, 15 cents; flounders, 10 cents; sea bass, 18 cents; eels, 18 cents; lobsters, 8 cents; sheepshead, 25 cents; scollops, \$1.50 per gallon; soft clams, 30 to 60 cents per hundred; whitefish, 18 cents per pound; pickerel, 18 cents; salmon trout, 15 cents; hard shell crabs, \$3 per 100.

—There is lively work just now for the lovers of the finny sports off the southern coast of Long Island. The black or "rock" cod are very plentiful at present off Rockaway Inlet and Sheepshead Bay. On last Wednesday Captain Isaac Carson and Mr. John Lundy, of Gravesend, went out between the wreck of the Black Warrior on the Rockaway Shoal and the lightship, starting about half-past six in the morning and returning about five in the evening. In that time they took 400 fish, running from four to seven pounds in weight. The bait used was "skimmers" or sea clams. The cold weather has brought the fish down in such numbers that they sell for half a cent a pound in the wholesale market.

—The intense heat of the past summer, causing a marked decrease in water, drove the trout from their usual haunts in the Adirondacks, and knowing anglers therefore anticipate great sport next May in trolling, and afterwards with the fly.

—*Apropos* to salmon returning to their own river, Frank Buckland says in *Land and Water*, that a gentleman in the train near Iverness, informed him that a salmon, a native of the River Connon, was once caught in the nets at Aberdeen. The fish had been previously marked in the Connon by a ring put through his back fin; in two and a half days afterwards the same fish was caught in the ringpools at the foot of the falls of Connon. Besides the power of smell to distinguish their own rivers, salmon, no doubt, have a homing instinct which we civilized men do not possess, but which is more or less developed in the savage man. Horses have the homing instinct well developed.

—Some of the southwestern rivers give excellent sport to the angler. The two prime fish of that section are the black bass and pike-perch. A correspondent, writing from Jacksonport, Arkansas, under date of Nov. 27th, says:—

"Black and striped bass in quantity in White and Black rivers, reward the patient troller, and are never so good as at this season. The Jack salmon (*Lucio perca*) or glass-eyed pike, bite freely at the live minnow. Sport good, and result at table most gratifying. The angler who takes his gun along is rewarded by an occasional duck."

PENNSYLVANIA.—Black bass are increasing rapidly in the Susquehanna, and already afford good sport to the angler. The salmon planted in the river have disappeared, but the fish known as the Susquehanna salmon, or perch-pike, since the compulsory removal of the fish baskets, has steadily increased. November and December are the best months to fish for it. It sometimes reaches a weight of fourteen pounds and affords the angler exciting sport. For the table it has but few superiors, and in its habits and manner of taking the hook is very similar to the true salmon. Minnows are the usual bait although it will take the artificial fly.—*Germantown Telegraph Nov. 28th.*

—Some few years ago our fishermen threw away most of the fish sounds taken out of cod, haddock, and hake; but recently there has been quite a demand for this part of the fish, especially those from hake, which are valuable for the manufacture of isinglass. It is said that some \$30,000 or \$40,000 per year is paid Nova Scotia fishermen by exporters of those sounds. Could not an isinglass factory be set in operation in Halifax? It would certainly pay well, for this article is practically unlimited.—*Halifax (Nova Scotia) Herald.*

MOVEMENTS OF THE FISHING FLEET.—The fleet have not made much of a show the past week, there having been but 5 arrivals, 4 from Georges and 1 from the Banks, with light fares. The shore fleet have also done poorly, the fish having almost entirely left the grounds off this shore. If they should remain away, our fisherman will have to follow them up and find them in their new quarters, probably off the coast of Maine. Fresh halibut have brought 16½, and 9 cents for white and grey; fresh cod and haddock \$3. Herring are reported very scarce.—*Cape Ann Advertiser, December 24th.*

For Forest and Stream.

"TROUT" FISHING AT MOOSEHEAD LAKE.

NEW YORK, Nov. 17th, 1876.

I HAD not visited Moosehead Lake, since the fall of 1868, although my friend the Colonel had asked me every season to accompany him on his annual trip. This year, however, I made up my mind, to try again some of the old spots, and the first of September found us en route for Kineo. We fished about the house for a day or so and then, in company with "Black Hackle," tried our luck at "Brassua." But something was wrong and we had indifferent success. At last, one day the Colonel said, "Bill, let us try the east outlet, I think there is no one there." So we called Simon and started about 11 a. m., for that point. The wind was light and we did not reach the dam until 3.30 p. m. Then we left our sail boat, the "D. H.," and started down the Kennebec. The water was pretty high, but the fish were in the pools, and we took four splendid fellows before dark. We concluded to stay at the house (Wilson's) all night and try our luck down the river in the morning. Five-thirty, found us again on the rapids and such sport as we had, catching thirteen fish before we had eaten a mouthful of breakfast. At 9 o'clock, we concluded we had caught enough to "swear by," so we pushed up the river again, ate our breakfast and started on our return to the Kineo House. We reached there about 4 o'clock, and placing our string upon the scales, found that our seventeen trout "tipped the bar" at forty-three pounds. And we had the satisfaction of knowing that we had made the finest catch of the season.

"CARR."

SOMETHING ABOUT HERRINGS.—The history of herring is the history of civilization in the North of Europe. The Island Kingdom and its adjacent nations, in treaty sessions, have made the herring supply and demand an item of diplomatic importance. It would seem that when God formed the British Isles, and the farther north coast of Norway, as well as our continent, He fitted its waters specially for the herring race. This species of sea tenant come from the far down northward in vast columns, and divide, one half to our own northern continent, and the other part to the localities first named. The English policy, from its earliest ages, has been to claim everything within sight and reach as her own—earth, sea, and all that dwell within them. This is not all; for she rolled up her sleeves and clenched her fist and assumed an attitude of defiance to foes, if foes did not say amen to her demands. All the sea she claimed, as far out "as a man could see in a fair day." In treaties with Holland the herring power was at the right turn of the argument—the sea is mine, the herring therein are mine, pay, said England, before you fling the first net. Holland paid heavy and made the Dutchland wealthy. As early as 1164 we find the Dutch embarked in the herring fisheries. In 1204 they were plenty in the Baltic sea. In 1306 Tamworth, England, was a large herring depot, and fairs were held there. Ale and jollity abounded. It was the custom in that age to make a herring pie and carry to the king, from the first school that descended upon the isle from the northward. The coast of Norway, too, was a fruitful field for Dutch and English fishermen.

We find no account of barrelled herring until 1397, when the pickling method was discovered. Prior to this they

were not salted. The English were large consumers of herring. Noble families laid in generous stores for their own use. Each noble at this early age had feudal dependants by hundreds to feed, and fish was an important item to store up. Salmon, too, were in stock. The monk was content to feast on eels. The monasteries consumed them by the cartload yearly; indeed they were legal tender for rents of farming lands. An eel is loathsome—he squirms in the mud, calls upon his best wits for mischief in the night-time, like all rogues. The herring ambles gracefully on sandy shoals, the sun reflecting on its silvery side, and from the cook's hands is a dainty dish for even kings. In modern days the herring is an important article of commerce. The invention of pickling in barrels, near the close of the 14th century, gave the commerce of Europe a lift, as that method of preservation enabled the fish merchants to send to distant markets, requiring larger vessels. One of the prominent streets of London was named in honor of this discovery Pickling Herring Street. The tonnage of northern Europe and the United States necessary to catch and distribute the herring tribe is immense.

We are of the opinion, as before expressed, that the markets of Europe will be largely supplied with that fish from our side of the Atlantic. Their abundance and our superior methods of catching them, with superior vessels to market them, favor the enterprise. Load over fish, and return salt. We are capable of supplying with oysters from Virginia, barrelled herring from our northern waters, and halibut and cod, fresh, in ice, possibly from the Grand Banks or Georges, to the markets of England. The English people want *fresh fish*. The exportation of herring should consist of only the *first quality*, in strong barrels, honest weight, and branded, as a partial security for the integrity of the owner's pack. *No other will pay the cost of freight.* The Island has 30,000,000 of fresh fish eaters. At certain periods Norway, Sweden, the Baltic ports, France, can take a few cargoes of herring, for short catches are common there. A new source of supply to the nations of Europe necessarily must go through the testing stages. American herring have their reputation to make. The world takes rapidly to a good, honest article—they shun the inferior grades. The ages are all agreed that honesty is a virtue of rewards and profits. A gentleman is well known to the writer who has made \$100,000 by selling honest herring. His brand sells the cargo. Nobody cares to weigh it or unloosen a head. That man never deacons his fish—hence his reward. Gloucester has a great future in the fisheries of the world, hence it is well to plan upon solid maxims in the outset, so that it shall go out in all the land that they who seek that city as buyers of the wealth of the seas, fish, shall be justly dealt with.—*Cape Ann Advertiser.*

Rational Pastimes.

THE YALE—HARVARD FOOT BALL MATCH.

EDITOR FOREST AND STREAM:—

NEW HAVEN, Nov. 25th, 1876.

I would like to call your attention to the report of the Yale-Harvard foot ball match which appeared in your last issue. From beginning to end it is full of inaccuracies. Your correspondent speaks of Yale as "showing a reckless disregard to the rules governing on and off sides." Perhaps so. Yale knew enough of them however to win the game. Again we read, "Harvard succeeded in getting two touch downs, but as the wind was unfavorable no goals were kicked." This is not correct. Harvard in the first half of the game obtained only *one* touch down, and the wind was not unfavorable. It blew steadily down the field keeping the ball near the south goal throughout the game whichever side it might be that was guarding it. Thompson's "lucky" kick (a generous comment) was made while this wind blew. Again we read, "at this exciting juncture the crowd, which at no time of the game kept the proper limits, broke in upon the field and used up twenty minutes of valuable time," etc. This is utterly false. The crowd did break in, but no valuable time was lost. There was an interval of 6½ minutes which time the referee religiously added to the length of the game, as by the way he did all the time lost in disputes, making the game last 1h. 47½m. instead of 1h. 30m. Your correspondent says again, "finally, Cushing obtained a touch down and was just placing the ball for a kick at goal when time was called and the crowd rushed in upon the field." This is untrue from beginning to end. The ball was kicked outside the goal, and then time was called. The game had continued one and a half minutes beyond the proper time to stop, so Harvard may have the satisfaction of learning that her second touch down was gained unfairly, after the game had properly closed. Your report says, "Harvard claimed a tie." True enough. To her shame she did. But on what grounds? Certainly not by the Rugby rules, for there three touch downs do not count a goal; and if they did it would have made no difference as Harvard only secured *two*. Your report says, "the wearers of the crimson naturally desire another opportunity for retrieving their fortunes." Why should they? At the supper given the Harvard team and its backers, at Redcliffe's restaurant, Mr. Curtis, of Harvard, said that his team had been fairly defeated and he had nothing to complain of. He spoke moreover in the highest terms of the referee. Now Harvard wants another game. Yet when she came down to play us she made the express stipulation that there should be no return match, alleging that she had neither the inclination nor time to play again. We sought hard to change her determination but without success. She was confident of victory and did not intend to give us another chance, saying that even if she wanted to play us again the thing would be impossible. Is her eagerness for another match now a heightened proceeding? Speaking of the Freshman teams, your correspondent says, "a match between the Freshman teams had been arranged." This is untrue. On Thursday morning the president of the Yale club both telegraphed and wrote to the Harvard Freshman team that the Yale Freshman would not play them Saturday. In the face of this telegram and letter received by them before they had purchased tickets, the Harvard Freshmen had the assurance to come down and try to bluff Yale into playing. The fairness of this little game will be appreciated when we mention that Harvard had but one Freshman on the University while Yale had two. We don't want any hard feeling to exist between the colleges,

but when one side publishes such reckless statements as those which have been made by Harvard how can the peace be kept.

G. C. W.

FOOT BALL.

A good game of foot ball was played on Wednesday of last week, between teams of Columbia College and Starns Institute, on the grounds of the St. George's Club at Hoboken. The Rugby rules were observed. Columbia won the first goal in thirteen minutes, the second in eleven, and the third in six. The fourth was hotly contested and it was fifty-seven minutes before the New York boys scored this last and won. Mr. Woods of Columbia Law School was referee.

On Thursday on the same grounds a match was played between Yale and Princeton, in which Yale was again victorious by two goals to none. The attendance of spectators was very large, there being over 1,000 persons present. Yale had the kick off and after a few minutes play, Camp of Yale, managed to pass the ball to Thompson, who carried it under his arms through the opposing ranks and secured a touch down, when Bigelow sent the ball over the string and secured the first touch down for Yale; time 23 minutes. Princeton played better in the second round but the backing up of Yale was too much for them and Yale after some fine play on both sides secured the second goal in 17 minutes. Before a third goal was made time was called. The teams were:

YALE—E. V. Baker (captain), O. D. Thompson, W. I. Bigelow (backs), W. C. Camp, W. D. Hatch (half-backs), W. V. Donner, C. C. Camp, R. Wurts, W. H. Taylor, F. W. Davis, N. W. Walker (forwards).

PRINCETON—A. J. McCosh (captain), H. S. Thompson, Samuel Johnson (backs), D. Stewart, J. O. Denny (half-backs), Benjamin Nichols, E. H. Nichols, H. Stevenson, J. Potter, E. McCalmont, W. E. Dodge (forwards).

Umpire for Yale—G. T. Elliot, of Yale. Umpire for Princeton—E. W. Price, of Columbia. Referee—S. C. Bushnell.

ATHLETICS.

The Scottish American Athletic Club held its annual games on Thursday last. The list of entries was very large and the sports well contested. The events and results were as follows:—

Putting the shot—1st, A. W. Adams, allowed 5 feet, 41 feet 6 inches. One hundred yards run—1st in final heat, F. J. Higgins, time 10½ seconds.

Throwing 56 pound weight—1st, A. Thompson, allowed 2 feet, 22 feet 4 inches.

One mile walk—1st, W. M. Watson, scratch; time 8 minutes 50 seconds.

Four hundred and forty yards run—1st in final heat, J. H. Ferguson, time 1 minute.

Running high leap—1st, C. W. Roth, allowed 6 inches, 4 feet 8 inches.

Four hundred forty yards run—1st, Knox, Jr., allowed 30 yards, time 1 minute.

Throwing the hammer—1st, A. Thompson, allowed 12 feet, 89 feet 1½ inches.

Half mile run—1st, H. Scot, allowed 45 seconds; time, 2 minutes 33½ seconds.

Three mile walk—1st, E. C. Holske; time, 24 minutes 31 seconds.

One mile run—1st, C. Vought; time, 5 minutes 11 seconds.

BICYCLING.

A bicycle race for \$500 and the championship, between Wm. De Noielle, and Wm. McClellan, occurred at the American Institute building on Thursday evening last. The terms of the race were the best three heats in four, of five miles each. The first heat was won by De Noielle, in 15m. 12s. The second heat was won by McClellan by less than a length, in 14m 52s., and the third was also taken by him in 15m. 30s., and the fourth and last race in 15m. 25s.

SKATING.

The skating season of 1876 and '77 was opened in Brooklyn on December 2nd, on which day the ball went up at the Capitoline Lake and Union Lake Pond.

At Central Park, owing to the exhaustion of the supply funds, there are no means at command to incur the expense of preparing the lakes and skating houses for the public, and the promise is that there will be very little skating at command this winter, unless the snow does not cover the ice on the lakes.

At Prospect Park everything is in readiness for the opening of the skating season, as soon as the ice covering the lakes is of sufficient thickness to bear the vast crowds which throng the park on skating days. A feature of this winter's sport at the Park will be the opening of the new and handsome skating house erected in the place of the temporary structure hitherto used each winter. The large lake has been set aside for the use of the Ice Boat Clubs, the curlers and ball players, the inner lakes being devoted to skating.

BILLIARDS.

The "Pool Room Tourney" which was the billiard event of the past two weeks in this city, ended on the 29th ult., leaving the following players as the leading contestants.

Players.	J. Dion.	Rudolphe.	Slosson.	Garnier.	Daly.	Shaffer.	C. Dion.	Games won.
J. Dion.....	..	1	..	1	..	1	1	4
Rudolphe.....	1	..	1	..	1	1	1	4
Slosson.....	..	1	1	1	1	4
Garnier.....	..	1	1	1	..	3
Daly.....	1	1	3
Shaffer.....	0	..	1	..	1	2
C. Dion.....	0	1	1	2
Games lost.....	2	2	2	3	4	4	4	21

It will be seen that Joe Dion had the lead only by excellency in general average, it being a tie on the score of games won and lost between him and Rudolphe and Slosson.

COOKING FISH IN CLAY.—After preparing, cover the fish with clay two inches thick, and throw it into a hot fire. The clay hardens almost instantly, and the fish in its tough oven bakes through and through, retaining all its juices. The clay is then poked out of the fire, cooled with a dash of water, and a sharp stroke with a stick separates it from the fish. The fish's skin peels off with the clay, and the dish is ready. Brown bread and potatoes constitute the rest of the meal. A little experience will enable one to cook a fish perfectly in this way. The clay is a good absorbent of the strong odors of the fish, and takes away all but the sweetest and best flavors. Game is also delicious cooked in clay.

—Pride is an extravagant opinion of our own worthiness; vanity is an inordinate desire that others should share that opinion.—*Cummings.*

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

—The Florida *Agriculturalist* says that Mr. W. S. Abbott of New Smyrna, is building a schooner to run on the Hillsborough and Indian rivers, between Smyrna and Jupiter. In order to pass through the canal at the haulover, lighters will be stationed there to receive her freight and convey it through the canal to the opposite side, where it will be restored to the schooner again after she passes through. This will be of great service to the settlers along the Indian river, who will thus be provided with transportation from their doors.

CURIOUS OVERLAND VOYAGE OF A SCHOONER.—The Jacksonville (Fla.) *Sun* mentions the incident of the schooner *Ida Smith*, which was lying at anchor on the 20th of October, near the south shore of Mosquito Inlet, when the gale of that date was so severe on the Florida coast, struck her and drove her across the sand bar at that point, and over the marsh island for three-fourths of a mile, where, after the subsiding of the waters, she was left high and dry 170 feet from a creek of sufficient depth to float her. In her path across the island she swept down bushes and trees, which her dragging anchor and chains gathered up and carried along. Not at all discouraged at finding his vessel in such an unexpected predicament, Capt. Masters obtained help and commenced the work of getting the schooner into her natural element. Ways were built, and after constant labor for twenty-eight days the *Smith* was once more afloat. She sustained but very little damage, which was speedily repaired, and she arrived here, as stated above, on Tuesday.

A BIG POLAR BEAR.—The skin of an immense polar bear has been received by a gentleman in Norwich, Conn., from a friend on the bark *Isabella*, at Cumberland Inlet, with an account of its exciting capture, which the *Bulletin* prints as follows: "A party of men from the *Isabella*, including a number of Esquimaux and myself, were walking on the ice a short distance from the ship, when rounding a hummock, we unexpectedly discovered at a short distance from us a large bear, quietly feeding. We would have returned to the ship without disturbing it, as we were armed with only one rifle and a few spears carried by the natives, had not one of the several dogs that were with us announced our presence by a loud bark. The bear, as soon as it saw the intruders, began to advance slowly toward us, but was met by the dogs, who attacked the animal vigorously, but with little effect. He shook them off, and, after injuring three of them so badly that they had to be killed, he continued to advance. We discharged the rifle, and then fled to the ship, where we armed ourselves, and came out to look after his bearship, who had disappeared behind one of the numerous hummocks by which we were surrounded. We had searched for some time, when, as one of the Esquimaux passed the corner of a hummock, he came face to face with the infuriated animal. He gave a fearful cry as the brute struck him with one of his immense paws. The rest of us heard the cry and rapidly surrounded the brute, which stood perfectly still over the body of the Esquimaux. We fired sixteen shots, twelve of which entered its body, before it received its death wound. The native was insensible when we picked him up, and badly torn about the shoulder by the beast's claws, but was not seriously hurt. We took the body of the bear on a sledge to the ship; it weighed 1,575 pounds, and was ten feet one inch, from nose to tail, and eight feet and four inches around the thickest part of its body."

THE SPORTSMEN'S ROUTE.**Chicago & Northwestern Railway.**This great corporation now owns and operates over
two thousand miles of road, radiating from Chicago.
Like the fingers in a man's hand, its lines reach in all
directions, and cover about all the country north,
northwest, and west of Chicago. With one branch it
reaches Racine, Kenosha, Milwaukee, and the coun-
try north thereof; with another line it pushes through
Janesville, Watertown, Oshkosh, Fond du Lac, Green-
Bay, Escanaba, to Naganawee and Marquette; with an-
other line it passes through Madison, Elroy, and for
St. Paul and Minneapolis; branching westward from
Elroy, it runs to and through Winona, Owatonna, St.
Peter, Mankato, New Ulm, and stops not until Lake
Kameoka, Dakota, is reached; another line starts from
Chicago and runs through Elgin and Rockford to Free-
port, and, via the Illinois Central, reaches Warren,
Galena and Dubuque, and the country beyond. Still
another line runs almost due westward, and passes
through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar
Rapids, Marshalltown, Grand Junction, to Council
Bluffs and Omaha. This last named is the "GREAT
TRANS-CONTINENTAL ROUTE," and the pioneer
overland line for Nebraska, Colorado, Utah, Idaho,
Montana, Nevada, California, and the Pacific Coast.
It runs through the Garden of Illinois and Iowa, and
is the safest, shortest, and best route to Omaha, Lin-
coln, and other points in Nebraska, and for Cheyenne,
Denver, Salt Lake City, Virginia City, Carson, Sacra-
mento, San Francisco, and all other points west of
the Missouri River.**TO SPORTSMEN:**THIS LINE PRESENTS PECULIAR ADVAN-
TAGES—FOR PRAIRIE CHICKEN, DUCK,
GEESE, AND BEAUTIFUL SHOOTING. THE
IOWA LINE TO-DAY OFFERS MORE
FAVORABLE POINTSthan any other road in the country, while for Deer and
Bear Hunting, and for Brook Trout, Lake Salmon,
Pike, Pickerel, and Bass Fishing a hundred points on
the Northern and Northwestern lines of this company
will be found unsurpassed by any in the West.MARVIN HUGHITT, W. H. STENNETT,

G. W. SIMMONS & SON,
Boston, Mass.Sold everywhere in the U. S. by all first-class
dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT,"

made by

G. W. Simmons & Son.

This new design of WATERPROOF SHOOTING SUIT,
made from extra quality duck, has attained such
popularity as to be called for from all parts of the
country, and even from England."Shipping clothing to England strikes us very much
like sending 'Coals to Newcastle,' but the merits
of the 'BOSTON SHOOTING SUITS' have been
heard of in the Old Country, and that land of sports-
men has sent an order to Messrs. Simmons & Son,
which will doubtless be followed by many others."—
Boston Paper.The design embraces the best points of the English
and French Suits, combined with the necessary re-
quirements for American service. Particular atten-
tion has been paid to color.Each suit is water-proofed by a new patent process.
The seams and pocket corners are securely fastened,
and nothing neglected to render the suit perfect in
every respect.THE PRICE HAS BEEN FIXED AT \$13, TO IN-
CLUDE HAT OR DOUBLE VIOLETTED CAP. DE-
TACHABLE HAVELOCK, COAT, VEST, AND
PANTALOONS.One hundred suits will be kept ready in stock, so
that we can furnish to order any size required, at a
moment's notice.In the Golden Rule (Rev. W. H. H. Murray's paper)
the enthusiastic editor writes:—"We were shown, the other day, a new water-proof
suit, specially adapted for sportsmen, designed and
made up by Simmons & Son, of Boston, and to which
we call the attention of all brethren of the out-door
and shore-shooting fraternity, because it meets the
demand of personal comfort and convenience beyond
anything of home manufacture seen by us before.
As a sportsman, we give it our unqualified endorse-
ment, as combining the best points of the English
suits, and in addition skillfully adapted to the neces-
sities of the American service. It is a most admirable
and satisfactory contrivance in color, style, water-
proof quality and capacity. The coat is a marvel
in this latter respect."PERSONS ORDERING FROM A DISTANCE NEED
SEND ONLY THE FOLLOWING TO BE SURE OF
A PERFECT FIT: BREAST MEASURE, WAIST
MEASURE, INSIDE SEAM COAT SLEEVE,
INSIDE SEAM PANTALOONS; MENTION HEIGHT
AND WEIGHT.G. W. SIMMONS & SON,
"OAK HALL," BOSTON, MASS."THE BOSTON SHOOTING SUIT.—One of the most
successful manufacturers of Waterproof Shooting
Suits is the firm of G. W. Simmons & Son, Oak Hall,
Boston. We had one of their suits on duty at Hun-
ter's Camp at Philadelphia Centennial Exhibition.
It has grown gray in service, but is good for
use yet. This suit is known as the 'Boston
Shooting Suit,' in contradistinction no doubt, from
the garments which are manufactured out west and at
Washington, each of which has a local demand of its
own. It is said that the western prairie fowl can
distinguish any sportsman who visits their domain
by his clothes. They can tell him 'by the cut of his
jib,' and the old educated birds (which no one cares to
eat, by the way) know exactly what distances to
keep from the rail-shooters, the brant men, and the
chicken killers respectively, to be safe. They have
'got them all down fine.' This used not to be so be-
fore, the waterproof shooting suits were invented.
Bostonians, Hoosiers and Buckeyes all stood the same
chance then. But now it is—with a sarill pipe to lead-
ward by the old-weather cock—'here comes a Sim-
mons; cheese it!' or, 'Ere's a 'Enning—lie low!' or,
'Look out for Holabird! Scatter! you beggars, scat-
ter!'—FOREST AND STREAM.]

Sportsmen's Goods.

HOLABIRD,

THE ORIGINATOR OF THE PRESENT

Popular Shooting Coat.

Certain Eastern makers offer a Shooting Suit calling
it an entirely new design, when it is only a fac simile
of the

FIRST HOLABIRD COAT

I have made great improvements recently and am
offering complete suits for

\$10, \$15 and \$20.

A Fit Warranted in all Cases.

The \$10 suit is far superior to anything in the mar-
ket, both in style and quality, and the \$15 and \$20
suits have no competitors.Money refunded and Express charges paid
if not perfectly satisfied.

JAMES MEYER, JR'S.,

Girondin Disinfectant,

FOR

Kennel, Stable, Poultry Houses, Sinks, Water Closets, Urinals, Privies, Sick Rooms, Etc.

OR ANY OTHER INFECTION OR NUISANCE.

THE GIRONDIN IS THE

Most Effective, Powerful, and Cheapest
DISINFECTANT AND DEODORIZER.

It is, when diluted, an Inodorous, Colorless Fluid, which does not injure any object or material it may be applied to, which never fails to destroy contagion, and neutralizes almost instantly the most offensive odors, vapors or gases, and is unrivalled for the dressing of offensive wounds.

Its merits as a disinfectant and deodorizer are indorsed by a host of prominent names in the medical profession and the business community, railroad companies, car lines, hotels, etc.;

THE HEALTH DEPARTMENTS OF NEW YORK, BALTIMORE AND WASHINGTON,

The Public Charities and Corrections, J. Frey, Superintendent Gen. Drug Dept. Bellevue Hospital;

Charles Rice, Chemist, Bellevue Hospital, New York, etc.

THE GIRONDIN, therefore, is invaluable where men and animals congregate, or where any nuisance whatever exists, and needs only a trial to be universally appreciated. Its application consists in Washing, Scrubbing, Sprinkling, Diffusing and Ventilating.

PROTECT YOUR BUILDINGS.

Which may be done with one-fourth the usual expense, by using our

Patent Slate Paint.

(Fifteen Years Established.)

MIXED READY FOR USE.

Fire-proof, Water-proof, Durable, Economical and Ornamental.

A roof may be covered with a very cheap shingle, and by application of this slate made to last from 20 to 25 years. Old roofs can be patched and coated, looking much better, and lasting longer than new shingles without the slate, for

One-third the Cost of Re-shingling.

The expense of slating new shingles is only about the cost of simply laying them. The paint is FIRE-PROOF against sparks or flying embers, as may be easily tested by anyone.

It Stops Every Leak,

and for tin or iron has no equal, as it expands by heat, contracts by cold, NEVER CRACKS nor scales. Roofs covered with Tar Sheathing Felt can be made water-tight at a small expense, and preserved for many years.

This Slate Paint is

EXTREMELY CHEAP.

Two gallons will cover a hundred square feet of shingle roof, while on tin, iron, felt, matched boards, or any smooth surface, from two quarts to one gallon are required to 100 square feet of surface, and although the paint has a heavy body it is easily applied with a brush.

No Tar is Used in this Composition therefore it neither cracks in winter, nor runs in summer.

On decayed shingles it fills up the holes and pores, and gives a new substantial roof that will last 10 years. CURLED OR WARPED shingles it brings to their places, and keeps them there. It fills up all holes in felt roofs, stops the leaks, and although a slow dryer, rain does not affect it in a few hours after applying. As nearly all paints that are black contain TAR, be sure you obtain our genuine article, which, for shingle roofs, is

CHOCOLATE COLOR,

when first applied, changing in about a month to a uniform slate color, and is, to all intents and purposes, SLATE ON

TIN ROOFS

our red color is usually preferred, as one coat is equal to five of any ordinary paint. For

BRICK WALLS

OUR BRIGHT RED is the only reliable Slate Paint ever introduced that will effectually prevent dampness from penetrating and discoloring the plaster.

These paints are also largely used on out-houses and fences, or as a priming coat on fine buildings.

Our only colors are CHOCOLATE, RED, BRIGHT RED and ORANGE.

Gunpowder.

The Hazard Powder Co.,

MANUFACTURERS OF

Gunpowder.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 3 1/2 lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short gun.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close, and with great penetration. For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 lbs., and 6 1/2 and 12 1/2 lb. cans of 5 lbs. FFG is also packed in 1 and 1/2 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

PATCH.

From the Ontario County Journal.

MY dog is dead! "Well, what of that?" they say;
"Sometimes dogs die, and sometimes men do, too;
Beside, you know, each dog must have his day,
So thank your stars death took your dog, not you!"

O, false philosophy! Have you not heard
There is a Being mightiest of all,
Who rules alike o'er man, and beast, and bird,
Who taketh note of every sparrow's fall?

But I forgive you. Patch you did not know.
His was a nature loving, brave and true;
And were he now to hear you speaking so
I am not sure but he'd forgive you too.

Patch was a Cocker of the finest strain;
Proud in the consciousness of his blue blood,
To mix with other dogs he would not deign
Unless they traced at least back to the blood.

And thou, O Patch, wast brave. Many a day
Thou hast done battle with some humble bee,
Or butterfly, or cow. What in thy way
Soever came, it mattered not to thee.

And thou wast loving, Patch. And when the wind
To "vex'd Bermoothes" thy dear master bore,
He little knew the love he left behind,
Nor dreamed thy life went out with him from shore.

Yes, Patch is dead. "And what of that?" you say;
"Sometimes dogs die, and sometimes men do, too."
You're right, alas! The dog has had his day,
And I could wish that I had had mine too."

*Patch, the subject of the above obituary poetry, was the property of A. S. Williams, Esq., Canadaigua, N. Y., and was bred by S. J. Bestor, Hartford, Conn. Patch was by imported Romeo out of imported Juliette.

For Forest and Stream.

Notes of the Catskill Range.

THAT part of the Catskill Mountains which lies south of the valley of the Esopus, contains the headwaters of dozens of clear cold streams, most of which are celebrated as containing trout in large numbers, or to be more precise, were formerly celebrated; for their once apparently inexhaustible supplies are now sadly depleted. This region is also, with the single exception of the Adirondacks, the wildest and least settled portion of the State; the lofty and rugged hills and narrow sandy valleys, offering little inducement to cultivation, so that, although within a few hours travel of the metropolis, the errant angler can yet find here the log cabins and primitive life of the backwoods.

Originally the level lands and river bottoms were covered with a dense growth of pine, and the name Pine Mountains was once used to designate the entire district, but the pines were long ago felled, sawed into lumber, and rafted down the Delaware to Philadelphia, and the old settlers are brimfull of stories of exciting scenes on the long voyage down the rapids and falls of the swift rivers, or of still more exciting adventures in the streets of the great city, where it is a matter of record that on various occasions many a stalwart lumberman has succumbed to the wiles of the seductive "confidence man," and returned to his family minus his hard earned cash, but enriched by stores of experience.

After the lumberman came the tanner, and with him came destruction to the trout. Everywhere along the streams rose the long ungainly buildings, and the water that formerly flowed like liquid glass over its pebbly bed now ran red as blood, and foul with lime and ill-savored "leach," while the ground bark collected in the pools and sifted in among the gravel, driving the fish from their hiding places and destroying the spawning beds. The trout continued to breed, however, in the numberless cold spring brooks of the higher mountains, from which they descended into the larger streams, and it was only when the headwaters were attacked that they began to yield, until now the fisherman must penetrate to the sources themselves, and even there long must be the line and light the cast that calls up any but the unsuspecting youngsters, the fingerlings, whom every honest angler returns to their native element with a few words of good advice.

A list of the fishermen who have frequented these streams would include the names of every famous angler of America. Herbert, Bethune, Roosevelt and Norris. I might continue indefinitely, but have not all of them testified in print to the same effect; has not the gifted and unfortunate "Frank Forester" spoken in their praise, and does not the American Walton, honest, dogmatic Thad Norris,

indite countless pages in willing testimony to the charms of the Beaverkill and Willewemoc?

First among the streams of this region is the far-famed Beaverkill, indisputably the most celebrated trout stream of America, and worthy indeed it is of its high reputation. It rises on the borders of Sullivan and Ulster counties, and is formed by the union of several small, ice-cold streams, and its general course is southwesterly to its junction with the East branch of the Delaware. Near the head of the Beaverkill are several small ponds, some of which contain trout, as Balsam lake, Thomas pond, and others; some again, like Tunis lake, do not. Some of them also contain sunfish and bullheads, and I presume frogs, lizards and mud turtles likewise. The lizards I can testify to myself, having seen them on a hot day floating on the top of the water by hundreds, and evidently enjoying life according to the lizard view of the question.

The outlet of Balsam lake enters the main stream at the Quaker Clearing, where, once upon a time, tradition relates that a sturdy old son of Penn erected a log cabin, and, aided by a family of stalwart sons, made this clearing, extending across the river bottom and far up the side of the mountain. Now, however, the land redeemed by so many days and weeks of hardest toil, is abandoned to the wilderness, a tangled growth of underbush covers the mountain pasture, the places where fences formerly crossed the meadow are to be known by the lines of trees that have already attained to a respectable size, and it was only after a long search that I was able to ascertain the site of the house. Here is all the material for a thrilling tale of wrongs, of griefs, and all the dire concomitants of woe, but I refrain. If possessed the pen of a Prime I would hang upon this slender thread I know not what of sentiment and poesy; but I have not and the reader is safe. When the long and sunny days of June are drawing to a close, however, the wanderer by the Beaverkill will thank the old Quaker, whatever be his fate, for then the deserted meadow blushes red as roseate lights of eve with an endless profusion of wild strawberries, sour, pungent and refreshing as a draught of costliest wine.

East of the Beaverkill and parallel with it is its sister stream, the Willewemoc, known and dear to many an angler; near its head is Sand pond, lately rebaptized Lake Willewemoc, famous for the size of its trout; this pond, with Balsam and Thomas ponds, belong to the Willewemoc Club, and can only be fished by permission, which, however, I imagine can easily be obtained from the obliging officers of that association. This stream, like the Beaverkill, contains small sized trout in fair numbers. East of these rivers is the Neversink, in my opinion, the finest river of the whole region, although it is also the most persistently fished. It is formed by two branches that unite at the little village of Claraville, just on the line between the two counties. Either branch is a good sized trout brook, or river rather, about fifteen miles long, and they formerly contained an almost inexhaustible supply of fish; at present, however, it requires a long and patient day's work to fill even a small basket. Some few years since, when I first fished this stream, a party of men, who drove over the mountains from the valley of the Esopus in three days' time, caught more than fifteen hundred trout, and they were only one of several dozen similar parties that season. The West branch of the Neversink has two tributary streams, Fall brook and Biscuit brook, so-called from the "biscuit" stones found in its bed; both of these contain large numbers of small trout even at the present time. Northeast of the headwaters of the Neversink are the sources of the Rondout, otherwise known as the Lackawack, and sometimes called the Sandberg, although I believe the latter name belongs properly to a tributary. There is near the head of the Rondout a hamlet known by the suggestive name of Sundown, and rattlesnakes are also said to abound in that vicinity; accordingly all anglers who fish the Rondout carry with them large supplies of snake medicine, otherwise and commonly known as old Rye.

The Big Indian, a tributary of the Esopus, rises only a few hundred yards from the Neversink and after flowing eight miles or so through Big Indian Hollow, which, by the way, is as pretty and picturesque a valley as the traveler often sees, it unites with the main stream and pursues a tortuous course to the Hudson.

North and west of the Big Indian are several streams, the best and most celebrated of which are Mill brook and Dry brook; in addition to these there are many more smaller streams, to all of which the same description will apply; they are clear, cold mountain brooks that come

tumbling over boulders and ledges and usually contain a fair supply of small trout. Indeed, all the trout of this region, even in the larger streams, are small; from a quarter to half a pound is a good weight, anything above a half is large; the largest trout I ever saw caught in Ulster or Sullivan counties weighed four pounds and two ounces, after several months spent in a tub with an unlimited supply of mummies to feed on. He was caught in the main stream of the Neversink, and weighed when captured three pounds and a half. Such a fish, however, is a rarity, and an average day's catch will not contain a fish more than a foot long, running from that size down to five inches; those shorter yet are usually returned to the water, as they should be, and as they will be when they come into the hands of honest anglers.

The scenery of this region, especially in the mountainous portions of Ulster, is second to none in the State for picturesque beauty. Slide Mountain, at the head of Big Indian, disputes with several others the honor of being the loftiest peak in the Catskill, and many others, as Peckamore, Denman Hill and South Mountain, are inferior only to Slide. One mountain, if old Bailey Beers, of Dewittville, known and beloved of many anglers as the oddest and best of innkeepers is to be believed, bears the peculiar title of Shingley-moose-von-shunk, which may be Indian, Chinese or Sanskrit for all I know, but more probably it is neither, but merely an effusion from the fertile brain of the said Bailey; but all who know Bailey can forgive him even such a name as this in consideration of his many virtues and his marvelous skill at "drawing the long bow." Long may he and his old woman live to welcome the angler to the Neversink, and we need not object if some appreciative fisherman includes his pretty grand daughters in the same wish.

The distinctive trees of the southern Catskills are the birch and the maple, and from the latter the woodmen make their sugar in the spring, and often in the winter, when their scanty stock of hay runs out they fell young maples and allow their cows to browse upon the tender tops, and the cattle thrive on his peculiar diet. Often when the angler is taking a short cut to his fishing ground, by some mountain path or abandoned back road, he will see these same cows watching him from the brush, and if he ever doubted the possibility of a cow's being beautiful he will doubt no longer; the cow of the Catskill is a sleek and smooth-skinned animal with slender legs and meekly curious eyes; and when one meets them browsing on the underbrush along some mountain brook they seem almost like the deer that once roamed in plenty on these hills.

In the wilder portions of the district, about the head of the Beaverkill or in the dense woods that crowd the valley of the Biscuit, the lonely fisherman will often meet the "prickly porcupig," as my friend Pierrepont used to call him, or he may start a wandering mink or woodchuck, who will scuttle off into the brush in great precipitation, or, if he is lucky, indeed, as he hastens home through some dusky balsam thicket in the gloom of the evening, he may come upon a black bear taking a twilight stroll before executing a flank movement upon some unprotected pig sty.

This is a country of springs. You meet them everywhere, dripping drop by drop down some ledge of broken slate, or tumbling headlong out of a pile of boulders, or else bubbling up from the oozy grounds in the midst of weeds and wild flowers. They are all cold, and in some that I know of the thermometer will not mark above forty degrees in midsummer; the main streams themselves are cold enough to drink from all the year round, and when one makes his first plunge of a morning into their icy torrents it will cause his teeth to rattle like the bones of an end-man on a minstrel stage. The extraordinary clearness of the water is another snare for the unwary, and many a novice has confidently stepped into what seemed a shallow pool, only to find himself undergoing baptism by immersion. The inhabitants consist of two distinct classes, the tannery hands and the settlers; the former are usually Irish, and frequently undesirable companions, while among the settlers, who dwell in log cabins and frame shanties along the streams, or in more pretentious houses in the villages, you will often find men like Bailey Beers, mentioned above, in whose company many hours can be passed with pleasure, and not without profit also to a student of human nature; many of them have lived since childhood in this neighborhood; some have never traveled further than to Ellenville or Rondout; and know hardly anything of the great world that works and rejoices, sorrows and is glad, beyond their blue hills; and again you will find occasionally a man who has wandered over half the globe

and stranded at last in this rough corner. You will meet anglers often enough who will say, "Oh! I have been to the Beaverkill," or, "I have fished the Neversink;" who will find it hard to associate the streams they know with log cabins, rough clearings, gnats, flies, and all the other peculiar characteristics of a backwoods settlement; but they have seen only the lower portion of the streams, and know nothing of the thousand beauties of mountain and forest, amid which they have their birthplace. Year after year I have visited them, stopping often with my old friend Bailey Beers on the Neversink, or else asking a lodging, which was always gladly given from Maybin of the West branch, or honest Pat Lake on the Beaverkill, or, sometimes, and this is best of all, making my bed of fragrant balsam boughs, and with a fire at my feet, sleeping as soundly as if in a bed of softest down, miles from the nearest habitation of men.

I have fished the Beaverkill, the Neversinks, the Big Indian, from where they were mere mountain springs that I could dam with a hand, and their eddies, holes, and shingly rifts are as familiar to me as the crossings of Broadway. Many streams there are where the trout are larger and more plenty, where the mountains tower more grandly upward, and the wilderness spreads in denser solitudes about, and I hope to make my summer camp on many such; but nowhere are there clearer, colder waters or more lovely valleys than amid the birch-clad Catskills, and many a veteran angler recalls, with a well-remembered thrill, his first cast on an Ulster or Sullivan trout brook.

The glory of these streams has departed, it is to be feared, forever; but even now the angler who possesses patience, some degree of skill, and the strength to wade all day on slippery rocks, knee deep in a torrent of icy waters, will be amply rewarded for his toil.

Such is the best natural trout country in the State, and perhaps in the world, where every valley contains a river, and every river contains, or did contain, abundance of fish; the numbers that have been taken from its waters are beyond the power of computation, but they are rapidly becoming extinct, and there is no chance of their lasting many years longer unless the people can be compelled to desist from pursuing them in season and out, with all the appliances and means the ingenuity of man can invent for their destruction.

Some help was once looked for from the Fish Commissioners of the State, but these learned gentlemen seem to have been expending their energies on some undiscovered country, and excepting the single instance of the shad the results of their labors have been so far imperceptible. An occasional article will appear in the papers stating that so many thousand salmon had been placed in the Oswego, or Crooked lake, or the Erie Canal, but the salmon seem to keep out of the way subsequently with remarkable success; perhaps the pickerel and perch of these favored streams or ponds could tell us something of their whereabouts. A few more years, however, may develop the idea that certain kinds of water are adapted to certain varieties of fish, and that the salmon and perch families dwell together only on the terms of the lion and the lamb, one within the other.

WALTER S. ALLENTON.

For Forest and Stream.

GROUPE FISHING AT SARASOTA.

WHILE I had been enjoying myself so extensively with the deer, it may be remembered that Mr. Woodruff was trying his luck with the redfish, but it seems that I had all the luck there was about the place that morning, for he caught no redfish at all, only one salt water trout and four of five bone fish, or as they are contemptuously called by the coasters, "carrahoes." They are a very slim built fish, about twenty inches long with a very large eye, mackerel like tail, and such a supply of bones as to make them worthless for anything except bait and guano. Very large schools often come in from the gulf. I consoled with him for his want of success, and it was decided that I should go with him the next morning just to break the luck.

Accordingly the next morning soon after breakfast we took my skiff and pulled over to the island. The first thing in order was to procure bait. Mullet is the handiest and quite as good as anything, all things considered. Every one who has fished in Florida waters know that they are the fish of the country, being quite the equal of the mackerel when they are fat, but they do not take bait readily, and are caught for home consumption with a cast net. And by-the-way, the same cast net is almost an indispensable Florida institution, for I have never seen one in use further north than South Carolina. I don't see how a man could live on the coast here without one; they are an absolute necessity, and I should think would prove valuable in some waters at the north. I often saw the need of one while on this cruise, and would never start again without one. Mr. Woodruff had a good one, and as he is an expert in throwing it, we soon had a large mullet flopping in the skiff. They are too poor at this season for table use, but from September until after spawning, in November and December, they are usually so fat as to yield enough grease to fry themselves in. I proposed that instead of trying our luck at redfish, with very likely the same success he met with yesterday, we should pull out into the channel and see if we couldn't find where the groupers were. Mr. W. informed me that he did not think a single grouper had been caught in the channel since I left, seven years before. He had directed several of the new settlers where to go, but they never caught one, and he believed they must

have left; perhaps the sand had washed over the rocky bottom they used to frequent so as to cover it. This was not very encouraging news, certainly, but I insisted that we try them awhile anyhow, and if they would not bite we would fall back on the redfish as originally planned.

When I lived here I had the bearings of the ledge in the channel from a snag which was stranded on one of the shoals; but this was gone, so there was no recourse but to hunt it out. Did any of my unscientific readers ever surmise that the position of certain kinds of rocks can be discovered in quite deep water by the sound they make? The first time I was told to look for the grouper ground, by listening for the rocks on the bottom, I thought my informant was trying to guy me, or that if a noise was heard it must be from the barnacles on the bottom of the boat instead of the bottom of the channel. But he was right about it, and it was in this way that we proceeded to find the spot. I pulled out into the channel and towards the main land. About every hundred yards I would rest on my oars, and placing my head as near the bottom of the skiff as was convenient, would listen intently. This must have been repeated seven or eight times, and we were fearing that we had chanced to pass on one side of the rocks, when my ears were greeted with the well remembered sharp crackle. Mr. Woodruff could also hear them plainly while sitting up erect. If the rocks were on the feed so briskly the fish ought to be in the same mood; so over went the killock, and we swung around to the tide, which was coming in fast. Now, to know the best or worst will take but a very few minutes. Mr. W. was the first to wet his line, as I had to assist my little son with his gear; but I was soon with him, and what was more to the purpose, I had the first response from below, which turned out to come from a fine red grouper that would weigh from six to eight pounds. The fish had not all left, that was sure, and for an inside fish this was a large one. Seven years ago I seldom caught one here in the channel of over five pounds. If larger fish were wanted they could be caught in any quantity a few miles outside. Before I had got my line ready for another cast my little boy heard from the depths. He laid back to it, like a plucky little fellow as he is, but the line was cutting through his fingers in spite of his efforts, and I told him to let go. The line was fast to a tholepin, and whatever was on the hook was brought up all standing for a moment, and then something seemed to give way down below. On pulling in the line the hook was found to be nearly as straight as a needle. A shark likes mullet better than any other food, and probably one had taken hold of this piece. I formerly lost two hooks to them for every three fish caught. Mr. W. now began pulling in line in an excited manner. "He is a big one, Major," and so he was, a fine black grouper of ten pounds. The black groupers are slimmer built than the red, being shaped a little like a codfish. The red grouper is a very handsome fish when first taken from the water. The inside of the mouth is the most brilliant scarlet. As to the flesh tastes differ; some prefer the black, others the red. Either are good enough for me, and whichever I happen to have at the time is the best. They are never poor, always fat, and the head and shoulders make the richest stew or chowder of any fish I know of either in northern or southern waters. The sport continued lively for half or three-quarters of an hour, during which we caught eleven red and two black groupers. Three small sharks from three to four feet long were brought up alongside, and after plunging a sheath knife through them until they were quiet and docile, were allowed to drift away with the tide. We had already more fish than we needed for our own use, but Mr. W. was too much elated and excited with our success to think of quitting as long as fish would bite and our bait lasted. There were plenty of neighbors who would be glad of a fine grouper for their dinner, and with that thought to appease conscience we kept on fishing. Indeed, I didn't need much urging, when I saw that the fish would not spoil on our hands. We waited for half an hour without a bite, and then decided to change our location a few yards further towards mid channel. Perhaps we had caught all there were in this hole in the rocks. There was just the same depth of water at the new place as at the last—three fathoms—and the rocks were crackling away quite as lively. My hook had barely reached bottom when something seized it. It was not taken just as a grouper bites, and yet as I pulled it came towards me much as a heavy fish of that kind does at the start. I thought I had got a twenty-pounder, when all at once the line stopped coming in as suddenly, as though the hook had caught on a rock. This seemed rather mysterious, but there was not more than a second or so of time to think out an explanation, when there came a surge upon the line which no strength which I could exert seemed to retard in the least degree. I must either let the line slip at lightning speed through my hands, or follow it overboard. I had no fancy for the latter, as this new development of power showed there must be a shark of unusual size on the hook, whom I did not care to interview in his own element, at least not in three fathoms of water. Before I had lost over three fathoms of line, which, by-the-way was a brand new coddling and very strong, I managed to get a turn of it around a tholepin, and when the boat swung upon the cable towards him, the extra strain brought him so near the surface that we made him out plainly; and he was a monster for these waters truly, for I know I am within bounds when I put his length at twelve feet, although I honestly think fifteen nearer the mark; but times were just a little exciting at that moment, and I would not like to exaggerate, or even knowingly throw myself open to the suspicion of doing so for no one shark, more especially

as I have picked up teeth at Sarasoto partly fossilized which a competent naturalist assured me came from a true shark much over a hundred feet long. We will let them tell the big stories. As this one surged over on his side at the surface I seized the sheath knife to cut the line, as I feared he would either pull the skiff under, or capsize us, as we now had a pretty good load in for so small a craft, but the instant before the knife touched the line something gave way, much to my delight, I assure you. On pulling in I found the hook had broken squarely in the bend; but I felt perfectly satisfied with it, and don't want any stronger hook for grouper fishing from a light skiff where large sharks are liable to take a hand. I don't remember that I ever was quite so well pleased at having a hook break before.

After the excitement had subsided we got at the grouper again and took six more before our one mullet was exhausted as bait. Twice during that time our attention was attracted by the back fin of a very large black shark, which cruised around us only a few fathoms away. Of course we could not know it to be the same one, but he certainly acted, with the help of a very little imagination on our part, as though he didn't like things in that vicinity and considered himself ill used. We tried by hallooing at him, splashing the water and rattling the oars, to frighten him away, but with doubtful success. He left when he got ready, and we left when our bait was used up. But our boat was a sight worth seeing, either by a sportsman or an artist, for the colors of both kinds of groupers are very brilliant when first taken from the water, and our's were grouped together upon broad palmetto leaves, which we had taken along to shelter them from the sun. I doubt if such a fine collection had ever been seen, and we could not refrain from sending to the nearest neighbors and inviting them over to take a look before we unloaded and weighed. The score lead off with two beauties, which looked perfectly alike, at 15 pounds—30; then one at 14; three at 12—36; two at 11—23; four at 10—40; three at 8—24. two at 6—12; two at 5—10. Total, nineteen fish, 189 pounds, or averaging nearly 10 pounds each. Bear in mind that this is "inside" fishing, done a little less than a mile from the main land, over two miles inside the outer bar, and quite close to islands so completely protected from rough weather that it is safe to visit it at any time in a small boat. By taking a boat of suitable size for outside work and running out until you just sink the land, much larger fish can be taken, and a boat can be loaded down in an hour. The large smacks which fish for the Havana market often take in a full load in two days. Fish which weigh under ten pounds are seldom caught, and must weigh at least that to be considered a "counter." But that outside fishing rapidly degenerates from sport to downright hard work. Instead of pulling a ten or twelve-pounder up through three fathoms of water, here it is on an average a twenty-five pounder, and the depth from fifteen to twenty fathoms. Finger stalls are needed, and certainly there is no sport in having a big Jewfish, or "warsaw," as they are sometimes called, lay hold of your grouper just as you have got him well started on his upward journey. The Jewfish weigh from two hundred pounds upward, and seem to be attracted by the fluttering the grouper makes when he is first hooked, and take him in. They are a great annoyance to the snapper fishermen from Pensacola. One was recently caught and brought into port weighing 250 pounds, which had just taken six seven-pound snappers; they were all in his maw with the hooks in their mouths.

MAJOR SARASOTA.

THE GAME AND FISH OF MISSISSIPPI

VICKSBURG, Miss., Nov. 20th.

EDITOR FOREST AND STREAM:—

I have never seen mention in your paper of this part of the country as a place where fish and game abound, and yet there are localities not far from here which are unexcelled in these particulars. There is a region of country lying north of the Yazoo river and east of the Mississippi, known as the Deer Creek and Sunflower country, in which such game as ducks, turkeys, deer and bear are abundant, and in the rivers and lakes of which there is no reasonable limit to fish. The Sunflower river is a tributary of the Yazoo, which latter finds an outlet into the Mississippi, fifteen miles above this place. For ten miles above its mouth it is dead water, when what is known as Oliphant's bar sets in, making navigation even to the smallest sized steamers quite difficult in low water. Perhaps fifty miles above the mouth are the Mussel Shoals, where mussels abound by the million, and where the river spreads out over so broad a surface in proportion to its volume, that all boats at this season of the year are compelled to pull over with cable and capstan. In other, and, indeed, most all places, the stream is so narrow and crooked, and full of logs and driftwood, that in many places a boat will not average over two or three miles an hour. In every direction are lowlands. The territory is almost a dead level, and during floods in the Father of Waters it all goes under. In the year 1867, it is supposed not a foot was uncovered, except the mounds which abound hereabouts. The river rises near the northern part of the State, and runs parallel with the Mississippi about fifty miles to the east of it, and passes through as fertile lands as any under the sun. They do not overflow as readily as those nearer the great river, and were they not so difficult of access would be much more valuable. Settlements are mostly on the river front, or cross lagoons and bayous, but they are not numerous anywhere, and there are many places where a man could travel days at a stretch, on foot, and not see a human habitation,

At this season of the year the swamps, as they are called, are dry, and but for the obstruction so frequently offered by the innumerable and almost impenetrable cane brakes, locomotion would be comparatively easy. Here and there are sloughs and bayous in which water still remains, and now and then are small lakes, all of which abound in fish, and are visited by great flocks of ducks, which fall an easy prey to the hunter.

In some parts of these swamps the bear are so abundant that, during roasting ear season, they do great injury to the fields by eating the growing ears, and at all times make it almost out of the question for the planter to raise hogs. Three years ago, while staying with a friend near the head of navigation, one day, sitting in the portico, we heard a hog squealing just above the house on the opposite side of the stream. The proprietor hastily took his needle gun and ran up there, when he found Mr. Bruin trying to make a meal off pork. It was an easy matter to bring him down with one shot. A neighbor of my host, by the name of Flannagan, who had a horde of bear dogs, had killed forty-three bears from January to the first of August, and he did not feel that he had done wonders at that.

A party of eight, headed by Dr. E. S. Henry, of this city, took the little steamboat Vicksburg, at sundown, on Saturday, intending to have a little fishing and hunting on the Sunflower. The boat was not a large one, but it had clever officers, and the party were made comfortable and at home. We reached the mouth of the river before daylight, and the foot of Oliphant's bar at about nine o'clock Sunday morning. In that wild region people, perhaps, forget the Sabbath day, for no sooner had the boat run her nose on the ground, and the mate began to put out his cable to haul her over, than one Nimrod had his "dug out" overboard, and himself into it with his shot gun, paddling for the shore. In a few moments we heard two shots from him, and began speculating upon his success. In the meantime, two other members of the party had their rods rigged up, and with small chunks of fresh beef for bait, were trying to entice the catfish. This resulted in the capture of one fellow about fifteen inches long. The hunter returned in about an hour without game, having made his two shots at squirrels. But finding the boat still worrying with the sand bar, he put off again, going higher up the stream, and when he came back at the call of the boat's whistle, he brought with him two squirrels.

After a day and night of hard wrestling with snags, logs and driftwood, poling the barge and the boat around the sharp turns by means of long poles in the hands of the rousta-bouts, we reached our destination at the mouth of Darling's bayou, at five o'clock Monday morning, and were put off, bag and baggage, upon the high sandy bank, in close proximity to a large pile of dry drift-wood. Here we put up our tent, and as soon as daylight was fairly at hand, all the members of the party except Capt. Auter, who bossed the arrangements about camp, were either in the skiffs we had brought along fishing, or were striking into the forests with their guns in search of game.

The first gentleman ready with hook and line, in his eagerness to get his work fairly in, baited his hook with a piece of fat meat, and it was not long before he had a couple of catfish "flopping" on the bank, and then a nice bass. It was the first time I had seen a bass so far forget his dignity as to strike at a piece of fat meat lying still in the water. But during the morning we hooked and captured quite a number with no other bait than small strips cut from the sides of some small perch we caught. Later in the day, however, we discovered a place where we could obtain minnows by the million, and from that time out used them freely. The bass bit ravenously during the day, and the fishing party were enabled to carry more into camp than could be used or saved, as the weather was pretty warm.

The second day was cold and rainy, and the larger part of the party remained in camp. The fish would not take hold freely, and only a few dozen were captured. Up to this time the hunter's had killed a few ducks and squirrels, and wounded a deer and a turkey. The gentleman who wounded the deer, tracked him so eagerly that he neglected to keep his bearing, got lost, and did not reach camp until a party of discovery went out and hunted him up.

On Wednesday morning, at five o'clock, we heard our steamboat whistle at the landing, five miles above, on her way coming back. In a moment all was bustle and confusion, packing up. In an hour or so the boat dropped in at our camp, and took on the luggage and about half of the party. The others, after supplying themselves with minnows, took to the skiffs and floated down the stream, stopping for a while at such points as gave indications of bass. These elegant fish seemed to be ravenous, and even tried to swallow our bobs. The fishermen actually became surfeited, and laying aside tackle started on the run after our steamer, which was overtaken about three o'clock in the afternoon in the narrow and crooked part of the river, where she and her large load of cotton were making but little, if any, over a mile an hour. The boat tied up at dark. As she had passed up, she ran of nights by the aid of a pine torch at her bow, but could not well do this going down with a load of cotton.

The next morning the larger skiff was put overboard, and three fishermen with our darkie went into it, where they remained all day overhauling the boat near the mouth of the river. Three hunters took the shore, and one his dug out alone down the river. These were all picked up a little after noon, having killed some ducks and squirrels. The fishermen had a field day of it, and brought in a magnificent string of black and striped bass,

Vicksburg was reached at daylight, on Friday morning, by a party who had enjoyed themselves hugely. Messes of fish were sent about over the city to friends.

It is a wonder this place I have written about is not visited by more sportsmen. There is, perhaps, no place on this continent where the game I have described is more abundant. It is not very hard of access, the people are genial and clever, and a man seeking a quarter in which to while away his time with the gun or rod, and meet with good success, cannot find a more favorable locality.

B. H. P.

COURSING HARES IN CALIFORNIA.

The California Pioneer Coursing Club—the only organization of the kind in the United States—has introduced hare hunting on this coast. The Club has been in existence several years. Its annual meetings are held in November, usually in the San Joaquin valley, where hares are most numerous and the country best adapted for the sport. Merced is generally chosen as the rendezvous.

On Tuesday afternoon, the members of the Club in San Francisco, accompanied by friends, started for Merced by the four o'clock train. The dogs, rugs, shot guns, valises, and sportsmen comfortably filled two cars. The journey was not a pleasant one for those not deeply interested in "dog talk." The whole town of Merced—that is to say, the seventy-five saloon keepers, four livery-stable men, three grocers, and a few obscure citizens—had assembled to receive the visitors. There was a startling premium on teams, and seedy plugs, that would never have escaped the poundman in a more pretentious town, were eagerly bid for.

In the pool-buying every one took a hand. Gentleman Jones, having won last year, was the favorite. Judge Pennie risked trade dollars on him in a way that was wildly indiscreet.

At eight o'clock in the morning the start is made from the hotel. The hotel keeper acts as guide. Behind comes a motley cavalcade indistinctly seen through the cloud of dust. Four-horse stage coaches jolt over the squirrel holes; "buck-board" teams skim past them; dilapidated buggies rattle along the plain, and lank mustangs plod with infallible sure-footedness through the gopher-holes. As the distance from home increases, the Indian file of vehicles and horsemen becomes broken. The mist floats heavy and thick over the brown plain. On we go, keeping in sight of the hotel-keeper's white duster. A hare, feeding in some stubble by the side of the trail, crouches down and watches the strangers in amazement until a pistol bullet rouses him to a sense of personal danger, when he speeds away amid a chorus of howls from struggling dogs who are with difficulty held in. Ploughmen rein in their long teams and stare, and a vaquero turns his mustang and comes at a wild gallop toward the sportsmen, with his arms and legs flying and his body swaying in the manner peculiar to Mexican riders. Now we swerve from the trail and follow a wagon track running by a creek. Some of the mustangs are beginning to wilt visibly, and many of the teams have dropped far back toward the horizon. Even the best horses show that the sharp ride has told on them, when the hotel-keeper halts at a rickety old barn. Here the sport is to begin.

At last the stragglers have all arrived with the exception of a few who, either from bad horsemanship, or slow mustangs, have been left so far behind that it would be foolish to wait for them. Ex-Sheriff Adams, as President of the Club, now assumes direction and announces that no dogs will be allowed to run loose, and there must be no shooting within half a mile of the teams. The latter announcement falls with crushing effect on a party of verdant sportsmen who have brought shot guns in the belief that the object of the Club is to kill the greatest possible number of hares. The dogs are all tied up with the exception of Mr. Adams's Ruler and Davidson's Sandy, which are placed on the slips. The teams form in line, with a field-steward on either side. The judge rides about fifty yards ahead, and the slipper, Frank Taylor, follows, holding the dogs. They have got about one hundred yards from the barn, when Dr. Sharkey, after a valiant tussle with two impatient dogs is vanquished, and the beasts charge directly in front of the dogs in slips.

"Halt!" roars the judge, in a stentorian voice. "Whose dogs are those?"

The doctor acknowledges reluctantly that he is the unhappy owner.

"Fined \$5, sir. Go ahead, Mr. Judge."

The dogs are caught and the cavalcade advances fifty yards further, when a hare springs from a bunch of weeds, and is a hundred yards off before the dogs see it. When they do, they plunge furiously forward, dragging the slipper after them. He holds them a few moments until they are straining evenly on the slip, when he pulls the spring and they are gone like a flash. Four hundred yards on a straight line and they have turned the hare. In the next hundred, Ruler is doing all the running, when the attention of the spectators is drawn to a black dog which has arrived with a new-comer, and joined in the chase. The other dogs outrun him easily, however, and before he come up, the hare escapes in the weeds. The teams halted when the dogs were slipped, and none but the owners or deputized persons are permitted to go after the dogs. The judge rides at a full gallop as close as his horse can run to the hounds, for the race is judged by points, and it is necessary for him to be near at hand when the hare, in its death struggle, twists and turns to avoid the relentless pursuers. Agility in turning, bursts of speed, and success in killing the hare, are each rewarded by a certain number of points. A race seen at the distance of several hundred yards and close at hand may present different aspects, and the owner who is behind rarely entertains the same opinion as the judge, unless the latter decides in his favor. The present race being decided in Ruler's favor, the President again asserts himself.

"Who owns that black dog?"

A meek old gentleman, leading the wretched culprit, replies, "Mr. Parr."

"Fine Mr. Parr \$5. Go ahead, judge."

This time Dominick Shannon's Empress and Jerome Deasy's Sallie Kearns are in the slips. The teams press a little closer on the slipper, when a demented hare, which might escape by lying still, bounds into view. Shannon throws the dogs off, and in two hundreds yards the hare is turned by Empress, who shows wonderful speed,

Baffled on a straight run, puss turns back and is met by Sallie Kearns, who misses her. Empress again takes the lead, and, after several turns, cleverly kills within three hundred yards of the team. Empress is an easy victor, the other dog scarcely scoring a point.

The mist has long since cleared away, and, far as the eye can reach, yellow stubble and brown prairie stretch toward the horizon. Against this dark ground the red jacket of the judge looks picturesque and harmonious. The blue and white habit of a country lady who has ridden up to see the chase is in pleasing contrast to the broadcloth and linen of the city folk. Hither and thither over the plain the cavalcade wanders after the judge, the tramp of horses and rattle of wagons startling the hares, which otherwise would lie close and elude the dogs.—*San Francisco Post*,

Fish Culture.

AN AQUARIUM IN PHILADELPHIA.—The Germantown *Telegraph* says, that the managers of the Zoological Garden at Philadelphia, contemplate adding an Aquarium to the other interesting attractions there. This will prove a very interesting addition to visitors, and the success of the Aquarium in New York is an evidence that it will be likely to pay.

—On the 5th instant, 25,000 California salmon fry were placed in Bakers river at Warren, New Hampshire, by Fish Commissioner Powers, of that State, assisted by Mr. Holmes, who is connected with the hatching house at Winchester, Mass. These are the first instalment of the 200,000 that the commissioners of Massachusetts and New Hampshire purpose placing in Bakers river this month. There was a loss of only nine fish in transporting them over one hundred and twenty-five miles. The fry were six weeks old, and appeared much stronger than our eastern salmon of the same age do.

CANADIAN FISH FOR ENGLAND.—Mr. Samuel Wilmot, Government Fishery Superintendent, passed through London on Saturday with 150,000 white fish from the Sandwich fishery establishment. A number of these ova are to be forwarded to the Duke of Marlborough and Lord Exeter. At an interview Mr. Blake had with these noblemen in England they expressed a strong desire to have forwarded to them some of our Canadian fresh water fish, for the purpose of introducing them into the waters of Great Britain.

THE FISH HATCHING ESTABLISHMENT AT BEDFORD.—Encouraged by the success of his first year's operations, Mr. A. B. Wilmot, the enthusiastic superintendent of the Bedford fish-house, has entered upon a second season's work on a more extensive scale. Last year he had about 570,000 eggs in the house. This season he has put in a million. They have been obtained from River Philip, the West, East and Middle rivers of Pictou, and the Annapolis river. A short-sighted and regretted hostility on the part of a few people, in some quarters, has made the work of procuring the eggs a difficult one. On one occasion, at River Philip, a quantity of lime was thrown into the water for the purpose, evidently, of destroying them. All the eggs in the fish house are looking well, and Mr. Wilmot is confident of being able to turn out a great quantity of fish next summer. He is watching with interest a new experiment which is of importance to the science of fish culture. Finding a scarcity of the mail fish at the West river he took the melt to that place from River Philip, and impregnated the eggs with it. Should this experiment prove successful it will be a valuable discovery.—*Halifax (N. S.) Chronicle*, Dec 7th.

A DUTCH PISCICULTURAL ESTABLISHMENT.

IN order to repopulate the impoverished waters of Holland and stock them with choicer kinds of fish, several gentlemen of Amsterdam and Arnhem have recently erected and carry on at joint cost a piscicultural establishment near to the latter town. To allude first to what is the most important point in all fish-breeding undertakings—the water supply—Mr. Op de Macks, director of the above works, has no less than four sources to draw upon, viz.: a 45 feet deep well, in the immediate vicinity, the river Yssel, and the Rozendaal and Beekhuizen streamlets. Before the latter—which are brought to Arnhem by means of underground pipes extending for nearly a mile—enter the hatching rooms and and nurseries of the establishment, they are made to pass through fineish wirework gratings to free them of impurities, and their volume and current are regulated by a number of sluices. In the case of the well water, raised by steam power to a cistern or large tank at the upper end of the incubating hall, the deficiency of oxygen is rectified by causing the water to fall into the upper hatching troughs, a depth of ten feet. It flows through small apertures in the form of a jet, and, striking against the small glass bars in the troughs, becomes thoroughly impregnated with air.

While one steam engine raises and renders available the well water above alluded to, a second, situated on the banks of the river, pumps up the Yssel water, admitted into the canals of the institution by means of a sluice. It raises ten cubic metres, or about 2,200 gallons per minute, and thus brings the water in the basins to the required height and temperature whenever a deficiency occurs in the supplies from Beekhuizen and Rozendaal, or the brook water is considered too cold. During summer Yssel water has sometimes a temperature of 72° Fahr. (22° Celsius); the well water, on the other hand, rarely rises above 43° Fahr.

With respect to the size and construction of the incubating hall, the same covers an area of about 180 square yards, is lofty and well ventilated, receiving the moderate amount of light admitted from windows on the north side of the roof. The stone troughs with which it is furnished, and which afford hatching accommodation for over 600,000 eggs, are arranged in four double rows, each of the latter—separated from one another by three feet wide passages—containing six pair of similar shape and dimensions. Be-

tween each couple and the two below there is a fall of five inches, the water flowing from one pair to the next through small pipes, and eventually emptying itself into tanks connected with the first set of canals or nurseries. As at Hünningen, the College de France, and elsewhere, the eggs are placed between diminutive glass rods, and the wooden frames into which these fit are kept about an inch below the surface of the water. To avoid the dangers incidental to oxydation no metal is used in the construction of the troughs and hatching apparatus.

The system of fecundating ova adopted by the Arnheim authorities is that known as the Russian or dry method, and after the operation has taken place in the laboratory, and the young fry have been duly hatched out in the incubating hall, they are at length—at the expiration of the yolk-sac period—admitted into the first set of zigzag canals.

The labyrinthine and alternate pool and shallow arrangement of the latter was adopted by Mr. Macks with a view to allow the fish to follow their natural instincts as regards direction, and to seek at will sunshine or shade. While here and there bigish stones afford welcome places of concealment, the bed of the nurseries is for the most part covered with fine gravel and pebbles, and the growth of aquatic plants is encouraged for the sake of the insects they harbor.

As to artificial food given the young fry, they receive at first-roe of the maifisch and smelt, but in the case of samlets the feeding is not continued long, as the fish are allowed to enter the Yssel as soon as they are able to pick up their own living. Owing to the complete separation of the watercourses at Arnheim it is possible to raise simultaneously several varieties of fish, and accordingly Mr. Macks has attempted the culture not only of salmon and common river trout but also of salmon trout, charr, and hybrids (cross between salmon and trout). He has not, however, been equally successful with them all, hatching out and raising a much larger percentage in the case of salmon and trout than that of charr. Indeed, during the season 1873-4, a year in which he turned into the Yssel 285,000 samlets, raised from 360,000 eggs, he was so unfortunate with charr (rearing only 1,500 out of 12,000) that he determined for a time to abandon their cultivation.

The requisite supply of salmon ova, procured in the beginning from Hünningen and Freiburg, was in 1874 for the first time obtained on the spot from fish caught in Holland. The gravid females are, of course, kept apart from the rest, and ample accommodation has been provided for them.

In addition to the zigzag basins in immediate connection with the incubating hall and the oval ponds, in front of the building, there is another set of watercourses available as well for spawning fish as for fish destined to be grown to a marketable size.

Should it be desired to remove a portion of the young fish from one of the first to one of the second set of parallel basins, this can easily be effected by permitting the fish to escape through the sluices (whichever may belong to the enclosure in question), into the adjoining pond, and then opening the sluice which gives access to the particular basin intended to be stocked.

With respect, in conclusion, to the question whether the founders of the Arnheim institution have been rewarded for their public spirit and enterprise by any substantial success in the work of stocking or replenishing the rivers of Holland, it is gratifying to hear that considerable progress has already been made in the desired direction.

Thanks in part to their exertions, in part also to the active measures taken and the satisfactory results obtained by the authorities of the sister establishment at Amsterdam, the rivers Yssel and Vecht (until lately almost barren of salmonidæ) now contain a fair stock of salmon and trout, while other waters of the country have been so far repopulated that many of the State fisheries now let at double, treble, and even fourfold the rent formerly obtainable. Better evidence could scarcely be furnished of the national benefit accruing from a well-conducted system of pisciculture.—*T. S., in London Field.*

Natural History.

—We desire to call the attention of such of our readers as are not especially interested in Natural History, to the very important and valuable extracts which we are printing each week from the address of Mr. A. R. Wallace to the British Association. Each of these contains in a concise and intelligent form, a number of facts which are of the highest interest to the biologist, and about which, in these days of scientific progress, no one can afford to be uninformed. In no way can this very necessary knowledge be so easily acquired as by perusing this address.

In last week's number attention was called to the fertilization of flowers by insects, and in the present issue it is shown that birds often assist materially in this fertilization, a fact which was not even suspected until quite recently, and which will no doubt be new to the great majority of our readers. The information in regard to the disadvantages under which those animals which are wholly white labor, is also of much interest, and explains many facts which have not hitherto been well understood.

In our next issue we shall take up that part of the address which deals with what will be to many a still more interesting subject, "the Rise and Progress of Modern Views as to the Antiquity and Origin of Man." Under this head will be found, compressed into the space of a few columns, all that is known at present in reference to man's earliest history. Mr. Wallace shows us that man must have existed at a period far anterior to the Glacial Epoch, and gives a series of weighty reasons for his statements to this effect. The essay is full of novel information and deep thought, and we commend it to our reader's careful attention.

—The plan which is set on foot to establish a Connecticut State Museum at New Haven merits our warm approval. Such institutions should exist in every State in the Union, their value as public educators can hardly be overestimated. We wish the projectors all success in their praiseworthy undertaking. Prof. W. P. Blake seems to have originated

the idea, and with him Mayor H. G. Lewis, Ex-Gov. English, Gov. Ingersoll, and many other influential men are coöperating heartily. The plan contemplates the transformation of the old State House, on the green, into a museum building. This can be effected at small expense, for which it is believed an adequate appropriation can be secured from the Legislature. The edifice was abandoned by the State some two years ago.

Already Prof. Blake has secured as a nucleus for the ethnological department of the collection, the interesting and valuable groups illustrative of Swedish costumes, industries, and social life, that constituted an important feature in the Centennial.

ADDRESS OF A. R. WALLACE BEFORE THE BRITISH ASSOCIATION

ON SOME RELATIONS OF LIVING THINGS TO THEIR ENVIRONMENT.

Continued.

IN Juan Fernandez, on the other hand, there is no such total deficiency of showy flowers. I am informed by Mr. Mosely that a variety of the Magnoliaceous winter's bark abounds there, and has showy white flowers, and that a Bignoniaceous shrub with abundance of dark blue flowers was also plentiful; while a white flowered Liliaceous plant formed large patches on the hillsides. Besides these there were two species of woody Compositæ with conspicuous heads of yellow blossoms, and a species of white-flowered myrtle also abundant; so that, on the whole, flowers formed a rather conspicuous feature in the aspect of the vegetation of Juan Fernandez.

But this fact—which at first sight seems entirely at variance with the view we are upholding of the important relations between the distribution of insects and plants—is well explained by the existence of two species of humming-birds in Juan Fernandez, which, in their visits to these large and showy flowers fertilize them as effectually as bees, moths or butterflies. Mr. Mosely informs me that "these humming birds are *extraordinarily abundant*, every tree or bush having one or two darting about it." He also observed that "nearly all the specimens killed had the feathers round the base of the bill and front of the head clogged and colored yellow with pollen." Here then we have the clue to the perpetuation of large and showy flowers in Juan Fernandez, while the total absence of humming birds in the Galapagos may explain why no such large-flowered plants have been able to establish themselves in those equatorial islands.

This leads to the observation that many other groups of birds also, no doubt, aid in the fertilization of flowers. I have often observed the beaks and faces of the brush-tongued lorries of the Moluccas, covered with pollen; and Mr. Mosely noted the same fact in a species of *Artamus* or swallow shrike, shot at Cape York, showing that this genus also frequents flowers and aids in their fertilization. In the Australian region we have the immense group of the Meliphagidæ, which all frequent flowers, and as their range extend over all the islands of the Pacific, their presence will account for a certain proportion of showy flowers being found there, such as the scarlet *Metrosideros*, one of the few conspicuous flowers of Tahiti. In the Sandwich Islands too, there are forests of *Metrosideros*; and Mr. Charles Pickering writes me that they are visited by honey-sucking birds, one of which is captured by sweetened bird-time, against which it thrusts its extensile tongue. I am also informed that a considerable number of flowers are occasionally fertilized by humming-birds in North America; so that there can, I think, be little doubt that birds play a much more important part in this respect than has hitherto been imagined.

It must be remembered, as Mr. Mosely has suggested to me, that a flower which had acquired a brilliant color to attract insects might on transference to another country, and becoming so modified as to be capable of self-fertilization, retain the colored petals for an indefinite period. Such is probably the explanation of the *Pelargonium* of Tristram d'Acunha which forms masses of bright color near the shore during the flowering season, while most of the other plants of the island have colorless flowers in accordance with the almost total absence of winged insects. The presence of many large and showy flowers among the indigenous flora of St. Helena must be an example of a similar persistence. Mr. Melliss, indeed, states it to be a remarkable peculiarity that the indigenous flowers are with very slight exceptions, all perfectly colorless; but although this may apply to the general aspect of the remains of the indigenous flora, it is evidently not the case as regards the species, since the interesting plates of Mr. Melliss's volume show that about one-third of the indigenous flowering plants have more or less colored or conspicuous flowers, while several of them are exceedingly showy and beautiful. We have every reason to believe, however, that when St. Helena was covered with luxuriant forests, and especially at that remote period where it was much more extensive than it is now, it must have supported a certain number of indigenous birds and insects which would have aided in the fertilization of these gaily colored flowers. * * *

Another interesting fact in connection with this subject, is the presence of arborescent forms of Compositæ in so many of the remotest oceanic islands. They occur in the Galapagos, in Juan Fernandez, in St. Helena, in the Sandwich Islands and in New Zealand; but they are not directly related to each other, representatives of totally different tribes of this extensive order becoming arborescent in each group of islands. The immense range and almost uni-

versal distribution of the compositæ is due to the combination of a great facility of distribution (by their seeds), with a great attractiveness to insects, and the capacity of being fertilized by a variety of species of all orders, and especially by flies and small beetles. Thus they would be among the earliest of flowering plants to establish themselves on oceanic islands; but where insects of all kinds were very scarce it would be an advantage to gain increased size and longevity, so that fertilization at an interval of several years might suffice for the continuance of the species. The arborescent form would combine with increased longevity the advantage of increased size in the struggle for existence with the ferns and other early colonists, and these advantages have led to its being independently produced in so many distant localities, whose chief feature in common is their remoteness from continents and the extreme poverty of their insect life.

As the sweet odors of flowers are known to act in combination with their colors, as an attraction to insects, it might be anticipated that where color was deficient, scent would be so also. On applying to my friend Dr. Hooker for information as to New Zealand plants, he informed me that this was certainly the case, and that the New Zealand flora is, speaking generally, as strikingly deficient in sweet odors as in conspicuous colors. Whether this peculiarity occurs in other island I have not been able to obtain information, but we may certainly expect it to be so in such a marked instance as that of the Galapagos flora.

Another question which here comes before us, is the origin and meaning of the odoriferous glands of leaves. Dr. Hooker informs me that not only are New Zealand plants deficient in scented flowers, but equally so in scented leaves. This led me to think that perhaps such leaves were in some way an additional attraction to insects. Mr. Darwin, however, informs me that he considers that leaf glands bearing essential oils are a protection against the attacks of insects where these abound, and would thus not be required in countries where insects are very scarce. But it seems opposed to this view that highly aromatic plants are characteristic of deserts all over the world, and in such places insects are abundant. Mr. Stainton informs me that the aromatic Labiatae enjoy no immunity from insect attacks. The bitter leaves of the cherry laurel are often eaten by the larvæ of moths that abound on our fruit trees; while in the Tropics the leaves of the orange tribe are favorites with a large number of lepidopterous larvæ; and our northern firs and pines, although abounding in a highly aromated resin, are very subject to the attacks of beetles. My friend, Dr. Richard Spruce, informs me that trees whose leaves have aromatic and often resinous secretions in immersed glands abound in the plains of tropical America, and that such are in great part, if not wholly, free from the attacks of leaf-eating ants, except where the secretion is only slightly bitten, as in the orange tribe, orange trees being sometimes entirely denuded of their leaves in a single night. Aromatic plants abound in the the Andes up to about 13,000 feet, as well as in the plains, but hardly more so than in Central and Southern Europe. They are perhaps most plentiful in the dry mountainous regions of Southern Europe; and as neither here nor in the Andes do leaf-eating ants exist. Dr. Spruce infers that, although in the hot American forests where such ants swarm the oil bearing glands serve as a protection, yet they were not originally acquired for that purpose.

I trust that I have now been able to show you that there are a number of curious problems lying, as it were, on the outskirts of biological inquiry, which will merit attention, and which may lead to valuable results. But these problems are, as you see, for the most part connected with questions of locality, and require full and accurate knowledge of the production of a number of small islands and other limited areas, and the means of comparing them one with another. If then we are to make any progress in this inquiry, it is absolutely essential that some collectors should begin to arrange their cabinets primarily on a geographical basis, keeping together the productions of every island, or group of islands, and of such divisions of each continent as are found to possess any special or characteristic fauna or flora. We shall then be sure to detect many unsuspected relations between the animals and plants of certain localities, and we shall become much better acquainted with those complex reactions between the vegetable and animal kingdom, and between the organic world and the inorganic, which have certainly played an important part in determining many of the most conspicuous features of living things.

[To be continued.]

A WONDERFUL PARROT.

QUEBEC, Dec. 1st, 1876.

EDITOR FOREST AND STREAM:—

My neighbor R. S. U. Bauchette, Esq., ex-Commissioner of Customs, for the Dominion of Canada, owns a wonderful parrot whose utterances astonish every one who hears him. That his many friends may better remember them, Mr. Bauchette, has had poll's sayings put in print. Having lately heard this wonderful bird repeat many of his utterances, I thought they might interest some of your readers, and send you the copy Mr. Bouchette gave me.

Yours very truly, J. U. GREGORY.

"POLL-THE-GREAT," OR A RENOWNED PARROT'S UTTERANCES.

Poll's Latin may not be exactly Mantuan—but there is a freedom in his translations which has certainly a dash of independence—e—g—

Ego sum Princeps avium—I am Poll the Great. Who are you?

Woodland, Farm and Garden.

HOLIDAY DECORATIONS.

AT the Holiday time decorations of some kind are, as a rule, attempted in every household, and the Christmas tree finds a place wherever there are children. The custom of decorating with evergreens is far from being a modern one, the Romans, two thousand years ago, did the same thing. Indeed, it is more than probable that the origin of adorning our homes with Holly, Ivy and Mistletoe must be sought for in the Roman Saturnalia held every year towards the end of December, or to the ancient Druids, with whom the Mistletoe grown on the oak was sacred. Many use decorations of quite a complicated character, but now that wreaths of ground pine and smilax are so easily procured, almost every one can have their rooms decorated at a small expense, and arranged to suit their taste or convenience. Mottoes formed of letters, monograms, or any other ornamental designs, are most easily made on a frame of wire work, or pasteboard cut out to the desired pattern, while stars, crosses, or other designs with straight lines are most easily made on a frame of light wooden work tied together in the desired pattern, on which foundation the evergreen can either be tied or sewn. Picture frames can be made in the same manner, and either tacked on or suspended by a fine wire over the ornamental or gilt ones; but Smilax makes the neatest and most natural drapery for pictures or mirrors, or for festooning of any kind, and will keep bright and green during the holiday season at least. All such decorations may have their effect very much enhanced by being made to look as if frosted. This can be produced in the following manner: Brush the leaves over with liquid green, and then dust them with glass or diamond powder, which can be easily procured at a trifling cost. A mirror draped with long, loose sprays of Smilax, Ivy, or the Japanese Climbing Fern, and sprinkled with these minute fragments of ground glass has a most charming effect by gas light. Many use dried flowers, such as everlasting, in these decorations, and they are much more desirable than artificial flowers, though the latter can often be used to advantage; but, if anything artificial can be dispensed with, so much the better. Florida or Louisiana moss (*Tillandsia usneoides*) makes a lovely draping for arches, pictures, etc., when not used too profusely, and can be frosted as before described, if desired. Dressed Hartford or Windsor Fern (*Lygodium palmatum*) and others of our native Ferns, autumn leaves, sprays of bitter sweet, Clematis, with its lovely sprays of white feathery seeds, the beautiful Ink berry, Jack in the pulpit, and even the dark, glossy berries of the cat briar, all work in with good effect, and most of them will keep the whole winter in good condition, and give a charm to the parlor or sitting room that cannot be had by any artificial means. Many of our native grasses, too, can be used either in bouquets or to lighten up the heavier decorations, while the lovely silvery plumes of the pampas Grass gives an air of refinement to the whole grouping. Letters can be made in rustic forms of branchlets of the spruce fir (the leaves of course being removed) which, if well frosted, are most effective on a crimson or colored ground work of any description. As to the placing of the mistletoe, that must be arranged according to circumstances, and as may be most convenient. With regard to decoration with natural flowers, a few plants judiciously arranged, cut flowers in vases, and wherever desirable, according to taste and means, must govern the arrangements, care only being taken to contrast or harmonize the colors, so that blue will not clash with purple, and so on.

W. J. D.

WILD CELERY.

SYRACUSE, N. Y., Dec. 4th, 1876.

EDITOR FOREST AND STREAM:—

Will some of your western contributors give information concerning the fresh water celery of that region? Can it be propagated from seed or root? Either, or both? It doubtless differs in some respects from the "Valisneria" of Chesapeake bay, as the former flourishes in fresh water, while the last does not grow above tide-rip; yet the exceptional flavor of the carvas-back is usually attributed to diet in both localities. If practicable, the introduction of this plant may be the means of bringing a new class of water-fowl to the interior aquatic shooting-grounds of the eastern States. At present the carvas-back, and several of its congeners, are seldom or never shot in this vicinity.

E. R. WILSON.

[An article appeared in the *American Agriculturist* (we think) a year or two ago, on the wild celery and carvas back duck, but we cannot find it as we have not a full file of the *Agriculturist*. Perhaps the letter of our correspondent herewith printed may draw forth some further information.—ED.]

—The manufacture of immortelle wreaths in Paris for funeral decorations engages upwards of 1,500 persons. The immortelles are gathered in October on the arid hills, of central and southern France. They are brought to the market in their natural condition, and the yellow blossoms are dyed or bleached green, red, or white, in readiness for All Saints' and All Souls days, Nov. 1st and 2d, when all good Parisians visit their relatives' graves. On these *fêtes des morts* the gates of the cemeteries are beset with crowds of dealers in wreaths, crosses and head crowns. At Pere la Chaise alone it is estimated that more than 200,000 persons visit the cemetery, and the sale of immortelle wreaths reaches about 25,000.

—The sweet potato vine is really desirable for the house, is a rapid grower, and much more delicate in appearance under house culture than when growing out of doors. Select a well ripened tuber of the Red Nasmond variety—

said to be a most vigorous grower—eight or ten inches long and four or five inches in diameter. A dark colored hyacinth glass is a suitable and pretty holder for the potato, but a common glass fruit can or small earthen jar will do. Fill the vessel with rain water and stand the potato in the mouth of it, allowing only two or three inches of the potato to go down into the water. Set it in a warm bright place to sprout, filling up the holder with water as fast as it evaporates. Probably a great many sprouts will start at once or in quick succession; break off all but three or four of these, as your vine will by so doing be much longer and more luxuriant. Nothing will now be needed for the perfection of the vine, except to keep the vessel filled with rain water.—*American Garden*.

RHODODENDRONS—"I do not think the difficulty arises from the cold, but from the drought, which is undoubtedly the case with most evergreen failures. If you will give Rhododendrons a good depth of soil in the first place, say at least eighteen inches of one-third peat or leaf soil, one-third sand, and one-third the top soil of an old pasture, well-rotted, and in a place where they do not get the mid-day sun, and mulch very thoroughly—*twelve to twenty inches*—of well-rotted leaves. The earth under them is always moist and cool in our hottest weather."—*Hurmevell*.

IMPROVE THE SEED.—It is not only simple, but comparatively easy, for any farmer to improve his seed grains, that with good cultivation, in five years he may increase the yield fully fifty per cent., and this at comparatively light cost; for the labor of sorting the grain amounts to a small sum per bushel, and it costs little more to cultivate an acre well, and no more to harvest it, than if it were only half cultivated.—*Exchange*.

EUCALYPTUS.—From the November *Naturalist*, we derive some interesting facts concerning this tree in California. A large forest of those trees has been planted by a company, and is situated on the line of railroad between Los Angeles and Anaheim. About 180 acres are set out with Eucalyptus, containing about 80,000 trees, of these some 30,000 are from 9 to 15 feet high. The young tree has been produced in greater numbers in California the past season than ever before, and are sold by the Nurserymen at much lower prices than formerly, with an increased demand. The Eucalyptus or blue-gum tree is a native of Australia, and although of extremely rapid growth, attains a great size. Its wood is useful for many purposes, but its principal importance is derived from its claimed effect upon malarial districts as fever-check. It has also been said that mosquitoes avoid its presence. Like many other recent introductions, it has been subject to much fanciful discussion, and we must await further developments, before its true value can be estimated. Yet it seems true that this tree emits camphorated and antiseptic vapors, which may be efficient for the results claimed.

OIL OR ORRIS ROOT.—Orris root owes its use during more than two thousand years chiefly to its fragrance, which, curiously enough, does not belong to the living root. Its slight and by no means aromatic smell is first developed into the agreeable perfume after drying, without doubt in consequence of changes of a chemical nature, concerning which at present our knowledge is deficient. When the dried root stock is submitted to distillation with water, eventually there appears upon the water a crystalline odoriferous matter, which is justly prized in perfumery and is specially prepared by some of the larger distillers. But the yield is very small, only about 1 part per 1,000 of the orris root used. The product is of a yellowish brown color, of the consistence of a firm ointment, and possesses the characteristic odor of the orris root.—*Scientific American*.

A SUBSTITUTE FOR BEESWAX.—Ceresin is the name of a purified product obtained from ozocerite, an impure fossil wax, found chiefly near the large coal beds of Drohobriz and Boryslaw in Galicia, and at Gresten, in Austria. The crude substance freed by fusing from the sand, clay, and other earthy impurities, is of a deep brown color, with a greenish tint, and has a specific gravity of 0.940–0.970, exhales a benzine-like odor, and in hardness, fracture and pliability, entirely resembles beeswax. It is very combustible, with difficulty solvable in oil of turpentine. It is purified and bleached, and in its purest form is used principally as a substitute for beeswax by manufacturers of candles, wax flowers, polishing pomades, cloth finishers, laundrymen, &c.

The white ceresin is moulded into round flat cakes like our sun bleached wax, while yellow is cast into various shapes.—*W. M. Hoge, N. Y.*

—The following from the Germantown, Pa., *Farmer and Gardener*, is sensible, seasonable and to the point:—

"Providing good walks about the dwelling, yard, barn and outhouses generally, should now be attended to. There is nothing so comforting in winter and spring as dry walks about the premises. They should be made to the pump, to the wood-shed or coal-bin, to the pig-pen, to the stables and so on, and there is nothing better to use for this purpose than coal ashes. Scrape away the mud or loose dirt, and deposit about two inches of the ashes on the top of the coarse portion, which should be evenly laid, then roll or beat down compactly. It will last till late in spring, and will require only a partial renewal the following winter. Leading to the front door of the house, boards should be laid down neatly, and removed in the spring and put away until needed again. These little conveniences will repay their expense many times over. They will accelerate movements from place to place, keep the feet dry and the boots clean, and perhaps save more than one doctor's bill.

LEANING TREES.—Often in a fine orchard we find one or more trees leaning over so far as to destroy the beauty of the whole orchard. It is also much more difficult to cultivate around a leaning tree. This may easily be remedied while the trees are young, by partially digging up and replanting the trees. The roots will usually be found the smallest on the side from which the tree leans; and therefore, these roots should be loosened from the earth, the tree set in a perpendicular position, and carefully fastened by stakes or guys and the earth replaced around the roots. It would be well to add some rich compost to promote their growth. If, as is very probable, the top of the tree has become one-sided, it should be pruned so as to restore the balance. In this way we have "righted up" pear trees six inches through the stem; but the best way is to look after the young trees and not permit them to depart from the way of uprightness.—*Journal of Horticulture*.

The Prince of Wales' visit to Canada in 1860 brought out Polly's loyalty. His cheers for our beloved Queen and the Heir apparent were and are hearty and thoroughly English.

Hip! hip! hip! Hurrah for the Queen!
Hip! hip! hip! Hurrah! for the Prince!

Nor was he unmindful of the public services of our statesmen. On Sir Geo. Cartier's return after his successful negotiation with the Hudson's Bay Co., and the annexation of the N. W. territories to Canada, Poll greeted the negotiator after this fashion:—

You're a trump, Sir George! On behalf
of the country I congratulate you.

Our hero Poll does not, it would seem, disdain the use of an occasional Yankeeism; for instance, he occasionally comes out with:—

I believe you, my boy—Yes sir-ir-r-ee!

But he has evidently a predilection for riddles and not unfrequently proposes the following one to his friends and visitors:—

Why does a donkey eat thistles?
Give it up?—Give it up? Because
He's an ass! ha ha-ha-ha-ha-a-a!

Whether Poll ever heard of the "step from the sublime to the ridiculous" I know not; but he has often been heard running from the ridiculous into the sublime by following up his riddles with some grave quotation from Shakespeare, thus:—

Most potent, grave and reverend Seignors,
My very noble and approved good masters,
That I have ta'en away this old man's daughter,
Tis most true—true I have married her,
The very head and front of my offending
Hath this extent, no more.—OTHELLO'S APOLOGY.

His education is, moreover, decidedly military; his rank probably that of a field officer. He is above company drill, and now commands his battalion with unmistakable aplomb:—

Left wheel into line—March—Halt—dress. Battalion
Attention—Eyes front. Rear rank,
Take open order—March!

A stranger called upon me one morning whose nationality Poll did not know. He first greeted him in German:—

Guten Morgen, Mein Her? Sprechen Sie
Deutsche.

But receiving no response he assumed him to be French, and addressed him in his own language:—

Bonjour, Monsieur. Comment vous portez vous?
Parlez vous Français? Prenez vous du tabac?

Poll is quick at picking up the current news. When the Abyssinian war was on the tapis he announced with exultation the death of the barbarian sovereign. The morning paper was usually thrown on the hall table near Poll's cage, which gave him an opportunity, of course, of getting the news before I came down to breakfast. He came out with it on one occasion, thus:—

Great news from Abyssinia. King Theodore
is dead.

In summer he was transferred to the library. I never caught him reading, it is true; but the clairvoyance of parrots is a problem not yet solved. He certainly gives his opinion on books, and recommends them to his friends, as shown in the instance here given:—

Have you read the life of
Lord Sidmouth? Pray read it.

He evidently assumed that the library was his own, for when my son, a boy of twelve, is in it looking the volumes over, Poll warns him to be careful by calling to him:—

Errol, Errol, take care of my books sir.

I have sometimes succeeded in drawing our hero out of a taciturn mood by upbraiding him for his silence. When it was my turn to be silent, he would invoke my speaking, and ask with emphasis:—

Why don't you talk, sir?

A charming cousin of ours, during a few days visit to us in Ottawa won decided favor in Poll's eyes, I should say his heart, for when she left, he for a long time sighed and said little else than:—

Dear Menon, forget me not.

Poll, though an orator, has no pretensions to melody. His attempts at "Wait for the wagon" are harsh and unmusical; but his whistling is clear, true and brilliant. He whistles the gamut and runs it up by thirds. Also whistles the first part of Dixie. This remarkable bird is a native of the coast of Guinea. His plumage is gray, whitish about the head, which is large, the feathers of the tail are bright crimson; his present age is probably twenty years; I have had him for fourteen years.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDENS DEC. 6TH.—One bittorn (*Botaurus minor*), presented by H. B. Case, Londonville, Ohio; three bantams, presented by Spencer Trotter, Philadelphia, one Virginia opossum (*Didelphys virginia*), presented by Ellwood Johnson, Germantown, Pa.; five ruffed grouse (*Bonasa umbellus*) two moose (*Alce americanus*), and two Polar bears (*Ursus maritimus*).
ARTHUR E. BROWN, General Supt.

ARRIVALS AT THE CENTRAL PARK MENAGERIE DEC. 2 TO DEC. 3.—One Chinese goose, *Anser cygonides*, presented by Wm. Simpson, Jr., New York city. One herring gull, *Larus argentatus*, captured on reservation. One mottled owl, *Scops asio*, presented by Master William C. Osborn, New York city. One sand hill crane, *Grus canadensis*, presented by Dr. L. P. Hatch, Minneapolis, Minn. Two gray-breasted parakeets, *Bolborhynchus monachus*, Hab. Monte Video, and two red-cheeked parakeets, *Palaeornis luciani*, Hab. East Indies, received in exchange. Two lions, *Felis leo*, bred in the menagerie. All of Mr. Barnum's animals have been placed on exhibition in the menagerie.
W. A. CONKLIN, Director.

VINE AND OLIVE. By Oliver Optic. Lee & Shepard, Boston.

The author of this little book is so well known as a writer of stories for children and his popularity is so great that the mere announcement is a sufficient guarantee of the value of the wares. Vine and Olive is the fifth volume of the second series of the "Young American Abroad," stories and depicts the travels and adventures of the cadets of the Academy Squadron during a cruise along the shores of Spain and Portugal. In a pleasant and readable manner much valuable and interesting matter regarding these countries, particularly the maritime history of Portugal, is conveyed.

THE YOUNG TRAIL HUNTERS. By S. W. Cozzens. Lee & Shepard, Boston.

This is another book for boys, in which the adventures of two lads on a journey across the great plains of the Southwest are described. The wild scenes of border life are vividly pictured, and all the vicissitudes of camp life in New Mexico and Arizona, with lots of mustang riding and Indian fighting placed before the reader. There is lots of hunting in the book and all described in an interesting and exciting manner. Mr. Cozen's abilities as a story teller are first class and his previous books have been received as welcome additions to the boys library. We predict an equally warm reception for his latest effort.

The Kennel.

—We would remind our readers that entries for the Baltimore Bench Show close on the 20th inst., after which we are assured that no entries, for competition, will be received.

DOGS ON THE RAILWAYS.—The following general order to train baggagemen has been issued by the Chicago, Milwaukee and St. Paul Railway. Would that there were more like it:—

1st. No train baggageman will demand or receive pay from passengers for the carriage or care of their baggage, or extras.

2d. No train baggageman will demand compensation for the carriage or care of a dog or gun belonging to a passenger, nor refuse to receive same on request of owner or person in charge; such owner or person in charge, being at the time a passenger on this road.

3. General order of Nov. 15th is rescinded.

D. M. CHRISTIE, General Baggage Agent.
A. V. H. CARPENTER, Gen'l Pass. & Ticket Agent.
Approved, S. S. MERRILL, General Manager.

JULE.—Our illustration this week is a portrait of the fine Gordon setter bitch Jule, the property of Mr. Alexander Pope, Jr., of Dorchester, Mass. Mr. Pope may be known to many of our readers as an artist of repute. Our city readers who visit Schaus' Gallery on Broadway will have observed some remarkable carvings of game birds colored to so closely resemble nature as to give the impression that they were the work of a taxidermist instead of an artist. Mr. Pope is the author, and we believe the originator in this country of this method of portrayal. Jule was bred by A. F. Copeland, Esq., owner of Norah and Shot, from his Gyp, by Mr. Belmont's dog, from his imported brace. Jule is remarkably handsome, thoroughly broken, docile and affectionate. Jule will shortly visit Mr. Copeland's (late Jerome's) Shot; and the produce should be something remarkably fine.

PURE GORDON SETTER BITCH JULE.

THE CENTENNIAL BENCH SHOW.

PIERMONT-ON-HUDSON, Dec. 4th, 1876.

EDITOR FOREST AND STREAM:—

It is well known that most of the exhibitors at the Centennial Bench Show are very much dissatisfied, and this being the case, should they not let the public know what they think of it, so that gentlemen managing future Bench Shows, and also exhibitors, may gain some information thereby. I understand the Grand Commission, or the judges at the Centennial fizzle, introduced a new point in judging pointers, as the following will show:—

Mr. Edmund Orgill exhibited the lemon and white pointer "Flake." The judge not being able to decide between him and the black pointer "Pete," the case went before the Commission of Judges; they decided that the Philadelphia Cup should go to "Pete," as he had a heavier hide, and they thought him better able to stand briars, not taking into consideration the fact that to encourage fine breeding is the object of Bench Shows, and it is the only instance that has come to my knowledge wherein a pointer has received a prize for a thick hide. Now I am not finding fault with "Pete"; he is a good looking dog, and was well groomed for the occasion; his coat was black and glossy as a raven. "Flake," on the contrary, had been hunted on woodcock almost constantly up to the day before he started for Philadelphia. Now, if a thick hide is to be one of the points for judging, instead of beauty of shape, symmetry and fine breeding, would it not be well to let breeders and exhibitors know it, that they may govern themselves accordingly.

The way Bench Shows have been managed lately in this country, will soon bring them into disrepute. The St. Louis Bench Show, held under the auspices of the St. Louis Kennel Club was a success; but will another one be, under the same management, when the public sees that the dogs, or progeny of dogs, belonging to the Club, or members of the Club, took most of the prizes? It seems to be a Club for the mutual admiration of each others dogs. Perhaps the New York or Westminster Kennel Clubs will get up a show, and award the prizes to themselves. Why not? The St. Louis Club has set the example, but why cannot there be a Bench Show of dogs in New York? Surely there

DISINFECTANTS.—It is a matter of great importance to owners of dogs to have within reach some simple disinfectant, the use of which will destroy obnoxious odors, and by keeping the kennel and its surroundings in a sweet and cleanly condition, add greatly to the healthfulness of its inmates. Something is also required that is not poisonous in its nature, that dogs may lick without giving up the ghost afterwards, and that is thoroughly efficacious in every respect. The "Girondin," advertised in another column, appears to fill the bill. Certainly the many testimonials to its great value from eminent sources, would indicate that it possesses all those qualities which we have enumerated above and which its proprietors claim for it. The following letter, addressed to ourselves, also speaks in its behalf, and is from a gentleman well known in business circles in this city:—

NEW YORK, Dec. 8th, 1876.

EDITOR FOREST AND STREAM:—

I noticed in this week's paper the advertisement of the Girondin disinfectant. I fully indorse all that Mr. Meyer claims for the article, having used it in my store and house. I have used it where animal matter has been left carelessly and has putridified, and also for cleaning kennels, barn, etc.; also to wash dogs after rolling in carrion. It is the best disinfectant I have ever used, and what is greatly in its favor it does not, like carbolic acid, make one stench to take away another.

F. O. DE LUZE.

POOR "BIZ"!—We are informed that Mr. D. Brooks, of Philadelphia, and Mr. V. J. Shipman, of State Centre, Iowa, have come to an amicable settlement with the express company for the loss of the famous dog "Bismark," belonging to Mr. Brooks, and the bitch "Phebe," belonging to Mr. Shipman, both dogs being suffocated in a box car during their transportation from the west in charge of the express company, a year or so ago. The suit has therefore been withdrawn.

—The Westminster Kennel Club will send to the Baltimore Bench Show the newly imported pointer Sensation, together with Whisky, Daisy and Flirt, the latter two of Whisky's first litter, by Mr. Schuchardt's Jim. Mr. Schuchardt will send Fritz, Ned and Jim.

GUN SHY DOGS.—Apropos of an article on the above subject, which we recently published, a well-known sportsman and popular coterie of Boston writes us as follows:—

"In answer to E. S., Baltimore, in FOREST AND STREAM, November 23d, I would suggest that his dog is not gun shy, but has been too harshly dealt with in breaking. I bought just such a "blinker" last August for \$5.00—a red Irish setter of fine appearance. He was never timid at the discharge of a gun, until in breaking he was scolded and whipped in *after a bird had been shot*. I just put him out to a man who hunted him carefully all day in company with another man and good dog, the "blinker" remaining at heel nearly all day. The second day he begun to work in, and 200 woodcock and ruffed grouse have been shot over him this fall, he doing his part as well as the rest. Offers of \$75.00 are now made for this same castaway. M.

—Another correspondent, a gentleman of long experience, writes as follows:—

EDITOR FOREST AND STREAM:—

"Your article on 'Gun Shy Dogs', in issue of 30th November, call forth some observations drawn from my own experience on the same subject. As there stated, the timidity of high bred pups is not uncommon, and their alarm at sudden sounds natural. I have found the snapping of a cap on the nipple of gun, the gun itself having been previously brought to the notice of the young dog—"making much of," and giving him at the same time a reward (as for instance, a piece of cake, or a slice of meat)—the best mode of reconciling him to the noise of the explosion. After he becomes accustomed to the sound of the cap, being in fact rather pleased than otherwise, in view of the accustomed and succeeding reward, a light charge of powder may be ventured upon with similar success. Do not precipitate matters; do nothing by surprise; let him see that the pointing of the gun is succeeded by the explosion without harm to him; by and bye he will exhibit pleasure on the sight of the gun in your hands, and gleefully follow to the usual place of exercise. Mine has been a spacious barn loft. Finally, I would not advise commencing very early with their lesson; six to eight months of his life should elapse before its introduction.

SENEX."

BALTIMORE BENCH SHOW.

EDITOR FOREST AND STREAM:—

I write to inform you of our increased success in securing more special prizes. The Mayor of Baltimore is now with us, and I can tell you we expect to have a grand show. I never, in all my life, saw such interest manifested before. The additional Specials are as follows:—

No. 26. Messrs. D. J. Foley, Bro. & Co., wholesale grocers and commission house, offers two one-quarter kegs best Hazard duck powder No. 4, for Chesapeake bay dog or bitch, also twelve one-pound cans of Hazard's electric powder for the best Gordon setter dog or bitch.

No. 27. An "Amateur Sportsman," offers \$25 cash for the best brace of setters of any strain, dogs or bitches.

No. 28. Ballard's Flea Powder Company, given by Messrs. Lazell, Marsh & Garden, New York, give one dozen packages of powder for the best poodle dog or bitch. No extra entrance fee.

No. 29. George W. Webb, Esq., jeweller, etc., Baltimore, offers a splendid silver cup for the best pointer dog, under fifty pounds weight, for stud purposes, to be shown with not less than two of his get.

No. 30. Alexander Wolley, Taxidermist, Baltimore, offers a splendid case of stuffed American game birds, to be given to the best Irish setter bitch, native or imported.

No. 31. R. Q. Taylor, hatter and dealer in fine furs, Baltimore, offers a very fine seal skin cap, to be given to the best Irish water spaniel, dog or bitch.

No. 32. Ferdinand C. Latrobe, Esq., Mayor of Baltimore, offers \$20 for the best Chesapeake bay duck, dog or bitch.

No. 33. John P. Moore & Sons, gun dealers, 300 Broadway, New York, offers one Colt's five shot pistol, nickel and ivory plated, for the best native English setter puppy, under twelve months, dog or bitch.

No. 34. Chris. Swan, "Cottage Saloon," offers a handsome silver plated ice water pitcher, for the best Irish water spaniel, dog or bitch.

No. 35. A. L. Webb & Son, agents, Dupont's gunpowder, offers three kegs of Eagle duck powder, for the best dog for ducking purposes; also a case of assorted powder for the best pair of pointers.

No. 36. A friend of the Dachshund's, offers a very handsome silver hunting horn for the best Dachshund, dog or bitch.

Entries close 20th December.

Every possible care will be taken of the dogs, and I will give my best attention to all dogs sent without their owners.

CHARLES LINCOLN.

ON DOGS—NO. 3.

IN my first communication I mentioned an uncle of mine as the owner of my old friend Diamond. This uncle was a great sportsman, and always kept well trained dogs; among the number he had, at one time, a fine old spaniel, Ranger, and two grey hounds, Smoker and Fly, the first a dog, the latter a bitch. Smoker was the fleetest and most powerful of the two. Ranger was a true sporting dog, and occasionally had a hunt for his own amusement. On such occasions he always selected Smoker as his companion. His *modus operandi* was as follows. He would hunt until he found a hare's seat, leave Smoker to mount guard, and then run for me, scratching at the front door, and barking until I made my appearance, my residence, at the time I speak of, being about one and a half miles distant from my uncle's. I always knew the purport of the old dog's visit, and, taking my gun, would follow him, being sure to find Smoker lying down with his eyes on the spot where poor puss was resting. But the moment we drew near he was on the alert. I would then, after reconnoitring the ground, bid Ranger start the game, which rarely escaped. Fly never made one of the party, she would only follow her master. My uncle was very particular about his dogs, consequently, when I wanted to have a day's sport, with some young friends, I resorted to the following plan to secure the dogs. Having satisfied myself that my uncle was from home, I would take to a field within hearing, fire a blank shot, and whistle, which soon brought my two friends to the spot.

are dogs enough in the city, and within fifty miles of it, to make a first-class exhibition, and as for judges, no part of the country has better qualified or more honorable gentlemen, who would give a decision against their own dogs or progeny of their dogs if they could not win on their merits. I think if FOREST AND STREAM will agitate the matter, we can yet have annual exhibitions that will vie with those at the Crystal Palace in London.

I saw in a recent issue of your paper, that Mr. Steel's "Flake" would be at the Baltimore Bench Show. There must be some mistake, as I have no intention of exhibiting him there or anywhere else, until I am satisfied that Bench Shows will be managed different from what they have been, and I am satisfied they are not gotten up to serve private interests in bringing certain dogs before the public, and that the best dog will win, no matter who he belongs to. To illustrate, some years ago, at a certain country fair, I exhibited a collection of flowers, and also a collection of grapes; both were far ahead of anything there. During the fair, the judges came to me and said, "You have by far the best collection of grapes, but Doctor V. is engaged in the nursery business, and we had better give the prize to him; if we do not, it may injure his business." It is needless to say, I never troubled them again, and neither shall I exhibit any dogs at a Bench Show until they are above suspicion, which I hope will be ere long.

WM. F. STEEL, owner of "Flake."

As regards the St. Louis Bench Show, we think that our correspondent is entirely wrong. That the Club exhibited the best dogs, and were fairly entitled to the prizes awarded them is beyond all question, as has been abundantly proven at the recent Memphis Field Trials, when their dogs proved themselves to be as good in the field as they were on the bench.

—Mr. E. F. Mecellott's fine orange and white setter bitch Pet, on the 5th inst., visited Mr. H. Shipman's famous setter dog Joe, bred by Theodore Morford, Esq., of Newton, N. J.

The 1st of October, being the opening of the sporting season, my uncle, who owned a small manor, always invited a large party to take the field, and I remember that on one occasion a Spanish gentleman joined us, in silk hose and dancing pumps; in short, in full ball costume, to the no small amusement of our jolly crew. The Don accompanied the sportsmen until his pumps gave out, when one of the servants had to pilot him back to the house.

Another sagacious ship's dog. I was intimately acquainted with a Jersey captain, named De Caen, who owned a large French poodle, whose name I forget, which always accompanied him on his voyages. He was an excellent watch dog, and when the captain was on shore, and the vessel within hail, the crew retired to rest, depending on the dog to wake them when his master hailed. On several occasions he has given notice of the approach of vessels in thick weather and dark nights, thus preventing serious, perhaps fatal accidents. He was very fond of the water, and during calm or light winds at sea he would get on the taffrail and ascertain the speed of the vessel. Once satisfied that her speed through the water was not greater than his swimming power he would skip round either captain or mate, and give them no peace until a piece of wood was thrown overboard for him to fetch. Having swam about to his heart's content, he would come alongside, and the sight of a rope being dropped, he would place himself in it to be hauled up. His master had also taught him a great number of amusing tricks, which made him a general favorite on board.

Captain De Caen, having contracted with a ship-builder to build him a new vessel, he remained on shore to superintend the work, and, meeting an old schoolmate, Capt. Mauger, of the brigantine "Centurion," he persuaded him to lend him the dog to amuse him during a voyage he was about to make to Valparaiso. De Caen was very loath to part with his poodle, but finally consented, having Mauger's faithful pledge to take special care of and restore him safe to his master on his return.

Valparaiso is the principal sea port of Chili, without, at that period, mole, wharf or jetty of any kind—a safe but exposed anchorage in northerly gales—to which the "Centurion" went to load copper ore. The vessel being loaded, the captain proceeded to the shore, in the jolly boat, to clear at the Customs, the dog accompanying him. In those high latitudes, in calm weather, immense waves, which the sailors call rollers, will sometimes come from seaward and rush to the beach like a tidal wave. Such a phenomena unfortunately occurred as the "Centurion's" boat neared the landing, and upset her. The four men who manned her met a watery grave. But Mauger was saved by the poodle. The "Centurion" reached England without further mishap, and the captain on his return to Jersey restored the dog to his master according to promise.

The due and faithful delivery of the dog, in good order and well-conditioned, being admitted by his lawful master, Mauger, stated to his friend that he had become so attached to him, since he saved his life, that he could not bear the idea of parting with him, and would cheerfully give one hundred pounds, or even more, if he were allowed to retain him. De Caen hesitated a moment, then taking the poodle by the collar he transferred him to Mauger, saying: "I will do to you as I should wish to be done by!" That golden rule, which if more generally and strictly observed, would be the means of sparing many a pang, and much bitter animosity.

Were I so tall as to reach the pole,
Or grasp the ocean with my span;
I must be measured by my soul—
The mind's the standard of the man.

—Watts.

Strange to say, that Capt. De Caen met with a watery grave, some three or four years ago, by the upsetting of a small yacht of his own, in St. Aubin's bay, Jersey. Had he had another faithful poodle his life might have been mercifully spared.

In concluding this remarkable narrative, I would fain call the reader's attention to what has always appeared to me to have been the mysterious dealings of an all-wise Providence, both in the case of the French poodle and the Newfoundland dog Prince, whose name figures in my first article on dogs. But for the transfer of Prince to the Brig "Suwarrow," the writer would not be here to tell the tale, after a lapse of nearly half a century, and fourteen human beings must have perished without any record of their fate. The dog lent Mauger likewise saved his life. It was a singular request, on his part, to ask for the loan of the dog, knowing, as he did, his friend's great partiality for the animal; and it is equally remarkable that De Caen would consent to part with his constant and faithful companion, in playing with which he had whiled away many a lonely hour at sea.

The last time I saw the poodle was in 1845, the year I came out to Canada. The "Centurion" lay in the London docks, and I went on board, though Captain Mauger was on shore, to take a last shake of the paw from a noble animal.

Oh! that man would therefore praise the Lord for His goodness, and declare the wonders that He doeth for the children of men!—107 Psalm.

PHILIP VIBERT.

Perce, November 13th, 1876.

—As William Loveland, of Aldenville, Pa., was driving a cow one night last week through a dark and lonely piece of woods twelve miles from Honesdale, Wayne county, known as White's Hollow, a panther jumped on the animal's back, and left cruel marks, but was frightened off by an approaching wagon.

—A movement is on foot in Halifax, Nova Scotia, to establish a Society for the Prevention of Cruelty to Animals, which is much needed there. The Halifax Reporter says that within the past few days shameful cases of cruelty have been reported in that city.

—Messrs. E. & H. T. Anthony, 951 Broadway, have a most attractive line of goods suitable for Holiday Presents, in the shape of Chromos, Albums, Magic Lanterns, and Views of all kinds.

—A group of Rogers' celebrated Statuary, or a set of Goodyear's Pocket Gymnasium apparatus will make a most acceptable Christmas Present for old or young.

—According to the London Garden, the Newtown pippins from the United States are now selling in Covent Garden market at \$1.50 to \$2.00 per dozen.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

C. V. B., Poughkeepsie.—Have replied to your inquiry about trapping, by mail.

J. S. J., Wrightsville, Pa.—What would it cost to take a dog to Oregon? Ans. Twenty-five dollars will be about the cost of taking a dog out.

GROUSE, Duxbury, Mass.—Please give me a receipt for worms in dogs. Ans. Areca nut, 60 grains in three doses two hours apart, followed in four hours by one ounce of castor oil.

F. W. F., West Point.—Where can I obtain specimen copies of *Land and Water* and *London Field*, as there is no newsdealer here? Ans. At Brentano's, 33 Union Square, this city. They will cost you about 75 cents for the two.

W. H. C., Brattleboro, Vt.—Have you any directions for use of vernier rifle sight; if so, please mail same to me. Ans. On page 34 of the pamphlet we have mailed to you, you will find tables for the use of the vernier scale.

IGNORO, Peekskill.—1. What was the fastest time made by Flora Temple, and when and where did she make it? 2. Is she still living, and if so how old is she? Ans. 1. 2:19½, made at Kalamazoo, Mich., October 15th, 1859. 2. She was foaled in 1845, and is still living.

S. and H., Charlestown, N. H.—Will you be kind enough to let us know who the parties are having the "Holton" Hatching apparatus for sale, if you can conveniently get the information? Ans. Seth Green has them. Holton was his nephew.

DOG, Baltimore, Md.—Where can I purchase the English *Fancier's Gazette*, giving description and points of dogs used by judges in bench shows, and at what price? Ans. You will have to write to the publishers, La Belle Sauvage Yard, Ludgate Hill, London, E. C., England.

CITINS, Newmarket.—As I purpose going to Florida, please inform me which is the best general map of the State, and where can I get one? Ans. Drew's map and Apthorp's map are both good. The last is the latest issued. Address Columbus Drew, stationer, Jacksonville, Fla.

MARK, Vergennes, Vt.—Will you please inform me where live quail can be bought in New York and at what price? Have written Whitley & Morris, Washington Market, but received no answer. Ans. See advertisement standing in our paper the past two weeks.

W. V., Poughkeepsie.—Could you inform me where I could get a map of the lakes in Canada west of Quebec, and whether there is good hunting and trapping? Ans. At the house of James Campbell & Son, 26 Front street, West Toronto, Canada. The trapping and hunting is very good, but the locality is hard to reach.

F. F. B., Battle Creek, Mich.—Do you think I would get good pups by crossing a Gordon with a Laverack setter? or would you advise me to keep the blood pure? Ans. You would be likely to get as good pups breeding from pure Gordon and Laverack as in any other way; yet as a general thing it is better to keep the strains distinct.

DIX, Ypsilanti, Mich.—Can you inform me where I can purchase the new model Springfield breech-loading rifle, 45 calibre, known as the officers' rifle, said to be finer finished and sighted than the soldiers' rifle of the same pattern? How much will it cost, and can I buy the common rifle of that pattern, and for how much? Ans. You cannot buy either.

R. A. R., Hartford.—I have a setter dog that shakes his head all the time, and his ear seems very tender, but I can see nothing in it. What can I give him that will help him? Ans. Make a solution of sulphate of copper, eight grains to one ounce of water. After washing out the ears with Castile soap and warm water, pour into them some of the liquid twice a day for two or three days. Feed the dog no meat, and give him exercise.

REMINGTON, Pittsburgh.—I have a Remington breech-loading rifle, .38 cal., 30-inch barrel, weight 8½ pounds. Could I make a good long-range gun out of it, by re-boring say to .40 cal.—barrel is one inch thick octagon—and adding vernier orthoptic sights? Ans. We doubt if you could. It would have to be sent to the factory to be properly done, and the expense would be almost equal to that of a new gun.

KIT, New York.—What can I do for my dog? He keeps up an almost incessant scratching; no sores to speak of. I have given arsenic and rubbed with ointment as you recommended to one of your correspondents some weeks ago. He seems in perfect health in all other respects. Ans. Besides the remedy you are using give him a small dose of compound cathartic pills, once a week for two or three weeks.

TEXAS, Beaver, Pa.—Please inform a constant reader of your valuable paper what it would cost to go from Pittsburgh to Denison, Texas; also the route, and whether winter or summer clothes. Ans. Take Chicago and Great Western and Missouri, Kansas and Texas Railroads. Fare to Denison about \$42. Take both thick and thin clothing, as the temperature varies. Overcoats are often necessary, and ice often forms an inch thick in the northern part of the State.

CYGNUS, Ithaca, N. Y.—Where can I spend a week or two not farther south than Virginia, where I might get a shot at a deer or bear, and a wild swan or so, all in the same vicinity—some place too small to contain a hotel? Ans. The Dismal Swamp, Virginia, is the only place we know of that fills all the conditions you name, unless we except the Central Park Zoological Garden. Get guides and other outfit at Suffolk, Va., and go to Lake Drummond, where you will make your headquarters.

W. C., Nyack, N. Y.—Will you be kind enough to inform me: 1. Where there is good squirrel shooting within fifty miles of New York city? 2. What will it cost to change a single barrel muzzle-loading shot gun to a breech-loader? Ans. 1. It is too late in the season for squirrel hunting. In many parts of Central New Jersey squirrels may be found to make fair sport in season. 2. Address H. C. Squires, No. 1 Courtlandt street, this city, or Clark & Snider, 214 West Pratt street, Baltimore, Md.

R. A. P., New Haven, Ct.—Will you please inform me the best way to get to Currituck, N. C., the best place to stay when I get there, and what kind of shooting will there be there the last of December? Ans. Take Old Dominion steamers to Norfolk, Va., and steamer thence to Knot's Island, which is three miles from the main shooting grounds. Time from New York, 30 hours; fare \$24 for the round trip. You can stop at Van Slaick's boarding-house or Lindsay's. The cost is \$5 per day for man, decoys, skiffs and marshes. Season lasts till Feb. 15th. Besides ducks and geese, English snipe and coons abound.

CARTERET CLUB, Elizabeth.—In your issue of Nov. 30th, in answer to "Crusoe," you state that paper shells turned over are as effective in close shooting as these left full length of chamber, and fastened by crimping or gluing, providing they are not cut, etc. Do you mean to convey that if the shell is cut so that it does not entirely fill the chamber the range and penetration of the charge is lessened? Ans. Yes; we consider that the shooting qualities of the gun are impaired, and that greater recoil is the result of a space being left between the end of the shell and shoulder of the chamber.

L. G., New York.—1. What do you consider to be the best kind of dog for use in hunting rabbits? 2. Is it desirable to hunt for rabbits with more than one dog at a time? 3. Can you refer me to any person who has pure bred beagle hounds for sale? I assume that what dog fanciers call dachshunds are in reality beagle hounds. 4. Are all beagle hounds first rate rabbit dogs in case they are pure bred? Ans. 1. None better than good well trained beagle hounds. 2. Yes; we have had great sport hunting with a small pack of well trained beagles. 3. Address J. H. Bergen, Road Hall, Middlesex county, New Jersey. The dachshund is a distinct breed, smaller than a beagle. 4. Yes; when trained.

C. T. H., Milwaukee.—1. In answer to "Crusoe," you speak of filling paper shells with wads till only enough paper is left to turn. How would you load a rifle shell of a capacity of 100 (or more) grains so as to use 50, 60, or 70 grains? I have been using a cork to fill the space, but am not at all certain but the ball should rest directly upon the powder to insure accuracy. I can get along with Dittmar Powder, but the black bothers me. Can you suggest any other way or give me any information? 2. How can I obtain a copy of the game laws of your State. Ans. 1. It is not necessary that the ball should rest directly on the powder to insure accuracy; fill the space with sawdust or bonedust. 2. By sending us 50 cents, for which we will send you "Fur Fin and Feather," containing the game laws of all the States.

AMATEUR, Philadelphia.—Will you please inform me how to feed a two-year old setter, who will not be worked till next summer? What is the proper diet when being worked? How is Indian meal prepared, and is it not as good as anything to keep him in good working order? My dog is a large, strong fellow, and will insist on working too far away in thickets, so it is almost impossible to keep track of him. Can you suggest any way to learn him to keep close? Will breaking a dog on partridge make him more cautious than to break him on quail? Ans. 1. There is no better food for a dog than the refuse of the table, scraps of meat bread, vegetables, gravy, etc., and when a dog is working he should be fed considerable meat. Well boiled mush of cornmeal with scraps of meat is excellent food. 2. The best way to break a dog of the fault of hunting too wide is to work him in a dense cover, and keep turning from him so that he will become lost and have some difficulty in finding you a few times. No dog likes to be lost from his master, and he will soon learn to keep within proper distance for fear of getting lost. 3. Yes.

KALMAN, Kewatin, Canada.—1. What is the weight of the largest speckled trout known to have been caught in the Nepigon river? 2. What was the biggest catch made by one rod in a single day? 3. Do salmon trout ever rise to the fly, as I can only kill them with a spoon? Ans. We have no means of answering the two first questions of our correspondent. He will probably remember the Irishman who used to fish for the catches of the Canadian Pacific Railway Survey, with which we are aware that he is connected. This Irishman fed 200 or so men with the proceeds of his rod, and we have seen him lift out an 8-pound trout by main strength with his ponderous tackle. We have no record of any larger trout being taken in the Nepigon river proper, but we have the affidavit of Mr. Henri Le Ronde, factor of the H. B. Company's trading post on Nepigon lake, attesting to a trout that weighed 17 pounds, taken at the mouth of a river emptying into the lake. 2. We have repeatedly taken the lake trout with the same fly which we used for speckled trout, especially at Island Portage.

M., Indianapolis.—1. Can you give any advice whereby the kink can be removed from a new sea grass line? 2. Is a cylinder-bored gun one that is just enough larger than correct gauge for reception of shell? 3. Are Kay's concentrators simply a paper shell—a shell only purchased loaded—or a device for loading any shell? and what price per hundred? 4. The recoil of my gun, (a 7½ pounds F. P. Clabrough) with more than 3 drs. of powder, is so severe as to be unpleasant. Having tried different kinds of powder, shells and loading, is not the above all it will burn to advantage? 5. In twelve targets (30-in) 40 yards; gun 30-in, 12-gauge, 1 oz. 6 shot, average was 90, viz. 4 shots with 2½ dr. powder, average 94; 4 shots with 3 drs powder, average 86; 4 shots with 3½ drs. powder, 89. Are the shooting qualities of the gun good, bad, or moderate? Ans. 1. By troling the line after you in a boat. 2. You are confounding cylinder and chamber; the former is a term used for barrels bored parallel and without contraction in any part. 3. They are a cloth cartridge containing shot only; price \$3.50 per 100. 4. Possibly you use too much shot, or your shells do not fill the full length of the chamber. 5. Considering the one ounce of shot the pattern is very fair.

E. J. R., Wethersfield, Conn.—1. Every dog but one in my kennel is sick with the distemper, and I know of several other persons whose dogs are sick and dying with the same disease. The more I read the dog books the less I know about doctoring them. I will be greatly obliged to you if you will state in your next issue what medicines you consider best, and what treatment, food, etc., you would advise for the distemper. 2. Two of my dogs have had worms, and I have tried areca nut without any effect, but since they have had the distemper the worms come away from them by the pint. Can you give the reason? Ans. 1. It is a difficult matter to prescribe the best remedy for distemper without seeing the dog. We have cured many cases of distemper by giving common table salt, a full ounce for a dose. It acts as an emetic and purgative, and is generally very efficacious. But unless dogs with this disease are kept comfortably warm they cannot be cured. See our issue of March 16th for Dr. Webb's course of treatment, which we recommend. 2. We cannot account for the worms being discharged, unless it was caused by some medicine given for the distemper. The areca nut rarely fails to rid a dog of worms when properly given.

D. R. C., Northeast, Pennsylvania.—1. Can buckshot be used in a choke-bored gun, and if so, should they chamber closely in the muzzle? 2. I notice you advocate cylinder-bored guns. How many pellets—average—should a good modern cylinder-bored gun, 10 gauge, put in a 30 inch circle, 40 yards, says 4 drachms Orange Lightning, 1½ oz. No. 7 Le roy shot, and how would the penetration compare with a similar gun choke-bored? 3. Would a choke-bored gun giving an average pattern of 150 on the above conditions be considered modified or full choke-bored? 4. Will it injure a gun to use metal shells ½ or ¾ inch shorter than the chamber in the gun? 5. I recently purchased a fine English gun. After using it a little I discovered in one of the barrels about eight inches from the breech, what appears to be a slight indentation similar to what might be made with the ball of the little finger, if placed on the barrel when heavily oiled and slightly moved. Can you suggest what probably caused it, and what I can do to remove it? 6. Are guns with very wide breeches preferable to those of more moderate width? 7. Do the leading English gun manufacturers all choke their guns on the same principle? Ans. 1. Yes, providing they chamber in the muzzle. 2. 125 pellets; it is claimed that the penetration is better in choke-bored guns. 3. Modified. 4. No; but the results would not be so good. 5. It is probably rust; take your gun to a gunsmith. 6. They are generally heavier, and capable of bearing larger charges. 7. No.

LINCOLN, Boston.—1. What is the fare from Pensacola to Sarasota? 2. Is any pine land near the southwest coast available for the settler at present? 3. Is the fever and ague contracted more readily on the seacoast of southern Florida than back in the country? 4. Could a healthy and strong constituted young man of about twenty-one strike in on some of the pine ridges or barrens of southwest Florida with shot gun, axe, a few provisions, but little money, a strong arm and a determination to cultivate the land he settled on, be able to win his way, and what would be the obstacles in his pathway? 5. Would a hundred dollars in cash be enough to start from Boston? Please answer these questions, as being a working man with but small capital, in an overcrowded city, with constant labor impossible, I would better myself by emigration if the future gave promise of anything better. Ans. 1. Capt. A. E. Willard runs an excursion steamer from Cedar Keys to Sarasota, and we understand that another boat is on the line for this winter. There is no steamer from Pensacola to Cedar Keys, unless the New Orleans and Key West steamer touches there, which we doubt. The fare would be at least \$10 between the two points. 2. Yes; a great deal of pine land. 3. No; only danger is near swamps, sluggish rivers, and low lands in the interior. 4. For a man to succeed in Florida, as elsewhere, time, patience and perseverance are necessary. It is possible and probable that the tiresome, dreary waiting for fortune to smile would prove too much for a young man fresh from the city. He could probably get a living easily, but not much else for several years. 5. Should think \$100 not sufficient. It would not much more than carry you there and buy a month's provisions. Work can be had in orange orchards at \$3.50 per day, and board \$1.50 per week.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[POST OFFICE BOX 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

NEW YORK, THURSDAY, DECEMBER 14, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

Trade supplied by American News Company.

CHARLES HALLOCK,

Editor and Business Manager.

CENTENNIAL AWARD.—We have received an official notification from the Director-General of the United States Centennial Commission to the effect "that the FOREST AND STREAM PUBLISHING Co. of New York City has been decreed an award on the Report of the Judges for a Collection Exhibit of Fishing and Hunting Implements." While we do not claim the "highest award" for our exhibit, we are pleased at this recognition of our efforts to have American sport and its accessories duly represented. Our thanks are also due to those gentlemen who have assisted us by loans of guns, etc.

SOUTH CAROLINA ORANGES.—From the pleasant grove of Chas. G. Kendall, Esq., on whose island domain, near Port Royal, South Carolina, we passed a pleasant week with skiff and gun last winter, we have received a box of superb oranges, of large size and delicious flavor. They are the finest we have seen from the Southern States, with the exception of lots from two locations in Florida—one on the Gulf Coast and the other on the St. John river, near Palatka. This is remarkable, when we consider the high latitude in which they were raised. On the main land frosts so frequently occur as to render orange culture a precarious venture, but on Palmetto Island and its neighbors, the western winds are tempered in their passage over the intervening salt creeks and estuaries, so that the temperature is some six degrees warmer; and this difference saves the crop. Mr. Kendall is devoting much attention to the culture of orange trees. The negroes on his place devoted the biggest part of their attention too, to the maturing crop—so much so that Mr. Kendall has substituted German laborers, which we trust will prove a wise measure.

When we receive such munificent gifts from our friends, we can contemplate with some serenity the life of the editorial drudge. ["Pa," said an urchin to his sterner parent, as he pointed significantly across the street, "Look! there goes an editor." "Hush, my son, don't make fun of the poor man. You don't know what you may come to one of these days."] And so we suffer and endure! Bunches of quail, braces of ducks and geese, packages of tobacco, suits of clothes, puppies, guns and fishing tackle, boots and disinfectants, these are forced upon us at odd times, anticipating Christmas all the year round, and making us feel the uncertainty of life, and that no one can know what a day may bring forth.

—The third number of the *Florida New Yorker* is just at hand. This is a most valuable publication for those seeking information about Florida. It is published at 84 Park Row, this city.

PROF. COPE'S EXPEDITION.

THE exploring expedition from which Prof. Cope has recently returned seems by all accounts to have been most successful. It had for its object the examination and determination of beds on the Upper Missouri, which have been visited but once or twice before by geologists, and in regard to the age of which there has been no little controversy in the scientific world. The deposits extend from a point some distance above the mouth of the Judith river, almost to Carroll, and run back from the Missouri for a considerable distance. They have been extensively affected by the erosive agencies which are constantly at work in that western country, and are worn and weathered into the deep gullies and ridges, and fantastic forms which are well known to characterize the *Manvaisés Terres* of the more recent (Tertiary) formations of the White river, and about which so much has been written. Prof. Cope was so fortunate as to make valuable collections on the north side of the Missouri at a point hitherto unexplored by geologists. From here the party proceeded to cross the river, and making camp not far from the mouth of the Judith, devoted considerable time to the examination of the Bad Lands on that stream. Dog River, which empties into the Missouri only about a mile to the east of the Judith was also examined, its rugged and precipitous bluffs yielding a considerable harvest of fossils. Prof. Cope left the main party here, and taking his guide and a pack animal loaded with provisions, proceeded to make a reconnaissance to the southeast for the purpose of discovering other favorable localities for the collections of fossils. In this he was successful, finding good collecting ground in the vicinity of Cow Island, and to the southeast of that point. In all about three tons of fossil bones were secured, besides a large number of the skins and skeletons of the recent mammals which inhabit the region. Collections of fishes and reptiles were made, and copious notes on the zoology and geology of the region taken. Indeed, Prof. Cope seems to have made the most of his opportunity, and to have manifested his usual energy and enthusiasm in conducting this expedition.

The party found game very abundant in the region traversed, buffalo and antelope being especially plentiful. Bighorn or mountain sheep, black-tailed deer and bear were not infrequently seen. Elk do not seem to have been met with, a state of things which somewhat surprises us, as they were within a few years very abundant all along the river, especially near Cow Island. A few years ago we had the pleasure of killing the largest bull we ever saw just below that point; since then perhaps the skin hunters have driven them all off.

Prof. Cope is to be congratulated that he was not disturbed during his investigations by hostile Indians; the wild bands, however, were all south fighting General Crook, and no more dangerous red men were seen than the Gros Ventres of the prairie and some River Crows; "coffee coolers" all, we suspect. Ordinarily, however, the regions between Carroll and Claggett's is about as bad an Indian country as one would care to travel through.

The fossil remains secured by Prof. Cope were chiefly dinosaurs fresh water and land reptiles, some herbivorous, others carnivorous, and most of them of gigantic size. Eighteen species are represented in his collections. The importance of these discoveries can be estimated when we state that all that we know of the ancient fauna of the region which has just been examined is contained in a few brief descriptions of teeth and imperfect fragments of skeletons announced some years ago by Prof. Leidy. The publication of detailed descriptions of the forms found by Prof. Cope will be awaited with much interest. It may be added that the evidence collected by Prof. Cope during the expedition from which he has just returned tends to confirm the opinion which has for some years been held by vertebrate paleontologists that the beds at the mouth of the Judith are of cretaceous age. Should his researches be found to have cleared up and finally determined this point, science will have to thank him for another most valuable contribution, of more importance perhaps than the discovery of a dozen new species.

HOMOSASSA.—We shall oblige a good many intending visitors to Florida by announcing that delightful Homosassa, on the Gulf, has doubled its capacity recently, and that Mr. and Mrs. Jones will therefore be able to make a larger number of people happy than before. They can now accommodate 25 persons comfortably, with rooms newly furnished throughout. All the rooms in the old house are now taken by last winter's boarders, but there are several rooms vacant in the new house. Ducks are now coming in freely, and sheephead and all kinds of fish bite well.

—Mr. Brown, who advertised Live Quail for sale in our paper, volunteers the information that two insertions of his advertisement brought him thirty-two letters of inquiry and fifteen orders for live quail. And yet some people think it not worth while to advertise in FOREST AND STREAM.

—The friends of Mr. C. L. Tiffany of Messrs. Tiffany & Co., jewelers, will be grieved to hear of the accident which befell him on Saturday last. While walking he slipped and fell on the ice and broke his ankle. The injury, although extremely painful, is not serious.

—Halifax, Nova Scotia, has been made the winter port of the Canadian New Dominion. It has a capacious water frontage and sheltered anchorages, surpassed by few.

WRESTLING.

AS PRACTICED IN ANCIENT AND MODERN TIMES.

A GREAT deal of popular interest was some time ago awakened in the species of athletic sport by the meetings of Miller, Christol, Carteron and others, and it was suddenly brought into the front rank of public favor. It is to be regretted that, more lately, exhibitions should have been made by men who resorted to it as a mere "gate-money" speculation, and whose endeavors have resulted in bringing it into very questionable repute. This regret is based upon a few very simple facts. Both ancient and modern usages bear testimony to the excellence of wrestling as a means of muscular development, and as an exercise combining gracefulness with skill. Many years ago in England it fell from its place among the diversions and accomplishments of gentlemen to the rank of an exhibition game for professional athletes. To the former class all its advantages were thus lost, and a closely similar course has been followed in this country. An art well worthy of being cultivated for its own sake appears to be in imminent danger of neglect from the odor associated with it in the general sense of the community. It is to be hoped that it may be retained in private gymnasiums, and a few facts in its history may not only show the estimation in which it was long since held, but be found to compose an interesting chapter in the literature of athletic sports.

The style of wrestling now in vogue has been called the Græco-Roman, from the similarity between it and that practiced in the gymnasia of Greece and Rome. We are thus carried back at a single bound to that period which in this as well as in a literary sense, is the most interesting in the history of the world. Watching the course of modern poesy, and taking a comprehensive glance of the themes of song, we are in no wise prepared for the poetical treatment of such a subject as wrestling or a wrestling match. It would require an imagination equal to their own to picture Longfellow, Bryant, Holmes, Saxe, Aldrich, or Thompson tuning their harps to sing of the feats of Miller or Christol, weaving in laudatory references to their antecedents, and figuratively twining wreaths of olive round their brows. It was less anomalous in Pindar's age. On looking over the odes of that poet we find the eighth and ninth of the Olympian, the eighth Pythian, the second, third, fourth, fifth, sixth and tenth Nemean, and the fifth, sixth, seventh and eighth Isthmian all dedicated to wrestlers or pancratiasts. Homer also describes with great spirit the wrestling match between Ajax and Ulysses, during the funeral games held in honor of Patroclus. We choose Pope's vigorous translation, and the passage is noteworthy, as showing the "style" which these great wrestlers adopted.

"Amid the ring each nervous rival stands,
Embracing rigid with implicit hands,
Close lock'd above, their heads and arms are mix'd,
Below their planted feet at distance fix'd,
Like two strong rafters which the builder forms,
Proof to the wintry winds and howling storms,
Their tops connected, bent at wider space,
Fix'd on the centre stands their solid base."

After such tugging and straining as might be expected from two such mighty heroes, Ulysses tripped up Ajax, and the struggle was continued on the ground, until Achilles decided that the prize should be divided between them.

Lucian furnishes us with a very vivid picture of the scene presented in an Athenian gymnasium. Thither Solon and a visitor from Scythia, named Anacharsis, are described as having wended their way, and in the dialogue the stranger extracts what fun he can out of the athletic contests. We quote the following passage, partly on account of its own merits, but chiefly for the idea which it gives of the manner in which the matches were conducted:

"Tell me, Solon," says Anacharsis, "what those young fellows are about who are grappled and locked together in that manner, and endeavoring to trip up one another, and those others who roll and tumble in the mud like so many hogs, and squeeze and throttle each other till they are almost strangled? But just now I saw them strip, anoint one another by turns very peaceably and like good friends; when all on a sudden, and without any offense taken as I could perceive, they fell together by the ears, threw their heads in each other's faces, and butted like two rams; and now one of them, as you see, has lifted his antagonist off his legs, dashed him upon the ground, and falling upon him will not suffer him to rise; but on the contrary drives him deeper into the mud, and twisting his legs about his middle and setting his elbows in his throat, seems determined to suffocate him, while the poor wretch at the same time strikes him gently on the shoulder, begging quarter, as I suppose, and beseeching him not to choke him in good earnest. Neither can I observe that they are in the least shy of dirtying themselves, notwithstanding their being rubbed all over with oil; and indeed they soon hide it with mud, by the help of which and a good deal of sweat, they become so slippery that I cannot forbear laughing to see them sliding like eels out of one another's hands."

Solon explains to his jocular companion that these were wrestlers, and that others, whom he described as buffeting each other, were pancratiasts. In the end, however, and like many people in our own day, the Scythian is inclined to question the utility of such an expenditure of strength and energy.

The above passages will give some idea both of the importance anciently attaching to wrestling as an exercise, and of the mode of preparing for and practicing it. Among the Greeks athletic games formed part of their religion, and the great meetings were originally instituted in honor of

the gods. While we state that fact no attempt is made to point to the time when wrestling began. We are told that Jacob wrestled with an angel, but unfortunately no rules are recorded by which the contest was governed. In India it was also engaged in from a very early date, and seems to have been regarded there, as in Greece, as a necessary part of warlike training. In the latter country it must have been resorted to as a pastime at a very early age, as we are told that Theseus, the hero of Crete and Ariadne, is to be ascribed the honor of first drawing up the rules by which the game should be regulated. At an earlier period, the legend says, Pallux had during the Colebian expedition, conquered Amyeus, and been nominated patron of boxing and wrestling. And there, so far as Greece is concerned, in a mythical age the history of wrestling begins. Very naturally, we find Hercules figuring among the adepts in the game. Coming down to a later date, and passing by the dubious institution of the Olympian games, we are still involved in doubt as to the exact method in which the wrestling contests were first conducted. According to West, and his assertion seems reasonable, Theseus' rules are now unknown. In any case the authorities differ considerably, and when it is added that almost every tribe in Greece had some peculiar trick or strategem, the difficulty of generalizing correctly becomes apparent. The authority of prints a few hundred years old is of course of little value.

As to the preparation and costume of the contestants there is, however, no doubt. Of these Lucian has already supplied us with a few hints. According to the earliest usage the wrestlers appeared naked, and afterwards with a waist cloth. In Homer's time the wrestlers did not anoint themselves, as we have seen they did in Solon's time, and as was also the custom in Crete and Lacedonia. When the usage did spread to Greece the practice was to rub the body with oil, or smear it with an ointment composed of oil, wax and dust. After the anointing process the athletic was either sprinkled with sand, or rolled himself on the ground. The obvious purpose of this was to give his antagonist a better hold, an object which, according to Anacharsis, was even then only partially attained.

There were three contests in wrestling proper—the *orthopale*, the *anachinopale*, and the *acrocheirismus*. In the *pancratium*, wrestling was combined with boxing, but in strict wrestling blows were not allowed, although the contestants might push each other back. Of the three first named the *orthopale* meant wrestling in an upright position. When one was thrown the other allowed him to rise again and resume the strife, the third fall deciding the match. When the contestants wrestled on the ground it was called *anachinopale*, and appears to have been nothing more than a trial of endurance, the one doing all he could to weaken his opponent, until one or other should acknowledge himself defeated. In the *acrocheirismus* the competitors held each other by the fingers, as indicated by the name, and did not seize upon the rest of the body. We are told of one, Levatisus, who had such a grip that he could break an adversary's finger. He was less successful in the *pale*. Sostatus gained a surname from his victories in this peculiar contest. What the great Milo of Cretona, the most famous of all the wrestlers of Greece, was, may be inferred from the fact that he could hold a pomegranite so firmly in his hand that no one could take it from him.

We may here introduce a few of the recorded feats of this hero of the arena. It is said that he carried a four-year old bullock forty yards, and then killed it with one blow of his fist. He was the winner of six Olympian and seven Pythian crowns. On one occasion at the Olympic wrestling match, he met with no antagonist, and the attendant circumstances are related in the following epigram:

When none adventur'd in the Olympic sand
The might of boistrous Milo to withstand,
Th' unrivall'd chief advanced to seize the crown,
But 'mid his triumph slipp'd unwary down.
The people shouted and forbade bestow
The wreath on him who fell without a foe;
But rising in the midst he stood and cried,
"Do not three falls the victory decide?
Fortune indeed has given me one, but who
Will undertake to throw me th' other two?"

We now come to the disagreements of authors upon the question of combination or separation of the contests in an upright and recumbent position. Some treat them as distinct exercises, others as mere variations of one contest. Dr. Smith speaks of the match as divided into two parts, those above indicated. If the contestants did not rise again the strife upon the ground ended the match whenever one gave in. He says, further, that the *arthropale* or that in an erect position, was the only one used in Homer's time, and afterwards in the great national games. We have, however, seen that Ajax and Ulysses contested on the ground, and it is hard to reconcile Dr. Smith's statement with Homer's description. The poet was most likely to attribute to the honors of his epic the usage of his own time. The latter part of his statement is, on the other hand, correct, or Milo's challenge loses all meaning. Mr. West, in his dissertation upon the Olympic game, regards the one exercise as merely a variation of the other.

The fact appears to be that the three kinds above mentioned might be combined or separated as taste inclined. When the athletes met each made use of all the expedients which his ingenuity could prompt, to seize the other at a disadvantage and throw him, and to avoid, at the same time, giving any such opportunity to the other. In the *pancratium*, which was first introduced at Olympia, and subsequently imported into Italy under the empire, two methods of throwing are known to have been used. One was to place a foot behind that of the adversary and force

him backward. The other was for one to seize the other round the middle and lift him off his feet, so that his body outbalancing itself, he fell. To Krause we are indebted for a wood cut illustrative of the last of these. One gladiator has the other round the middle, head down and feet in the air, which could only have been done by crossing the hands—the right to the left side of the opponent, the left to the left—and turning him completely over while lifting him off his feet. He also presents an illustration of the *anachinopale*.

The conclusion at which we arrive is, that both the authors who speak of the different exercises as separate, and those who speak of them as variations of one contest, are correct. The Greeks did probably what is everywhere done to-day, viz., employed different styles on different occasions, and in different places. We have already seen that each district had its peculiarity. We have also seen that the upright position was that used at Olympia. In this, be it observed, the first three falls decided the victory, and as it is stated that the strife was not continued on the ground, there could have been none of the nice distinctions as to what constitutes a fall, which are now so minutely specified. A fall was probably made by an athlete throwing the other to the ground in any fashion.

In the *anachinopale*, although begun in an upright position, and continued on the ground, there could be no such thing as a fall, since the test was one of strength and endurance, and not one of touching the ground with any part or parts of the body.

The *acrocheirismus* probably showed a form of wrestling in which tripping was employed. We can, however, easily imagine a contest in which not only the two first named but the last should be combined.

This brings us to the Græco-Roman style some time since introduced into New York. In the match between Miller and Carteron last December, the rule forbidding the clasping of hands and interlacing of fingers was suspended. A fall was declared to consist of one throwing the other fairly on his back, so that both shoulders touched the ground at the same time. When Miller and Christol first met here they grasped each other's wrists. Tripping is not allowed, the lower limbs being only used for leverage. One authority refines the definition of a fall, and gives the following as a brief synopsis of the rules of the game: Catch above the belt; no tripping allowed; touching the ground with two shoulders and one hip, or two hips and one shoulder, to make a fall.

The rules may, in fact, be modified to suit the contestants. What is not clear, however, is the title of the style to the distinctive appellation, Græco-Roman. We have seen that Ulysses made use of tripping in bringing Ajax to the ground, and into the method of wrestling on the ground none of the conditions of touching shoulders, etc., were introduced to which modern athletes have resorted to decide their bouts. In a few general features only were the styles alike, and for that reason we must presumably accept the name.

GAME PROTECTION.

THE NEW YORK CITY ASSOCIATION FOR THE PROTECTION OF GAME.—The annual inauguration of the winter session of this potential association is always a noteworthy event among those interested in the objects for which it labors. Comprising, as it does, nearly one hundred of the leading citizens of New York, (its maximum membership,) with high public functionaries as honorary members, and working with the purpose, vigor, and unity which wealth and influence lend to it, and being always foremost in its schemes for protecting game and in the prosecution of offenders, its meetings are scanned with interest, not only by those whom the law is liable to reach, and by the law makers themselves who accept its suggestions as bases of legislative action, but by the game clubs and societies throughout the State and country who follow its lead. The first meeting of the present session took place on Monday night at the residence of Royal Phelps, Esq., who has been its honored and efficient President for so many years that his severance from the main body would be equivalent to corporeal decapitation; and when that worthy gentleman seated himself in the time-honored official chair of deer's antlers the members present felt as if they were in an Arcadian atmosphere, and adjusted themselves comfortably to listen to his opening address. It may be premised here, that this Society has no club room. Its meetings are held at the private residences of its members, and no applicant is admissible to its ranks who is not eligible from a social status also.

The President on rising said:—

Gentlemen of the New York City Association for the Protection of Game:—I am happy to meet you again at this, our first meeting for the season 1876-7. In consequence of the great excitement growing out of the national election, the Executive Committee determined to hold no meeting in November. Of the \$2,500 which, at the commencement of last season, you placed in the hands of the Executive Committee, \$735 93 has been paid for law expenses over and above the amount collected by the lawyers of the association. The counsel, Mr. Whitehead, and the assistant counsel, Mr. Outhbert, will inform you of the condition of the different suits the association had pending in the courts. There are at the present time thirty-six clubs and associations in this State all owing allegiance to the New York State Association, and it will be very hard if, with our united influence, we cannot get what is so much needed, viz: a law by which a Game Constable may arrest infractors of the law without going through the form of getting a warrant from a court. When the farmers and owners of land come to understand the practical working

of game laws in America, where the country is divided up into small farms and held in fee, they cannot but be in favor of them. On Long Island, where the game laws are tolerably well enforced, it is not an uncommon occurrence for a farmer to get \$10, \$20, or even \$30 for the right of shooting over a few acres of swamp or woodland, and fishing in a small trout stream by which his place is bounded. So, in any view you take of it, the American farmer is benefited by game laws, whereas in England, where the land is almost universally leased to the farmer with the privilege of shooting and fishing reserved to the landlord, they are detested and a source of continued irritation. The Secretary will read the correspondence which has taken place since our last meeting, and I would particularly call your attention to that with the President of the State Association, James W. Wadsworth, Esq., and the Superintendent of the State Fishing Commission, Seth Green, Esq. You will observe that a highly influential committee has been appointed to supervise amendments to the game laws, and it is to be hoped that the close season for quail will be continued up to the 1st day of November, instead of being thrown open on the 1st of October, as it now is.

Letters were read from Mr. Seth Green on the condition and prospects of trout fishing, and from Mr. Genio C. Scott on violations of the game laws in the States of New Jersey and Pennsylvania. Mr. Charles E. Whitehead addressed the meeting on the progress of law suits instigated for violations of the law. The following gentlemen were proposed for membership:—Judge Henry A. Gildersleeve, James H. Benkard, Joseph C. Willetts, and William C. Maimbeer. Messrs. Charles E. Strong and Roland Redmond, previously proposed, were elected. The meeting adjourned to meet again on the second Monday in January, at the residence of Mr. Charles E. Whitehead, that date being fixed for the annual meeting of the association.

VERMONT GAME LAWS.

EDITOR OF FOREST AND STREAM:—

I have just been reading an address delivered by the Hon. E. I. Phelps, at Burlington, Vermont. The gentleman begins his address by asking, "Of what consequence, if any, is the preservation of the wild game of this State to the public?"

I would like to answer through your paper, of *no consequence whatever*, if in preserving the game we do *anything* which would tend to make an aristocracy based on money, or anything which would tend to establish a privileged class in society; anything that would tend to make the poor man hate the rich man; anything that would tend to encourage eternal law suits, or which tends towards or imitates the English Game Laws. Better *every* game bird and fish be destroyed, than to carry out the plan which has been commenced in this State by a few men, who appear to think they ought to be the only ones who should have the right to hunt and fish. They call themselves gentlemen, I suppose—all others are "peasants," "loafers," "vagrants," etc., these men appear to think.

Now, one of the most prominent men of this set, who would transport a poor man to "Botany Bay" for shooting a woodcock, has the reputation in the town in which he lives of being the worst "Poacher" in it.

These gentlemen know they can't have in this country an "aristocracy of blood," so they want one of the very meanest kind—one of money.

I predict that the effect of the game laws just passed in our State, will be to make a very large majority of men who take any interest in hunting or fishing, feel that they will do all they can to destroy the fish and game *entirely*, rather than a few men who may chance to have a little money should have all of those privileges they have always had an equal share in. "It won't work"; too much law is bad. The gentleman who delivered the address at Burlington, says "the presence of game attracts people in search of pleasure to the country who leave money behind them." That is true, but the attraction looses its charm somewhat, when the pleasure seeker finds "Old Jones" after him with an officer, and he is brought up before "Old Dogberry," and finds out, when too late, that he is a criminal, and has got to go to jail or pay a heavy fine and costs, because he has crossed "a sheep pasture" on his way home from the stream (when he has already paid a high price for "the right to fish"), "with the implements of fishing in his hands," the chances are that he will "leave money behind" him *just as soon as he can*, and try and find some place where he's not obliged to leave quite so much money behind him.

It is noticeable that those who want so much law, refer continually to England and her game laws. Now, when we have a condition of society and a government like that of England, it will be *quite* time enough to imitate her game laws, and not before.

"While the bird remains on your land, it is your property just as much as your sheep are."

This is *not the fact*. The bird is *not* your property until captured.

Should any one kill and take away from off your land a bird or fish, he would *not* commit a theft; but should he kill and take away a sheep, he would be a thief without doubt. I am sure most people want good strict laws, as to "close and open seasons," and as to kinds of implements to be used, and I have and always shall be ready to help maintain good reasonable game laws, but this extreme legislation I am opposed to, and feel sure the effect will be bad, and only tend to bring into contempt the whole subject of the preservation of fish and game, and discourage any private individuals in their efforts to restock the streams with fish.

If these gentlemen who want so much *law* would make one-half the effort to get our State to establish a State hatching house, as New York has done, and fill our splendid streams with fish, and let the rich and poor, high and low, share them on equal terms, they would do something that would amount to something, though perhaps they would now and then be annoyed by meeting a "peasant" on the stream, yet for the public good they ought to be willing to endure that.

What we want, is a set of game laws that all good, fair-minded men, would see were reasonable, and *bore alike on all*. I am certain such laws would be supported and reasonably observed, but a lot of laws which *plainly* are made for the *benefit* of a few, of course, it is folly to suppose will have that support from the people that would

produce any good results, and I believe only tend to make the mass of the people entirely disregard all game laws.

A VERMONT.

What our correspondent appears to object to, is that a trespass act has for the first time been introduced into the game laws of Vermont. The provision is to the following effect:—

"If a land owner desires to protect the fish and game on his premises, he must post, at fit places, a notice to the effect that he forbids shooting or fishing on them. This being done, any person trespassing for the purpose of fishing, hunting or trapping, may be sued for such trespass and be made to pay \$10 for every offence. Under this act it is not necessary that the trespasser shall catch a fish or shoot a gun even. If he is seen on the land with a fishing rod, a gun, or traps, the law makes the act presumption of intent to trespass, and punishes it as if he actually caught fish or killed game. The act does not hinder the entrance upon land for the purpose of killing any noxious animal, as foxes, racoons, bears, lynxes, etc."

Now this act is almost identical with that in force in this State, and none of the objections or unhappy results predicted by our correspondent have ever come to pass. We consider that the principle which involves a man's right to say who shall or shall not come upon his land, of even more importance than the question of the ownership of game upon it. A farmer or land owner of any description may or may not post his lands as he sees fit; the probability is that it will not be done in one case out of a hundred, and even then, unless the land owner has an eye to profit, the chances are that any respectable person can obtain permission to shoot or fish. The law is not nearly so stringent as that in many other States. In Kentucky the fine for trespass when the lands are posted is \$25; in Mississippi \$10. Connecticut has a trespass law which does not even require boards or public notice. North Carolina has a law similar to the one complained of, and in New Jersey the fine for fishing in any pond or water after a notice has been posted adjacent to it is \$100, so that our Vermont friends need not think that they are being badly treated, or curtailed of any privileges to which they are legally or justly entitled.

CANADA—A correspondent at Quebec sends us a slip containing the latest tinkering to which the game laws of that province have been subjected to at the hands of the loose legislation. He says:—

"The changes proposed are of a very sweeping nature; the close period in mostly every case is made shorter. Pot-hunters are not satisfied with appealing to the greed of the white man, in order to kill the goose who lays the golden eggs; the red skin is also enlisted for the nonce. In order to make the destruction of game doubly sure, the Indian declares that for him no "close period" should exist, and that as he does not wish to till the soil or make baskets, the caribou and deer, even when big with young, is to be indiscriminately slaughtered to furnish him with tobacco and rum. You will be pleased to hear that the Montreal Fish and Game Protection Club, as well as several private individuals, have done their best to protect and multiply game, thereby furnishing food to both the white and the red man."

We regret that our space will not permit us to print in full the proceedings of the Committee on game laws, but we give below an abstract of the evidence of the chief witnesses called. Mr. Rintoul, Secretary of the Montreal Fish and Game Club, Paul Picard, Head Chief of the Huron Indians at Lorette, and Francois Gros Louis, a chief of the same tribe.

Mr. Rintoul said that, with respect to the clause of the bill relating to the deer family, the Club were of opinion that until the 1st of February was much too long to put back the opening of the close season—at least in regard to red deer. He was not so well acquainted with the habits of the moose and caribou; but he believed there was not a very marked difference between those of the one and those of the other. In February and March, red deer were usually heavy in fawn; moreover the snows were deep, and the chances were against the poor animals, who were then easily and uselessly massacred. If they were killed only for food, there could be no objection; but unfortunately, in the majority of cases, they were hunting for their skins. The laws in Ontario and Nova Scotia were very strict on this head. In the latter, moose killing had been altogether prohibited for three years, and the authorities had met the case of evasions of the law by prohibiting the traffic in moose hides. This measure was absolutely necessary to prevent the complete extermination of this noble ruminant in this Nova Scotian forests. It was positively inhuman to butcher the poor beasts, when heavy with calf and in a helpless condition on account of the deep snows.

It was agreed that it be a suggestion to fix the commencement of the close season for red deer in Quebec at the 1st January.

Mr. Rintoul said, with regard to the different species of wild ducks, such as black ducks, wood ducks and teal, which bred about the Sorel marshes, and throughout the Province, they came in very early. Mr. Lemoine had shot one on the 23d April, and, on examining where she had risen from, had found a nest of eggs, thus showing that, at that time, these species had already commenced to hatch, and any killed after that destroyed whole clutches. The 10th of May was too far on to postpone the opening of the close season. If spring shooting was not altogether forbidden, the close season should be made to begin at least on the 20th April. He also explained that, while snipe came up the river, these ducks came from the west, following the ice as it broke up.

It was agreed, as a suggestion, to change the close season from the 1st May to the 1st September, to from the 20th April to the 20th August.

Snipe and woodcock shooting was then fixed at the same date of opening in the fall as duck shooting—the close season for such birds to commence on the 1st March.

Mr. Rintoul objected to the snaring of partridges. He thought there could be no surer way of exterminating them. Shooting gave them a chance, and was, to some extent a sort of protection, on account of the difficulty and trouble it gave the sportsman in hunting up the game. With snares, however, a whole bush could be quickly depleted.

Mr. Gauthier said that hares could not be caught in any other way than by snares, for market, and, as long as snares were set for hares, partridges would be caught in them.

Mr. Rintoul thought the 1st April was too long to put back the close season for hares.

Mr. Price suggested the 15th March.

Some conversation ensued, the tenor of which was that no close season was, in fact, needed for hares at all. As long as there was a forest in the country, there would be hares.

The subject here dropped, without any change being made in the conclusions already come to on these heads.

Chief Picard, of Lorette, here asked to be allowed to address the Committee, and, permission being granted, he went on to say that the territory between the St. Maurice and the Saguenay, had been conceded by treaty both with the French and English Governors to the ancestors of the Huron tribe of Indians as their special hunting grounds, with power to kill moose and caribou at all times for their wants, and he had a paper to that effect. They understood the necessity of preserving these deer, as much as possible; but if the Indians were prevented completely from killing them during the close season, it would be a source of very great hardship to them. He said the Indians had no land, no cattle, no sheep; and if they were deprived of this means of subsistence, it was difficult to say how they were going to live after such a period of hard times, when there was no sale for their snow shoes, *train-eaux*, moccasins and bead work, and with the prospect of a severe incoming winter. He argued that it was not the Indians, but the whites who were exterminating the moose. He asked that each head of a family in the Huron tribe be permitted to kill at least two or three moose during the close season.

Chief Gros Louis said many families in Lorette would starve next winter unless they had the right to hunt and fish.

The Chairman said the Committee desired to protect the Indians; but the difficulty was, in making discrimination, to obviate the abuse thereof.

Chief Picard said he was an old man, with white hair known to them all, and he gave his word that any abuse of the permission to kill more than the prescribed number would be immediately reported. He also said no law was necessary for caribou. They were here to-day and 30 miles away to-morrow. Moreover, they were so plentiful that there was little reason to apprehend their extermination. For moose, however, some legal protection was necessary.

The Chairman said the Indians in New Brunswick enjoyed the privilege asked by the Hurons.

Mr. Rintoul said it was not so. Moose, could not be killed at all during the close season and, in the open season, the number to be killed by each Indian should not exceed two.

An addition to the clause was suggested to give to the Hurons the privilege asked for, each Indian to make a declaration upon oath before the game-keeper of the number of deer killed by him, and to produce the same when offering the venison or skin for sale.

Chief Picard agreed to this.

It is almost painful to contemplate the views held by some of the gentlemen comprising the Quebec Legislature on the subject of game protection, and we regret that our space will not permit of our printing the proceedings in full. One gentleman considered that the curtailment of the Spring duck shooting would work great hardship to those who lived by fowling, notwithstanding that it was shown by Mr. Rintoul that at the proposed commencement of the close season ducks were sitting on their eggs. As we in the "States" have an interest in those ducks which find a winter refuge and feeding grounds on our bays and rivers, the gentleman in question will be entitled to the thanks of all our sportsmen. Another gentleman suggested that hares could not be caught for market in any other way than by snaring, and as partridges would unavoidably get themselves into snares, snaring should be permitted. A nice argument truly. It is fortunate for the sportsmen of Quebec that they have such a body as the Montreal Fish and Game Club with such active and efficient officers as Mr. MacPherson Lemoine, President, and Mr. Rintoul, Secretary, to look out for their interests.

NEW YORK.—Our Niagara Falls correspondent writes under date of December 6th:—

"The first snow of the season fell last Friday, and the pot-hunters have been out in force. One of them reports killing eleven at one shot, of a bevy of twelve quail sitting in the snow. I am of the opinion that quail shooting, after December 1st, ought to be abolished, or the utter extinction of them will be the consequence. They have enough to contend against in the hard winter, without being tracked up in the snow and systematically potted."

NIAGARA."

We cannot agree with our correspondent as to having the close season commence on December 1st. We think quail shooting should commence hereabouts at least, on November 1st, and one month's shooting would be hardly enough. Better "pot" your pot-hunters, and stop destruction in that way.

—Owners of ground at College Hill, Hamilton, Ohio, and vicinity are disposed to protect the birds. The consequence is that pot hunters do not find it pleasant for their business thereabouts. College Hill and Spring Grove, with the intervening territory, now forms one of the best bird preserves in the country, being well wooded, well watered and well watched. Boys, do all you can to protect the birds, especially those that stay with us the winter through.

—The St. Augustine hotels are now open, and visitors are arriving in force. The Indians are still at Fort Marion, and will furnish one of the chief attractions of the ancient town during the winter season.

—Ice was common in Florida last week—not only at Jacksonville, St. Augustine, and other points east, but at Homosassa, on the Gulf.

Sporting Notes From Abroad.

FROM OUR OWN CORRESPONDENT.

LONDON, November 27th.

It is pleasant to note that one at least of your sporting contemporaries on this side of the Atlantic is willing to admit to its columns an occasional kind word for manners and things American. Fortunately the ridiculous and scurrilous statements of the *Field* correspondent, who represented that journal at the Centennial regatta and revenged the defeats of his countrymen or some fancied lack of courtesy to himself by slandering the country, are generally taken for what they are worth. There are too many intelligent Englishmen visiting the United States now-a-days for the vapors of one idiot to have much effect, and while real or imaginary peculiarities of speech are jestingly reproduced, the great masses of the English people are appreciating American worth and industry. The *Sporting Gazette* alludes to the return of a well-known member of Parliament, Mr. C. M. Cambell, and a speech made by him on the occasion of the presentation of an address by his workmen, in which he said that during his visit to America he had experienced nothing but kindness, and that Americans could teach their British cousins, among other things, respect for women, and sobriety. A word of such testimony is sufficient offset to all that could be said by a dozen "Caracta-cusses." By the by, the address to Mr. Cambell mentioned above was presented to him by four workmen whose united period of service with his firm aggregated 207 years.

The 300-mile walk between O'Leary, the American champion, and Crossland was brought to a conclusion on Thursday night by the latter withdrawing, an accident to his leg in the early part of the match having disabled him. At the finish O'Leary was fourteen miles ahead, having walked 264 miles in 74 hours 10 minutes and 34 seconds. The times, from 121 to 251 miles, are the fastest on record, viz., 28h. 2min. 7sec, and 67h. 59min. 50sec., compared with 32h. 26min. 23sec., and 69h. 13min. 29sec. It was estimated that 15,000 persons were present at the finish, and 39,000 in all attended during the four days. O'Leary can now safely claim to be champion, although he is to walk another match at the same distance in a few days for that title. He has shown such wonderful powers of endurance that the odds will be largely in his favor. Nothing more has been heard regarding a match with Weston, and the chances are that the cornet player will avoid a meeting. O'Leary's diet appears to have been liberal; stewed oysters, beef tea, jellies and champagne. If he should meet Weston the match would be a very exciting one, and even if Weston lost he could exclaim with Bombastes, "he conquered all but Fusbos, Fusbos he."

Speaking of champions; it was hoped that a sculler's match for the championship of England would be arranged between the two great aquatic artists, Boyd and Higgins, but a hitch has occurred which will probably prevent it. Higgins issued the challenge, but wants to row on the Thames, where the championship matches have heretofore usually been decided, but Boyd will only row by his own Tyneside. This Higgins "can't see," so there will probably be no match.

The irrepressible Captain Boyton has been heard from again; this time from the river Po, on a paddling voyage in costume from Turin to the Adriatic. He has at last found his match, however, and was obliged to abandon his task after being upwards of eighty hours in the water. While en route he wrote a note to a friend, which he flung on a bridge in passing, which is as follows: "On the Po, Nov. 5th, near Valenza, 28 hours out. 'DEAR FRIEND:—This is the worst river I ever struck paddle into. I have run on rocks a hundred times since I left Turin. This morning, above Casale, during a heavy fog, I fell over a dam, and I wonder I am alive to tell you so. A few hours since I ran into a mill, and then under it. There is always a heavy fog on this river during the night, so that it is most dangerous to run. I am making slow time—am strong and hearty.—BOXTON.' And yet after all the gallant captain had to give it up."

The abandonment of the Kennel Club Bench Show at Alexandra Palace is occasioning some comment and much disappointment among intending exhibitors. It is said that the Palace Company is in "difficulties." The Birmingham Show commences on the 14th prox., and the entries are already closed. By a singular coincidence the number is precisely the same as it was last year, 1,000; and includes 120 fox terriers, 79 pointers, 39 English setters, 30 black and tans, and 38 Irish, 70 retrievers, 46 mastiffs, 41 St. Bernards, 68 collies, 29 bulldogs, and 27 pugs. All the celebrities will be there, and there will be the usual surfeit of correspondence in the sporting papers afterwards regarding the decisions. Bristol had a dog show last week for the first time, the entries for which amounted to some 350. Some of the regular "mug hunters" who are found at every show were on hand, so that good specimens were not wanting. Fox terriers were as usual a very large class. It is wonderful the rage for this dog which exists throughout the United Kingdom. It must be because he combines the qualities of many breeds. As perfect a "varmint" destroyer as any other terrier, he seems to possess all the pugnacious qualities of the bulldog, or at least the bull terrier. The stud services of some of the champions command almost as high prices as the most fashionable greyhound. And that reminds me that the celebrated Laverack setter Dash II., who last year

MASSACHUSETTS—*Duxbury, Dec. 7th.*—Very light bags lately. Game well hunted. Demand greater than supply. Largest number 10—taken yesterday. Geese flying plentifully. Flock of 70 entirely demolished—none remaining to tell the tale. Ducks, whistlers, quandies and coots, in the bay in good numbers. GROUSE.

Salem, December 11th.—Gunning has frozen up. TEAL.

OHIO—*Tiffin, Dec. 1st.*—Quail are plenty here this season, but protected by law until 15th November, 1877. Coon hunting has been good here this fall. A young man in our neighborhood has caught about thirty. He shoots them after night with a rifle, using a jack-lamp to throw a light on their eyes.

December 5th.—Rabbits are plenty here this winter, some gunners bagging eight in a day. A few turkeys some four miles from town. BUCK SHOT.

TEXAS—*Gainville, Dec. 1st.*—Captain Rowland and eight others have returned from a three week's hunt, having killed 1 bear, 55 deer and 80 turkeys. Dr. Salmon killed a deer 300 yards with a Sharp's. Edward Fletcher and three others, during the same time, but in a different place, killed 30 deer, and only what turkeys they needed to use. Cold here now; ice an inch thick. Uncommon for this season. TEXAS.

Furs and Trapping.

TRAPPING THE OTTER AND MINK.

THE habitation of the otter is made in the banks of the river which it frequents, or sometimes in a hollow log or crevice beneath rocks. A short search will reveal the place where they crawl from the water on to the bank, and at this spot, which will generally be shallow, a steel trap should be set, on the bed of the river, about four inches under water. The trap should be secured by a stout chain, the latter being ringed to a sliding pole, which will lead the animal when caught into deep water. If deep water is not near at hand, the spring pole may be used, the object of either being to prevent the animal from gnawing off its leg and thus making its escape.

The trap may also be placed at the top or the slide, two or three feet back of the slope, a place being hollowed out to receive it and the whole covered with snow. To make success more certain a log may be laid on each side of the trap, thus forming an avenue in which the animal will be sure to run before throwing itself on the slope. Care should be taken to handle nothing with the bare hands, as the otter is very keen scented and shy. Anoint the trap with a few drops of fish oil or otter musk. If none of these are handy, ordinary musk will answer very well.

The trap may also be placed with a heavy stone and chain, as seen in the page title at the beaver. Another method still is to find some log in the stream having one end projecting above water. Sprinkle some musk on this projecting end and set the trap on the log in three or four inches of water, securing it firmly by a chain, also beneath the water.

A rock which projects over the stream may also be utilized in the same way as seen in the page title at the opening of this section. Smear the musk on the edge which juts into the water, and secure the trap by the chain as before. When the animal is caught he will fall or jump into the water, and the weight of the trap and chain will sink him. In every case it is necessary to obliterate every sign of human presence by throwing water over every foot print, and over everything with which the naked hands have come in contact. Where the traps are thus set in the water it should be done while wading or in a boat. In the winter when the ponds and rivers are frozen over the otters make holes through the ice at which they come up to devour their prey. Where the water is a foot deep beneath any of these holes the trap may be set in the bottom, the chain being secured to a heavy stone. When the otter endeavors to emerge from the hole he will press his foot on the trap and will thus be caught. If the water is deep beneath the hole the trap may be baited with a small fish attached to the pan, and then carefully lowered with its chain and stone to the bottom. For this purpose the Newhouse, No. 3, is best adapted, as the otter is in this case caught by the head.

The beaten track of the animal may often be discovered in the snow in the winter time, and a trap carefully sunk in such a furrow and covered so as to resemble its surroundings, will be likely to secure the first otter that endeavors to pass over it. A trap set at the mouth of the otter's burrow and carefully covered is also often successful, using the sliding pole, to lead him into deep water.

The skin of the otter should be removed whole, and the operation may be performed in the following manner: Slit down the hind legs to the vent; cut the skin loose around the vent, and slit up the entire length of the tail, freeing it from the bone. With the aid of the knife the skin should now be peeled off, drawing it backward and carefully cutting around the mouth and eyes before taking it from the head.

With the fur thus inside, the skin is ready for the stretcher, and the tail should be spread out and tacked around the edges.—*Gibson's Complete American Trapper.*

A MINK TRAP.—A mink trap is made by boring a two-inch or two and a half-inch hole in a log, four or five inches

deep, and into the edges of this hole drive three sharpened nails, so that they will project half an inch or so inside, as shown. The bait being at the bottom, the mink pushes his head in to get it, but on attempting to withdraw, it is caught by the nails. Musk-rat is good bait for them, and a highly praised bait is made by cutting an eel into small bits, which are placed in a bottle and hung in the sun, and after a time become an oily and very odorous mass. A few drops of this are used. The above simple mink trap may be made by using any block of wood, or a stump of a tree, large or small, and the same plan may be made use of to trap skunks, or, by using a small hole and some straightened fish-hooks, it will serve to catch rats or weasels, enemies of the rural poultry yard, which may be thinned off by the use of this trap.—*Agriculturist.*

TRAPPERS.—Messrs. H. C. Jones and John Kellogg, of Massachusetts, reached our county a week or so ago on a trapping expedition. They bring with them some five dozen traps, but the weather since their arrival has been rather unpropitious and has prevented them from making the necessary observations in order that they might find desirable locations for all of their traps; but with only a few set they have caught three or four beaver—several muskrats, and a beaver foot or two. Beaver, minks, muskrats, and other fur-bearing animals are numerous in our streams and on our water courses.—*Lawrenceville (Va.) Advocate, Dec. 7th.*

Sea and River Fishing.

FISH IN SEASON IN DECEMBER.

SOUTHERN WATERS
Pompano, *Trachynotus carolinus*. Grouper, *Epinephelus nigritus*.
Drum—two species. Family *Sciaen*. Trout (black bass) *Centropomus* *varius*.
Kingfish, *Menticirrhus nebulosus*. Striped bass or Rockfish, *Morone* *lineatus*.
Sea Bass, *Sciaenops ocellatus*.
Sheepshead, *Aricosargus probato-* Tailorfish, *Pomatomus saltatrix*.
cephalus. Black Bass, *Micropterus salmoides*.
Snapper, *Lutjanus caesus*. M. *nigricans*.

FISH IN MARKET.—The heavy storms of the past week have retarded the operations of the outside fishermen somewhat, although prices are without material change. In fact, fish are now brought such distances by steamer and rail, and refrigerating has reached such perfection, that even such weather as we have been experiencing effects only the local catch. Just now this is confined almost entirely to one or two varieties, principally of the cod family. A glance at this list below will show that our market is supplied with fish from the most distant portions of the country—smelts from Maine, red snappers from Florida, and white fish from the great lakes. We quote:—Striped bass 25 cents per pound; smelts, 25 cents; bluefish, 12½ cents; salmon (frozen), 40 cents; mackerel, 25 cents each; shad (southern), \$1 each; white perch, 18 cents per pound; green turtle, 18 cents; terrapin, \$12 to \$24 per dozen; frostfish, 8 cents per pound; halibut, 25 cents; had-dock, 8 cents; codfish, 8 cents; blackfish, 15 cents; flounders, 12½ cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 25 cents; scollops, \$1.50 per gallon; whitefish, 18 cents per pound; pickerel, 18 cents; salmon trout, 18 cents; red snapper, 18 cents; hard shell crabs, \$3.50 per 100.

—Francis Francis' "Book on Angling," which is a complete treatise on the art of angling in every branch, as practised in Great Britain, has now reached its fourth edition. Between thirty and forty pages of fresh matter have been added, and the author has made considerable changes in the salmon-fly list, founded upon information supplied by local authorities, to bring it up to the present date. This book has now been before the public nine years. Mr. Francis is well known from his long editorial connection with *London Field*.

—A correspondent writing from Tiffin, Ohio, says that Black bass in the river there, (the Sandusky) can be caught after night by baiting with a piece of red flannel and trolling it when the usual method baiting with minnow will avail nothing. Darker the night the better and near midnight. He doubts if the above method is generally known.

—A large number of the members of the Massachusetts Anglers' Association, with their ladies, met on Saturday evening to listen to an address on "Salmon and Salmon Fishing" by Walter M. Brackett, Esq. The President, Dr. John P. Ordway, occupied the chair. The lecture was chiefly confined to salmon fishing in Canada, and was of a very interesting and practical character, the lecturer exhibiting a thorough knowledge of this peculiar fish, and of the best methods used in its capture. The speaker was applauded frequently, and at the conclusion of his remarks the chairman stated that the Society intended to have a series of such lectures the present season.

BLACK BASS OF NEW YORK.

ALBANY, December 4th, 1876.

EDITOR FOREST AND STREAM:—In your issue of November 30th, appeared an article on the black bass of this State, which is the most correct, according to my experience, of any yet published in your valuable paper. I have always been informed (or misinformed) that the Mohawk and Oswego bass were the same. It would do me, and no doubt many others a favor, if you or any correspondent could give the source from which these aforementioned fish sprung; also, whether their advent into swift water has so changed the form and actions when hooked, or are they a different variety? Like the Hudson bass, they have dusky bars on the side after being caught, and do all their fighting in the air. The former I have always attributed to the clearness of color, caused by living in pure, swift water, and their rage to the fact that there was not depth enough for them to go down very far. I have noticed two varieties in Lake Ontario; one at Stony Island being very thick and light colored, always sounding the minute they were hooked; another in the Black River Bay, dark colored, much slimmer than the former, and most always coming to the surface the first thing. I know of two instances where they ran under the boat, and leaped clear of the water on the other side. On one of these occasions there were two of about three pounds weight, only one of which was saved. The gentleman fishing had a light bamboo rod, and dared not check them,

which accounts for their getting under the boat in such a manner. Your Glen's Falls correspondent states four and a half pounds as the largest river bass to his knowledge yet caught. In the Mohawk a number have been taken of five pounds and over, mostly in the spring with nets, a practice that has ruined the lower section of this once fruitful stream, unless it is restocked, and a law passed prohibiting all kinds of netting. As regards the carmine dot, I have always noticed it in the rock bass, but never in the black. In relation to bait, I agree with your correspondent, but always found the Dobson or Hellgramite, crawfish and grasshoppers, the staple baits for river fishing, the former in spring and fall, and two latter in summer and autumn. One season, however, we caught more bass on common worms than with all other baits combined. There must be some cause for the change. Whether it was in the river or in the fish, remains to be proven. Of one thing I am certain: if some of our fish culturists would give the trout a little rest, and study the habits of the black bass, they need never be in want of something to occupy their mind and time, and the black bass would receive his just deserts. In hopes of hearing more on this, one of the foremost, if not first, among our game fishes, I remain, DEXTER.

✓ SETH GREEN ON OSWEGO BASS.—Mr. Green sets himself right in the following note:—

ROCHESTER, Dec. 8th, 1876.

EDITOR FOREST AND STREAM:—

I notice in your issue of November 30th, a correspondent from Glens Falls, criticizes me on the black bass question, and I think he is right in doing so. From the way it is worded in your paper, I may have said that the river and lake black bass was the livelier fish of the two, and was called the Oswego bass. If I did, it was a slip of the tongue. You will see by reading my circular, that I have always called the Marsh bass the Oswego bass. As I see he takes it from the article of October 12th, when I spoke before the Fish Culturists at Philadelphia, I think the more likely supposition is; that your reporter misunderstood me when I was speaking. Yours, SETH GREEN.

MOVEMENTS OF THE FISHING FLEET.—There have been 7 arrivals of the fleet the past week, 5 from Georges and 2 from the Banks, bringing in 27,000 pounds of halibut, and 30,000 pounds of codfish. The shore fleet have landed small fares, indicating a scarcity of fish off this shore. While this scarcity exists in this section there is an abundance of "rock" cod off the southern coast of Long Island. The FOREST AND STREAM says that they are very plentiful off Rockaway Inlet and Sheephead Bay. Two parties caught in one day's fishing 400 fish, running from four to seven pounds in weight. The supply has filled the market, and prices have ruled low, in some instances fish having sold for fifty cents per hundred pounds at wholesale. This probably will not last a great while as it is quite unusual to find fish so plentiful in that section.—*Cape Ann Advertiser, Dec. 8th.*

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER, FOR THE WEEK.

—Our London correspondent states that the proposed challenge between Higgins and Boyd, the scullers, for the championship of England is off. Higgins issued a challenge to any man in the world to row him for £500. This challenge is replied to by Edward Hanlan of Toronto, who wants Higgins to go to Canada to row. As Higgins' challenge was to row on the Thames, and as he would not go so far even as the Tyne, to row Boyd, it is not likely that he will cross the Atlantic to row Hanlan. In fact the latter's letter will probably be considered as partaking very much of the nature of "bounce."

—The schooner *Atalanta*, N. Y. Y. C., which put into Norfolk some time since and went on the ways at Graves' ship-yard for repairs, sailed on the 4th inst. for Jacksonville, Fla., where her owner, Mr. William Astor, is awaiting her arrival.

THE COUNTESS OF DUFFERIN.—The *Toronto Mail*, in alluding to the fact that this yacht still remains unsold, says that "Maj. Gifford, it is understood, is likely to be a heavy loser by his spirited undertaking to whip the champion yacht of the New York Club. If properly sailed and trimmed, the best American authorities agree that the Countess could next year give them very serious trouble. Under these circumstances we are not surprised to hear that several gentlemen have it in contemplation to buy and equip the Countess for what is sure to turn out a more successful trial of her speed. The price asked for her is so moderate that we need not despair of patriotic sportsmen enough being found to improve the occasion."

A MISSIONARY YACHT.—During the past summer an English mission yacht, called the *Evangelist*, traversed the southern coast of England and distributed Bibles and Testaments in various languages, and other religious reading, to all of the vessels it met.

R. A. A. C.—The Rowing Association of American Colleges, or at least what is left of it, held its annual meeting last week at the Fifth Avenue Hotel. But three colleges out of the twelve which were represented last year sent delegates, these being J. N. Ostrom, of Cornell; E. E. Sage and G. T. Goodwin, of Columbia; C. C. Clarke and R. N. Corwine, of Princeton. Mr. C. S. Boyd, of Columbia, was President; Mr. C. C. Clarke, of Princeton, Vice-President; Capt. Ostrom of Cornell, Secretary, and Captain Goodwin, of Columbia, Treasurer.

After hearing the report of the Regatta Committee, it was resolved that the annual regatta of the Association for

1877 be held at such time and place as may be hereafter agreed upon.

Mr. Ostrom offered the following resolution, to take the place of the first section of the amendments to the constitution, which was carried:—

Resolved, That students of colleges, members of this Association, candidates for degrees of A. B., Ph. B., LL. B., M. D., P. D., or any similar parallel or course, or any students studying for an advanced degree, not to exceed two years, provided it be an unbroken continuation of his previous course, shall be eligible to row in the regattas of this Association.

Mr. Ostrom was desirous that future races of the Association be rowed in eights, but Mr. Sage proposed, and his motion was adopted, that the races in future be rowed in fours without coxswains. This will considerably lessen the regatta expenses.

Mr. Goodwin, of Columbia, offered the following:—

Resolved, That any college not a member of the Association wishing to participate in the regatta of 1877 can do so by making application to the Regatta Committee before June 1st, 1877, provided such college or colleges are approved by the Regatta Committee.

The resolution was adopted. It is, however, only intended for the present year.

After much discussion the 11th of July was decided upon as the date for holding the regatta, but the location was not decided upon. Places will be drawn for on June 1st.

Mr. William Blaikie was unanimously chosen referee, and Mr. Cross, of Princeton; Mr. Butterworth, of Columbia, and a Cornell representative were selected as judges.

—The Argonaut Rowing Club of Toronto, has had a most successful season, from a pecuniary point of view. Owing to additional accommodation afforded for storage of boats and the attractions offered to junior members, the club having added a new four-oared gig to their list of boats, the membership has largely increased. They now have the largest stock of racing and practice boats owned by any club on the continent, as well as accommodation for about fifty private boats.

Rational Pastimes.

A feature of this winter's sport will be a return to the fashionable exercise of roller skating which was in vogue here some ten years ago. Since it has become so fashionable with the higher classes in England and France, our democratic America must of course take it up again. Consequently, preparations are in progress to transform the Hippodrome into a great roller skating resort, as also the Brooklyn Rink; at the latter place they are now laying an asphalt floor for the purpose.

FOOT BALL.

The long anticipated match between Yale and Columbia was played on Saturday last, on the ground of the St. George's Cricket Club at Hoboken. The weather was anything but propitious, a cold biting wind sweeping over the ground, and rendering preliminary games of leap frog, etc., necessary to keep anything like circulation in the thinly clad bodies of the contestants. The game was played by eleven men on each side, and according to the Rugby Union Rules. Yale sent on the magnificent team with which she has beaten Harvard and Princeton, and by admirable discipline and most excellent play succeeded in scoring another victory. Time was called at 3:15 p. m. Columbia having won the toss, and electing that Yale should take the "kick off," Baker, the Captain of the visiting team, made an excellent effort against the strong wind, and sent the ball well towards Columbia's goal; here it was stopped and sent back, and a lively scrimmage ensued. Finally Train, of Columbia, secured the ball and touch down. Pryor, however, failed to send the ball over the string. After another scrimmage Yale secured a touch down, and Bigelow, of that team, was more successful in the "try," sending the ball clean over Columbia's string, and securing first goal for Yale. Time, 44m. 45s. The second goal was taken by Yale in just 2m. 30s., Bigelow being again successful in the kick after a touch down, obtained by the fine play by Baker and others. For forty-five minutes longer Columbia worked hard to make up lost ground, but it was of no avail, and time was called with two goals for Yale, and none for Columbia. The teams were as follows:—

Yale—E. V. Baker (captain); W. I. Bigelow (backs); W. D. Hatch, O. D. Thompson, W. C. Camp (half backs); W. V. Donner, W. H. Taylor, R. Wurts, G. H. Clarke, N. U. Walker, W. C. Camps (forwards). Columbia—W. H. Radford, W. F. Morgan (backs); G. M. Hammonds, W. H. Ward (half backs); E. W. Price, (captain), W. E. Hil-dreth, J. W. Pryor, E. M. Train, F. D. Weeks, G. DeH. Brower, H. F. Morewood (forwards). Umpire for Yale—G. T. Elliott, of Yale. Umpire for Columbia—W. H. DeForest, of Columbia. Referee—Mr. Seamans, of Harvard.

BASE BALL.

The League Association held their first annual convention on Dec. 7th at the Kennard House, Cleveland, on which occasion delegates from seven of the eight professional clubs comprising the League were in attendance. The Board of Directors had met the day previous to take action upon questions brought before them, but only one case was acted upon and that was in regard to the failure of the Athletic and Mutual clubs to play their full quota of championship games. This violation of the League rules, it would appear, was regarded as equally criminal with that of indulging in the worst phase of fraudulent play, for the Board agreed upon a sentence of expulsion from the League Association, a disgrace which could not have been increased in the way of punishment had the clubs in question been guilty of the worst violation of the League code of laws. While making the two clubs in question justly amenable to censure, the League might have avoided such an extreme penalty as they enforced. The result will be to elicit a sympathy for the expelled clubs, and greatly to decrease the popularity of the League. They have unwisely, too, re-adopted the fifty cent tariff, and though the new regulations for membership admit of a club's joining the League before April 1st, the rules are so worded as to practically exclude all but the wealthy stock company organizations. They adopted a rule prohibiting all League clubs from employing players who have signed agreements to

play with co-operative clubs, unless it be done before April 1st. This will have some effect in reducing the list of revolvers. The League retains the rule prohibiting a League club from playing within five miles of the grounds of another League club, and they also prevent two League clubs existing in one city. The new list of members of the League gives the ruling power to the Western members by a vote of four to two, or Chicago, St. Louis, Louisville and Cincinnati against Boston and Hartford. The contest for the championship for 1877 will therefore be confined to those six cities, New York and Philadelphia being left out in the cold by the League this year.

The amendments to the rules include the adoption of a rule doing away with fair foul balls, or rather limiting the extent of ground such balls can be hit to. They adopted a rule allowing but one make of ball to be used in League club contests, the double covered Mahn ball of last season's use, containing the customary ounce of rubber, being the League club ball for 1877. It is not a lively ball, though not as dead as some balls used in 1876. This throws the base balls of Messrs. Peck and Snyder, Ryan, Ross, Reach, Shibe, &c., out of the League market and gives the monopoly to Mr. Mahn of Boston. Only six clubs out of the two thousand and odd in the country are, however, obliged to use the League ball for 1877. A rule was also adopted increasing the size of the bases from one foot square to fifteen inches square; also for obliging base runners to run to first base only on the direct line of the base; also obliging players returning to bases on foul balls to run back to them instead of walking back as was previously optional.

The rule admitting of foul bound catches was retained, though against the Boston vote. Mr. Young was authorized to issue the books of the constitution and rules, so as to be in the hands of the clubs by January. The league publish a lengthy circular in defence of their action in expelling the clubs, and making the strange statement that every man in the League nines during 1876 was "a good and true man," in other words, that they were all honorable men. The habitués of the various city pool rooms of New York, Chicago, St. Louis, or Philadelphia, will smile in their sleeves at this. On the whole, it will be seen, that the self-same policy has been pursued by the League at their convention as marked their March proceedings.

SKATING.

The ball went up at ten o'clock on Tuesday morning at Prospect Park, and the skating season of 1876 and '77 at this popular resort was then and there inaugurated. The weather proved very favorable for the full enjoyment of the sport, and the skating lake was crowded. On Saturday a ball match on skates will be played at the large lake.

The Capitoline Lake and Union Pond were also well patronized on Monday last, and skating is in full operation in Brooklyn, while in New York there is none to be had owing to the absence of proper provision for the sport at Central Park, where excellent ice is at command.

NOTHING LIKE SOAP.—When John Roach builds a noble steamship like the City of Peking, the firm of John Roach & Sons get a great deal of newspaper flattery and public praise. If steamships were articles of common purchase, the natural result of all this reputation would be that everybody would buy those made by this firm. So it is the world over, that those products conspicuous by reason of their excellence are most largely bought by the people. An apt illustration of this fact is noticeable in that article of common domestic use, soap. Everybody uses soap, and naturally everybody wants the best soap that is made. A good many years ago, when actual merit was essentially necessary to success, B. T. Babbitt, the now great soap manufacturer of the world, put his brand of "Best Soap" on the market. It was then the best soap made; it is still equally the best, and as a natural result nine-tenths of American families use it. It is therefore a matter of more than usual concern that this manufacturer has introduced a new soap—B. T. Babbitt's Toilet Soap—a soap for the face and hands and bath, for family use outside the laundry. It is strictly vegetable, a soft, splendid soap for the skin, and without a particle of foreign substance in it. There are no chemicals to give it a color, no artificial scent to make it acceptable by a false odor. Yet it has a lasting, delicate, agreeable perfume, the effect of its pure vegetable oil ingredients and its perfect manufacture. The cakes are large, about twice the size of the usual toilet article, and the price is very low. Five years from now nine-tenths of all the families in the country will be using B. T. Babbitt's Toilet Soap to the rigid exclusion of other makes, just as they now use his "Best Soap." Mr. Babbitt will get a great deal of public favor at once, and newspaper mention, as in this instance, because everyone knows that his products are conspicuous for their actual superiority.—N. Y. Tribune.

DESIDERATA IN SMOKING.—According to Dr. Berthand, in the Tribune Medicale, whatever be the mode of smoking, direct contact of the tobacco with the "mucus buccalis"—mucous lining of the cheeks—and the teeth must be avoided; cigars should be smoked in an amber, ivory, or enameled porcelain mouthpiece; to smoke, by relighting them, portions of cigars that have been extinguished, together with the system of blackened and juicy pipes, must be avoided, as it is the surest way of being affected by nicotine; every smoker would do well, if practicable, to rinse his mouth after smoking, and it would be well to subject pipes and bowls in which tobacco has been burned to frequent washings either with ether or with water mixed with alcohol or with vinegar. The cigarette is preferable, by reason of its slight quantitative importance, and the paper which interferes with the contact of its contents with the buccal mucous membrane; but to realise all the desiderata in this case it would be necessary to have the "papelito" made of flax thread, and to abstain from the practice—which has been so universal—of retaining the aspiration at the back as the mouth, so as to pour it out of the nostrils afterward.

—F. Steele & Son, jewelers, of Hartford, Conn., have issued one of the handsomest illustrated catalogues of goods that we have ever seen. One of its most convenient features is the classification of goods into groups, according to price. The buyer can determine at a glance what he can purchase for fifty cents and what for \$1,000. This firm is said to have the finest establishment in New England, outside of Boston.

—On the ice bound ponds is now heard the hum of the festive Miss-Skaters.

New Publications.

BOOKS RECEIVED.

THE CENTENNIAL FROG, and Other Stories, Claxton, Remsen & Haffelinger, Philadelphia, Publishers. For sale by Jas. Miller, 647 Broadway.

This is an attractive child's book for the Holidays, profusely illustrated, which will no doubt prove entertaining to all who have any curiosity to learn the story of Lieut. Frog of Frogmarsh.

POPULAR SCIENCE MONTHLY.—The ever welcome *Popular Science Monthly* comes to us again, and with a contents more varied and entertaining than ever. Indeed, this periodical, which occupies a field unfilled by any other magazine in this country, or perhaps in the world, seems to improve each month, and under the guidance of its able editor, Mr. Youmans, exercises a widespread and healthy influence on the minds of a large circle of cultivated readers in the United States. It contains each month many of the most important discoveries in science that are of interest to the general public, by far the greater part of which would be wholly inaccessible to most readers were it not for some such medium of communication as the present. For it must be remembered that the material which is here collected, and presented in an attractive and intelligible form, was originally scattered through half a hundred reports, journals, proceedings of scientific societies, and private papers, and, besides this, was apportioned among four or five different languages. Now, for any reader not specially interested in the subject to attempt to keep up with the march of science, is, under these circumstances, quite out of the question, and the public at large have to thank Mr. Youmans for the constant additions to their knowledge of scientific progress which his admirable journal affords. To collect all this material, and to cull from it matter which shall prove not only instructive but entertaining as well, is a task of no small magnitude, and one requiring great judgment, as well as accurate scientific knowledge, and the manner in which these duties are here performed leaves nothing to be desired.

We have said that the present number is especially attractive, and a brief review of its contents will justify the statement. The leading article is by Prof. Tyndall on "Fermentation and its Bearings on the Phenomena of Disease." This is a report of a lecture delivered before a Glasgow audience, and is in Prof. Tyndall's usual entertaining and instructive vein. He first discusses the nature and growth of the various ferment plants and the influence of temperature on their development, and asserts that there is no experimental proof whatever of spontaneous generation. From this he proceeds to the consideration of the low organisms which give rise to putrefaction and contagion, and of the possibility of preventing these effects by proper precautions, and closes by predicting, at no distant day, the triumph of surgery over disease. The article is well worth reading and pondering.

An interesting and practical essay by Prof. Maxwell, taken from *Nature*, treats of the "Protection of Buildings from Lightning," after which Mr. Wedderburn gives us "Mormonism from a Mormon Point of View" at some length. "More about Mechanical Tools" is followed by what must be regarded by Americans at least as one of the most valuable contributions to this number; we refer to Prof. Morse's paper, entitled "What American Zoologists Have Done for Evolution." We regret that it is not in our power at present to review at length this very detailed and able exposition of the labors of our leading scientific men. This, however, is a pleasure that we intend shortly to give our readers and ourselves. It is sufficient here to say that Prof. Morse discusses quite fully what has been done by our most successful workers in science-giving to each his meed of praise, and summing up with some very instructive conclusions and suggestions relative to the well being of the human race. With the exception of Prof. Huxley's second lecture the remaining articles are short. "The Laws of Health," "Canine Sagacity," "The Constancy of Motion," and a sketch of Prof. Mayer, all of them very readable, and each conveying its lesson.

The lecture by Prof. Huxley is, no doubt, familiar to many of our readers, but will well repay perusal. The beauty and excellence of the woodcuts with which it is illustrated are a marked feature of the article.

The Editor's Table is interesting reading, and the discussion of the evolution question is happily carried on with much vigor and humor. Dr. Taylor's position, as an opponent of the great biologist, is, by this showing, not a very strong one. One point which is to be taken into consideration in this argument is the great disadvantage which the theologians labor under in knowing little or nothing of biology, while their opponent is a master of the subject. It would seem to an unprejudiced mind that defeat must surely await them.

The miscellany in this number of the journal is extended and interesting and the magazine, as a whole, probably contains more valuable information than any volume of the same kind that has been issued for a long time.

THE SPORTSMEN'S ROUTE.**Chicago & Northwestern Railway.**

This great corporation now owns and operates over two thousand miles of road, radiating from Chicago. Like the fingers in a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Naganagan and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kamoska, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, via the Illinois Central, reaches Warren, Galena and Dubuque, and the country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN:

THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GEESE, AND BRANT SHOOTING, THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS

than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West. MARVIN HUGHITT, W. H. STENNETT, Gen. Supt., Chicago. Gen. Pass. Agt., Chicago. apl6

Sold everywhere in the U. S. by all first-class dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT,"
made by
G. W. Simmons & Son.

This new design of WATERPROOF SHOOTING SUIT, made from extra quality duck, has attained such popularity as to be called for from all parts of the country, and even from England.

"Shipping clothing to England strikes us very much like sending 'Coals to Newcastle,' but the merits of the 'BOSTON SHOOTING SUITS' have been heard of in the Old Country, and that land of sportsmen has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—Boston Paper.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is water-proofed by a new patent process. The seams and pocket corners are securely fastened, and nothing neglected to render the suit perfect in every respect.

THE PRICE HAS BEEN FIXED AT \$13, TO INCLUDE HAT OR DOUBLE VISOURED CAP. DETACHABLE HAVELOCK, COAT, VEST, AND PANTALOONS.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

PERSONS ORDERING FROM A DISTANCE NEED SEND ONLY THE FOLLOWING TO BE SURE OF A PERFECT FIT: BREAST MEASURE, WAIST MEASURE, INSIDE SEAM COAT SLEEVE, INSIDE SEAM PANTALOONS; MENTION HEIGHT AND WEIGHT.

G. W. SIMMONS & SON,
"OAK HALL," BOSTON, MASS.

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of Waterproof Shooting Suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp at Philadelphia Centennial Exhibition. It has grown gray in service, but is good for use yet. This suit is known as the 'Boston Shooting Suit,' in contradistinction no doubt, from the garments which are manufactured out west and at Washington, each of which has a local demand of its own. It is said that the western prairie fowl can distinguish any sportsman who visits their domain by his clothes. They can tell him 'by the cut of his jib,' and the old educated birds (which no one cares to eat, by the way,) know exactly what distances to keep from the rail shooters, the brant men, and the chicken-killers respectively, to be safe. They have 'got them all down fine.' This used not to be so before the waterproof shooting suits were invented. Bostonians, Hoosiers and Buckeyes all stood the same chance then. But now it is—with a shrill pipe to leeward by the old-weather cock—'here comes a Simmons; cheese it!' or, 'Ere's a 'Enning—lie low!' or, 'Look out for Holbird! Scatter! you beggars, scatter!'—FOREST AND STREAM]

WIND-PROOF

Leather Vest and Jackets,
Flannel-Lined.

(Made and sold only by Messrs. G. W. SIMMONS & Co., OAK HALL, BOSTON.) are considered the most sensible protectors ever devised for winter wear. They are especially adapted to the requirements of sporting men, whose rapid walking is likely to be followed by frequent halts in the cold wind. Price, Vest \$7; Jacket \$9. Measurements required are Waist, Breast and Inside Seam of Sleeve. Mention Height and Weight.

LADIES LEATHER VESTS AND JACKETS made to order. Indispensable to all who are in any way exposed to the weather.

CAMPING and MINING

STOVE.

PATENTED JUNE 22, 1875.

Outside dimensions, packed, 12x12x20 inches. Weighing only 35 pounds, very durable, will cook for ten persons, and is especially adapted for camping purposes. The ware consists of 8 qt. kettle, 6 qt. tea kettle, 2 qt. coffee pot, fry pan, round tin pan, 2 square pans, dipper, gridiron, tent collar, 8 ft. funnel, and an oven that will roast 15 pounds beef.

The ware is so constructed that it nests and packs in the oven, and the oven and funnel pack inside the stove, as represented in cut 2, leaving room for packing half a dozen plates, knives, forks, spoons, and drinking cups. Price complete, \$15. SEND FOR CIRCULAR.

ABBEY & IMBRIE,

(Successors to Andrew Clerk & Co.)

New York, London, and Redditch,

Importers, Manufacturers, Wholesale and Retail Dealers in

FISHING TACKLE

Of Every Description and Quality.

We particularly call attention to our extensive assortment of fine goods for sportsmen, such as Salmon Trout, and Black Bass Flies and Snell Hooks, on hand and tied to order; Cuttyhunk and Pasque Islands Bass Lines, Water-proof Braided Silk Lines, etc., etc. Every genuine H. L. Leonard's Six-Spliced Bamboo Salmon, Trout, and Bass Rod is marked "H. L. Leonard, maker, Abbey & Imbrie, sole agents." Beware of imitations.

Sole agents for the McCord Patent Celluloid Black Bass Reel, and Aiken Black Bass Rod. Proprietors of the celebrated Winchester Patent Braided Rods.

Sole importers of Joseph Warrin's Drill-Eyed and Egg-Eyed Needles.

Parties fitted out with appropriate tackle for the Rocky Mountains, Pacific Coast, Canada, Maine, Adirondacks, etc., etc. Orders by mail will receive the personal attention of the firm.

(CELLULOID PATENT.)

Trolling and Click Reels.

The finest Reels made light, durable and finely finished. Ask your dealer for them.

SOMETHING FOR CHRISTMAS.

From St. Nicholas for December.

A CHRISTMAS SONG.

BY MRS. S. RUSSELL.

THE oak is a strong and stalwart tree,
And it lifts its branches up,
And catches the dew right gallantly
In many a dainty cup.
And the world is brighter, and better made,
Because of the woodman's stroke,
Descending in sun, or falling in shade,
On the sturdy form of the oak.
But stronger, I ween, in apparel green,
And trappings so fair to see,
With its precious freight, for small and great,
Is the beautiful Christmas tree.

The elm is a kind and goodly tree,
With its branches bending low;
The heart is glad when its form we see,
And we list to the river's flow.
Ay! the heart is glad, and the pulses bound,
And joy illumines the face,
Whenever a goodly elm is found,
Because of its beauty and grace.
But kinder, I ween, more goodly in mein,
With branches more drooping and free,
The tints of whose leaves, fidelity weaves,
Is the beautiful Christmas tree.

The maple is supple, and lithe, and strong,
And claimeth our love anew,
When the days are listless, and quiet, and long,
And the world is fair to view.
And later—as beauties and graces unfold—
A monarch right regally drest,
With streamers aflame, and pennons of gold,
It seemeth of all the best.
More lissome, I ween, the brightness and sheen,
And the coloring, sunny and free,
And the banners soft, that are held aloft,
By the beautiful Christmas tree.

For Forest and Stream.

A CRUISE WITH A SHARK.

THE balance of the day, after disposing of our grouper, and also the next, was spent at work on my sloop and skiff. They were both got out on the beach and repainted. And while at that, I had a little experience which may be of benefit to others. As I passed through Cedar Keys, I tried to purchase some copper paint for the bottom of my yacht, but there was none in town. Our ship chandler advised me to use coal tar, saying that all the boatmen about the Keys preferred it to copper paint, and its price was a mere nothing. He mentioned one or two with whom I was acquainted as using it from choice, and as I must have something of the kind, I took a gallon. It was applied almost as easily as paint, but I heated it a little, as it was handy to do so, and worked easier. I was charmed with it, for when first put on the bottom of the boat it was like glass. I recommended it to every one I met, including our friend Jones, of Homosassa. I hope he hasn't put it on the "Spray," for I take back everything I said in its favor. I never put anything on a boat's bottom before, that seemed to be accepted by barnacles as an invitation, quite so readily as this was. In less than three weeks from the time it was applied, the whole bottom was completely covered. Common paint is much to be preferred, but all valuable boats should be coppered thoroughly if for constant use in these waters.

The morning after finishing my repairs, I borrowed a little bit of a skiff for a visit to Deer Key. This Key lies between Sarasota Pass and the New Pass, and is an inside Key, thickly covered with palmetto and dead cedars. It used to be a favorite hunting ground of mine, and I wished of course to revisit all my old haunts. The skiff, as I have said, was very small, was built for one man only, and was intended to be light enough for its one man to haul it across dry oyster bars or sand flats, and withal was so very crank that it would hardly answer for a tobacco chewer to shift his quid suddenly from one cheek to the other. But I was safe on that score, and so put out just before daybreak. I reached the island all right, found my old landing place well grown up with brush, and as usual at this time of the day and year, was soon wet through to the waist with the heavy dew before I got out into the open. This island, like the others, is cut up with open strips, but they don't resemble beaches so much as those on Big Sarasota. The island is nearly round, and not over a mile in diameter. I prowled around cautiously, up one open strip and down the next, saw plenty of "sign," but no deer, although some of the tracks were not more than an hour or so old; could see where the dew had been shaken off the bush by the deer taking a bite of the tender leaves. I had worked the whole island nearly, and was close over to the west shore, when, as I was examining a fresh track on the sand, I heard a rush and snort in the brush just ahead of me. My rifle was at my shoulder in an instant, and as I caught one glimpse of a head going through the brush I sent a bullet that way, hoping there might be luck in it, but there wasn't. I soon heard him splashing in the water. Now, if he really took to the water for a trip to the next island, I might get a chance to put in a good shot. I listened intently for a moment to his jumps, and soon had his bearings and a tolerable idea of the island he would make for. All at once it flashed upon my recollection, that at the extreme western end of the island was a little clear mound, which I had more than once used as a lookout station. To recall the fact of the mound, was to be there as swiftly as my legs would carry me. There was my deer, scarcely two hundred yards away to the left. He was still on the jump, for the water did not quite come up to his belly, but the depth was beginning to increase rapidly

as he approached the channel, and when it became too deep for him to jump, yet not deep enough to make him swim, would be my opportunity. There was no use in wasting a shot while he was going at the irregular gait which he still held, for every time he sprang the water flew all over him as well as in every direction. The distance was momentarily increasing; he was already further off than I care to shoot at a deer, for more deer are killed at less than seventy-five, yes, less than fifty yards, than are killed beyond that distance even with the best rifles. I dropped upon one knee to steady myself, and brought my rifle to my shoulder. As my eye glanced along the sights, and as they began to bear upon the deer, whose gait was getting much steadier, the thought passed through my mind, "Can I do it?" Why these doubts of myself? It *must* be done, and bracing every nerve to the effort, I sighted so that, if my ball fell a little short, upon the ricochet, it would strike in the right place. It wouldn't do to wait longer, the water was deep enough now to stop the high jumps, and realizing that "he who hesitates is lost," I pulled the trigger. It was a success after all my doubts. He gave one last high spring into the air and fell upon his back. I waited to see no more, but hurriedly taking the bearings of the place when he fell, with a prominent dead mangrove on the outer island, I ran for the skiff, which was nearly a mile away. You may rest assured that I did not let grass grow under my feet, or stop to still hunt now. The game was killed, but not bagged. Any number of things might happen before I could get the skiff around to the spot. Its lightness enabled me to make one short cut, for I pulled it over a narrow, dry sand bar, which was three or four hundred yards around. I got in range of my shooting point and the dead mangrove at last, and commenced paddling slowly out on the line, keeping a sharp lookout meantime upon the bottom. One who has never tried to find a particular point, under water, upon an extensive mud flat, when there are no prominent objects to guide him, cannot realize the difficulties of the endeavor. The water was very clear in the present instance, and my bearings having been well taken, I found him without undue delay. There he lay, on the bottom, in about four feet of water, and I soon fished him to the surface with an oar; but here a new and entirely unexpected difficulty presented itself. The skiff was so light in its build, that every time I attempted to lift the deer on board I pulled the skiff partially under, and after making the trial in two or three different ways, I was forced to give up lifting the buck on board in such deep water, but with the aid of my belt I made him fast to the skiff, and towed him into shoal water where I could step overboard and only get wet up to my knees. Here I had things now my own way, but I had to try placing him in several positions before I got him so that, with myself on board, the little craft was properly trimmed for a sail across the bay. There was but very little over an inch between the water line and the gunwale aft after all was fixed, and as it happened, my final trimming had left the carcass so that the nose hung just a little over the side. I paid no especial attention to that fact, at the time, nor did I notice especially that a little blood was dripping from the nostrils. I placed my rifle in the bow, girded my belt around me, took a look at the weather and things in general, felt pretty well satisfied with my morning's work, and took my seat to pull across the bay. Everything passed off smoothly while on the shoals, and I was very nearly across the main channel, which comes in from the Big Pass, when I noticed away astern the back fin of a large shark. He was not sailing along with that quiet and dignified air which they usually assume when on an ordinary cruise, but was making short rushes from one side to the other. Sometimes his whole back would show above water, and a moment after the back fin would be almost out of sight. At first, although my attention was attracted, I paid no heed to his maneuvers, but before long I noticed that he was much nearer to me than when I first saw him. Then it seemed that his rushes from side to side were in reality tacks, and about the time that idea was settled in my mind, the purpose for which they were made dawned upon me. He was on the trail of blood, and getting more and more excited every moment, as the trail grew stronger. I now saw the whole thing. As I have before said, the deer's head was lying so that blood dripped from the nostrils into the water, and as I had pulled diagonally across the channel, this blood had drifted out with the tide, and Mr. Shark had got a scent of it. A very little blood seems to go a long way in tainting water so that sharks will notice it. I had observed that in fishing for them often before, and when they once get the scent, they always follow up against the tide to find where it had come from. As my course had been across the tide current, he would run outside the trail every time he went straight ahead; then of course he came about and found it again on the other tack, and was, in fact, beating me up, just as a well trained dog beats up a covey of birds in a stubble field. The game was reversed now, the hunter was hunted, and didn't like it at all. The situation was getting interesting very rapidly. I tried to move the head around with an oar, but the body and neck had stiffened too much. I took a step towards it to pull it around, but the first movement brought water over the side. I sat down again, and picking up a gourd threw the water out; but this only made things worse in another way, for as the water in the skiff was very bloody from the bullet hole in his side, I freshened my trail. By this time the shark was only twenty-five or thirty feet away. I picked up my oars again and began pulling. It was three-fourths of a mile to the nearest shoal water on the main land side, and a little over one-fourth back across the channel. I couldn't think of pulling back across that

channel again, for I might call up one or more companions to my uninvited follower, which might make him even more enterprising than he already was. No, one was enough; the longer pull seemed the safer one, in that respect at least, and I laid down to my work, but it was no use trying to pull away from him. I hadn't taken half a dozen strokes when they attracted his attention, and he came straight for me. He came right up to within four feet or less of the stern, then veering to one side, just outside of my oars, passed me. His back fin was cutting the water like a knife. It made that little spurt of water, which is often noticed at the bow of a wherry or racing boat, when in rapid motion. I had a much better chance to look him over than I cared for. As he ranged alongside, I could compare his length with that of my nine foot skiff, and he was four feet longer, if an inch. Just as his back fin was off my bow he sunk himself, and the glimpse I got of him over my shoulder, showed that he had turned under the boat. Was he going to roll over on his back and take a bite of it? I remembered a well authenticated instance of a shark in Boca Segua Bay, turning upon the boat from which he had been harpooned, and tearing a piece out of the bow, capsizing it with its two men, who fortunately escaped to land, which was very near, and with the wreck of the skiff in tow putting straight out into the Gulf. There was no consolation in that remembrance. It was true that shark was enraged by having a harpoon tickling his vitals, but this one might be just as fierce from hunger, and he was certainly excited by the smell of blood. I was momentarily relieved, however, by seeing the back fin come up on the other side, and swim along even with me for a few yards. Was he looking things over to pick out the weakest place? He soon let himself drop astern, then made a rush up on the other side, then dropped back again for another rush. On the whole he was not getting more excited, as well as I could judge, but who can tell what may be passing through a thirteen foot shark's mind, granting that he has a mind of his own, and certainly there was room for a good sized one in that head, which was as wide as a half barrel. I was keeping along on the even tenor of my way, doing in the way of speed as well as could be expected under the circumstances. After a while he stopped making the rushes, and took up his station at the stern. He seemed to have found just where the blood came from at last, and now swam steadily along, high out of water, with his nose not over three feet from that of the buck. What conscious power there seemed to be in every movement he made. I was pulling with all my strength, while he seemed to hold his place by mere volition. How viciously he rolled up those little cat-like eyes at me! They were only a few inches under water. Why not put a bullet down through that broad head? It could be done very easily. I came very near picking up my rifle and doing it on the spur of the moment, for I was getting rather vexed at the fellow's persistence in following me so closely; but probably a second thought was best in this case, for, unless I severed the back bone just back of the skull at the first shot there would be a big splashing, and one flirt of that tail would send water enough on board to swamp me. I knew from experience, that a shot through the brain would leave the tail end very active, but if I could touch the spinal column just after it leaves the skull the whole body would be left perfectly motionless. But to shoot through three or four inches of water into a neck that must be nearly a foot and a half across, so as to strike a line not much wider than the bullet itself, required very nice judgment, to say nothing of a knowledge of anatomy. The risk was too great. I wouldn't try it unless he got very excited again, and then only as a last resort. I remembered a recent correspondence in FOREST AND STREAM, to the effect that there was no well attested account of a man having been eaten by a shark. I did not get much comfort out of that theory, however; this customer was too near. It is true he was after deer's blood; but suppose we were both in the water together? I feared Mr. Shark might get too excited for any nice discrimination between venison and man. When living on Sarasota before, I had often fished for them in various ways, and the experience I had heretofore had, showed that the great difficulty was to get near enough to a shark to even put an iron into him; but this one was of a very different character that was sure. I recalled a boast that I used to make, to the effect that even if I did capsize anywhere, I was so well acquainted with all the sharks in the bay that none of them would trouble me. In proof of this, had I not been swamped one afternoon in the middle of Tampa Bay, and after being in the water the remainder of the day, and all of the following night, swimming some three miles and a half to land in safety? When I went out to the boat the next day with assistance to raise her, was not the water alive with sharks, and did I not dive down over twenty feet, and pass a line through the traveler to hoist by? I firmly believed at that time, that a shark would not attack a man when the water was clear enough for it to make him out for a man distinctly. I ought to have got a good deal of comfort out of these recollections, but somehow I couldn't. This particular shark had either forgotten me, or must have been a stranger in the bay, and there was no one to introduce us. I didn't like to introduce myself in such deep water, and from such a small boat. There he was, holding himself close by that deer's nose. Who should have that venison? I had earned it, and it was still mine by right of possession. There was no flaw in my title so far. But, here was a regular piratical claimant, who seemed disposed to jump my claim without any formalities. But you keep quiet, old fellow, for a few minutes longer. I am getting well over towards the other shore, and if you will only quietly

hold just what you have got, and no more, until I get on to the edge of the bank, in say five or six feet of water, I will put in an argument from Ballard, no particular book or page, but the whole length of the barrel. But he wouldn't do it. Just as I got where I could see the bottom, and began to gloat over the satisfaction I would take out of him for the way in which he had annoyed me, by sending a 46 bullet crashing through his old skull, without one parting flap of his tail, by way of warning, he let himself settle down into the deep water, and like the crabs, silently stole away. I was mad.

To illustrate the way sharks follow up a trail of blood, I will tell a little story which is current on this coast, but which I don't vouch for, although I believe. A party of Dagos and Creoles, some five or six in number, in some way caught a porpoise, which they took to the North Channel at Egmonte Key, a little outside of the light, and near the outside point. They arrived there just before sunset, and got everything fixed for work before dark. Their plan was to cut the porpoise up in small chunks, in a dug out canoe they had, throw water upon it plentifully to soak out the blood, and then, when the tide turned out, throw over a bucket full of this bloody water occasionally, which would be taken by the tide out towards the outer bar. Sharks seem to be especially fond of porpoise, more so even than of mullet, and by using pieces of it for bait, these men succeeded in this way in taking one hundred and eight large sized sharks in that one night. They did not stop to play their fish at all, but all hands would lay hold of the line when they had a bite, and drag him *volens volens* ashore. It must have been sight worth coming some distance to see, to take a look at that pile of sharks on the beach next morning. The livers alone are used, and from them a fair quality of oil is obtained. I used to put the carcass in the compost heap.

My plan of fishing was a little different from that of the Dagos. I never was strong handed enough to take a big shark out on the beach by main strength. Seldom had more than one assistant, and to make up for want of muscle, brought brains to bear. In the Big Sarasota Pass there were a number of large palmettos, and I used to attach a single block to several of them (snatch blocks would have been handier, but I did not own one), and when we had a bite, would lead the line through the block which happened to be nearest, and then both taking hold of it, would go off down the beach on the run (if we could), and with much ground and lofty tumbling, Mr. Shark would travel up to the tree. One of us would take a turn of the line around another tree, while the other would kill him with an axe, or, if he was too large and vigorous with his tail, would try and see how near he could come to hitting the back bone with a rifle ball.

Very good sport can be had in any of the passes in South Florida waters, even during the winter months. The best hook is one of medium sized, well tempered steel, attached to not less than a fathom of strong chain. I have seen a hook made of three-quarter-inch round iron, hardened as hard as iron could be, drawn out perfectly straight by a shark, and if the hook had been of full one-inch iron, I think it would have fared just as badly. Besides that, these iron hooks are too large and clumsy. A float of some kind is often needed just to keep the bait off the bottom, and, as in rapid tide-ways, the float and bait would be soon drifted in shore, if the inshore end of the line was made fast, I throw out into the stream, and then walk along opposite, with the line in hand. The assistant has the very end in his hand, ready to pass it through the block when you first notice a bite, and he takes up the slack, if any, as fast as possible, until when well hooked I join him, and the fun begins in earnest.

MAJOR SARASOTA.

For Forest and Stream.

ROUGHING IT IN CANADA.

THE following notes of a vacation spent in the backwoods of Ontario, may be of interest to the readers of FOREST AND STREAM. Our party, consisting of "Uncle Charlie" D., the writer, with "Eddie," cook and caretaker of the camp, with three good hounds, left Hamilton early in October, taking the Toronto & Nipissing Railway to Cobocok. By the courtesy of the General Manager we were enabled to take our canoes along with us, on the mail train, and were thus saved a day's delay at Cobocok. For this and other favors, extended to our party, we owe him our hearty thanks. From Cobocok, north, we had about two and a half days canoeing; and here let me say, that for a trip of this kind there is nothing equal to a good board canoe, of the Peterborough or Rice Lake, pattern. They carry a large load, are much safer, especially on the lakes, run much faster, and are almost as light to "carry" as a Birch Bark.

At Elliotts Falls, where mine host Leary, is always ready to furnish a substantial meal to the hungry wayfarer, we were joined by "Toasty" and "Med," two others of our party who had come in a day or two ahead. They were fortunate enough to kill a fine buck on Gull Lake the day before. Leaving the head at Leary's to be called for on our return, we paddled up Gull Lake, a fine sheet of water about eight miles long, and from one to five miles wide, with several islands in it. This is the first lake on the route, which contains any quantity of lake trout. At this season the trolling is excellent, the fish averaging about seven pounds. At Minden our supplies are procured; then a 12 mile drive over a backwoods road, brings us to "Ka-sha-ga-wig-a-mog" Lake. Another long day's paddle, and we arrive at our intended camping

ground, Lake "Pe-pe-wau-be-kung." Our trip up was not all fair sailing; we had strong and cold north and north-west winds, with several flurries of snow. Large flocks of wild geese passed us going south, in one of which we counted 105. At Trading Lake "portage," or "carry," we lost two of our dogs; then on Raven Lake "Uncle Charlie" and "Eddie's" canoe filled and swamped. Eddie struck out for the shore manfully, and reached it in an exhausted state, while Uncle Charlie, having a very valuable English gun, did not like to let it go without an effort. He managed to swim 15 or 20 yards with it, but there being a heavy sea on and the gun weighing 12 pounds, he was compelled to let it go, after he had been down twice, and had not Toasty and Med came up in their canoe, it is probable Charlie would have gone after it. We fished the gun out the next day.

We were joined at Lake Pe-pe-wau-be-kung by our hunters, "Andrew" and his son, with two dogs. A few hours after our arrival Uncle Charlie was recalled home on account of sickness by a telegram, forwarded from Minden by special messenger. Charlie left the next morning with the messenger, very much to our regret. The same day being the first really fine day we had, Toasty and Med brought home to camp a fine yearling buck. The two following days were cold and stormy, we could not get out on the lake and were two indolent to travel through the bush (which is here very rough and rocky) for partridge, which are very plentiful. We put in the time making the camp comfortable—making a hemlock bed for those of our party who were not so fortunate as to have a camp lounge, extemporizing stools, a table, &c. Speaking of the camp lounge reminds me that it was first thought of, talked over and decided on, by our genial friend G. J. Barker, of Massachusetts, the inventor, some three years ago, when he was camped with us on Raven Lake—and a great luxury they are. The weather moderating somewhat the next day, we started two of the dogs, but the deer did not come into the lake. On our return to camp, we found Uncle Charlie and another friend, "Scripture," from Hamilton. On his arrival at Minden Uncle Charlie received a second telegram announcing great improvement at home, and that he need not return. Almost the first person he had met at Minden, was our friend Scripture, who was then on his way up to join us.

The next day we started the dogs and they brought in a fine doe, which was captured by old Scripture. In the afternoon, we missed a race. The next morning the dogs started early, D. and I were watching at the head of an Island, and improved the time by catching 14 fine lake trout, when, about giving up all chance for a deer to come in, we saw with a glass the two dogs on the shore about two miles down the lake and concluding that the deer must be swimming, if not already across, we put out in the direction we supposed it would be by that time, and after a hard and exciting paddle of fully two miles, against a strong head wind, D. finished the race with a couple of charges of buck shot—making doe No. 2., weighing about 120 pounds. We trolled for an hour in the afternoon and added eight more trout to our string. Not a bad day's work.

Some of our party having come across some fresh tracks on Bear Island, we tried to get a start there the next morning, but without success. Taking the dogs over to the north shore about 11 o'clock, they were off in five minutes and after circling around three times, went off out of hearing for over an hour, and probably took the deer to Fletcher's Lake, where we had no watcher. On their back track, they got another start, and after about an hour of their exhilarating music, D. and I heard something crashing through the bush near our watching ground, then take the water, swim across a narrow cove, only about 100 yards, and apparently land on a bold rocky point. Then the dogs came down to the shore, giving splendid tongue. We heard something scramble up the rocks, paddled over there, but could find no trace of anything having landed. Thinking we must have been mistaken (we were nearly half a mile from the point where we heard the noise,) we gave the usual signal, and got the party together for dinner. After talking the matter over with Andrew, and not feeling quite satisfied with the result of the morning's hunt we went after dinner to the point for another, and closer inspection; searched around pretty thoroughly. D. discovered a large cave. When about giving it up for a bad job, I fancied I saw some traces of a recent disturbance on an old fallen tree about 30 feet higher up the bluff; climbed up there with the aid of a paddle, when up jumped a noble buck from behind a large boulder, not ten feet from me. Not stopping a moment to inquire why he was disturbed, away he went down the rocks with a perfect rush and into the lake. Scripture being in the best position, got to him first, and dispatched him with the third charge of buckshot. He proved to be a fine fellow indeed. On our way home we weighed him at Cobocok. After being dressed and his head off (the latter, Scripture's trophy) he turned the scales at 205 pounds.

Andrew, not placing much reliance on our "wild goose story," had taken the dogs out into the bush to try and get a fresh start after dinner, so hauling the buck out on a rock, we made for our various watching posts. Toasty and Med, who went over to Fletcher's Lake, were rewarded for their extra trouble by the deer coming in there about 5 p. m.—nearly dusk. They practiced at it with a revolver, but had to use a Ballard to finish it, this being doe No. 3. We did not get back to camp until after 7 o'clock, having had a long but glorious day of it.

Our time being limited, and having lost so much on our way up, and by the unfavorable weather on our arrival, we

were reluctantly compelled to pull up stakes and make a start for home the following morning. We found that although we had managed to use up pretty thoroughly our stock of groceries, flour, &c., our load was considerably increased on the downward trip. This was especially felt to be the case on the portages, which vary from 20 yards to two miles in length, there being two of the latter and several of from a quarter to a half a mile long. These were not considered serious obstacles, however. The increased strength and buoyancy of feeling, that we had gained, by a two week's life of constant exercise and activity in that pure and bracing air, together with the throwing off of all business cares, or anxieties, seemed to have infused new life into us, and made us almost sigh "for new worlds to conquer."

Only those who have spent a few weeks in the wilderness, entirely away from telegraphs, post offices, and newspapers, with a few right good fellows, who are determined to make the best of everything, and enjoy themselves in a rational way, to their utmost, can fully appreciate the pleasures of a trip of this kind. And here let me say a word in honor of dear old Uncle Charlie, who was always brimful of good humor, and the life of the camp; and our friend D., who always had a song, or a story to enliven the pleasant hours spent around the camp fire, or over a friendly game of euchre in the evening. I have made one of a party, to go "out back," as we call it in Canada, meaning out in the back woods, or as some of our American friends have put it, "out in the wilderness," every year, for the past 13 years, and can safely say that this has been by no means the least enjoyable one. I trust that many of the readers of FOREST AND STREAM may be enabled to "go and do likewise" next fall, and can assure them that there are hundreds of such places in Canada, where the sport is excellent, the scenery magnificent, and where the true sportsman and gentleman, will meet with a hearty reception from the few and scattered settlers and hunters.

G.

For Forest and Stream.

A FOX HUNT IN VERMONT.

WE were up and off bright and early, and the sun showing himself over the long ranges of the Green Mountains found us on our hunting grounds.

There were three of us, with two hounds, Gabriel and Trumpet (Gabe and Trump for short), the first of whom had run many a member of the Reynard family to his death, the latter a younger dog, but a worthy follower of his elder companion; and we had chosen this bright morning in the the Indian summer, when the hoar frost hung heavy on the long grass in the lowlands, and the fallen leaves in the woods were fully damp enough to hold the scent for a fox hunt. The hills were clothed in scarlet mantles, the fiery red of the sumac, the darker hue of the oak, the maple with mottled coat, and the sombre evergreen, all blended as only those who have passed an autumn in the North can know, the forests and streams lay silent as if the hush of death was on them, the Adirondacks rose towering through the mellow haze, beyond the blue Champlain and the Green Mountains, Vermont's own, rolled away swell after swell to the eastward—glorious specimens of God's handiwork.

We skirted grove and mountain, walked eastward through the "notch," watching the morning sunbeams sifting through the yellow leaves and then into the swamp, and, following an old log road, watched the dogs' noses to the ground, tails erect, looking over every log and fallen tree, beating the ground again and again to the right and to the left of us, entering as zealously into the spirit of the chase as their masters. And at last the older dog's patience is rewarded, he stops, gives a long snuff, raises his head and gives voice to a long drawn note, Trump joins him, and together they set about following the old trail; steadily they work it up, occasionally giving voice as a particularly "hot" scent strikes them, they grow more eager, and follow easily. Suddenly R. stops, and at the instant both hound's voices are lifted joyously and make the woods ring with echoes "he's started!" and we ran for the runways. M. is a novice—has never shot his fox, and to him is given the best of the "notch."

The dogs make a wide sweep on to the last mountain—are lost to hearing for awhile, and then M. hears them nearing him; he cocks his gun and waits, his heart beating the while like a flail; hears a rustle in the leaves, looks, and there within fifty feet of him stands the fox, unaware of danger, one fore foot on a rock, the other raised, his head turned back listening to the dogs. M. fires without lowering his head, and the charge cuts through the tree tops twenty feet above his intended victim, who jumps behind a tree, and keeping it between him and M. until out of reach of the second barrel, flies up the mountain side; the dogs come; look disgusted, and follow him.

The shooter sits down on a rock and communes with nature; he will not even load his gun. The hounds take a turn or two, and then M., sitting there disconsolate, hears R.'s "destroyer" speak; a minute more, the dogs yelp sharply, and then are still, and he knows that living man will never more get shot at that fox.

But it is not often a fox is so easily killed as this one; often he is old and cunning, and has been there before. He will not run in circles, nor keep on any particular tract, but "reaches out" in long stretches of miles; will never run in the same place; avoids the regular runways, and baffles the dogs at every turn. Many a day I have tramped unsuccessfully after such a one, returning tired and with worn out dogs at night, only to try the same fox again and

again. A young fox, with a slow running dog, is apt to stay near his den. A fast dog will often run him off. Many good and well-bred dogs will not kill a fox if they come up to him, as is well known. The writer remembers one instance of a black and tan bitch belonging to a neighboring sportsman, being seen not ten feet from a dog fox sitting on her haunches and barking at him, and he has heard of others of the same kind. It generally seems to be the opposite sexes that so fraternize, and only when one dog is running.

MUSH QUASH.

Fish Culture.

THE HAMBURG AQUARIUM.

BY DR. H. DORNHR.

[Continued from page 195.]

THE greater part of the aquarium was devoted to the fishes. We exhibited mostly those found in the North Sea, a few from the Baltic Sea, and all the fresh water fishes which came into our possession. Most of the fishes of the sea—indeed most all of the marine animals—were furnished to the aquarium by a fisherman of Heligoland, a man who for years had searched the surroundings of his little bit of fatherland after the interesting forms of animal life, and was known to every naturalist who spent some fine summer weeks on the shores of the little island engaged in zoological studies. Hilmer Luehrs knew of no greater pleasure than to serve as a faithful guide to some student or professor who devoted his time to the animals, and every one soon found out that he could trust to no better man for fishing, dredging, or collecting in other ways the various treasures with which the sea abounds. The islander did not talk very much, none of his countrymen are fond of talking, but whatever he said was experienced and reliable. He knew to a certainty all places within the radius of five miles where there were to be found the different forms of aquatic life, and was sure to bring to light a certain fish, a crustacean, a sponge, a lucernaria, a carupanularia, or what else the sea contained. All remarkably shaped animals which casually were caught by his fellow fishermen were conveyed to him, and so he was sure to collect a great variety of interesting animals, which from time to time he sent to Hamburg.

Some more animals were obtained from a fisherman living near the mouth of the Thames; another fisherman living in Norway brought the brilliantly colored wrasses (*Labrus mæstus* and *maculatus*) and the northern red crabs (*Lithodes arctica*), against which we used to exchange the animals possessed by the aquaria at Berlin, Brussels, Cologne, Hanover, London and Havre.

I do not propose to give a long list of all the fishes contained in our tanks, but prefer to make a few remarks about those which invited the observation by their mode of living, or by exhibiting various stages of development. I am glad to mention, as the first among them, the common perch, (*Perca fluviatilis*) as it reminds me of my juvenile sports, when I, with some companions, used to catch these beautiful and lively animals, which required no unusual skill to induce them to take a bait. They are very bold and voracious, and easily tamed, so that after a few days' confinement in a tank they take the food freely out of one's hand. They differ but slightly from the yellow perch (*Perca flavescens*) found in the United States and Canada, and are distinguished from them only by their darker color and their smooth operculum, which in the American species shows some shallow furrows or striæ. Guæther states that, after an examination of the skeletons, he is inclined to consider both to be varieties of one and the same species. The perch is not only a lively and beautiful fish, but also exhibits a remarkable tenacity of life. It will do no harm to him to have been for six hours or more out of the water, and it is a fact that the same individuals that have been exhibited for sale in the market may be taken back to the water in the evening, and will appear just as brisk and lively on the fishmonger's stand during the following day. In rivers he prefers the sides and the shallower places to the deeper parts, but in some lakes he is found in considerable depths. This is particularly mentioned of those living in the lakes of Switzerland, where the perches brought up from the depth of thirty to forty fathoms exhibit a remarkable peculiarity. The cavity of their mouth is filled with a clumsy body resembling a thickly swollen tongue, which, when closer examined, proves to be the stomach completely turned up so that the inside of it has become the outside. The cause of this emergency is the sudden expansion of the air contained in the swimming bladder. While the fish is violently carried into shallower places, the pressure of the water diminishes, the swimming bladder bursts, being too weak to resist the force of the expanding air, and the latter, entering the free abdominal cavity and pressing against the outer surface of the stomach, flings the latter towards the throat.

The genus *Labrax* or bass is represented on the European shores only by a single species, *Labrax lupus*, a fish plainly distinguished from the perches by Aristotle already. All the other species of *Labrax*, six in number, are to be found in American waters. The European bass is perhaps not as handsome as the famous striped bass of this country, but he is equally attractive by his lively manners, his splendidly glittering body, and the easiness with which he can be kept in sea or fresh water for a considerable length of time.

Next to the bass we kept the Sander (*Lucioperca sandra*) in small numbers. This fish resembles the common perch

by having a number of transverse dark bands across the body, but is easily distinguished from him by his lead color and the large projecting teeth in both jaws. He is as rapacious as the perch, but does not exhibit the same liveliness, usually lying almost motionless upon the bottom of his tank, and hardly coming forth when some smaller fish are in his neighborhood. Accordingly he did not live well in our tanks, and had often to be refurnished. It is a pity that this fish, the number of which rapidly diminishes in European waters, is not bred artificially, being one of the most delicate and tasteful of the river fishes, esteemed almost like the salmon.

All the above named fishes have their near relatives in American waters, the sander being represented by *Lucioperca grisea*, a handsomely spotted or mottled river fish, exhibited in some splendid specimens in the New York Aquarium; but no representative is to be found in America of the Ruffe or Stur (*Acerina cernua*) a small fish, spotted all over the body and fins, and distinguished from the foregoing fishes by having but a single dorsal. The head of this lively, hardy, rough-skinned fish has something martial in its appearance, like the iron-clad head of some mediæval knight; the gill cover projects in a sharp spine, and it is quite a sight to look at a school of these simply but interestingly marked animals spreading out their indented dorsal fin as far as possible, and gliding in every direction through the clear water. As food fishes they are not much esteemed, being small and having a great many small bones, yet they are valued as a fit nourishment for weak and convalescent people.

Two species of *Trachinus* or Weever fishes, a genus also not represented in North American waters, were exhibited in our aquarium, the Greater Weever or Sting Bull (*Trachinus draco*) and the Viper Weever or Viper fish (*Trachinus vipera*). These fishes are highly interesting, both in their form and manners. The form of their body resembles a thick knife or blade, the back being nearly flat, and the sides high and compressed. The pectorals, abdominals, and the first dorsal are very small, and lie close together, but the second dorsal and the anal fin are of extreme length, lining almost the entire body.

As soon as these fishes are brought into a tank they hurry to the bottom, and quick as lightning are concealed between the gravel and sand, the upper part of their head and the large, protruding eyes being the only parts of their body still to be seen. The long anal fin is the chief motor during this performance. They are caught by means of trawl nets in great quantities on the northern shores of France and the Netherlands, and brought to the market fresh and smoked, generally averaging one foot in length. Two years ago I had occasion to see a great number of them in the northern part of Holland, and to make inquiries about their supposed venosity. All fishermen, when asked, asserted this to be the case, and said that they were accustomed to handle these fishes with the greatest caution, cutting away the first rays of the dorsal fin and the spines of the gill cover before exhibiting them for sale. I was also told that some of the men had occasionally suffered from injuries made by the sharp spines of the Weevers, and that after a sting, not only the injured part but the whole body suffered more or less pains for about a week.

I am well aware that venosity is supposed in many instances where a real fluid venom never has been found. If, after the bite of a rat or the sting from the spine of the dog shark, the injured part swells and becomes painful and purulent, the tooth or the spine is commonly called poisonous, and yet any puncheon made of bone, wood, or steel is able to cause the same effect. In all these cases the evil consequences are caused by the blood being shut out from circulation, and yet remaining in the body. But the sickness following the sting of a Weever is of quite a different nature, there being an extensive inflammation, the limbs swollen to a large extent, and pains almost in the whole body.

If we examine the spine itself which, unlike the spines at the gill covers of perches, sanders, and other fishes does not form the very end of the gill cover, but is situated a little before the hind border of it, we find a hollow channel extending almost through its entire length, and opening a little before its tip. Thus it bears a close resemblance to the hollow tooth of a poisonous snake. To prove its poisonous nature it would still be necessary to find the gland secreting the poison, which I was unable to observe in the only specimen which, a short time before my departure for America, I had occasion to examine. Likewise I did not succeed in causing any serious damage to a lively Goldsinny, (*Orenilabrus rupestris*) the body of which I pierced in three places with the spine of a living Viper fish. But I may mention that a genus of Batrachoid fishes, *Thalassophryne*, living in the vicinity of Panama, is undoubtedly poisonous, Dr. Gunther having found and described (Proc. Zool. Soc. 1864, p. 155) the poison organ to which is attached a hollow spine closely resembling the spines of *Trachinus*. Capt. T. M. Dow, C. M. Z. S., who had occasion to observe some living specimens of *Thalassophryne* at Panama, states in a letter addressed to Dr. Gunther (P. Z. S. 1865, p. 677) that the slightest pressure of the finger at the base of the spine caused the poison to jet a foot or more from the opening of the spine.

[To be continued.]

Mr. C. G. Atkins, of Maine, has concluded his operations for the collection of spawn at Grand Lake stream. He has secured about 550,000 eggs—about half the number of last year. Mr. Atkins will remain at the stream much of the winter to superintend the hatching.

STRANGE FISH.

Prof. W. C. Coup, of the New York Aquarium, corner of Broadway and Thirty-fifth street, has very kindly loaned us the cuts illustrating this article. Both fish are on exhibition at the aquarium, and are exceedingly interesting. The twin salmon is a freak of nature, not uncommon, but never before brought to public notice in a fashion that made an examination practicable. The two bodies are attached to one sac, but each fish is perfect in itself. The connecting vesicle is filled with oil globules, arteries and veins, and it was expected that a microscopic examination would discover a diaphragm separating the circulation into two distinct systems. The closest scrutiny, however, fails to discover this wall, and the circulatory systems appear so intimately connected that the blood flows freely from one body to the other, impelled, however, by two hearts.

TWIN SALMON.

There is probably but little chance of their living after the absorption of the sac, for if they survive till that time the abdomens will be joined by the membrane of the sac, and being thus compelled to swim on their sides, great difficulty will be experienced in obtaining food. In this instance, however, a careful system of artificial feeding will be adopted in case the pair reach an age when they will need such nourishment.

THE KINGIYO.

The presence in the Aquarium of the Japanese Kingiyo should be a cause of special congratulation, as it was transported from Japan only by infinite pains-taking. The body is red in color, similar to that of a brilliantly-hued gold fish; the tail, however, is a pearly white, and as it rests in the water presents the appearance of a fine, silken fabric, terminating in a delicate fringe. The Japanese claim that the brilliant colors displayed in this fish, and the wonderful development of its triple tail, are the result of many years careful breeding. This one is an unusually fine specimen. In Baltimore there are seven of these fish which, during the summer, spawned, the result being about fifty young fry, which exhibit all the peculiarities of the originals.

SPAWN FOR PENNSYLVANIA.—A Greenville (Pa.), correspondent writes: The State Commissioners of Pennsylvania, have notified the Fish Warden of this locality that they will be on hand next month with our allotment of spawn, salmon and brook trout. They will have something like a million of the above, with Sacramento salmon, to distribute this winter. Fish culture thus begins to assume a substantial shape, thanks to the quiet education in that direction which has been going on during the past few years.

STOCKING CONNECTICUT WATERS.—J. Ives Pease, of Twin Lakes, Salisbury, Connecticut, says, December 16th:—

"Of the three thousand lake trout 'we' put into the lake two winters ago, nothing has yet been seen; but it is hoped that at least a sample fish may be caught during the winter by somebody, and a report thereof made. By the way, the hatching house on 'Our Farm' has been put in running order, with a new tank, and a capacity of screen-room of nine hundred and ninety-nine thousand (or, say a million), and an installment of twenty-five thousand is daily expected to arrive from McKean county, Pennsylvania, which are to be hatched for the 'Salisbury Game and Fish Protecting Society' by one of its members (the artist mentioned above), and are to be placed in some of the depleted trout brooks of this over-fished region.

STOCKING THE UPPER POTOMAC.—On Tuesday morning last, Mr. G. W. Delawder received at Oakland eighty-three thousand salmon, sent to him by Fish Commissioner Ferguson, to be placed in the head waters of the North Branch of the Potomac. This fact would carry pleasure with it to every body living within a dozen miles of the said North Branch, were it not for another fact. Some years ago black bass were introduced into these waters, and every body piscatorially inclined congratulated himself on the sport which he would in a few years have in taking that game fish from the waters. But, alas! what has been the result? The bass have devoured the greater part of the fish native to the waters, and in the search for food, and by reason of their migratory nature, they have now nearly all gone down over the dams, and cannot get back again. That the stocking of these waters with bass was a fine thing for those people living on the lower waters of the Potomac is beyond dispute, but it has proven a failure for those above, and until fish ladders are placed on the river, or some other arrangement made by which the fish can be made to come up stream again after going down, it is a matter of little importance whether the North Branch is or is not stocked with salmon or any other species of the finny tribe not native to the waters. The fish commissioners are implored to look into this matter and remedy the evil.—*Exchange.*

VERMONT.—Gov. Fairbanks has appointed Rev. W. H. Lord the Fish Commissioner of Vermont. During the last eighteen months the State Fish Commissioners have put 6,000 land-locked salmon into the Winooski river at Essex. Fifty thousand salmon have been put into Lewis creek, Ferrisburg, and 5,000 each in Franklin and Fairfield ponds, Franklin county. The total distribution of fish from May, 1875, to November, 1876, has been as follows: 20 pike, 300 Potomac bass, 363 black bass, and 140,000 salmon—distributed in some thirty different places.—*Manchester (N. H.) Mirror.*

Natural History.

ADDRESS OF A. R. WALLACE BEFORE THE BRITISH ASSOCIATION

RISE AND PROGRESS OF MODERN VIEWS AS TO THE ANTIQUITY AND ORIGIN OF MAN.

Continued.

As my own knowledge of, and interest in, Anthropology, is confined to the great outlines rather than to the special details of the science, I propose to give a very brief and general sketch of the modern doctrine as to the Antiquity and Origin of Man, and to suggest certain points of difficulty which have not, I think, yet received sufficient attention.

Many now present remember the time (for it is a little more than twenty years ago) when the antiquity of man as now understood was universally discredited. Not only theologians but even geologists, then taught us that man belonged altogether to the existing state of things; that the extinct animals of the Tertiary period had finally disappeared, and that the earth's surface had assumed its present condition before the human race first came into existence. So prepossessed were even scientific men with this idea, which yet rested on purely negative evidence, and could not be supported by any arguments of scientific value, that numerous facts which had been presented at intervals for half a century, all tending to prove the existence of man at very remote epochs, were silently ignored; and more than this, the detailed statements of three distinct and careful observers were rejected by a great scientific society as too improbable for publication, only because they proved (if they were true) the co-existence of man with extinct animals!

But this state of belief in opposition to facts, could not long continue. In 1859 a few of our most eminent geologists examined for themselves into the alleged occurrence of flint implements in the gravels of the North of France, which had been made public fourteen years before, and found them strictly correct. The caverns of Devonshire were about the same time carefully examined by equally eminent observers, and were found fully to bear out the statement of those who had published their results eighteen years before. Flint implements began to be found in all suitable localities in the South of England, when carefully searched for, often in gravels of equal antiquity with those of France. Caverns, giving evidence of human occupation at various remote periods, were explored in Belgium and the South of France—lake dwellings were examined in Switzerland—refuse heaps in Denmark—and thus a whole series of remains have been discovered, carrying back the history of mankind from the earliest historic periods to a long distant past. The antiquity of the races thus discovered can only be generally determined by the successively earlier stages through which we can trace them. As we go back metals soon disappear, and we find only tools and weapons of stone and of bone. The stone weapons get ruder and ruder; pottery and then the bone implements cease to occur; and in the earliest stage we find only chipped flints, of rude design though still of unmistakable human workmanship. In like manner the domestic animals disappear as we go backward; and though the dog seems to have been the earliest, it is doubtful whether the makers of the modern implements of the gravels possessed even this. Still more important as a measure of time are the changes of the earth's surface—of the distribution of animals—and of climate—which have occurred during the human period. At a comparatively recent epoch in the record of prehistoric times, we find that the Baltic was far saltier than it is now, and produced abundance of oysters; and that Denmark was covered by pine forests inhabited by Capercornices, such as now only occur farther north in

Norway. A little earlier we find that reindeer were common even in the South of France, and still earlier this animal was accompanied by the mammoth and woolly rhinoceros, by the arctic glutton, and by huge bears and lions of extinct species. The presence of such animals implies a change of climate, and both in the caves and gravels we find proofs of a much colder climate than now prevails in Western Europe. Still more remarkable are the changes of the earth's surface which have been effected during man's occupation of it. Many extensive valleys in England and France are believed by the best observers to have been deepened at least a hundred feet; caverns now far out of the reach of any stream, must for a long succession of years have had streams flowing through them, at least in times of floods—and this often implies that vast masses of solid rock have since been worn away. In Sardinia land has risen at least 300 feet since men lived there who made pottery and probably used fishing nets; while in Kent's Cavern remains of man are found buried beneath two separate beds of stalagmite, each having a distinct texture, and each covering a deposit of cave-earth having well marked differential characters, while each contains a distinct assemblage of extinct animals.

Such, briefly, are the results of the evidence that has been rapidly accumulating for about fifteen years as to the antiquity of man; and it has been confirmed by so many discoveries of a like nature in all parts of the globe, and especially by the comparison of the tools and weapons of prehistoric man with those of modern savages, so that the use of even the modest flint implements has become quite intelligible—that we can hardly wonder at the vast revolution effected in public opinion. Not only is the belief in man's vast and still unknown antiquity universal among men of science, but it is hardly disputed by any well informed theologian; and the present generation of science students must, we should think, be somewhat puzzled to understand what there was in the earlier discoveries that should have aroused such general opposition and been met with such universal incredulity.

But the question of the mere Antiquity of Man, almost sank into insignificance at a very early period of the inquiry, in comparison with the far more momentous and more exciting problem of the development of man from some lower animal form, which the theories of Mr. Darwin and Mr. Herbert Spencer soon showed to be inseparably bound up with it. This has been, and to some extent still is the subject of fierce conflict; but the controversy as to the fact of such development is now almost at an end, since one of the most talented representatives of Catholic theology, and an anatomist of high standing—Professor Mivart—fully adopted it as regards physical structure, reserving his opposition for those parts of his theory which would deduce man's whole intellectual and moral nature from the same source and by a similar mode of development.

Never, perhaps, in the whole history of science or philosophy, has so great a revolution in thought and opinion been effected as in the twelve years from 1859 to 1871, the respective dates of publication of Mr. Darwin's "Origin of Species" and "Descent of Man." Up to the commencement of this period the belief in the independent creation or origin of the species of animals and plants, and the very recent appearance of man upon the earth were practically universal. Long before the end of it these two beliefs had utterly disappeared, not only in the scientific world, but almost equally so among the literary and educated classes generally. The belief in the independent origin of man held its ground somewhat longer, but the publication of Mr. Darwin's great work gave even that its death blow, for hardly any one capable of judging of the evidence now doubts the derivative nature of man's bodily structure as a whole, though many believe that his mind and even some of his physical characteristics may be due to the action of other forces than have acted in the case of the lower animals.

We need hardly be surprised under these circumstances, if there has been a tendency among men of science to pass from one extreme to the other, from a profession (so few years ago) of total ignorance as to the mode of origin of all living things, to claim to almost complete knowledge of the whole progress of the universe, from the first speck of living protoplasm up to the highest development of the human intellect. Yet this is really what we have seen in the last sixteen years. Formerly difficulties were exaggerated, and it was asserted that we had not sufficient knowledge to venture on any generalizations on the subject. Now difficulties are set aside, and it is held that our theories are so well established and so far-reaching that they explain and comprehend all nature. It is not long ago (as I have already reminded you) since facts were contemptuously ignored because they favored our now popular views; at the present day it seems to me that facts which oppose them hardly receive due consideration. And as opposition is the best incentive to progress, and it is not well even for the best theories to have it all their own way, I propose to direct your attention to a few such facts, and to the conclusion that seems fairly deducible from them.

THE AUSTRALIAN REGION HAS ALWAYS BEEN NOTED as furnishing to naturalists more than its share of zoological surprises, and it seems that its wonders are not yet exhausted. Within a short time two discoveries have been made in that section of the globe which are of the utmost importance to zoologists. These discoveries, announced in a recent number of *Nature*, are pregnant with suggestions of the unknown forms which we may hope that Australasia will yet reveal.

The Arak Mountains of New Guinea have afforded to

a collector employed by an Italian nobleman a new and very large species of *Echidna*, and the importance of this fact will at once be appreciated when we consider that the Monotremes have hitherto been supposed to be wholly confined to the mainland of Australia.

In the vicinity of Peale's Island has been found a new *Amphioxus*, which is regarded by some as being generically distinct from the only one hitherto known. It is not impossible that a careful study of this new form may furnish to zoologists a clue to what is now one of the most difficult problems with which they have to deal.

NOTES.—*Loxia curvirostra* var. *americana* has appeared in considerable numbers in some sections of southern Connecticut. . . . Black bears have been unusually abundant in Lewis County, New York, this fall and winter. Ten or a dozen have already been killed there. . . . The snow which fell last week brought with it the first *Plectrophanes nivalis* of the season.

THE MAMMALS OF WYOMING.

WE take pleasure in laying before our readers the following list of the mammals found near Fort Sanders, Wyoming, reported by Col. A. G. Brackett, U. S. A., with the dates of their collection in 1875. This catalogue will be of much interest to those who are but little acquainted with the fauna of the Rocky Mountains, while to such as have collected among their rugged fastnesses it will be useful for comparison with their own lists:—

April 12th—Skunk. *Mephitis mephitis*.
April 15th.—Prairie gopher. *Spermophilus Richardsonii*.
May 7th—Striped prairie squirrel. *Spermophilus tridecemlineatus*.
May 13th—Prairie hare. *Lepus campestris*.
May 13th—Gray rabbit. *Lepus sylvaticus*.
May 18th—Muskrat. *Fiber zibethicus*.
May 24th—Chipping, striped or ground squirrel, Chipmunk. *Tamias striatus*.
May 24th—Yellow-footed marmot. *Arctomys flaviventer*.
May 24th—Say's striped squirrel. *Spermophilus lateralis*.
August 2d—Prairie dog. *Cynomys ludovicianus*.
August 11th—Antelope, Prong Horn or Cabree. *Antilocapra americana*.
August 15th—Grizzly bear. *Ursus horribilis*. Killed by Lieut. Fowler's party.
August 16th—Mountain sheep; Bighorn; Argali. *Ovis montana*.
August 17th—American elk. *Cervus canadensis*.
August 18th—Black-tailed deer. *Cervus columbianus*.
August 18th—White-tailed deer. *Cervus leucurus*.
September 2d—Coyote or prairie wolf. *Canis latrans*.
September 22d—American badger. *Taxidea americana*.
October 4th—Yellow-haired porcupine. *Erethizon epimachus*.

A QUERY.

TIFFIN, Ohio, Dec. 5th, 1876.

EDITOR FOREST AND STREAM:—

While hauling fodder to-day there was a small bird about the size of a robin, of a light blue color with black stripes on its head, which would come and pick up the mice within a few feet of me. It would use its mouth to kill and carry off its prey instead of its claws, as a hawk would have done. If it had any distance to carry its burden, it would change back and forth from mouth to claws. In your next issue let me know the name of the bird if you can tell it from the above description. It is not what we call the pigeon or mouse hawk here.

BUCKSHOT.

From the very brief description given by our correspondent, we should imagine that the bird which he saw was probably a blue jay (*Cyanurus cristatus*), a species which is much more tame and confiding in the West, than it is with us. An ornithological friend at our elbow suggests that it may have been one of the shrikes (*Collurio*), but in our opinion there is nothing in the description to warrant that supposition. Neither of the shrikes could properly be called "light blue," and besides the blackish wings and tail of those birds would undoubtedly have been noticed and mentioned had one of them been the mouser referred to.—ED.

WHAT IS IT?

MAGOG, Nov. 23, 1876.

EDITOR FOREST AND STREAM:—

As you have once visited this locality and have seen the size and depth, and the scenery and beauties of Lake Memphramagog, I will not describe them. That there is a serpent or some monster that lives in this lake, I have no doubt, some of the facts are as follows: During the early part of October three reliable persons were driving a flock of sheep to Magog along a road which passes very near what is called Sand Beach. Two of the men were on foot, the other some way back on the Bay in a wagon. On reaching the Beach the men on foot saw this serpent lying on the sand not two rods from the road. He appeared to be sunning himself and was in about one foot of water. Almost as soon as they saw him he raised his head high up in the air and started for deep water. Just as he started the other man came up and asked the first two what they were looking at, they pointed and he soon saw what it was. The men all gave it as their opinion that it was a serpent of some kind. They could see thirty feet of his length and his size through appeared to be about eighteen inches. His head resembled that of a horse. They were so near him that it does not seem as if they could be mistaken. His skin, they say was not smooth but rough or scaly. The men watched him till he had got nearly opposite the steamboat wharf about one half mile from where they were.

Some years ago this same monster was seen a number of times by different persons, and all the accounts of him correspond very closely. All stated that they saw about 30 feet of him. He has never before been seen so far down the lake.

Another circumstance which may have some connection

with what I have stated above. Last winter as some men were fishing, about three miles up the lake, all at once they had their hooks and lines broken like thread. The water at this point is from seventy-five to one hundred feet deep. The men had a very large hook made, but they could do nothing. Such are some of the facts; now what is it? That it is something, I verily believe. I only hope, that I may see it, but not too near. No I thank you.

The close season for lake lunge is off. They are catching a good many now by trolling and will continue to do so until the lake closes up, which will be about Christmas. One of our fishermen was trolling and by some means hooked and saved one weighing over eighteen pounds and the fish never bit, he was hooked through the body.

Canada grouse have been very plentiful here this fall; in fact all kinds of game, such as ducks, foxes, mink, sable, and fisher, have been very abundant. A. W. HUBBARD.

[We have read the above note with a great deal of interest, and can assure our correspondent that it grieves and mortifies us not a little that we cannot satisfactorily answer his query. The fact is, however, that just at present we are rather rusty on sea serpents, and so must call to our assistance some of our readers. To sea faring men especially do we address our appeal. Has any one who reads this paper any knowledge of this undescribed monster, either marine or fresh water? If so, we adjure him to "come over and help us." Seriously, we hope that Mr. Hubbard's letter may draw a response from such as may have any facts to communicate on this subject.—ED.]

PUGNACITY OF THE MUSKRAT.

MORGANTON, N. C., Dec. 11th, 1886.

EDITOR FOREST AND STREAM:—

A story in a late number of your paper of a man being attacked by a muskrat reminded me of an incident which occurred to me when a boy. I was walking on the bank of a mill-race, which ran through a piece of woodland, and came suddenly on a muskrat out foraging some three hundred yards from home. I could find no stones, but the way I pelted that rat with elbds and pieces of wood is no doubt yet related to its descendants as a warning not to venture too far into the wicked world. Well, the chase had continued about two-thirds of the distance, and I was having a good time, when suddenly the rat turned back and charged up the bank at me with as much vim as if inspired with the spirit of one of the "old guard." When right at my feet I struck it with a piece of rotten wood, and it returned to the water, and that muskrat proceeded home without further interruption. I assure you having such a harmless and usually timid creature turn on me so boldly gave me a sensation I have never experienced since: G. H. N.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDENS DEC. 13TH.—One snowy owl (*Nyctea nivea*), presented by W. C. Farnsworth, Philadelphia; one Virginia deer (*Cervus virginianus*), presented by W. F. Whitner, Philadelphia; one red-tailed hawk (*Buteo borealis*), presented by J. Richardson, Rutland, Vt.; four goldfinch mules, presented by A. W. Stevenson, Philadelphia; one bald eagle (*Haliaeetus leucocephalus*), and one caracara vulture (*Polyborus brasilensis*), purchased.

ARTHUR E. BROWN, General Supt.

Woodland, Farm and Garden.

ON THE ARRANGEMENT OF CUT FLOWERS.

To those living in any of our large cities, nothing need be said as to the arrangement of cut flowers. Each city or town seems to have its own peculiar style of arrangement, and anything different is to the inhabitants rank heresy. Take, for instance, the difference between the New York and Boston styles; the former seems to try to get as many flowers together as possible, artistically arranged, it is true, but yet too rich and heavy; while the latter is more natural in its style in the use of more green leaves, Ferns and Smilax, in proportion to the quantity of flowers desired. While we doubtless are much ahead of the English in the quantity of cut flowers used at our festal occasions, and in their arrangement in bouquets and baskets, or designs, yet we may learn a lesson from them in the lightness and grace of their designs, more especially for mantel and table decoration. For the latter, one of the "March Stands" is most generally used; that is, a round glass dish, from the center of which springs a slender glass rod, about eighteen inches high, supporting a trumpet-shaped vase. The lower dish may be lined with tinfoil, and filled with moss or sand if desired, but if plenty of green leaves be at hand, this is not necessary. Many varieties of flowers are now attainable, and such a dish looks lovely if some *Bezonias* sprays and fern leaves are tastefully laid round, overhanging the edges a little green wood moss will keep them securely in place, then three *Calla Lilies*, and between each a few *Bow Silene* rose-buds, and a few *Marie Louise Violets* in loose bunches, placing over the top, so as to "wave out" good stiff fronds of the lovely *Maiden Hair Fern* (*Adiantum cuneatum*). Three *Camellias* with their leaves, taking *Sufrans* roses if pink *Camellias* are preferred. Clusters of *Pomsettias*, or any large distinct flowers can be used, instead of the *Callas*. In the trumpet-shaped vase, some *Carnations*, two or three *Camellias* with their leaves, *Roman Hyacinths*, *Stevia*, *Daphne*, *Acacia*, a few *Rose-buds*, or any flowers on hand can be used, only make the grouping light and graceful, and allow a few long sprays of *Smilax* or *Lygodium* to droop over and mingle with the flowers in the dish below. For vases on the mantel, the same arrangements can be carried out, only care being taken to have the colors harmonize or contrast nicely. A few sprays of light, graceful grasses, will give an air of refinement to the whole arrangement. A very chaste and ornamental stand can also be made for the table, by taking one of these rustic terra cotta fernery vases or oblong plant stands, and filling them with say a *Dracaena* or *Palm* in the center, and *Ferns* and other plants around, filling up the spaces left with green wood moss, or *Ly-*

cophodium, then arranging a few flowers among the foliage to lighten it up. Large flowers, or groups of smaller ones, look best in the arrangement, and give a grace and elegance to a table decoration, not easily attained by any other at so small an outlay.

VALISNERIA, OR WILD CELERY.

Valisneria spiralis.

OUR last issue contained a query from a correspondent who desired some information regarding the *Valisneria* or fresh water celery of the west, to which is attributed the same quality of imparting to the flesh of the canvas-back duck that delicious flavor which it receives from a diet of the same or a similar plant within the tide waters of the Chesapeake. We print below the article from the *Agriculturist*, to which we then referred, together with some further notes on the same subject:—

"There is scarcely anything more curious in vegetable life than the fructification of the Tape-grass, sometimes called Eel-grass, but not the salt water plant bearing that name. The Tape-grass, *Valisneria spiralis*, is common in ponds and slow streams, but as it makes but little show above the surface, it is not noticed except by close observers. The leaves grow from two to four feet in length, according to the depth of the water, are flat and tape like, and a quarter of an inch or more in breadth. The curious thing about this plant is its manner of flowering; the staminate and pistillate, or male and female, flowers are borne on different plants. The pistillate flowers are attached to long, slender, and spirally coiled stalks, which allow them to rise to the surface of the water. The staminate flowers are borne on short stems at the bottom of the water, and in a position where, under ordinary circumstances, fertilization would never take place. But by a remarkable provision the staminate flowers, as soon as mature, break off, rise to the surface, expand, and shed their pollen, and thus fertilize the pistillate ones. When the female flower is fertilized, the coiled stem contracts, and draws the flower beneath the surface of the water, where the fruit ripens. Those who write us to know what plants are best suited to a fresh water aquarium, can hardly find one better for the purpose than the *Valisneria*. It lives well in confinement, and grows summer and winter, and if one is fortunate enough to get both staminate and pistillate plants, he can observe the curious phenomenon we have briefly described. Those who have microscopes of considerable power will find in the leaves of the *Valisneria* a most beautiful object, as they show the circulation of the contents of the cells in a most distinct manner. The *Valisneria* flourishes even in brackish streams, and is abundant in the Hudson river, at points where several salt water plants are found. This species is found also in Southern Europe and in other warm countries, and there is another species confined exclusively to Australia. There are several other plants more common than the *Valisneria* which will answer for the aquarium. Indeed there are few fresh water streams and ponds but will furnish one or more."

Assuming that this plant is the same as that which attracts the canvas-back to western waters, where it grows, and we believe it to be, our correspondent (who writes from Syracuse) will see that it is already to be found in immense quantities in the State, and it would be a very easy matter to transplant it to some of the lakes. In the Hudson above West Point, and possibly below it, it is so abundant that it is difficult to work a boat through it at low tide. It is also found in quantities on the Passaic river, but being entirely submerged, except the flowers at blooming time, it is rarely noticed, and is much more common than is generally supposed. As to its propagation and introduction into other waters, much would depend upon the quantity of water. It would be difficult to get the seeds, as after fertilization the female flowers descend, and the ripe fruit, which is quite small, would not be found readily in the mud. The best way is to rake up the roots; they are quite tenacious of life, and could be sent to a long distance in cool weather, if kept moist. In planting, the roots should be tied up in small bundles to which a stone is attached, and dropped overboard. Probably this would be better done in early spring, for in fall or early winter the ducks would be sure to get it.

MARKS ON TREES.—An old surveyor sends Dr. Asa Gray some interesting observations on marks on trees. For several years before the war I was the surveyor for Davidson County, Tenn., in which the City of Nashville is situated. A large part of my duty was running old lines established by former surveyors, numbers of which had been cut fifty or sixty years before. These lines were indicated by hatchet marks upon the trees, through, or near which, the lines ran. Three chops with the hatchet about 4 inches apart, breast high, was, and is, the recognized mark for surveyor's lines. So uniform were the marks given to the trees by the old surveyors that by practice in noting the position, depth, angle, width, and distance apart of the marks, I could generally tell what surveyor had run the line. Very old lines through bottom lands had often been surveyed on horseback, and in such cases, the marks would be found 7 or 8 feet from the ground. It may be interesting to know that the most permanent marks are those in which the hatchet does not go through the bark. In such cases the marks were as plain and sharp after fifty years as when just made. If the sapwood was touched ever so little the edges of the cut would widen and fresh bark would be made, and this being smoother than the old bark and surrounded by a sort of lip, the whole would, as the tree grew old, assimilate in appearance to the rest of the tree, so that only a practised eye could detect the mark at all. If the chops were very deep the bark between them would be thrown off by the tree, and all replaced by new bark, and present a blur, which in time, would be very hard to recognise, and such a tree could only be proved to a jury (as it was often necessary to do), by cutting into the tree and exposing the chops or marks in the solid wood under the sap, and often under many layers of the tree wood. Law suits where lines were questioned have been decided by this method. I may here state that I have often known these layers to tally exactly with the number of years since the survey was made, and thus carry the

most convincing proof that the tree was marked at that time. The point, however, in which the present interest lies is that among the many thousand marked trees I have examined I never knew one in which the distance of the marks from the ground, or each other, had varied from the general practice of surveyors. Many of them had been so marked in the presence of old settlers who accompanied me in the re-establishment of the lines, and I never knew of any change being spoken of in the appearance, except by being cut too deeply. Many of the marks were the subject of especial study to me; but I never met with or heard of marks that had grown up a tree or that had widened apart out of the surveyor's customary limit. In some instances the original level of the soil had been changed by being washed away, but this was only on hill sides, and easily accounted for, and proved by other trees and circumstances. The habit of bears of standing up against Beech trees and scratching them with their claws somewhat as cats do against table-legs is a case in point also. No bears have been found in Davidson County for the last fifty years, and I have had pointed out to me trees that had been scratched all round in this manner, and although the same trees would be marked by the climbing of the bear, yet the peculiar marks made by this playful scratching were never any more than the usual distance from the ground. I know a place near Nashville where, about forty years ago, a Cedar-wood seat was put between two close growing trees by notching it into each one. The trees have grown quite large, and entirely round the ends of the board, but it is exactly the same height as when first placed. I also know where I cut my initials into the bark of a young Hackberry tree with those of a young lady; this was twenty-three years ago, and the marks are there at the same height. These last, however, are special instances, and only prove the habits of Beech, Elm, and Hackberry trees, while those of the surveyor's marks comprise all kinds of trees indigenous to this country, and extend through such periods of time as give very complete observation.

FLOWERS ON THE TABLE.—Leigh Hunt says:—"Set flowers on your table—a whole nosegay if you can get it, or but two or three, or a single flower, a Rose, a Pink, a Daisy. Bring a few Daisies or Buttercups from your last field walk, and keep them alive in a little water; preserve but a bunch of Clover, or a handful of flowering Grass—one of the most elegant of Nature's productions—and you have something on your table that reminds you of the country, and gives you a link with the poets that have done it most honor. Put a Rose, or a Lily, or a Violet on your table, and you and Lord Bacon have a custom in common, for this great and wise man was in the habit of having flowers in season set upon his table, we believe, morning, noon, and night—that is to say, at all meals, seeing that they were growing all day. Now here is a fashion that will last you for ever, if you please—never change with silks, and velvets, and silver forks, nor be dependent on caprice, or some fine gentleman or lady who have nothing but caprice and changes to give them importance and a sensation. Flowers on morning tables are especially suited to them. They look like the happy wakening of the creation; they bring the breath of Nature into your room; they seem the representatives and embodiment of the very smiles of your home, and the graces of good morrow."

CELERY FOR THE NERVES.—A writer who is familiar with the use of Celery, says that he has known several men and women, who, from various causes, had become so affected by nervousness that when they stretched out their hands they shook like aspen leaves on windy days, and by a moderate daily use of the blanched footstalks of Celery as a salad, they became as strong and steady in limb as other people. He has known people cured of palpitation of the heart by the use of Celery. Everybody engaged in labor weakening to the nerves, should use Celery daily in its season, and Onions in its stead when not in season.

MANAGEMENT OF MERINO SHEEP.—A well known breeder of Merinos in Western New York answers the question "how large fleeces are produced," in the National Live Stock Journal, very concisely, as follows:

I will first state what I do not do, as that would seem necessary to a full answer. I do not blanket my sheep, unless when shipping to fairs, etc. I never feed any oil-cake, oil-meal, or anything of that kind. I endeavor to breed a large, strong-boned, broad-backed, square-built sheep, rather plain bodied, well covered from their nose to their toes with a long even staple of wool. I take particular care to get my hay, straw and corn fodder in the best condition possible. My farm has a warm, dry soil. In summer I pasture, and feed no grain. If feed gets dried up, as it did this year, I feed some hay. When I commence to use the ram, I grain my ewes lightly, and increase to about one bushel to one hundred per day, of corn, oats and bran, mixed. For fodder I feed corn-stalks in the morning, straw at noon, and hay at night; and if I have pea or bean vines, feed them to my sheep (the latter very sparingly, if at all, to breeding ewes). I endeavor to get my corn-fodder used up before warm weather in spring, and then feed clover hay twice a day. I try to house my sheep (and all other stock) from storms, but frequently fail to do it. I salt often, and turn my sheep out when filling their racks to avoid the danger of getting hay seed and chaff in their fleeces, and to give them an opportunity of getting water, having none in my sheds.

Now there is no secret about it, further than to get good stock and take good care of it; and, I will add, that I never knew a successful breeder of any kind of stock that was not a good care-taker.

NATURAL ADAPTATION.—A most interesting case of the harmony of nature is illustrated in an annual plant called the Rose of Jerico, *Anastatica hierochuntica*, according to a German journal. This plant has its habitat on the sandy deserts of Africa. After dying, the plant having curled up into a ball, becomes detached from the soil, and is blown about on the surface whither the wind listeth. The seed vessels remain closed until moistened by rains, when they open, the seeds fall to the ground and germinate in about eighteen hours. What a beautiful adaptation to the circumstances! If these seeds took a long time to germinate, the moisture from the rains would have disappeared from the arid sands, and germination become impossible. Then too, if the plant were not released from its root hold, it would, doubtless, soon have been buried beneath the shifting sands.

Furs and Trapping.

For Forest and Stream.

THE TRAPPER NOT THE ONLY ENEMY OF THE MUSKRAT.

THAT a good sized pickerel will make mince meat of a muskrat where he has a clear field and a keen appetite, there are those who know too well to dispute. Nor would they argue the question as to the disposition of the fish hawk to come in for his share, if the rat fooled his time too long on the surface while this rapacious body-snatcher was hovering thereabout. But when told that the mink, an animal not over one-third the weight of a full-sized muskrat, is not only a match for but a terror to the latter, there would seem some grounds for a difference of opinion, more particularly when we look at the anatomical structure of both, and the formidable pair of incisors with which the muskrat is provided, aside from his superior weight.

I was hunting snipe upon a small marsh upon an island below the Kickapoo rapids of the Illinois river east of Marseilles, and while walking quietly along the edge, I heard a noise in the grass, when I discovered some object rolling towards the water, having the appearance of a ball about six inches in diameter. Being somewhat amused, I stood my gun against a log and walked up to it rather unceremoniously, when to my surprise I found a mink and a muskrat clinched, and so completely covered with mud as to be almost unrecognizable. In a moment the mink released his grip and escaped in the tall grass and flags. The muskrat was too far gone to escape when I arrived, and picking him up I found him bleeding profusely from a severe wound in the head and his jugular vein bitten through, from which he soon died. Here was an animal twice the size of its destroyer, caught in open day in a fair fight, and all but bagged by a tiny animal of but slight bellicose proportions; and but for my interference would have carried home his well-earned meal. How many lose their lives at the hands of this newly discovered enemy is but a conjecture; but judging from the empty muskrat houses in localities where trappers seldom visit, the destruction must be greater than we can conceive. We are aware that the depredations of the mink, in its forays upon our winged visitors, their eggs and young, are endless, and we charge to his account the destruction of many of our game birds in all stages of their existence. But when we find this pestiferous scamp making meat of the muskrat without counting his hide worth a cent, we acknowledge ourselves not only beaten, but thoroughly disgusted.

Streator Ill., Dec. 7th, 1876. M. A. HOWELL, JR.

TRAPPING THE MINK.

This animal, as will be seen by our illustration, has a long, slender body, something like the weasel, to which scientific family it belongs. The mink is an aquatic animal, inhabiting small rivers and streams, and living somewhat after the manner of the otter. It has a most wide range of

diet, and will eat almost anything which is at all eatable. Fishes, frogs, and muskrats are his especial delight, and he will occasionally succeed in pouncing upon a snipe or wild duck, which he will greedily devour. Craw fish, snails, and water insects of all kinds also come within the range of his diet, and he sometimes makes a stray visit to some neighboring poultry yard to satisfy the craving of his abnormal hunger. A meal off from his own offspring often answers the same purpose; and a young chicken in the egg he considers the *ne plus ultra* of delicacies. The voracity of this animal is its leading characteristics, and is so largely in excess of its cunning or sagacity that it will often run headlong into a naked trap. Its sense of smell is exceedingly well developed, and through this faculty it is often enabled to track its prey with ease and certainty. The mink lives in burrows, in steep banks, or between rocks or the roots of trees, and the young, five or six in number, are brought forth in May.

The chief occupation of the mink consists in perpetual search for something to eat, and, when so engaged, he may be seen running along the bank of the stream, peering into every nook and corner, and literally "leaving no stone unturned" in its eager search. Taking advantage of this habit, it becomes an easy matter to trap the greedy animal. Set your trap, a Newhouse No. 2, in an inch of water near the edge of the stream, and directly in front of a steep bank or rock, on which you can place your bait. The bait may be a frog, fish, or head of a bird, suspended about eighteen inches above the water, and should be so situated that in order to reach it, the mink will be obliged to tread upon the trap. The trap may also be set in the water and the bait suspended eighteen inches above it, by the aid of a switch planted in the mud near the trap. It is a good plan to scent the bait with an equal mixture of sweet oil and peppermint, with a little honey added. If there is deep water near, the sliding pole should be used, and if not, the "spring pole" in every case, in order to prevent the cap-

tured mink from becoming a prey to larger animals, and also to guard against his escape by amputation, which he would otherwise most certainly accomplish.

The trap may be set on the land, near the water's edge, baiting as just described, and lightly covered with leaves or dirt. Any arrangement of the trap whereby the animal is obliged to tread upon it in order to secure the bait, will be found effectual.

The trap may be set at the foot of a tree, and the bait fastened to the trunk, eighteen inches above it. Minks have their regular beaten paths, and often visit certain hollow logs in their runways. In these logs they leave unmistakable signs of their presence, and a trap set in such a place is sure of success.

Some trappers set a number of traps along the stream at intervals of several rods, connecting them by a trail, the mink being thus led directly and almost certainly to his destruction. This trail is made by smearing a piece of wood with the "medicine," and dragging it on the line of the traps. Any mink which crosses this trail will follow it to the first trap, when he will, in all probability, be captured. A dead muskrat, crow, fish, or a piece of fresh meat dragged along the line answers the same purpose. The beaten tracks of the mink may often be discovered, and a trap set in such a track and covered with leaves, dirt or the like, will often be successful.

Minks may also be easily caught in the dead fall, garrote trap or a twitch-up, baiting with fish, muskrat, flesh, or the head of a bird, of which the animal is especially fond. A liberal use of the "medicine" is also desirable.

The fur of the mink is in best condition in the late autumn, winter, and early spring, and the animal should be skinned as described for the fox.—*Gibson's Complete American Trapper*.

—Near his fish pond in Foxcroft, Me., Mr. Caleb Weston recently felled a cedar tree which had been gnawed by beavers, the prints of their teeth being plainly visible. As there have been no beavers in that section for seventy years the marks have endured at least for that length of time.

BOOKS RECEIVED.

WOMAN ON THE AMERICAN FRONTIER. By Wm. Worthington Fowler, 527 pp. 8vo. illustrated. S. S. Scranton & Co., Hartford, Ct.

The object of this work is to present in a narrative form the noble deeds of our countrywomen who have been members of the great pioneer army, which for more than two centuries has been pushing our frontier westward and building empires in the wilderness. In a style remarkably rich and graphic the author has shown us the pioneer wife, mother and daughter in the various hardships, trials and dangers to which they have been subjected. The incidents, anecdotes and biographies are largely new and unhackneyed, and all of thrilling interest. As a heroine, a hunter, a soldier, a patriot, a comforter, and as the actress in a thousand stirring and moving scenes, woman is here placed before the eye of the reader in such a manner that having pursued one chapter he will not be content without finishing the book. We can safely say that woman's claims to our recognition as the heroine of the frontier have never before been so brilliantly presented as in this volume. The illustrations, of which there are many, are splendid and well designed.

MAGAZINES.

The *American Naturalist* for December opens with a very important and interesting article on "The Development of Flounders" by Mr. Alexander Agassiz. The author discusses very clearly the progress of the young of this fish, commencing with individuals only an inch in length, and announces the startling fact of the passage of the "eye from the right side to the left through integuments of the head between the base of the dorsal fin and the frontal bone." The observations on which this announcement is founded are soon to be given to the scientific world at more length and in greater detail in a paper with illustrations which Mr. Agassiz is now preparing. It is interesting to note that the young flounder at first swims vertically, and that the change from this position to the horizontal takes place gradually with the translation of the eye from one side to the other. The young of the transparent flounder, of which the author speaks, do not invariably lie down on the right side. It seems more or less accidental which side is chosen. Out of fifteen of Mr. Agassiz's specimens eight laid down on the left, and all these died without accomplishing any part of the transfer of the left eye to the right side, although living as long as the seven which on the other side completed the transfer of the other eye to the left side. All the other species kept alive turned down on the proper side for the transfer of the eye.

Prof. Allen, in a very readable article, gives the "Former Range of New England Mammals." By a most industrious examination of the works of early historians, and of the records of some of our New England towns, he determines the former range and abundance of our larger mammals, showing that their present "restriction of range and numerical decrease are obviously due to man's agency." The information afforded to the reader is most valuable. His citations are from "Kalm's Travels," "Lewis' History of Lynn," "Natural and Civil History of Vermont," etc., etc.

"Rock Inscriptions of Ancient Pueblos of Colorado, Utah, New Mexico and Arizona," by Mr. Edwin A. Barber, is an interesting article on a subject about which not much has been written. It shows careful observation, and the descriptions of the rock writings, and the probable explanations, are given with considerable detail. A number of illustrations which are given will afford to the reader a fine conception of the characters of these inscriptions. "Microscopy at the International Exhibition," by Dr. Ward follows, being little more than a catalogue of the different instruments and their makers.

"Bastian and Pasteur on Spontaneous Generation," by Mr. Henry J. Slack, is reprinted from the "Monthly Microscopical Journal" for October.

Dr. Elliot Coues, in a brief essay on the "Destruction of Birds by Telegraph Wire," announces that the mortality among birds from this cause amounts to many hundred thousand annually, a number far greater than we could have supposed possible had our authority been other than Dr. Coues.

General Notes are full and interesting, and the number as a whole is quite up to its usual high standard.

Vick's Floral Guide for 1877. We have just spent an hour or two very pleasantly over *Vick's Floral Guide*, which comes to us full as ever of good things, and so suggestive of the beauty of summer and the odor of many blossoms that the pinching cold and driving snow are forgotten while reading its cheery, chatty pages. Mr. Vick, this season, has added a very useful and compendious Botanical Glossary giving plain and practical definitions of such terms as all who love and cultivate flowers should understand, and which will prove of great service to many of his readers.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

A number of correspondents who have sent us queries of late will understand why they do not find replies by attentively perusing the line at the head of this column.

B. E. Hanesburg.—Can you inform me where I could purchase a few English hares? wish to stock an island. Ans. No English hares to be purchased alive that we are aware of.

C. H. B., Exeter, N. H.—Will you please give me through your paper the names of some responsible fish dealers in New York. Ans. E. G. Blackford and Messrs. Middleton, Carman & Co.; address, Fulton market.

F. W. S., Philadelphia.—Being desirous of subscribing to your paper the coming year I ask for information: Can I subscribe here, or how will I send subscription to you? Ans. Send postal order, check or greenbacks—\$4.

SNIPER, Montreal.—Where within 200 miles of this city will I find good deer and rabbit shooting, and what will be the best method of hunting them in that locality? I want to hunt about Christmas week. Ans. Go to Renfrew, or the upper Ottawa and strike in.

J. H. W., Buffalo.—Will you please inform me, if possible, through the column of Answers to Correspondents the best part of California for sheep raising, and who to write to about buying a rancho. Ans. Los Angeles or San Diego counties. Write to J. W. Haverstick, U. S. Land office, Los Angeles.

J. A. B., Boston.—1. Can you kindly inform me where I can procure live quail now, and the proportion of male and female, per dozen, and price; best time for putting out for breeding. 2. Is there any better book on Florida than "Camp Life in Florida" for a sportsman's use? Ans. 1. Address J. W. Brown, Lock Box 1097, New Haven, Conn. For instructions as to breeding quail see our issue of January 7th, 1875. 2. No.

J. E. S., Sussex Corner.—Is there any work published which would show the cheapest manner of building a skating rink, and the probable cost? Also, any work on the art of skating? An answer through the columns of your valuable paper will greatly oblige. Ans. No work on skating rinks. Would have sent you work on skating, but you do not give State. Price, 25 cents. We do not club with any other paper.

F. R. G., Noroton, Ct.—1. What kind of decoys should I have for ducking on the Sound, in this neighborhood? 2. Do you think a 9½ pound gun too heavy for quail shooting? 3. Would a suit of bag (corn bags) cloth be good for ducking in sedge grass, over a suit of old clothes? Ans. 1. Sheldrakes, widgeon and black ducks. 2. We should not like to carry it all day, but if you weigh 200 pounds it is not too heavy. 3. Yes, if water was no objection.

J. W. K., Ayer, Mass.—Do you know of any person near Boston and Worcester that can and would perform the operation of spay on a pup? Also at what age had it ought to be performed. Ans. We do not know of any one in Massachusetts who performs the operation. The proper time to have it done is before the pup is ten weeks old. If the operation is performed after pups are grown up it enervates them, and they generally get very fat and their usefulness is partially destroyed.

W. B., Monmouth Junction.—I have a hound dog eighteen months old who has about two inches of his tail sore and the bone partly eaten off lengthwise. He scratches himself constantly, and his coat smells badly. He has a spot on his hip as large as a silver dollar which is bare and red. His toe nails are from an inch to an inch and one-half long. Can you tell what is the matter with him? Ans. Give your dog a small dose of compound cathartic pills once a week for three weeks. Feed moderately, and give him no meat; and give him plenty of exercise.

L. E. S., Philadelphia.—Is there not an explosive bullet manufactured; and, if so, where can it be purchased? What sort of a gun can it be used in? I suppose it would be unsafe in anything but a breech-loader. My idea was to try it on sharks. Would those bullets be safe to carry or handle? Ans. The Mead explosive bullet is used for rifles, and there is an imported explosive bullet for shot guns. They are safe when handled with care, and can probably be had through H. C. Squires, No. 1 Courtland street, this city.

D. F. E., Strasburg.—1. Will you please let me know if Ames' rifle (holding 33 cartridges, or in that neighborhood), has any reputation for accuracy and penetration? 2. What would it cost to have a pair of Greener's choke-bore shot barrels fitted to a Remington stock (breech-loaders), cost of barrels and fitting? Ans. 1. We know nothing about the rifle. 2. The action would have to be sent to England, and the expense would be as much as the cost of a new gun.

K., Virginia City, Montana.—I have a Parker gun, No. 10, choke-bore. At target it shoots close and shows good penetration, but does not kill game dead. Not one bird in ten shot when it comes to the ground dead. What is the cause? Is it in loading? I load with pink edge wads, two generally on top of powder and one on shot, with from 3½ to 5 drs. of powder, and from 1 to 1½ ozs. of shot. Ans. There must be some error about the penetration of your gun; try it on wood. We once had a 10-bore breech-loader, made by a celebrated maker, that would not kill quail dead with less than 4½ or 5 drs. powder.

A. D. B., Carlisle, Pa.—My setter dog (two years old) has a large swelling on his left shoulder, and on the point of the shoulder blade there is a round rough lump forming. The swelling is quite large, and extending over both shoulders. I am fearful that it may stiffen his leg. It does not pain him or impede his movement, and after a day's hunt it is not near so large. Will you please suggest some means by which I can remove the lump on the shoulder blade without resorting to the knife? Ans. Before resorting to the knife, try bathing repeatedly with crude coal oil.

L. C. W., Brookville, Saline Co., Ky.—I have a setter bitch three years old, in good condition; works well, eats well, and looks well enough with two exceptions. Her nose is dry and hot, and has been for the past two years and now she has a sort of cough. After coughing two or three times tries to vomit, but generally nothing comes up. She seems to feel as well as ever now, but the cough is getting worse and I wish to find some remedy. Have given arca nut, and am now giving pine tar. Ans. Try the following remedy: Barbadoes tar 2 drachms, powdered squills, 4 drachms, extract of belladonna, 2 scruples, licorice powder a sufficiency. Make into 20 pills and give four daily.

G. C. R., Portland, Me.—1. Can you give me the address of J. W. Long, the author of "American Wild Fowl Shooting"? 2. Where can I obtain a copy of the English Kennel Club Stud Book, and at what price? 3. Where may I obtain the condition powders for dogs I have often seen recommended in the *FOREST AND STREAM*? 4. What would be an A 1 pattern of No. 2, 4, 6 and 8 shot, 40 yards, 30-inch circle, with a 12-gauge breech-loader, using 1½ ounces of shot? Ans. 1. J. W. Long, Beethoven street, Ward 19, Boston, Mass. 2. The first two volumes, new, can be had at this office; price, \$13. 3. Our Kennel Editor can send them. 4. No. 8, 175; No. 6, 130; No. 4, 90, and No. 2, 70, would be a good average.

T. S. K., Allegheny, Pa.—1. I have a fine skye terrier that I would like to exhibit at a bench show in January, but his ears are so sore from running through briars and underbrush that I am afraid he will not look well. Please tell me in your next what I had better do for him. My setter also had his front paw almost taken off by another dog; is it best to let him lick the sore or not. 2. Also the best way to promote the growth of hair on a dog that has had the mange. Ans. 1. Bathe the dogs ears with a solution of sulphate of copper, 15 grains of the sulphate to one ounce of water, and secure the ears with a cloth over the head, so that he cannot shake the stabs off while the sores are healing. 2. It is better that your setter should lick the wound. Keep the dog in a cool place and his skin clean.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH-CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOLENT IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK.
[POST OFFICE BOX 2332.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

NEW YORK, THURSDAY, DECEMBER 21, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

Trade supplied by American News Company.

CHARLES HALLOCK,

Editor and Business Manager.

CHRISTMAS.

CHRISTMAS comes but once a year, and here it is. At least Monday is but a few days off, and then Christmas trees and the giving and receiving of presents is in order. Now do the little ones put on their best behavior and look anxiously at the chimneys, wondering what old Santa Claus will bring them; and paterfamilias, as he walks up town in the evening, while the shops are all aglow with bright lights, and he recognizes the toys which once made his own heart beat, thinks of those at home and the last fall in stocks, and sighs at the hard times. But in spite of stocks and hard times, many a heart will throb joyously on Monday morning as the stockings are removed from the mantel shelf, for Christmas is essentially the gala day of the little ones, and it is fit that it should be so, for is it not also the birth day of Him who said, "Suffer them to come unto me"? and he who giveth even a cup of cold water to one of these in His name shall be blessed a thousand fold. Merry Christmas to you, reader, and God bless you all, great and small.

COLD WEATHER IN FLORIDA.—The mean midday temperature at New Smyrna, Florida, for the month of November as furnished us by Major Geo. J. Alden, was 68 degrees; at 7 a. m., 57; at 9 p. m., 60. Highest for the month 80; lowest 42. The temperature stood as follows on the days indicated:—

	7 A. M.	2 P. M.	9 P. M.
Dec. 1.....	33	43	36
Dec. 2.....	29	43	34
Dec. 3.....	30	43	38
Dec. 4.....	34	50	40

At St. Augustine the weather was the coldest known for years. Ice formed daily for six days, and vegetation was greatly injured. There have been a large number of oranges frozen.

ART.—Now is the time to select articles of vertu and bric-a-brac. Messrs. Leavitt hold another mammoth sale, comprising the Gates collection, at the art rooms, No. 817 Broadway, to-day and to-morrow. See their advertisement.

—There will be five eclipses in 1877, viz.: A total eclipse of the moon on February 27, visible in the United States; a partial eclipse of the sun on March 14, visible in Western Asia; a partial eclipse of the sun on August 8, visible in Alaska, Kamschatka and the North Pacific Ocean; a total eclipse of the moon on August 23, partly visible in the Eastern and Southern States, and a partial eclipse of the sun on September 7, visible in South America.

A PLEA FOR THE SEA SERPENT.

OUR last advices from the sea serpent came from a vessel bound for Melbourne, and the account was furnished by a clergyman. We have also heard of him quite recently near this city, off Coney Island in fact, where he is said to have done good service during the garbage war by devouring a considerable portion of the *casus belli*. Where he will next appear we will not venture to predict, but we have sufficient faith in his methodical habits to feel reasonably confident that before the next summer is passed this interesting but slippery animal will have furnished a dozen paragraphs for the newspapers.

Does it not seem almost time to look for the capture of this individual or some one of his race? There is really no reason in the uncompromising disbelief with which the name of our friend is always met. It is but a few years since the sea serpent and the Kraken, the giant cephalopod of the north were classed together, and the two are equally the subjects of pert scoffs and sneers. Now, however, we know all about the latter animal, and half a dozen specimens are at present in our museums, yet for hundreds of years the Kraken was unknown except from an old print and its accompanying description, while almost every summer tourist to Europe has seen, or has had an opportunity of seeing, the great sea snake. We have never had the latter ashore, it is true, but we take it that this fact alone would be regarded by scientific men as a very poor reason for disbelieving its existence.

The fact is that the ocean and its inhabitants are as yet but very little known, and there are vast possibilities in the wide extent of waters that surround us. Where there is so much smoke there must be at least a little fire, for it is scarcely to be believed that all those who profess to have seen the monster have been deceivers or deceived. We know that in the distant past, during the cretaceous epoch, giant reptiles of various kinds inhabited the ocean in vast numbers. Some of these, the Mosasaurs, were snake-like in form, but possessed fore and hind limbs in the shape of paddles not unlike a whale's fin, and sometimes attained a length of from sixty to seventy feet; others, the Plesiosaurs, were more lizard-like in appearance, but had a long, swan-like neck and a small head. These latter could no doubt have raised head and neck high above the water without showing any part of the body, except perhaps the back just flush with the waves.

Now why is it not possible that some of these animals may have continued to exist either in the same or in some modified form until the present time? We know of no reason for supposing that the conditions of marine life were any more favorable to the existence of such animals in the past than they are at present, unless possibly food may have been somewhat more abundant then than now. Their enormous abundance in the cretaceous of the west warrants us in believing that during that period they were among the most numerous of all the strange forms that inhabited the sea. Dreadful creatures they must have been and terribly destructive to their neighbors in this ancient ocean.

That sea serpents exist at present is a well known fact, but they are pigmies beside the monster which causes the periodical sensations of which we have spoken. About the islands of the Indian Ocean there are several species of marine snakes, characterized by flat tails and a venomous bite, but which never attains to a greater length than eight or ten feet. They are an interesting class of ophidians, and with their rough and barnacle-covered skins would, except in the matter of size, answer very well to the description ordinarily given of the sea serpent.

But this unknown monster, or others of his class, do not seem to be confined to the ocean. We hear of them from other sources. It is not long since that in conversation with one of the most intelligent as well as most influential of the citizens of Utah, we were informed of the probable existence in Bear River Lake of a monster, which yields only to his oceanic rival in size, and not even to him in ferocity and general uncouthness. This remarkable creature differs from the average sea serpent in appearing not always singly, but often in companies of from two to half a dozen individuals. Though sometimes seen alone they have been ordinarily observed in what are apparently families—that is in groups consisting of individuals of different sizes. The marvellous stories that are told of their deeds, the attacks which they are said to have made upon Indians, and the unsuccessful attempts made to capture them, must be passed over; but in the light of the evidence furnished by the testimony of reliable witnesses we are forced to acknowledge that there is probably something in this lake widely different from anything with which we are at present acquainted.

All our accounts of these strange creatures do not, however, come from a distance. In another column will be found a letter from our friend Mr. A. W. Hubbard, giving an account of a serpent or monster said to have been seen at various times in Lake Memphremagog. What this can be, if anything, we are at a loss to conjecture. We have heard of individuals of the genus *Tropidonotus*, under favorable circumstances, growing to a length of eleven feet, although we must acknowledge that we have never seen one much over five. It seems hardly probable, however, that a giant water snake of even that size could be taken for a monster thirty feet long with a head like a horse, and we think on the whole that we will wait until we have ourselves seen the animal before pronouncing on him.

THE VALUE OF IRRIGATION.

IF there is a lesson which should have been brought home to the agriculturist of this country by the severe drought of the past season it is in the value of irrigation; or at least in the necessity of being prepared to supply, certainly their corn and garden crops with that moisture which Nature, from some unknown cause, has failed to send to them. The traveler through Colorado, Utah, and California can not fail to be impressed with the important part played by water in the agricultural system of those parts, where summer rains are almost unknown and where, without a resort to artificial means, fruits, flowers, and vegetables would be wanting save in exceptionally favored spots, for half the year. The ease with which water is handled and controlled, as well as the results which follow its judicious application, seem alike remarkable; and yet the slightest knowledge of the principles of hydraulics, the fact that water will run down hill, is all that is possessed by the inhabitants of these countries wherein irrigation has been practiced for centuries, if not for ages.

Nor is it merely as an irrigant that water is valuable. Its qualities as a fertilizer are, and were fully appreciated by the Chinese, the Egyptians, the aboriginal inhabitants of this hemisphere, and in all countries where other substances are had in insufficient quantities; and even in California where the credit of unusual production is generally awarded to a virgin soil of unusual richness, the free use of water in irrigation is undoubtedly entitled to a large share of it. The peculiar properties of Nile water and the crops raised on the lands washed by it are so well known and appreciated that the absence of the annual overflow is regarded in the light of a national calamity, and the most familiar picture of Nile travel is what some one calls the "retched fellah" toiling at the wheel which lifts the water to the required level. The same scene is to be witnessed in China—not in rice culture alone—where water is lifted by means of a succession of wheels to the highest plateaus and then distributed by means of long handled buckets, possibly with a slight addition of liquid manure, over the surrounding crop. In portions of Peru, Chili, and Mexico, the ruins of aqueducts used in times past to bring water from the mountains are constantly met with, and the Padres who founded the missions of California have left similar monuments of their early labors. These last, however, are rapidly disappearing; the modern plough share is fast leveling them, and the adobe bricks are crumbling back to mingle with the soil from whence they come. The Padres, indeed, found irrigation a necessity, and with the immense amount of Indian labor at their command were enabled to accomplish an amount of work which would appal the modern agriculturist in a country where laborers receive \$30 per month. At the Mission of San Gabriel, in the vicinity of Los Angeles can be seen and traced the grass covered remains of an immense ditch or aqueduct which brought the waters of the San Gabriel river, from where it leaves the mountains some eight miles distant to fertilize the vineyards and orchards of the Mission. Today it is a common sight to witness one of the few remaining native California cultivators with his heavy hoe irrigating his field of barley or patch of watermelons; the water a mere ditch full procured probably through the grudging assent of a detested *Americano* proprietor. But of late years so fully impressed have the farmers of California become with the value of irrigation to their lands from which successive crops, principally of wheat without rotation have been taken, that in the valleys watered by large rivers, such as the San Joaquin and Sacramento, ditching companies have been formed, with the object of irrigating large bodies of land devoted to the cultivation of cereals. Of course every one irrigates their orchards and it is questionable whether the character of much of the fruit of California, magnificent in appearance but lacking in flavor, watery and difficult to keep, is not owing to the too liberal use of water. As most grain crops are planted in the fall, are matured by the winter rains and harvested in the spring, irrigation, until recently, was looked upon as not only supererogatory but impracticable, but it has now been discovered that by thoroughly irrigating land in the fall before the rain, not only is plowing and planting possible at a much earlier day, and the harvest correspondingly early, but the land is manured and also in much better condition to stand a drought. For droughts are by no means uncommon in California, and a drought there means no rain either winter or summer. The writer had the misfortune to experience one of three years duration, when, except on wet lands, grain scarcely headed, and barley hay, or rather straw, was worth from thirty to forty dollars per ton.

It is the experience gained at that time, in connection with careful observation here, that has impressed us with the idea that our farmers, or such of them as have running water on or near their lands, might by the expenditure of little labor at odd times, place themselves beyond the fear of consequences of drought. That is, as regards certain crops. A large field of wheat, oats, or rye, unless perhaps the seed had been drilled in, could scarcely be irrigated, unless it was so situated that it could be flooded, and the baking of the soil afterwards would more than counterbalance any good results; but corn could be irrigated with the greatest ease; the furrows form the ditches and the plow or cultivator would prevent baking. Fruit trees and vegetables could be irrigated without much trouble, and as regards the former, if one tithe of the attention was paid them that is given his trees by the California farmer, the results would be larger crops, finer fruit, less disease and longer lived trees. A few furrows on each side of the trees

whereby the ground at the trees would be kept open instead of surrounded by a closely pressed sod, is all that is required.

There are probably but few farms that have not either a stream of some kind on them or in the immediate vicinity. If the water is running it must come from a point higher than a portion at least of the farm, if not all of it. The amount of fall required to carry water is so trifling as to be almost astonishing. Frequently in California, particularly in approaching a valley which has been ditched for mining or agricultural purposes, the observer is astonished at seeing water apparently running up hill. The fact is that the fall is so slight, perhaps only a few feet to the mile, that this optical delusion is produced. A great fall is therefore unnecessary. We have seen a farmer in California start with a plow from the point where he wanted to tap his stream, run a furrow around a hill, up the valley a little, along the side of another hill to the field which he wished to irrigate, all by the eye alone; returning along the same furrow, the ditch was made and a little work with the hoe and the *sanja* was ready for water. It would be a very simple matter for most farmers to have a ditch at the head or highest portion of their fields. Where there are inequalities of the land it could be "ditched up" or flumed over. The water need not necessarily be running in them, but boxes or gates could be constructed ready to lift and admit it. The head of water need not be large. A small spring will irrigate a considerable piece of land, as the water can be dammed in the ditch until it accumulates. At first there will be considerable *seepage*, but if there is any clay at all in the soil this will soon stop. When necessary to irrigate the water can be turned from the ditch along, for instance, a row of corn. That one irrigated, a few strokes of the hoe closes the gap and the ditch is tapped at the next, and so on until the whole field is irrigated; or if there is sufficient water a dozen rows can be irrigated at once. A boy can do the work.

But even if it is not a season of drought there is no better way in which fertilizers can be applied to corn or vegetable crops than by means of the ditch, particularly if barn-yard manure is used. It has only to be put in the ditch and the water carries it directly to the roots of the crop.

When we buy our farm it shall have a stream of water on it and an irrigating ditch at the head of every field.

GAME PROTECTION.

PENNSYLVANIA.—Our correspondent at Greenville, Pa., sends us the following: "The latest piscatorial 'catch' is that of seven set nets on the banks of the Shenango—there because the stream is frozen up. The fact has been reported to the Fish Warden, who will take the proper action in the premises.

THE VERMONT GAME LAWS.—Apropos of the game laws recently passed in Vermont a correspondent writes:—

"Although your correspondent, 'a Vermonter,' talks 'rather strong' in FOREST AND STREAM of this week, I cannot help sympathizing with him to some extent. Undoubtedly every land owner in Vermont has a legal right to recover damages, nominal, at least, of every man who enters on his land without permission from the owner. But is it worth while for the people of Vermont to undertake to enforce any such right against each other or against visitors from other States when the persons against whom the right is enforced are guilty of nothing worse than wandering down a mountain brook and whipping a few trout out of it? And was it worth while to enact a special statute for the purpose of enhancing the amount of damages to be recovered in any such case?

"Vermonters are clearly right in saying that such a law will be generally disregarded. The Vermonters are, a stubborn sort of Yankees—many of them very fond of trout fishing—and they cannot be held back from the exercise of what they regard as their inalienable right to fish their streams by any such law, especially when they feel, as 'Vermonters' does, that the law has been imposed upon them by a class that assume to look down upon the common people. For my own part I prefer to obey the law. I have spent a great many summers in Vermont, and have caught a great many trout there. I believe that none of my good friends there have complained that I was illiberal in the expenditure of the money which they have richly earned in providing for the entertainment of myself and family among them. I hope to spend more summers in Vermont, and catch a good many more trout there. But if I should find myself annoyed in my sport by the law in question I shall, of course, give up Vermont (with most sincere regret) and go where I can wade down a brook without making myself a criminal.

"Honest anglers obey the laws. Many honest anglers frequent Vermont who will stay away from that beautiful State if they cannot practice their innocent art without violating the law. It seems to me, therefore, that the legislation in question will practically do no good, while it may do much harm.

"Vermonters hit the bullseye when he declares that the true policy of Vermont is to enact some suitable law, and spend some little money, for the purpose of stocking her 'splendid streams with fish,' and then let everybody, 'rich and poor, high and low,' fish them at all reasonable times and in a reasonable manner. 'Vermonters' will please accept the compliments of

"A CONNECTICUT VERMONTER.

"New Haven, Conn., Dec. 14th, 1876." We expressed our views regarding the new game law in Vermont last week. Our correspondent scarcely states the case fairly. No trespass is committed nor can a land owner secure even nominal damages for trespass unless he has boards posted in conspicuous places warning persons off. It rests entirely with the farmers themselves, whom we presume to be the principal land owners, whether the law shall be obnoxious or not. Our correspondent says that Vermonters are a stubborn race and cannot be held

back from what they regard as their unalienable right to fish their streams. But are they *their* (the fishermen's) streams? No one doubts the right of a man to fish his own stream, but has he a right to fish his neighbor's stream, particularly against the latter's wishes? It must be a pleasant sight for a man who, at a great expense, has stocked his private trout stream, either for his pleasure or profit, to see its banks lined with fishermen taking out the unwary fingerlings with the seductive worm, and he unable to stop them. No, "Vermonters," gentlemen both, read the game laws of other States and you will find that you have no bigger grievance than the rest of us.

PROFESSOR PERICORD'S SPASMS OF WISDOM—SPASM NO. 4.

PROFESSOR PERICORD ON THE DERIVATION OF WORDS.—"The significance of words," remarked the Professor, as he mopped his forehead after an animated and protracted debate, "is contained entirely within their meaning. Elegance of language—eloquence of diction—depend in an incomparable degree upon the choice of words; but how much more does the *meaning* that is intended to be conveyed depend upon their careful selection. A postulate is a postulate, and an axiom is an axiom, but a postulate is not necessarily an axiom, nor can an axiom be always considered a postulate, no matter how positive may be the assertion or declaration on the part of the respondent. This is a fact that cannot be controverted. Facts are facts, and two and two make four. [The Professor was in the habit of using the phrase "two and two make four" as a clincher, whenever he arrived at a conclusion satisfactory to himself, just as Euclid employed the cabalistic letters "Q. E. D." at the end of a problem supposed to be conclusively solved.] In literature, continued the Professor, the most graceful writers will be found to be industrious students of synonyms. Words that are synonymous convey meanings quite different according to the connection in which they are used. That which may be wholly appropriate here, may seem ridiculous there. *Hate* and *dislike* are synonymous words. You may hate a man and dislike jalap; but to hate jalap, which is often man's best friend, would not only be absurd but unreasonable.

In the selection of appropriate words, nothing assists so much as the study of their roots—the origins from which those words are derived. It is for this reason, young gentlemen, that I have always encouraged the study of the Latin and Greek languages among you, although I have never dared to hope that you would become classical scholars. A student is one thing, and a scholar is another. Here is an example of my instruction—I should rather say an illustration of what I am now attempting to inculcate. Of course, as I intimated, I can only *hope* the attempt will succeed. Some men's brains are set further back in the cranium than others, and the cerebrum is not always conspicuous in the *os frontis*. By "conspicuous" I do not mean prominent—another instance of the case in point. A thing conspicuous is not always or necessarily prominent—that is, projecting, sticking out. Take now, for instance, two synonymous words that are often substituted the one for the other, but which, used in certain connections, produce effects diametrically opposite: I mean the words "incident" and "circumstance." The first is derived from the Latin words *in* and *cido*—to cut in, while the latter is derived from *sto* (or *stare*) and *circum*—to stand around. Imagine for one moment the difference between a mob of men merely standing around, and a mob cutting in. In the one case they are passive and harmless; in the other active and destructive. Take your own selves, for example. Here you are, young men, standing around, gaping at me as if I were a hippopotamus in a menagerie. Just suppose, now, that you cut in to prayers as quick as you can get. The lecture is finished—and the class dismissed!" As the students rushed pell-mell out of the door the Professor in his enthusiasm at the success of his efforts could not resist letting fly an old lexicon after them, just as a housewife throws an old shoe after a departing guest—for luck.—Reported exclusively for Forest and Stream.

A GOLDEN GIFT.—We are in receipt of a box of oranges from the celebrated grove of Alfred P. Jones, Homosassa, Florida. They are of exquisite flavor and far superior to the fruit grown on the east coast of the peninsula. Mr. Jones has many hundred trees in his orchards, which comprise a great variety of the Citrus family, among which may be enumerated the sweet and sour lemon, the bitter and sour oranges, the Bergamot and Mandarin orange, the lime, shaddock, grape fruit and citron. One of his trees was planted thirty years ago by old "Alligator," head chief of the Seminole Indians. Mr. Jones has also several immense fig trees, whose trunks measure three feet in diameter. The fruit of Homosassa is one of its principal attractions to Northern visitors who go there to spend the winter.

MR. JAMES WATSON, the well-known aquatic and athletic writer and authority, sailed for Liverpool last week in the steamer Nevada of the Williams & Guion line. Unless Mr. Watson finds permanent work for his talents on that side of the water he will return home in the spring. In the mean time some of our sporting papers will probably be in receipt of his interesting and valuable letters.

—The "Acme" club skates, for which Messrs. Fish & Simpson, No. 132 Nassau street, are the agents, is the correct thing this season. It is a self-fastener, requiring no key, and will be used by all the first families.

OUR WASHINGTON LETTER.

PROTECTION OF GAME—THE BILL NOW BEFORE THE SENATE—SPORTING MATTERS AT THE NATIONAL CAPITAL.

WASHINGTON, D. C., December 11th.

In my last letter I referred to the necessity of stringent game laws in Maryland and Virginia to protect the birds against pot hunters, and prevent their destruction out of season. As Washington affords a market for most of the birds trapped and killed in those States by those who follow that business, a wholesome game law for the District of Columbia, forbidding the sale of birds, except in proper season, will do much towards the protection of game in this locality. Unfortunately the District is entirely dependent upon Congress for all legislation looking to its welfare, and as subjects of so much national importance will engage the attention of our legislators during this short session, it is not likely that our bill for the preservation of game, which was introduced in the Senate last session by Mr. Edmunds, will become a law at present. This bill contains some very sensible provisions, among them one for the protection of dogs. In this District a dog is not protected by the law, not being recognized as property, and as a result may be stolen, killed, or injured, and the owner has no redress at law. The bill, when introduced, was referred to the Committee on the District of Columbia, and it has been allowed to quietly rest in one of the pigeon holes in that committee room since, though it would probably have been heard from this session had it not been that the complicated questions of the Presidential muddle render it impossible to act upon measures of minor importance. It forbids any person from killing, exposing for sale, or having in possession, either dead or alive, any partridge between January 15th and November 1st; pheasant or ruffed grouse between February 1st and September 1st; woodcock between January 1st and August 1st; snipe or plover between May 1st and September 1st, under a penalty of \$5 for each bird so killed or in possession. Wild ducks, geese or brant are not to be killed, exposed for sale, or had in possession between April 1st and October 1st, under a penalty of \$5 for each fowl killed, and during the period in which the killing is not prohibited they shall only be shot on Tuesday, Thursday and Saturday of each week. It fixes the close season for ortolan and reed bird from February 1st to September 15th, and it is made unlawful to kill robins and smaller insectivorous birds, or to rob birds' nests. The penalty for trapping, netting or ensnaring any bird or waterfowl is \$5 for each bird or fowl trapped, and \$20 for having in possession the net, trap, or snare. It further prohibits the use of any gun in killing waterfowl, except such as are habitually raised at arm's length. A penalty of \$25 shall be paid for every bird or waterfowl shot at night. Any person trespassing on the lands of another for the purpose of shooting or hunting thereon, after due notice to quit by the owner or occupant of the land, shall be liable to such owner or occupant in exemplary damages to an amount not exceeding \$100, and also be liable to a fine of \$10 for each and every trespass. Shooting or hunting on Sunday is forbidden, under a penalty of not more than \$25 nor less than \$10. The clause designed for the protection of dogs provides that any person stealing, or maliciously killing or injuring the dog of another shall be subject to a penalty of not less than \$20 nor more than \$100. The bill also provides for the taxation of dogs and for the destruction of sheep killing dogs. There are some few amendments to it which will be acceptable to the sportsmen of this locality, and it is to be hoped that it will be passed by Congress at the next session anyhow, if not at the present one.

One great convenience to the sportsmen of this vicinity would be the existence here of a first-class establishment where a large assortment of guns, fishing tackle, etc., could be found. There is but little doubt that such a house would have a profitable trade. There are several very respectable though small establishments where a limited supply of gunning implements and fishing tackle may be obtained, and occasionally a breech-loader or two, oftentimes of some unknown maker, may be found; but there is nothing like an extensive establishment here where a supply of breech-loaders of the different manufacturers are kept on hand from which a sportsman may make his selection, and it is oftentimes the case that such selections are made from assortments in our neighboring city of Baltimore though more frequently from the extensive stocks in New York. The Remingtons have an agency here, where guns of their own make can be obtained; but a gun of any other maker must be ordered from abroad. In a few instances I have noticed one or two fine breech-loaders of some well known maker in one or two prominent jewelry establishments, but I doubt very much that there is a store in Washington where half a dozen good breech-loaders can be found for sale; if so, the proprietor would do well to make the fact known through the advertising columns of FOREST AND STREAM.

A magnificent farm on the Virginia shore of the Potomac river, about seventy-five miles below Washington, which would make a perfect paradise for sportsmen, was recently purchased by a Virginia gentleman for a very reasonable sum. The property consists of 650 acres, improved by a large and comfortable dwelling, necessary out-buildings, etc., and the price paid was but \$7,000. The farm is located directly upon the bluff above the river, and throughout the adjoining country partridges, pheasants, wild turkeys and rabbits are plentiful, while upon the river immediately in front of the house, and upon a large creek in the neighborhood, geese, swan, and all kinds of

ducks may be found in abundance during the season. A gentleman just returned from there informs me that the duck shooting especially could not be excelled. There are many such places all along the Potomac, and it is a wonder that some of these farms have not been purchased by clubs of sportsmen, as property in Virginia at this time can be bought at such low prices.

For the past ten days the weather in this locality has been exceedingly cold, the mercury sometimes standing only a few degrees above zero. As a consequence the partridge shooting has not been so good as heretofore, the birds having been driven from the fields to the swamps and thickets to seek shelter from the cold and high winds.

The Baltimore bench show, which takes place next month, is already exciting some interest in this city, and it may be safely predicted that there will be a large attendance of Washingtonians at the exhibition daily. From all accounts the affair promises to be an interesting one, and the gentlemen having it in charge seem determined to make it a success.

The recent cold snap has covered all the ponds in this vicinity with ice, and skaters during the past week have been enjoying themselves. Babcock Lake, a sheet of water covering four or five acres, just south of the Executive Mansion, is the favorite resort, and it is filled with a merry crowd all day. A proposition is now made to have it brilliantly illuminated, that the sport may be kept up after night.

OCCASIONAL.

Sporting Notes From Abroad.

FROM OUR OWN CORRESPONDENT.

LONDON, December 4th.

FOR a non-hunting man the reports in the sporting papers of the runs with this that and the other pack of hounds in various parts of the country, must seem to possess an uninteresting amount of sameness, and he wonders at the enthusiasm with which each detail of the sport is described. How hard, then, must it be for the reporter, unless he possesses sporting proclivities of the most marked character, to dish up each day of his existence, at least during the hunting season, the same report for his readers. The chosen ones for the labor must indeed be possessed not only of unlimited enthusiasm, but must be almost ubiquitous as well, hunting to-day with one pack and to-morrow with another, or as it would almost seem with both at once. Now that the season is in full swing, no doubt the city man, who would hunt if he could, as well as the country gentleman who does hunt, and who likes to know what sport his neighbors are having, finds it the most interesting department of his country paper. If old Squire Western were alive how he would open his eyes at the hunting of to-day as compared with the sport in his time. Horses and hounds appear to have increased in speed together (and foxes, too, perhaps) until a "fast twenty minutes" with a fashionable pack is nothing more than a steeple chase with an indefinite finish and no penalties or allowances. I am wrong about penalties. A desire to be with the first flight, or one of those mishaps incident to the hunting field which we only wonder do not happen more frequently, sometimes brings some one to grief. Many an heir has found himself unexpectedly in possession through this means, and scarcely a week passes without one or more serious accidents being reported. And yet there is a fascination about hunting which is irresistible; the very danger providing the excitement and the hot blood bringing a sort of recklessness which calls for the special interposition of Providence on more occasions perhaps than is imagined. Among the accidents reported during the past week was one which befell "the beautiful Mrs. Rousby," the actress, whose romantic career on the stage has been as much discussed on your side of the water as on this. While returning from hunting with the Duke of Beaufort's hounds her horse stepped on some rotten ground and fell with her, bruising her badly, but not preventing her from appearing the same evening in the play which is familiar to Americans, "Twixt Axe and Crown." Another accident occurred to the huntsmen of the Heythrop hounds while crossing a field in which a steam plow was at work. A wire connected the plow with the engine, and against this his horse stumbled and fell.

Speaking of accidents, the *Calcutta Englishman* mentions the death of a Mr. Langdon of Narvada, who was killed by a tiger which had been committing much mischief in the villages of that district. Mr. Langdon appears to have been armed only with a pistol, and could make but little resistance. Another sad case which recently occurred in India is that of Mrs. Stevenson, wife of the Conservator of Forests, Cochin, who was killed by a wild elephant at Palapully, near Trichoor. She was traveling with her husband on horseback with a number of coolies when the elephant suddenly appeared. Mrs. Stephenson being frightened, jumped off her pony, and fell, and before she could get out of the way the elephant rushed on and trod on her neck. Death was instantaneous.

The irrepressible Mr. Greener (W. W.) is again in print, if indeed he is ever out of it, and as the occasion is one of interest to American sportsmen as showing some of the workings of the gun trade, I will refer to it briefly. It seems that a firm who deal largely in guns of various manufacturers, inserted for sale in their catalogue several "Greeners." Mr. W. W. of that ilk, knowing that they had none of his make, denounced it as a fraud, when the firm in question admitted that they were the make of one J. H. Greener. Now

Mr. W. W. publishes a correspondence showing that this J. H. Greener has not made guns for years, but for a royalty allows some other maker to use his name, the object being, apparently, to palm off an inferior gun through the means of a popular name. This may solve the riddle which has puzzled your sportsmen for so long, viz., how guns bearing the names of Greener, Scott and other well known makers are sold at auction for little more than what the duties on a fine gun would amount to.

A very liberal piece of newspaper policy is that of the *Newcastle Daily Chronicle*, which is willing to devote the sum of £200 to determine the vexed question of who is the champion sculler of England. This is offered in the shape of a £100 challenge cup and £100 in money prizes, of which, in addition to the stakes, the sum of £50 goes to the winner. The competition will be open to all scullers who can reasonably claim a right to enter, and from the entries six competitors will be selected to row. The first race for the cup will be some time in March, on the Tyne, and if six enter will be decided by three trial heats with a final heat on the succeeding day. The great Universities, Oxford and Cambridge, have had their races between their "trial eights," a preliminary trial to bring out their best men to place in each boat preparatory to commencing active work for the great race in the spring. None of the boats are complimented very highly on their form, but this could scarcely be expected to be up to the mark as yet. By-the-bye, I notice that a "Member of the Regatta Committee of the Centennial Regatta" has addressed a letter to the *Field* relative to the report of the event, which appeared in that paper. The gentleman confines himself entirely to the questions of fact regarding the results and incidents of the races, without going into the question of the conduct or misconduct of the *Field* representative, which he might have done, and thrown some light on the animus by which that person was actuated.

It is suggested now that the North Pole may be reached, if it is reached at all, by means of balloons. After going as far as possible with the ship, balloons are to be sent up at intervals, each carrying a small sledge, which could be dragged on the ice by the balloon; but nothing is said about the wind blowing the wrong way, or does it always blow towards the Pole in high latitudes? In this connection it is interesting to note that the remains of a balloon have just been found on the coast of Iceland. In the car, it is said, were some human bones, forming an incomplete skeleton, and a quantity of undecipherable papers. It is thought that this is one of the missing balloons dispatched from Paris during the siege. The sportsmen of the late Arctic Expedition do not appear to have found much game in their winter quarters. A few musk oxen and owls. But then there were the trout; at least after several hours' patient exertion one of the officers caught three small fish resembling trout. How thick the ice was as that particular spot is not stated, but it would have been enough probably to have astonished some of your pickerel fishermen.

Capt. Allen Young of the Pandora has presented to the Zoological Gardens the Esquimaux dogs brought by him from Netelik in Whale Sound, the highest inhabited latitude in the world—77 deg. 13 min. North. They possess the same characteristics as all the dogs brought from high latitudes, with the sharp pointed ears of the wolf and jackal, and have the same appearance as the dogs found all along the eastern coast of Asia. One can understand why dogs whose habitat is the Arctic region should be supplied with such a heavy coat of fur, but why the dogs of Canton should be provided with the same covering is a mystery I have never had explained. That they do is beyond question, and the only explanation I can give is that they must have been brought from the north of China by returning rice junks; but why have they not adapted themselves to the climate and changed their coats? *Quien sabe.*

VAQUERO.

CHRISTMAS FOR THE POOR CHILDREN.—The following is the honorable record of the Children's Aid Society's work for the past year. What a deal of good has been accomplished! There were during the past year in the six lodging houses, 14,584 different boys and girls; 266,665 meals and 198,618 lodgings were supplied. In the 20 day and 11 evening Industrial Schools were 10,345 children, who were taught, partly fed and clothed; (481,303 meals were supplied); 3,989 were sent to good homes, mainly in the west; 1,770 children were aided with food, medicine, etc., through the "Sick Children's Fund;" 2,195 children (averaging 157 children per week) enjoyed the advantage of the Seaside Home. In the Girls' Lodging House 464 girls have been instructed in the use of the sewing-machine; there have been 8,102 orphans in the Lodging Houses, and 1,165 of these provided with homes. Total number under charge of the Society during the year was 33,347.

This Society wishes to give a merry Christmas to the children under their charge. It desires to distribute thousands of shoes and garments among the children of their Industrial Schools, and have pleasant festivals for these poor little ones. They propose, if money be sent, to give good Christmas dinners in the Lodging Houses to the street boys and girls, and they solicit donations from the charitable, gifts of clothing, provisions, books, money, etc, which may be sent to Charles L. Brace, 19 East 4th street.

—The hotels in St. Augustine, Florida, this season are generally much improved, and their accommodations superior to any previous season.

—The new Harvard catalogue shows 192 Seniors, 175 Juniors, 222 Sophomores, and 232 Freshmen, besides 549 in the other departments, making in all 1,370.

Rifle.

LADIES AT THE TARGETS.—It has become quite the fashion for ladies to practice rifle shooting. At many fairs regular matches are shot between teams of young ladies selected according to nationality or otherwise. The *Florida Press* mentions a match recently shot near St. Augustine, in which two ladies participated as partners to two gentlemen and made the highest scores, the shooting being done at 100 yards at a target 19½ inches square with a three inch bullseye. A ladies Rifle Club is talked of. The same paper says: "A rifle match took place on last Saturday afternoon, south of the Barracks, the following gentlemen shooting: Capt. Kennett, Dr. Terril, Capt. Pratt, Lieut. E. L. Zalinski, Mr. D. Hilger, Col. Bainbridge, Col. Tracy, Mr. Maynard, and Mr. May. The range was 100 yards, off hand, and prize, a turkey. Mr. May, of the steamer Bache, won by 19 points, out of a possible 25. Another match will take place this afternoon."

HARVARD RIFLE CLUB.—At a meeting of this club last week it was voted that the regular fall championship match take place Saturday, December 16. To give interest to the match competitors will be divided into two classes; to the first any member will be admitted, to the second none who have ever made a score of 38 or more out of a possible 50 in any match whatsoever. Of course no second-class man will be entitled to a first-class prize. It was also voted to award a prize to the member having the highest average for the year, provided that he shall have shot in at least three matches.

—Col. J. A. McDonald, Captain of the Scottish rifle team, which recently visited the United States, has been appointed Solicitor General for Scotland.

THE GALLERY CHAMPIONSHIP.—The Gallery Championship for the City of New York, was decided last Friday evening, December 16th. The two best shots of the Zettler Rifle Association were matched against the two best of Conlin's Gallery, each man to shoot one hundred shots (ten shots per target), with rifle and ammunition from their respective galleries. The shooting was at a 200 yard Wimbledon target, reduced for the distance, 110 feet. Creedmoor rules governed the match. The match commenced at eight o'clock, and continued till two a. m. Sometimes on side and then the other would lead a few points, and the match was finally decided by the last round of ten shots.

To show how closely contested the match was, the first 50 shots per man, possible 500, Conlin's Gallery led by 6 points, and on the last 50 the totals were tie, Conlin's winning by the 6 points. The following are the scores and totals per team:—

CONLIN'S GALLERY.—Capt. J. B. Blydenburgh. (Possible 50 per target.)

Name.	Score.	Total.
Charles A. Cheever.....	39 46 43 44 45 39 44 40 45 46.....	431
C. E. Blydenburgh.....	40 42 45 44 43 41 40 43 44 46.....	428

Grand total.....859

ZETTLER'S RIFLE ASSOCIATION.—Capt. J. L. S. Kellner.

Name.	Score.	Total.
C. S. Zettler.....	45 45 43 42 46 40 48 45 42 45.....	441
M. B. Engle.....	38 41 40 43 42 40 39 45 44 40.....	412

Grand total.....853

Conlin's Gallery victorious by six points. The following will show the number of points lead per side, at the end of each round:—

Name.	1st.	2d.	3d.	4th.	5th.	6th.	7th.	8th.	9th.	10th.
Conlin.....	0	0	3	6	6	6	3	0	0	6
Zettler.....	4	2	0	0	0	0	0	4	1	0

Average shooting per man: Chas. A. Cheever, 43 1-10; C. E. Blydenburgh, 42 8-10; C. G. Zettler, 44 1-10; M. B. Engle, 41 2-10; possible 50. Average per team, 42.95, Conlin's; 42.65, Zettler's.

After the match, Frank Lord, the noted pistol shot, showed his skill with some of the finest shooting on record. Distance, 60 feet, 20 paces, with pistol he hit two common musket caps, in three shots, and three bullets, size of old fashioned musket bullet, in six shots. This shooting was witnessed by at least thirty persons.

CREEDMOOR, JR., RANGE.—This popular daytime resort, Broadway, corner Warren street, for off-hand shooting, will commence its regular winter season matches next Tuesday, the 26th, which will be subscription match day. Terms of match: Distance, 100 yards; position, off-hand; rifle, any of 32 calibre or under; number of shots, 7; entrance, 50 cents; one-half the entrance money to be divided between the three highest scores; enter as many times as you please. The day following, Wednesday, the 27th, will be pool shooting. Tickets, 5c each, one-half the money to be divided among those making bullseyes. These matches will be open for entries on those days, from eight a. m. to six p. m. On Tuesday following will be commenced a series of matches for gold coins, the terms and particulars of which will be published next week. There has been a number of improvements made in this range, which will add greatly to the comfort of its patrons. Among others, the Putnam powder only is used, making little noise and no smoke, thereby doing away with the necessity for any draft or circulation of air to carry off the smoke, which makes this underground retreat a comfortable contrast to the biting air of the upper world. There has also been added a second room, comfortably lighted and seated, which makes it possible to avoid the crowded state of the single room of last winter. Mr. Fisher has secured the services of his brother to take charge of the range, and the patrons of rifle shooting, now that Creedmoor, Sr., is closed for the season, will meet with every attention, and there will be no delay for want of markers. The range is open daily for practice from eight a. m. to six p. m.

—Major H. S. Jewell, Inspector of Rifle Practice of the Fifth Brigade, Brooklyn, has made his annual report to the Adjutant General of the condition of rifle practice in his department, showing the number of marksmen who qualified at the Creedmoor during the past season as follows: Thirteenth Regiment, 34; Fourteenth Regiment, 30; Fifteenth Battalion, 25; Twenty-eighth Regiment, 20; Separate Troop Cavalry, 15.

—The Secretary of the National Rifle Association has prepared the tickets for renewal by annual members for

the coming year, which may now be obtained at the offices of the Association, No. 23 Park Row. The annual meeting of the association will be held at the "Rendezvous," No. 9 West Thirteenth street, on Tuesday, January 9th at 8 p. m. Five new Directors will be elected, and the reports of the officers for the past year will be presented.

A rifle match has been projected between Companies C and K, Twenty-third Regiment, Brooklyn, to take place at an early date.

RHODE ISLAND.—The third competition for the Newport marksman's badge was shot at that city on the 8th inst. The conditions were 10 shots each at 200 yards. The strong wind blowing during the day not only kept away many of the original competitors but made good shooting very difficult. The following are the scores:—

Name.	Total.	Name.	Total.
W. M. Farrow.....	39	H. Bull, Jr.....	37
E. H. Totten.....	30	E. Braman.....	34
W. R. Landers.....	36	G. S. Slocum.....	33

At the close of the championship competition, a friendly match under the same conditions was shot between E. H. Totten and H. Bull, Jr., resulting in a score of 35 for the latter against Mr. Totten's 33.

FINE MARKSMANSHIP.—Last week Mr. Arthur T. Jones, formerly of Turin, and representing the noted Whitney Arms Co., of New Haven, Conn., gave our marksmen a fine exhibition of his skill with one of the superior Creed-moor rifles manufactured by that company. At 800 yards, after sighting his gun, he put every bullet he fired into the bullseye, after which several crack shots tried the arm, many of them meeting with like success. The rifles made by that company which Mr. Jones exhibited, appeared to be complete in all the essentials which are needed to make a perfect weapon, and in accuracy and power surpasses any ever before brought here.—*Louisville Journal*.

Game Bag and Gun.

GAME NOW IN SEASON.

Moose, <i>Alces malchis</i> .	Pinnated grouse or prairie chicken, <i>Cupidonia cupido</i> .
Caribou, <i>Tarandus rangifer</i> .	Ruffed grouse or pheasant, <i>Bonasa umbellus</i> .
Elk or wapiti, <i>Cervus canadensis</i> .	Quail or partridge, <i>Oryzopsis virginiana</i> .
Red or Virginia deer, <i>C. virginianus</i> .	Woodcock, <i>Philohela minor</i> .
Squirrels, red, black and gray.	
Flares, brown and gray.	
Wild turkey, <i>Meleagris gallopavo</i> .	

"Bay-birds" generally, including various species of plover, sand-pipers, snipe, curlews, oyster-catchers, surf-birds, phalaropes, avocets, etc., coming under the group *Limicola* or Shore Birds.

—In our last issue we stated that the fare to Currituck for the round trip per Old Dominion steamers, was \$24. The officers of the line inform us that the price has been reduced to \$18, and this amount includes meals and state-room to Norfolk. This fact may be of interest to future inquirers. Surely no sportsman in pursuit of pleasure can find it at a cheaper rate. The steamers of the Old Dominion line are noted for the general comfort which they provide.

—Mr. Arthur Duane, of Bergen Point, and Mr. Joseph Earle, of Brooklyn, have returned from Currituck, where they killed 292 ducks, 8 geese and 2 swans; 80 of the ducks were canvas-backs. They had about five full days' shooting during the late cold snap.

POT HUNTING.—The Uniontown (Pa.) *Standard* says:—

"Several hunting parties passed through here last week with a fine lot of game of all kinds. We never saw as much game killed in one season in this section before—quail, pheasants, and rabbits by the hundreds; also a number of fine looking deer and a few turkey. We heard of one party making a fine bag last week in about one and a half hours, killing some 29 quails—25 of them in two shots. We call that extra good shooting. It is not every sportsman(?) who can kill 25 quail in two shots. It is a science that requires long practice and great nerve."

We should think so; and if the wretched pot hunter who succeeded in exterminating two bevvies of quails by shooting at them while they were huddled on the ground had a charge or two of shot lodged in his own miserable carcass it would be but serving him right.

THE MICHIGAN TURKEY CALL.—Our correspondent, "Archer," writes:—

"Seeing in your last issue a notice of a Michigan Turkey Call, I am tempted to give my experience. First, your correspondent says nothing of the material the box or call is to be made from. Second, he must be a better 'musician' than the writer, to make it call satisfactorily if made of the dimensions given. The material should be Spanish cedar, and the best size, as far as my humble, limited experience goes, is: two and one-half inches long; three-fourths to seven-eighths deep, and one inch wide. Cut a piece of smooth slate so that it will lie nicely in the bottom of the box; have the top smooth and even, and no resin will be needed. I make the box of the same material throughout, and put together with brass pins. Brads or glue spoil the sound, not giving sufficient vibration. If made from pieces of cigar box, be sure that no paper remains on the box, and use the thinnest portions.

Mr. F. H. Vanderburg, of Port Huron, Michigan, tells of a call that answers admirably. It consists of a short piece of Spanish cedar, with a good sized nail driven half through it; draw a piece of slate across the head of the nail.

To operate either of these calls, hold the slate between the thumb and middle finger of the right hand, while the call is held by the thumb and middle finger of the left. Above all things, do not make over five strokes for a single call—oftener four. If you exceed this number you will get no turkey, for a turkey can count. If any desire these calls, and do not desire to take the trouble to make them, I will procure some for them from the maker of mine. The price, I presume, is twenty-five cents, as that is what he has charged heretofore."

[Our correspondent is certainly very kind, and no doubt many readers will desire to accept his offer. We will cheerfully give his name to any applicants.—ED.]

CAPTAIN BOGARDUS IN CALIFORNIA.—A dispatch to the *Herald*, dated San Francisco, December 18th, says that Captain Bogardus and Crittenden Robinson, champion of

California, shot a pigeon match at Oakland Park on that day for a purse of \$250, 60 single birds and 20 pairs, under California rules. Bogardus killed 52 single birds and Robinson 53. Owing to the darkness only 18 pairs each were shot at, Bogardus killing 26 birds and Robinson 32, the latter winning the match. Robinson killed 25 birds consecutively and Bogardus 16. The referee was strongly in favor of Robinson, and the evident unfairness of some of his decisions against Bogardus were severely commented upon by the crowd, and probably had the effect of disturbing Bogardus, but his opponent shot so carefully and well that it is doubtful if Bogardus would have won even had the decisions been fair. Another match, under Prairie Club rules, will probably be arranged between the two men, when a fairer test of their skill may be expected.

LOADING SHELLS.

OLYMPIA, W. T., Nov. 28th, 1876.

EDITOR FOREST AND STREAM:—

Since reading the unfortunate accident that happened to Dr. Thebaud while loading a shell, the nerves of many sportsmen have undoubtedly been disturbed while going through the operation.

The caution of "A. C. H." of Bridgeport, published in your valuable paper of the 2d inst., is very opportune, and should be strictly adhered to in every instance as the only safe rule, viz., to always cap the shell before loading. My experience has been exactly the same as that of "A. C. H." The cap must be well set home every time to guard against misfire, and in doing so I generally explode five or six out of every 1,000, but of course without any harm while the shell is empty. This, I think is caused by a slight rupture of the edge of the cone. I have often wondered that sportsmen do not become thoroughly disgusted with their attempts to load their own shells without the proper conveniences. Many of them no doubt think that for all the shooting they will do it will not pay to make any extra preparation, hence you will see them attempting to load one shell at a time, and generally capsizing one out of every six, and spilling their shot, etc., and spending as much time in loading fifty shells as it would take to load 300 with the proper appliances, besides the danger to themselves and unnecessary annoyance. My plan of loading shells may be of some service to sportsmen generally, and with your permission I will give it: I have a loading board, constructed of two ash boards an inch thick each, and dressed level so as to fit closely together. These are attached together by two pairs of small brass butt hinges on the edges, so that they will open and close like a book. The upper board is spaced off with a pair of dividers for as many shells as it will contain without weakening the board too much, and then bored through the board with an extension bit set to fit the shell. The shells should fit snugly but freely into their holes in this upper board. The bottom board is then marked to correspond, and is also bored three-eighths of an inch deep, with a bit sufficiently large to receive the base of the shell freely, and the center of these holes are continued through the board with a $\frac{3}{8}$ bit, over which the cap rests without any pressure from any source whatever. When capped ready to load, the shells are placed in the upper board from the under side, and pushed down till the flange of the shells rest against the under side of the board; then the boards are closed and secured by a small brass hook attached to the edge opposite the hinges. The shells can then be filled by placing the board on the knees of the operator, and using a small tunnel in the left hand to guide the powder and shot into the shells; the wad on the powder can then be driven home safely and smartly with a small wooden mallet without the least danger of explosion. I do not believe, however, in ramming powder too snugly in any gun.

My board is 10x13 inches, and contains seventy 10-gauge shells, which I can cap and load in fifty minutes. This board can be of any size to suit the operator, and I can assure all who try this plan that they will not complain of any annoyance or inconvenience in loading their shells hereafter.

It will be seen that not even a No. 10 shot, or any other substance, can possibly pass from the surface of the upper board to the lower one while loading, hence perfect safety to the operator is guaranteed. To remove the shells after loading, open the boards and place the upper side or muzzle of the shells on a stand or table, when they will all start back, and can then be easily removed.

PACIFIC.

Our correspondent, Mr. Kendall, who was in this city at the time of the accident, and took particular pains to enquire into the cause, writes us as follows:—

"Your Philadelphia correspondent, N., and all other interested parties, are informed that the metal base of the shell which caused Dr. Thebaud's death, and the rest of the debris found after the explosion were carefully preserved, and can undoubtedly be inspected on application, either to Dr. Reynolds, of West Fourteenth street, or to Mr. Paul Thebaud, of No. 119 East Thirty-fourth street. Having investigated this matter at the time, I gave the conclusion arrived at. I wish to add that, to the eye there was no evidence that the pot of the shell was thin or defective in strength. The suggested explanation was purely theoretical.

What is certain is, that the explosion took place under conditions precluding the possibility of any hard substance having been in contact with the head of the percussion cap. It may be that the anvil was a little longer than usual, and pressed with unusual force against both pot and fulminate, the former being of full strength, but in this instance suffering some little vibration from the blow of the mallet, or possibly the primer was defective, and particles of the fulminate were rolling loose around and about the anvil. In such case, minute portions would be sure to catch between the anvil and the inner surface of the pot, and any sharp vibration might ignite the fulminate.

This accident has clearly shown the danger of using brass loading tubes. Why not make these instruments of wood, or papier mache, which, if blown to pieces, could scarcely inflict other than surface wounds?—*Port Royal, S. C.*

CHARLES G. KENDALL.

[It may be of interest to our readers to know that at a recent meeting of the New York Pathological Society, Dr. Sands presented the anterior portion of the right lung, removed from the body of the unfortunate Dr. Thebaud. It seems that it was not the shell which caused death, but a portion of the brass cylinder in which the shell had been placed for the purpose of loading, although a piece of the

pasteboard accompanied it, and was removed shortly after the accident. The report which we find in the *Medical Record* says that "the autopsy was made by Dr. Fennell, during which the pericardium was accidentally opened by the Deputy Coroner. On raising the sternum a square piece of the brass cartridge cylinder (1½ inches) was found firmly imbedded in the anterior portion of the lung. The right margin of the piece of brass was concealed from view, while the left margin presented a sharp angular edge, which penetrated the lung, made a small perforation into the pericardium, and lay in direct contact with the left ventricle of the heart." Dr. Thebaud was afflicted with chronic pneumonia, as was shown by the condition of his lungs. It was the universal opinion of medical men that any attempt to remove the foreign body would have been inadvisable, owing not only to the condition of shock under which the patient labored, but also the known existence of organic disease of the lung and the dangerous proximity to the heart.—*Ed.*]

CONNECTICUT—*Salisbury, Dec. 16.*—Ducking has been rather poor the past fall hereabouts, and though there has been several "wild goose chases," of some miles, yet no golden eggs or the goose that might lay them have been seen. Woodcock have been scarce also, but more English snipe have been shot than for many seasons. Partridges (grouse) have been unusually abundant and fine, and now that the law is so soon to protect them (Jan. 1st) that it may be whispered through your speaking trumpet, *FOREST AND STREAM*, without danger of their utter extermination by your host of crack shots. There is an effort to be made to introduce quail (a bevy of which are occasionally seen) and it would be a good thing to do.

J. IVES PEASE.

PENNSYLVANIA—*Greenville, Dec. 9th.*—Certain sportsmen(?) in these parts have been detected in using pick and shovel in hunting rabbits. "A word to the wise," etc. The terrible cold weather just now will be severe on quail and such. It is our prayer that it may not last long.

W. H. B.

VIRGINIA—*Wytheville, Dec. 9th.*—A wagon was driven into town Wednesday loaded with bear meat, venison, wild turkeys, pheasants, rabbits, &c. They were killed in the Stony Fork neighborhood, in this county, we learn, and belonged to different parties. Twenty cents a pound was asked for the bear meat at first, but it went off at a shilling.

NORTH CAROLINA—*Morgantown, Dec. 11th.*—Quail shooting has been fairly good this season, but most of it has to be done in the woods. My score since the season opened is 253, but I have made none of the heavy bags—50 or 100—which I read of in *FOREST AND STREAM*; 26 has been my best, and when I walked home by starlight it was with the proud consciousness of having done well.

G. H. M.

Newbern, December 8th.—A party of gentlemen from Edgecombe county came down here last week and killed eleven deer besides smaller game, mostly around Slocums creek, sixteen miles below Newbern. Brother and self bagged a fine lot of mallard here in the river on Tuesday.

J. E. WEST.

Poplar Branch, Currituck Co., Dec. 10th.—I and Charley Hance of Flushing, L. I., had some fun shooting duck yesterday evening from 3 o'clock to half past 4 o'clock. We shot 110 duck, American widgeon, sprigtails, black ducks and mallards. We had one breech-loader and one muzzle-loader, and you may just bet we had fun for a short time. The wind was northwest, blowing a storm and cold. We had to break our way home through ice, arriving at the house with our game about 6 o'clock.

D. W. LINDSEY.

SOUTH CAROLINA—*Port Royal, Dec. 15th.*—Since my last we have had quite a cold snap, the mercury ranging a little below freezing during the nights, but not uncomfortably cold during the daytime. An undoubted effect of such early cold weather will be to bring ducks and geese in large numbers to their southern haunts. Two or three Beaufort sportsmen are now on the Combachee waters in pursuit of mallards, etc., while the writer has but now been able to get his skiff ready for service, and hopes soon to make good use of her. Rumor has it that the Naval Commission appointed to investigate the question is unanimous in recommending this point for a permanent naval station. This being so will make things lively after a time. Politically all is as quiet here as a summer's day, and no intending visitors need fear being eaten by an African cannibal, or to be spitted by a ferocious Ku Klux. The Arctic owls have not reached this point as yet, but we have many peregrines. Being keen fellows they know how to take good care of themselves. Port Royal is not on the main land, but on Port Royal Island. The town of Port Royal is some fifteen miles distant from the main. RUSTICOS.

FLORIDA.—Eight men went out deer hunting from St. Augustine, and returned each with a buck strapped to his saddle. They came into town together, and the scene has been clearly described by the local press.

SPORTING PARTY LOST.—A party of four fishermen formed the project of wintering in the forests of Fortune Bay, N. F., in February last, for the purpose of making a large catch of trout in the lakes and gulleys of that quarter, which abound with these fish, in order to try the experiment of salting them and establishing a trade in pickled trout. No account was ever received from them, though constantly up to the end of June the friends and relatives of the missing men searched the forests for their bodies. Not until near the close of September was the mystery cleared up, when a trouting party, composed of several telegraph operators, and their friends, discovered four skeletons near a gully. The unfortunate fishermen must have lost their way, and been immersed in the drift during one of the terrific blinding snow storms that prevail in that section. The truth of this is not vouched for.—*Halifax (Nova Scotia) Herald*.

—The Harvard Library contains 200,000 volumes; Yale's Library has 100,000; Cornell and Brown University have 40,000 each; Michigan University has 22,000; Dartmouth, 59,000; Tufts, 23,000; Williams, 15,000; Bowdoin, 24,500.

The Kennel.

SALE OF DR. GOLDSMITH'S KENNEL.—Mr. W. J. Farrar, of Cleveland, Ohio, writes us that he has purchased Dr. Goldsmith's entire kennel, the dogs comprising Plunket, Carrie, Rapp, Nell and two young red gyps by Plunket from imported bitches. Mr. Farrar proposes to place Plunket and Rapp at the stud, and also to establish a first-class kennel. With such stock to start with he should be successful. Most of our crack dogs appear to be going west. Well, there is room for them there, and game to work them on, and probably we will be allowed to buy a young one occasionally.

BALTIMORE DOG SHOW.—Mr. Lincoln writes as follows: At the time of writing this everything looks fair and promising for the success of the show. The entries close on the 20th, and as yet we cannot form any estimation of the number of dogs that will be exhibited. Every arrangement is being made for the dogs. They will be exhibited on raised benches, 2 feet from the ground, thus enabling the public to get a good view of them. The special prizes, since I last wrote you, are by Messrs. Joseph C. Grubb & Co., Philadelphia, who offer a Busey Gyro Pigeon Trap for the best native setter puppy under 12 months old; Messrs. Stuart, of Baltimore, offer \$20 for the best pointer bitch, to be shown with not less than two of her pups.

Yours truly, CHAS. LINCOLN, Supt.

SENSATION.—This splendid imported pointer, the property of the Westminster Kennel Club, is indeed a sensation. Already a number of fine bitches have been sent to him to serve; among them Dr. Webb's Whisky; Lilly, owned by the St. Louis Kennel Club, and sent all the way from Missouri for the purpose, and Belle, owned by C. L. Austin, Esq., of Boston; the latter the handsome black bitch to whom was awarded second prize at the last Springfield show.

—Our correspondent "Roamer" of Portland, Me., has had painted by Mr. W. W. Brown, of that city, portraits of his celebrated setters, Old Cora, Cora II and Guy. Cora is probably the best known dog in Portland, having been presented to her present owner some ten or twelve years since by the late Cale Loring. The portraits are said to be remarkably good. By-the-bye, Mr. Brown will spend this winter in Washington, and gentlemen who desire to have their pets "preserved in oil" would do well to look him up.

—Mr. F. B. Farnsworth, of Paris, Ontario, writes us that his Laverack setter Calowitz was visited on Nov. 17th by Messrs. Gillman's & Lincoln's Orphina, by Pride of the Border, out of the Gildersleeve setter Nellie.

—Mr. Wm. Jarvis, of Claremont, N. H., claims the name of Joe II for his orange and white setter pup, out of Theodore Morford's bitch May, by Glen, bred by Mr. Morford, now the property of Col. Valentine of Hacketstown, N. J.

THE ST. LOUIS BENCH SHOW.

BOSTON, Dec. 18th, 1876.

EDITOR FOREST AND STREAM:—

Wm. F. Steel, owner of "Flake," appears to be jealous that the St. Louis Kennel Club are winning so many prizes at bench shows and field trials. If such is the fact, it must be the fault of the judges. The well-known sportsman, Mr. John Davidson, judged at St. Louis, and I have yet to learn that any of the exhibitors found fault either with his ability or honesty; he certainly had no axe to grind with the St. Louis Kennel Club, and as he has usually bred and been a champion of native blood, there is no good reason to suppose that he would be prejudiced in favor of the St. Louis Kennel Club's blue bloods.

I think Mr. Davidson takes too much pride in his opinion to allow his judgment to be influenced in favor of any man's dogs, or any strain of blood. I understand he has been selected to judge the sporting dogs at the coming Bench Show at Baltimore. If he succeeds in satisfying the exhibitors there, the stay-at-homes who have got such fine dogs that they they fear won't keep if they show them, certainly ought not to complain.

The judges at Memphis, Messrs. J. H. Whitman, of Chicago; Edmond Orgil, of New York, and James Gordon (Pious James), of Mississippi, are gentlemen of too much character and acknowledged ability to require any comments from me. I will only say, they are all breeders of natives. If those sour grapes that Mr. Steel exhibited, that he had ought to have got the prize on and did not, should ever sweeten, I hope he will come forth at shows and try again; and if he should come in competition with the St. Louis Kennel Club and wins, I will promise that the members shall all look pleasant and bear him no malice.

Yours truly, LUTHER ADAMS.

THE CENTENNIAL BENCH SHOW.

EDITOR FOREST AND STREAM:—

NEW YORK, December 16, 1876.—In last week's number of the FOREST AND STREAM, Mr. Wm. F. Steel, under the heading "The Centennial Bench Show," gives vent to his feelings by attacking the judges of that wonderful show. Perhaps he will feel a little better when I tell him that he is not the only dissatisfied and disgusted exhibitor; there are a good many more who share his opinion. In addition to the facts he mentions it seemed also that it was not only necessary to have a dog with a thick hide but that the dog must have the size of a four-months old calf in order to be entitled to a prize. Can you tell me how it came that Mr. Colburn's Bank was awarded a premium by the Centennial judges, when that dog was hunting chickens on the prairies at the time of the exhibition? What kind of glasses did the judges use? They must have been very strong. Let us hope that the gentlemen who have the courage to send their dogs to Baltimore will fare better than those who

were foolish enough to send theirs to Philadelphia. I trust, also, that Mr. Lincoln will see that the dogs intrusted to his care in Baltimore, are fed and not starved or left to the charity of chance visitors as ours were in Philadelphia. Can't you get up a Bench Show next spring to be held in New York? Yours truly, PHAKREE.

RAILWAY EXTORTIONS IN NORTH CAROLINA.

NEW YORK, December 19th.

EDITOR FOREST AND STREAM:—

Having recently returned from a hunting and shooting trip to North Carolina, where I have suffered pecuniarily at the hands of railway companies, I desire to call the attention of sportsmen to the extortions attending a trip south if accompanied by dogs. And what is the worst feature in most cases the fee exacted goes to the company, and is not a perquisite of the baggageman as in other localities.

From Wilmington to Flemington, N. C., a distance of thirty miles, \$5 was demanded by the agent in charge of the express and baggage car, if my brace of dogs was permitted to travel in his company, but fearing the contamination of his society might not prove beneficial to my setters, I refused to pay the charge, and was ordered to the second class car with my pets, though I held a first class ticket.

The above agent acted for the Southern Express Co., and I trust soon to learn if such charges are authorized by the company, or if it was a private venture or the enterprising agent. On my return to Wilmington from Flemington a few days later, I was obliged to pay \$2 on my brace, though my own fare was but \$1.35. I remonstrated with the conductor, but as he produced an order from the superintendent of the road instructing him to make such a charge, I had but to pay and look pleasant.

Gentlemen going south with dogs should not fail to go by the Weldon & Wilmington Railroad, over whose line every courtesy will be extended to sportsmen, and the expense of transporting dogs will equal, if not exceed, the cost of a first class passenger ticket. From Wilmington to Weldon I was obliged to pay \$6 to the conductor for my dogs' transportation in the baggage car.

The expense on my brace attending the journey from New York to Flemington and back amounted to between \$30 and \$40. Rather hard on a poor sportsman. Don't you think so, Mr. Editor? I can only interpret such extortion by the railway companies as an evidence that the patronage of sportsmen is not desired (great corporations can never be called short-sighted) for surely they could not adopt a more effective plan to drive this portion of the traveling public from their roads.

My experience only extended to North Carolina, but I have been told that on the roads further south it is still more expensive traveling with dogs. Will not the sporting journals stir the matter up a little, and see if something cannot be done to relieve the traveling sportsman?

H. N. M.

[This letter of our correspondent shows a condition of affairs in North Carolina strangely in contrast with that existing elsewhere. Only last week we printed an order issued by the authorities of the Chicago, Milwaukee & St. Paul Railway, directing their employees to transport passenger's dogs and guns without fee or compensation. A policy shaped on a somewhat similar liberal scale would result much to the benefit of the roads over which our correspondent traveled. Because sportsmen are a liberal and free-handed class it is none the less an outrage to practice extortion upon them, and the road upon which it is allowed will soon find itself minus a very paying share of its patronage.—Ed.]

SOME REASONS WHY ONE SHOULD KEEP A DOG.—In the first place they belong to no sect, creed or party. They neither smoke, drink rum, chew tobacco, swear, tattle, gossip or lie. They are protectors to life and property, faithful servants, seldom teach a bad example, I might say never unless first shown by a human. Their sagacity puts human intelligence at a discount often; their patience and endurance might teach us many a lesson. If a person has ever been frightened by one it is hard to outgrow the feeling, but otherwise I always consider the "make-up" of any person seriously defective who cannot endure them. Lastly take them where you will 7 times out of 10 their deportment is far more fit for society than many of their masters, called superiors, who own them.

Salem, Dec. 18th.

"TEAL."

THE DOG WITH THE PERIWIG.—In the British *Sporting Magazine*, published in London in 1796, we find the following extraordinary anecdote, which is associated with a performance of the celebrated actor, the late Mr. Garrick, in the early part of his life. It has been said that man is the only animal that laughs, but though dogs may not absolutely laugh, they are sometimes like Falstaff, the cause of laughter in others:

"One very sultry evening in the dog day's, he performed the part of *Lear*; in the four first acts he received the customary tribute of appearance. At the conclusion of the fifth, when he crept over the body of *Cordelia*, every eye caught the soft infection. At this interesting moment, to the astonishment of all present, his face assumed a new character, and his whole frame appeared agitated by a new passion; it was not tragic, for he was evidently endeavoring to suppress a laugh. In a few seconds, the attendant nobles appeared to be affected in the same manner, and the beautiful *Cordelia*, who was reclining upon a crimson couch, opened her eyes to see what occasioned the interruption, leaped from her sofa, and, with the *Majesty of England*, the gallant *Albany*, and tough old *Kent*, ran laughing off the stage. The audience could not account for this strange termination of a tragedy in any other way than by supposing the *dramatis personæ* were seized with a sudden frenzy, but their risibility had a different source. A fat, Whitechapel butcher, seated on the center of the front bench in the pit, was accompanied by his mastiff, who being accustomed to sit on the same seat with his master at home, naturally supposed he might enjoy the like privilege here. The butcher sat way back, and the quadruped finding a fair opening, got upon the bench, and fixing his fore paws on the rail of the orchestra,

peered at the performer with as upright a head and as grave an air as the most sagacious critic of his day. Our corpulent "slaughter-man" was made of melting stuff, and not being accustomed to a play-house heat, found himself much oppressed by the weight of a large and well powdered Sunday periwig, which for the gratification of cooling and wiping his head, he pulled off and placed on the head of his mastiff! The dog being in so conspicuous, so obtrusive a situation, caught the eye of Mr. Garrick and the other performers. A mastiff in a church-warden's wig, (for the butcher was a parish officer) was too much. It would have provoked laughter in Lear himself at the moment he was most distressed. No wonder, then, that it had the effect on his representative."

Sea and River Fishing.

FISH IN SEASON IN DECEMBER.

SOUTHERN WATERS

Pompano, *Trachinotus carolinus*. Grouper, *Epinephelus ne gritus*.
Drum—two species. Family *Sciaen*. Trout (black bass) *Centropomus at-*
idae.
Kingfish, *Menticorax nebulosus*. Striped bass or Rockfish, *Roccus*
Sea Bass, *Sciaenops ocellatus*. *lineatus*.
Sheepshead, *Archæargus probato-* Tallofish, *Pomatomus saltatrix*.
cephalus. Black Bass, *Micropterus salmoides*.
Snapper, *Lutjanus caesus*. *M. nigricans*.

FISH IN MARKET.—Our quotations show but little change from those of last week. Striped bass are worth 25 cents per pound; smelts, 25 cents; bluefish, 15 cents; salmon (frozen), 40 cents; mackerel, 25 cents each; shad (southern), \$1 each; white perch, 18 cents per pound; green turtle, 20 cents; terrapin, \$12 to \$30 per dozen; frostfish, 8 cents per pound; halibut, 22 cents; haddock, 8 cents; codfish, 10 cents; blackfish, 15 cents; herring, 10 cents; flounders, 12½ cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 25 cents; scollops, \$1.50 per gallon; whitefish, 20 cents per pound; pickerel, 18 cents; salmon trout, 18 cents; red snapper, 18 cents; ciscoes, 12½ cents; hard shell crabs, \$3.50 per 100; soft shell crabs (rock), \$1 per dozen.

—A mullet 30 inches long, and weighing 10½ pounds was caught at Mayport, near the mouth of the St. John's river, Fla., last week. It is the largest known in that section.

—A fortnight ago we replied affirmatively to a correspondent who inquired if lake trout ever took the fly in the Nepigon river, north shore of Lake Superior, Canada. The following is an incident in point occurring in our individual experience:—

In the Niagara-like current that sweeps over the ledges that occur in the Nepigon at intervals of two or three miles, there is ample work for a bamboo salmon rod, and there are laurels for success. Once, in playing a brook trout in an eddy filled with debris and floating trees forty feet long, that regularly made the circuit of the swirl created by the back water from a projecting point of rock, we hooked a lake trout of 12 pounds, our two or three-pound *fontinalis* totally disappearing down his gullet. Both fish were fast enough (to the single gut leader) but you can imagine the situation. For play-room for handling our fish we had choice only between the impetuous mill race and the quiet water of the eddy with its tangle of roots, trunks and branches. Well, we gave the two Hesperians line down the chute—and a square butt when they swung into the eddy again; our three Indians meanwhile pushing with poles at the raft of rubbish to keep it clear of the line, and endeavoring to shove it down stream. Out on the tide the whole mass would go, careering like a bob-sawyer on a crevasse, and we would fancy we had lost sight of it altogether, when the reflux would catch it again and listlessly drift it back to the pool. We all had as much as we could do—the fish, the Indians, and the angler; and although we finally triumphed over the whole combination of opposing forces, our victory was qualified by the fact that the poor *fontinalis*, who was engulfed in the deep throat of the lake trout, had had no show whatever for displaying his pluck. No doubt he would have made a good fight and acquitted himself with credit and honor to his race and species; but all he could do under the circumstances was to remain passive and be ignominiously disgorged when the united victims came to the gaff.

LANDING A PIKE.

EDITOR FOREST AND STREAM:—

THE "Black Maria," heroine of a season of signal conquests, lies lost to sight, though to memory dear, on the banks of the shrouded Shenango; our run chubs and silver-sides are packed away in ice; the bouncing bamboo rests on its winter pegs, and the noisome reel is locked, Memnon-like, until the warm breath of spring throws its music out again. So what can we do but sit by the ingle side and fight our battles over again—and read FOREST AND STREAM?

We have lately had the supreme satisfaction of landing a real old *Esox lucius*, a fifteen-pound pike. There can be no mistake about his (or rather her identity, for it was of the latter gender). It answered your description of green and gold completely. And this grand piscatorial achievement very properly closed the season for us. As intimated above, the fish was of the feminine persuasion, and was found to contain a hatful of eggs, which leads us to imagine if the *Esox* family spawn oftener than once a year, or would this member have retained her eggs until next spring before depositing them? It seems like a murder of the innocents to destroy these thousands of embryo sovereigns, but such is the fate of war.

A circumstance worthy of remark attended this catch. The water was very muddy at the time, which had the effect of demolishing an old-time local theory, that pike would not bite with the water in that condition. We sup-

pose it is only a question of proximity of the bait to the fish. We were trolling with rod and will, with a large chub for bait, when a little surprise party overtook us. She took that chub after the manner referred to by one of your correspondents in a like situation, as though a rock had sat down on it—a way, in fact, which these business-like fellows seem to have. And when, after due dalliance, we had our prize hooked down deep—for the size of the fish is pretty generally indicated by the manner of the bite—we found that we really had a job on hand. You say that *Esox* weakens. It is true, and we think he ought to. It is one of the good things about him, because half an hour's wrestle, such as we had in landing this chap, is about all a man wants by way of sport. He weakens just at the proper time—when you weaken, and are ready to scoop him with the net. The supreme moment was when we brought our beauty to the surface with a view to landing her. She laid with back out of water, as docile as a tired hound, a sight to gladden the heart even of the fellow in the other boat! A gentle lead towards the boat, a dextrous dive with the net, and our suspense and suspenders were at rest. If ever a man is on good terms with himself it is at denouement of such an experience. Of course he has had fishing enough for that day, but in the morning he goes out an hour earlier and stays an hour later.

Parentetically, Mr. Editor, allow us, with many others, to thank you for the intelligent work you are doing in a needed direction—the elevation of the nobler outdoor sports.

AMATEUR ANGLER.

Greenville, Pa., Dec. 1.

TROUT FISHING ON THE PASSADUM-KEAG.

EDITOR FOREST AND STREAM:—

It may not be uninteresting to some of the readers of your valuable paper, to know that there are other waters, aside from Moosehead Lake, where every year we reel in the speckled beauties, and find more real exciting sport in doing it than we ever realized on Moosehead or Grand Lake. We refer to the Passadumkeag river. Eight years ago we visited these waters for the first time, in company with five other sportsmen. We landed our canoes at five o'clock p. m., at a place known as the big rock, just above the mouth of the Nicktower's, and as we had fasted since eight o'clock, we lost no time in getting out our tackle.

Stationing myself on a projecting log, with a gray fly for a leader, I made my first cast. Before my line fairly whips the water, the tempting baits are seized, not by a trout, however, as the contest ends too soon for that specie. I landed three small white perch (I have never since met with them in those waters), but the next cast my bait falls just below a little eddy, about midway of the stream. This time it's a trout sure; yes, two or three of them. My slender rod comes down to hand under the steady strain, and, after fifteen minutes of the most intense suspense, I succeed in landing two trout, the largest weighing three and one fourth pounds, the smallest one pound. Passing them over to the cook, I cast again with similar results. We remained in camp ten days, and might have caught hundreds of trout each day, but denied ourselves the pleasure, taking only what we wanted to eat.

I have since been there once or twice a year, and have never yet failed to find plenty of sport, although the trout have not averaged quite so large. The largest specimen I have ever taken was in June last, which weighed four pounds. Our party took several, weighing from two to three pounds. We also made a trip to Pistol Lake, three miles above. I would like to tell you some something of that lovely sheet of water, and the speckled beauties we fished out of it, but have already made my letter longer than I intended, and will defer it until another time.

CORRESPONDENT.

NORTH CAROLINA—Newbern, N. C., Dec. 8th.—The great ocean bluefish have put in an appearance upon our coast. A few days since one man caught over four thousand, another twenty-five hundred, weighing from five to some sixteen pounds each, and would average nine or ten pounds apiece. Our market has been glutted with them, selling at from 25 cents to 40 cents for choice. These schools of bluefish follow the schools or shoals of fat backs or moss bunkers upon the shore, and sometimes as many as fifty shoals of them may be seen at once, varying in size from a fifth to a quarter acre, "reaching five feet below the surface of the sea, and rising in a dense body a foot above it" (I am not responsible for that portion), and the bluefish cutting in every direction, bloodying the ocean all around.

The catch above referred to was on the coast, just above Hatteras.

I. E. WEST.

DOINGS OF THE FISHING FLEET.—There have been but four arrivals the past week from Georges and LaHave, bringing in 8,000 pounds of halibut and 16,000 pounds of codfish. These are extremely slim fares and the vessels would be far better off alongside the wharves. Last sales of halibut 20¢ and 14¢ for white and grey. The shore fleet have also had a poor week's work; codfish have sold at \$3.50 per hundred pounds.—Cape Ann Advertiser, Dec. 15th.

Yachting and Boating.

THE ATALANTA.—Mr. William Astor's yacht, the Atalanta, arrived at Jacksonville, Fla., on the 10th inst. after a very rough passage. She will remain in Florida waters during the winter.

BROOKLYN YACHT CLUB.—The monthly meeting of the Brooklyn Yacht Club was held last Wednesday evening, the President in the chair. The prizes won at the regular

regatta in June were exhibited and formally presented to the successful competitors as follows:—

SCHOONERS.

Club Prize—Large musical box, to the Comet, William H. Langley.

Flag Officer's Prize—Silver pitcher, to Estelle, James B. Smith.

FIRST CLASS SLOOPS.

Club Prize—Silver jug, to the Arrow, Daniel Edgar.

Flag Officer's Prize—Set of signals and book, to the Undine, William M. Brasher.

SECOND CLASS SLOOPS.

Club Prize—Silver service, to Lizzie L., J. G. Johnson.

Flag Officer's prize—Marine clock, to the America, Jno. R. Treadwell.

THIRD CLASS SLOOPS.

Club Prize—Silver dish, to Susie S., E. P. Miller.

Flag Officer's Prize—Album and easel—William T. Lee, Charles A. Cheever.

GREENPORT REGATTA OF 1875.

First Prize—Tobacco box, to the Kate, George F. Randolph.

Second Prize—Silver spoons, to the Schemer, C. H. Hall.

A committee of five yacht owners were appointed to nominate flag officers for 1877, and a similar committee of non-yacht owners to nominate civil officers of the club, both committees to report at a special meeting to be held January 6th, 1877. The election will take place on the second Wednesday evening of January.

ST. AUGUSTINE YACHT CLUB.—The annual meeting of the Yacht Club was held on the 7th instant. The requisite number, ten, for a quorum, were present. The only business transacted was the admitting of the following gentlemen as members: R. H. Pratt, E. H. Zalinski, E. T. Brown, Dr. Alba, and N. C. Vanderslice.

—The side-wheel steamer C. H. Dexter, which ran for many years on the Connecticut river, is now en route for St. Augustine, Florida, via: Long Island Sound, the Delaware and Raritan and Delaware and Chesapeake canals to Norfolk, through the Currituck canal, Albemarle and Pamlico sounds, outside twenty miles to Cape Fear river, through a series of inlets to Charleston, Fernandina, and Jacksonville, from which the remainder of the journey will be made to St. Augustine outside. The Dexter is a flat-bottomed vessel.

Rational Pastimes.

THE YALE-HARVARD FOOT BALL MATCH.

EDITOR FOREST AND STREAM:—

I notice in your issue of December 7th a communication from J. C. W., containing an unqualified denial of several statements made by a correspondent in a previous number, in regard to the recent University Foot-Ball match between Harvard and Yale. I would by no means excite a useless controversy upon a subject which has already undergone considerable debate, both in the college papers and several of the New York and Boston dailies; but I should like to be allowed a little of your space to show that the article in question was not such a gross perversion of facts as W. asserts.

I maintain in the first place that the Yale players were sadly ignorant of the rules regulating "on" and "off" sides, and in this I express the unanimous opinion of the Harvard team and the Harvard papers, nor does W. deny this himself. It does not alter the case that Yale "knew enough of them, however, to win the game," for to those who are conversant with the Rugby game it will readily appear that a breach of these very important rules may be a material assistance rather than a disadvantage. W. then misquotes as follows: "Harvard succeeded in getting two touch-downs, but as the wind was unfavorable no goals were kicked," and denies that the wind affected the kick at goal. The report, however, attributes this failure to the fact that both the touch-downs were too much to the side of the goal posts, in which case the wind was unfavorable. Furthermore, Harvard gained two touch-downs during the first part of the game. The first, made by Leamans, resulted in an ineffectual kick-at-goal, and the second was made soon after by Cushing. But the latter was so near the touch line and such a distance from the posts that it was "punted" out. In the second half of the game, after some very rough work, the ball was kicked by Thompson and sent within twenty feet of Harvard's goal. A Yale player "having it down" kicked it behind him to Thompson, and the latter, while in a stooping posture, kicked it over the goal. This was the "lucky" kick referred to. The time lost by the interference of the crowd was, as stated by the *Advocate*, fifteen minutes. The game according to W. lasted 1 hr. 47½ min., thus allowing 1 hr. 30 min. for the game, there was left the generous margin of 2½ min. wherein to settle the many disputes which arose, disputes which in a fair game are never left to an umpire to decide but are or should be avoided. Now with all due respect to the courtesy of the Referee, there is still something wrong with this question of time. The last point of dispute which W. finds in the game proper, is in regard to the last "touch-down." The facts of the case are these, Cushing of Harvard secured a touch-down and Seamans was running for the kick. The Referee stepping between the ball and the goal, called time. Seamans was told by the Harvard players to kick at it any way and did so; but that he did not kick it over the rope between the posts is not to be wondered at. W. questions the ruling of his own Referee by declaring even the last "touch-down" an unfair one. Harvard's claim of tie was based on the fact that in their usual game three "touch-downs" constitute a "goal." But this is only when no goal has been kicked. With this understanding, and acknowledging the ruling of the Referee, they submitted with commendable grace to defeat. I see not the baseness in Harvard's wishing to play again. Mr. Curtis expressed such a desire at the supper in view of the fact that Yale was so extremely desirous before the game to play a series. In conclusion I would say that Jordan, Captain of the Harvard Freshman team, challenged the Yale Freshmen, which challenge was duly accepted and the 18th of November was appointed for the first game. On Friday morning, the day before the 18th, Mr. Jordan received a telegram from Yale, stating that the Freshmen would not play. It was six hours from the time when they were to take the train, and the tickets had

been bought, so there was nothing else to do but to go to New Haven. "The fairness of this little game," was shown by the fact that Jordan offered to put two substitutes on his team in the place of those who were to play on the University, if the captain of the Yale team would like to do the same.

I heartily agree with W. in his desire to maintain peace and good feeling between those two Universities; nor would I say anything prejudicial to this delectable state of things. But, verily, I am constrained to remark that opinions, however numerous they may be, never exactly agree. Further discussion on my part, would be simply a reiteration of the statements that I have just made. P.

SKATING.

—The changeable character of the weather the past week has materially interfered with skating. The Prospect Park Lakes were opened to the public for two days when a thaw interfered, and afterwards snow and rain stopped the sport. The Capitoline Lake was opened on Tuesday afternoon, the 19th inst., after the fall of snow and good skating was had there.

BASE BALL—NEW RULES.

The amendments to the rules adopted at the recent League convention are in brief as follows:—

The ball to be played with by the League clubs is the same in size and weight as last year, but instead of the balls being supplied by half a dozen manufacturers it is to be made and supplied by one only. Mahn, of Boston, having been chosen as "Ballmaker to their Majesties," as the cricketers say in England.

The bases—all but the home base—have been enlarged in size from one foot square to fifteen inches square. The home base is to be placed inside the diamond. The batsman's position has also been brought forward so as to place him a foot nearer the pitcher, his position extending three feet in front of the line of the home base instead of two as before.

Base runners now have to run to their bases instead of walking in the case of returning on foul balls and taking bases on called balls or balks. In running their bases, too, they must avoid allowing a batted ball to touch them or they will be decided out. Also when running a base they must get out of the way of a fielder who is fielding a ball. (This rule conflicts with that which prohibits their running out at the line of the bases to avoid a ball). If the base runner collides with a base player and knocks the ball out of his hand the runner escapes being put out.

If a nine commences play shorthanded and place a substitute in the field for an absent regular player they can only place the latter in the nine in case he arrives before the close of the second innings. This, of course, does not prevent players from being substituted for injured players in any innings of a game.

High and low balls are now designated from the belt instead of the waist; a low ball being from the belt to the knee and a high ball from from above the belt to the shoulder. The line of the belt, too, is the boundary line for the pitcher's arm when swung forward, which must be "below the belt" or it is a foul delivery.

Balls which count as called balls from being unfair, and which strike the batsman are not only dead, but count as a called ball.

Batsmen failing to take their position at the bat within one minute of the umpire's call are to be decided out.

The home club are to go to the bat first, the tossing for position being done away with. If rain falls for twenty minutes the game ends for the day.

—No more Sunday trains in Canada. The Dominion Government has issued orders that no trains shall be run on the Sabbath day except in cases of great emergency, and then only on direct order of the Government.

TUTOR—"Describe the alimentary canal." STUDENT—"I can begin and go through it, sir, if you wish." TUTOR (with a comico serious look)—"A plain description will be sufficient."—*Yale Courant*.

THE SPORTSMEN'S ROUTE.**Chicago & Northwestern Railway.**This great corporation now owns and operates over
two thousand miles of road, radiating from Chicago.
Like the fingers in a man's hand, its lines reach in all
directions, and cover about all the country north,
northwest, and west of Chicago. With one branch it
reaches Racine, Kenosha, Milwaukee, and the coun-
try north thereof; with another line it pushes through
Janesville, Watertown, Oshkosh, Fond du Lac, Green
Bay, Escanaba, to Nagaunee and Marquette; with an-
other line it passes through Madison, Elroy, and for
St. Paul and Minneapolis; branching westward from
Elroy, it runs to and through Winona, Owatonna, St.
Peter, Mankato, New Ulm, and stops not until Lake
Kamoska, Dakota, is reached; another line starts from
Chicago and runs through Elgin and Rockford to Free-
port, and, via the Illinois Central, reaches Warren,
Galena and Dubuque, and the country beyond. Still
another line runs almost due westward, and passes
through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar
Rapids, Marshalltown, Grand Junction, to Council
Bluffs and Omaha. This last named is the "GREAT
TRANS-CONTINENTAL ROUTE," and the pioneer
overland line for Nebraska, Colorado, Utah, Idaho,
Montana, Nevada, California, and the Pacific Coast.
It runs through the Garden of Illinois and Iowa, and
is the safest, shortest, and best route to Omaha, Lin-
coln, and other points in Nebraska, and for Cheyenne,
Denver, Salt Lake City, Virginia City, Carson, Sac-
ramento, San Francisco, and all other points west of
the Missouri River.**TO SPORTSMEN:****THIS LINE PRESENTS PECULIAR ADVAN-**
TAGES--FOR PRAIRIE CHICKEN, DUCK,

MANUFACTURED ONLY BY

G. W. SIMMONS & SON,
Boston, Mass.

SOLD everywhere in the U. S. by all first-class dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT,"
made by

G. W. Simmons & Son.

This new design of WATERPROOF SHOOTING SUIT, made from extra quality duck, has attained such popularity as to be called for from all parts of the country, and even from England.

"Shipping clothing to England strikes us very much like sending 'Coals to Newcastle,' but the merits of the 'BOSTON SHOOTING SUITS' have been heard of in the Old Country, and that land of sportsmen has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—Boston Paper.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is water-proofed by a new patent process. The seams and pocket corners are securely fastened, and nothing neglected to render the suit perfect in every respect.

THE PRICE HAS BEEN FIXED AT \$13, TO INCLUDE HAT OR DOUBLE VIORED CAP, DETACHABLE HAVELOCK, COAT, VEST, AND PANTALOONS.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining 'the best points of the English suits, and in addition skillfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect.'"

PERSONS ORDERING FROM A DISTANCE NEED SEND ONLY THE FOLLOWING TO BE SURE OF A PERFECT FIT: BREAST MEASURE, WAIST MEASURE, INSIDE SEAM COAT SLEEVE, INSIDE SEAM PANTALOONS; MENTION HEIGHT AND WEIGHT.

G. W. SIMMONS & SON,
"OAK HALL," BOSTON, MASS.

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of Waterproof Shooting Suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp at Philadelphia Centennial Exhibition. It has grown gray in service, but is good for use yet. This suit is known as the 'Boston Shooting Suit,' in contradistinction no doubt, from the garments which are manufactured out west and at Washington, each of which has a local demand of its own. It is said that the western prairie fowl can distinguish any sportsman who visits their domain by his clothes. They can tell him 'by the cut of his jib,' and the old educated birds (which no one cares to eat, by the way,) know exactly what distances to keep from the rail shooters, the brant men, and the chicken-killers respectively, to be safe. They have 'got them all down line.' This used not to be so before the waterproof shooting suits were invented. Bostonians, Hoosiers and Buckeyes all stood the same chance then. But now it is—with a sarill pipe to leeward by the old-weather cock—'here comes a Simmons; cheese it!' or, 'Ere's a 'Enning—lie low!' or, 'Look out for Holabird! Scatter! you beggars, scatter!'—FOREST AND STREAM.]

WIND-PROOF

Leather Vest and Jackets,
Flannel-Lined.

(Made and sold only by Messrs. G. W. SIMMONS & Co., OAK HALL, BOSTON.) are considered the most sensible protectors ever devised for winter wear. They are especially adapted to the requirements of sporting men, whose rapid walking is likely to be followed by frequent halts in the cold wind. Price, Vest \$7; Jacket \$9. Measurements required are Waist, Breast and Inside Seam of Sleeve. Mention Height and Weight.

LADIES' LEATHER VESTS AND JACKETS made to order. Indispensable to all who are in any way exposed to the weather.

BULLETIN OF THE NUTTALL ORNITHOLOGICAL CLUB.

A QUARTERLY JOURNAL OF ORNITHOLOGY.

This journal (now entering upon its second volume) is at present the only serial publication in America devoted to GENERAL ORNITHOLOGY. While it is intended to serve primarily as a medium of communication between working ornithologists, it also contains matter of a sufficiently valuable character to interest all who take any interest in the general subject of which it treats. Although devoted mainly to North American Ornithology, it will be so far general in its character as to give notices of all the more important works or memories relating to Exotic Ornithology. The list of contributors to its pages already embraces nearly all of the leading ornithologists of the country. Among them are Dr. Elliott Coues, Mr. Robert Ridgway, Mr. George N. Lawrence, Dr. T. M. Brewer, Dr. T. H. Henshaw, Mr. W. H. Henshaw, Mr. William Brewster, Capt. Charles Bendire, U. S. A., Dr. J. C. Merrill, Dr. J. G. Cooper, Mr. E. W. Nelson, and numerous others more or less well known to ornithological readers. Its editorial supervision is in charge of Mr. J. A. Allen, assisted by Prof. S. P. Baird, and Dr. Elliott Coues. Although published by the Nuttall Ornithological Club of Cambridge, Mass., it is not in any narrow sense the organ of any section or locality. It being conducted as a MAGAZINE OF ORNITHOLOGY, its department of reviews gives prompt notices of all papers relating to North American Ornithology, as well as of all important ornithological works or memoirs wherever appearing; while its department of "General Notes" is rich in notices of rare or little known species of North American birds, and gives the latest and fullest intelligence attainable respecting the progress of ornithology in our own country. It is hence a journal no one interested in ornithology can well afford to be without.

Terms: \$1 00 a year (including postage), strictly in advance; single numbers, 30 cents. Back numbers can be supplied. Circulars, giving a list of contents of Volume I, sent on application. Address Mr. H. B. BAILEY, Newton, Mass.

AT THE LAST.

Selected.

THE stream is calmest when it nears the tide
And the flowers are sweetest at the eventide,
And birds most musical at close of day,
And saints divinest when they pass away.

Morning is holy, but a holier charm
Lies folded close in Evening's robe of balm,
And weary man must ever love her best,
For Morning calls to toil, but night to rest.

She comes from Heaven, and on her wings doth bear
A holy fragrance, like the breath of prayer;
Footsteps of angels follow in her trace,
To shut the weary eyes of day in peace.

All things are hushed before her as she throws
O'er earth and sky her mantle of repose;
There is a calmer beauty and a power
That Morning knows not, in the Evening hour.

Until the Evening we must weep and toll—
Plow life's stern furrow, dig the weedy soil—
Tread with sad feet our rough and thorny way,
And bear the heat and burden of the day.

Oh! when our sun is setting may we glide,
Like summer Evening down the golden tide;
And leave behind us, as we pass away,
Sweet, starry twilight round our sleeping clay.

For Forest and Stream.

The Rocky Mountain Ranges.

AGAIN, in the heart of the grand old mountains, and yet as glad to behold them, as enthusiastic in our admiration and as extravagant in our expressions as if we had passed our existence on some vast prairie, and had never seen anything in the mountain line greater than a good-sized haystack. The Rocky Mountains are at all times beautiful and interesting, but in the sleepy autumn, when the crispy leaves are falling and the sympathetic wind mournfully sighs and whispers through the dying wood, then do they appear to the best advantage, presenting a picture of solemn grandeur and imposing sublimity that is intensely impressive and never to be forgotten, even by the most indifferent observer. From the plains are seen three distinct ranges of mountains, running parallel with each other, designated as the foot hills, the mountains proper, and the snowy range. The former claim our attention first, being the first interruption of the great plains. These mountains are several thousand feet above the sea, and would be dignified as such, were it not for the mighty giants just beyond, who frown upon them from their dizzy heights. The intermediate range attains an elevation of ten and twelve thousand feet, and is generally covered with forests of pine and cedar, while here and there bleak and desolated spots are visible, the result of extensive fires and violent gales. Just now they are truly beautiful, nature having wrought for them during the past month a mantle of many colors, seeming like some vast quilt of patch work, as if to shield them from the frozen breath of their mighty neighbors. The snowy range—the highest and grandest of the Rocky Mountain system—towers far above all others, grim sentinels whose granite ribs and shoulders are blackened with the wounds and scars of a thousand storms, whose bald and wrinkled heads are white with the snows of ages. Indeed, there is a fascination about them that we are unable to explain, and we never grow weary of watching them, and last evening at sunset, just as the sun had imprinted a glorious kiss upon the snowy brow of a neighboring peak, it seemed to melt the snow into rivers of gold and silver, the face of the majestic mountain being suffused with crimson blushes, as if shocked at the audacity of the "god of Day." The license allowed one's imagination on such occasions has a decidedly refreshing and benificent effect; at least such is our experience.

The autumn months are unquestionably the most perfect of the year in the mountains, the mornings being cool and invigorating, warm and comfortable during the day, while the evenings are perfectly charming, clear and bright, with an atmosphere so rare and pure that one never gets enough of it, and praises its virtues as he would those of a fine old wine, and such it is—the "wine of life." Those who visit the mountains for health or pleasure during the summer months generally hasten away at the approach of autumn, and by so doing make a great mistake, as the stimulating qualities of the air are greater and more beneficial in the autumn than at any other season, while the mountains are more attractive. A great many English and Scotch Nim-

rods annually seek the mountains in the autumn, while not a few of their own ranches and parks that are stocked with game, notable among whom is the Earl of Dunraven, who is a frequent and daring hunter in these parts. This gentleman on one occasion visited the great National Park in the Yellowstone region, under the guidance of the well-known scout Texas Jack. They were gone two months, killing a number of white and black-tailed deer, antelope, elk, and a few cinnamon bear, while grouse and other wild fowl were to be found everywhere in abundance. They reported trout as the best in the world, frequently catching them for sport and throwing them back into the stream, many of them weighing as high as three or four pounds. Their party was a picturesque one, clad as they were in foreign hunting suits, with Texas Jack in the background dressed in a gorgeous suit of fancifully beaded buckskin, "the observed of all observers." Those who visit this beautiful valley for the first time, after a long and tedious journey through vast deserts of sage brush, and over range after range of snow-capped mountains, are not only charmed with the delightful change but completely captivated with the unsurpassing loveliness and physical characteristics of this remarkable basin. The scenery around Salt Lake is grand and impressive, reminding us of Geneva, the jewel of Switzerland. To the west a range of lofty mountains bound in ice rise almost perpendicular from out its briny depths, casting their long dark shadows over the silent sea of Zion, while to the east stretches a vast plain, extending from its saline beach to the base of the Wasatch range, in whose deep gorges and weird canyons can be seen great drifts of snow, that even in midsummer are unsusceptible to the influence of a scorching sun. Situated as it is in the very heart of the mountains, it is difficult to believe that a valley so rich and beautiful, dotted with picturesque hamlets and thriving villages, was, until recently, a bleak and barren waste of sage brush and greenwood; and when we consider how comparatively recently the pioneer band of Mormons entered this desert, and the great disadvantages they labored under and hardships endured, we wonder at the great transformation, and cannot but applaud their energy and perseverance. They are indeed a persevering people, and hold on with a determination that is remarkable, building temples and founding colonies in the States, only to have them destroyed and themselves driven westward, with little means and few friends, enduring untold hardships on the plains, fording rivers, scaling mountains, fighting Indians in a land comparatively unexplored, until finally they start anew in the midst of a desert in the wilds of Utah. Nothing but a religious zeal approaching fanaticism could have induced anyone to attempt to do what they have accomplished, with a prospect so discouraging and uncertain. But their energy has been rewarded, and we see today a prosperous people in many respects, and in lieu of their primitive log cabins and dugouts we find thriving cities, and instead of a desert, a vast garden, producing an abundance of fruit and cereals.

To those who would for a time exchange the cares of a city life for that of a hunter and trapper, we would advise an autumn trip across the wonderful plains, the home of the buffalo, antelope, coyote and savage, and ere you tire of this, a cozy nest in some of the natural parks just under the range, where in glorious seclusion and elegant leisure one could pass the time in hunting and fishing. Add to this the numerous lakes and trout streams, ever shady, and teeming with fish and fowl; the matchless parks, walled in by towering mountains and stocked with deer and other game; the dark and dismal canyons into which the sunlight never enters; the natural mineral baths, hot and cold soda fountains, and you have a country possessing a greater number of attractions than can be found in any other locality.

FRANK L. THAYER.

Salt Lake, Nov., 1876.

A curious little scientific toy has made its appearance in the opticians' windows, and, we should think, might rival in popularity the old gyroscope. It consists of a tiny windmill enclosed in a glass bulb of about three inches diameter, which revolves without any apparent motive power. The secret of the mystery is that the four vanes of the mill are blackened on one side, and coated with bright foil on the other. The bright side reflects the radiant heat of surrounding objects, and the dark side absorbs it. The enclosing bulb being partially exhausted of air, the difference of temperature creates a sufficient current to cause the vanes to move. The contrivance is called CROOKES'S Radiometer, from an erroneous idea which its inventor had that its motion was due to the force of rays of light.

For Forest and Stream.

MY FIRST GHOST.

BY N. W. BECKWITH.

I WAS a boy, a small one too, twelve years of age. I had been placed at an academy twelve miles from home. Being so near, I had formed the habit of walking home—there was neither rail nor coach, but much piny woods, in those days—every Saturday (which was a half-holiday at our school) to return on Monday. Bright and early my setting out on Monday had to be, since it was imperative to report to the head-master at halfpast eight, or come to grief for the delinquency.

It was mid-winter on the occasion in question. On the road, and near three miles from home, lay a village, where lived a cousin of mine—a boy nearly two years my senior. I used to reach this village about mid-afternoon, and of course, always stopped at aunt Sally's for a bowl of bread and milk. Equally of course, if "Plum" had anything new, my stay was apt to lengthen until after supper, when he would accompany me part of the remainder of the lonely road home. Sometimes—O times without a parallel in memory's lengthening record—when our joint supplications had obtained him the permission to go all the way, and stay all night, then the grand repetition, at my house of all the precedent jollification, the second supper—and what boy after a three-mile walk ever refused it?—the tearing through the house at our own sweet wills, for privileged beyond most youth were we, for each was an only child; the swim among the "picture books" tumbled on the carpet; the out-door dash for a "coast" down hill by moonlight; the nut roasting and "make-believe" smokes in the kitchen; and the final nestling away in the cozy little bed, there to chat each other to sleep; then to waken for a still more cozy chat in the long, grey, winter dawning. Ah me! why do I linger? Long years ago they closed those gentle blue eyes, and laid that noble head, heavy with its clustering curls of gold, beneath the burning sod of Hayti. Smitten down in youth's full flush of promise, by the dread yellow fever; they buried far away from me the only mortal that ever I called brother.

One bright starlit night, we parted at the top of a wind-swept hill which stands half way between the two villages. In a steep decline, through a long, dark vista of swaying pines and firs, my way ran straight for nearly half a mile, where it was cut off—absorbed, so to speak—by the cleared main-road which led to my own home. Now, on this occasion, "Plum" had got a new book, a wonderful, a terrific book, Mrs. Shelley's Frankenstein, to wit, and that very afternoon and evening we had devoured it to the utmost, sparing scarcely the fly leaves. Of course it formed the topic of our wayside chat; our conversation taking a speculative turn, and debating the possibility of our "building" such a giant, but one that should be "good" of course, when we grew up to be men. Yet, so far as I remember, all thought of the unearthly tale had left my mind, as I "let out" my pace down the long, sighing hollow, intent only upon reaching home as soon as might be. To the right the wood road I followed was cleared for some extent upward from its junction with the main-road. Lo! as I neared the open corner, a colossal spectre, a thousand times more hideous than all my fancy had made of Frankenstein's demon; standing with out-flung arms, and forward foot, ready to intercept whomsoever should attempt to pass. I halted *instantly*. I often hear gentlemen expatiate upon an "unaccountable" and altogether "unmanageable" propensity to "walk right up" to the terror exciting object, that controls them under similar circumstances; whereby they always luckily discover what it is, save their reputation for courage, and proceed on their way rejoicing. I am not of that class. I may further add, that in an unusually checkered experience through much adventure by field and flood and service among many races of men, I have never met that type of human being yet. I never saw a recruit, for example, who was not apt to exhibit a deucedly near "unmanageable" propensity to "walk right" away from a battery, when ordered up to the charge, as fast as legs could carry him; or a raw tar who didn't look like betaking himself to the run, when the enemy's ports belch out in flame and smoke, as he glides up a beam for the good, old fashioned ding-dong set-to. So I retrograded slowly—walking backwards with stealthy steps—and watching fixedly for any movement on its part. Heavens! how gruesome it became during those long moments of suspense! The skeleton lankiness of those far reaching arms, and of that out-flung leg; the long, narrow robe of glittering

white, that fell from crown to heel, like a shroud; the awful, superhuman statue, remain impressed upon my memory with a vividness that can still reproduce the chills that crept up and down my youthful spinal marrow whenever I think of it. By degrees I began to note that the gaze of the colossus was steadfastly fixed in a direction away from me. Words cannot convey the relief I experienced as this discovery dawned upon me. With it, too, came a renewal of hope; and a partial restoration of the courage of which I stood so sadly in need. "I can get home, after all," I said to myself; "I can just leave the road right here, cross the corner behind it, and fetch out on the main-road 'way past it, and then won't I leg it for dear life! But O-o-o-o-o, if it *should* happen to look round when I'm out there in the clear starlight! Nevertheless, I determined to attempt it. Still cautious, however, I went on all-fours, crept out of the road, *through* the fence—for my life I durstn't think of climbing it—rose to my feet, and struck a bee-line across the lot at the best pace I could get up in the fresh and unbroken snow. Neyer was an enemy's rear more successfully turned. Not once did the monster change his fixed line of outlook. I reached the other fence, which emboldened by success, I leaped with much bravado, and found myself safe on the straight road home, the lights wherof gleamed encouragingly in the distance. On that well-beaten track, I picked up my heels and ran till I had well entered the outskirts of the town, putting a good three quarter mile between me and the goblin sentinel at the lone and gloomy turning.

How vast a difference in the seeming of things, by night and day. As I neared the haunted corner on Monday morning in the strong ruddy light that precedes sunrise, an aspect of cheerfulness had displaced the gloom and horror of Saturday night. The bright green of the pines alone, would have given life to a dozen landscapes, while the sleety covering of the old, familiar trunk of the lightning blasted birch at the cleared corner, was overlaid with a flashing diamond net work from Jack Frost's beautifying fingers. That poor old lonely ruin of a once magnificent tree—there hung a pathos about its thunder-scarred bole, and piteously out-flung arms, that never failed to touch my childish heart, and win from my pensiveness a moment's regard of pity and wonderment; and lo! this morning, a new feature added to my old familiar *ensemble*. A pole—a fence pole—reared against its lofty side; the work, doubtless, of some boy, who aspired to reach the snow-cushioned top of the broken column, but must have found his improvised ladder all too short, for the rounded swell of the cap of snow was everything intact. But that fence-pole was a revelation! I said some naughty words and flew at it like a wildcat; I kicked it down; I kicked it ignominiously clear across the road; and know not how much farther I should have kicked it, but that I discovered that my toes were getting the worst of it. That single, unfamiliar feature in the gloom of night, had been the means of "scaring me out of a year's growth."

For Forest and Stream.

MASCULINE HOUSEKEEPING AND QUAIL SHOOTING.

IT is the year of our Lord 1876; Thanksgiving is just two weeks ahead; the wife and the babies have flitted home to the grandpa's—shall take my Thanksgiving dinner with them; meanwhile I am to board myself, a very simple matter. Any man of ordinary intelligence can do the cooking for one with very little trouble, and live like a prince besides. Many invitations to dinner and supper have I had—I respectfully declined them all. The next morning I waited for the milkman before getting up. Slowly eight o'clock came, and then nine o'clock—no milk for coffee. I got up, put it to stewing over the gas, and drank it without milk—coffee and crackers is not a bad breakfast. I don't care much for breakfast anyhow. Just as I had finished the last mouthful, Mr. Schneider, the milk provider, came around. With much trouble I hunted up a tin pan wherein to put it, finding in my researches two pans nearly full—had a good supply ahead. Dinner time came. The butcher's is but a step—ten cents in sausages will make me two meals, nutritious and easily prepared. Filled the kitchen stove up with charcoal to get it well going; put half the sausages into the spider and set them to frying; then went to pulling potatoes, about a peck of which I found in the cupboard ready boiled. The sausages soon began to sizzle and splutter. I stirred them, and they spluttered worse than ever. I took the carving knife and speared a hole in each one of them—no improvement; moved the potatoe business out into the woodshed. The sausages commanded the four points of the compass and all the kitchen. I calmly peeled potatoes and let them splutter, bound to have sausages for dinner since I had set about it, and bound to have them cooked, too. Potatoes peeled; taking the wash-boiler cover for a shield, I managed to set them to cooking in the other spider; put a mince pie in the oven; sat down in a crack of the woodshed door to watch progress and to study a little.

How do the women-folks manage about the splutter? I never noticed any grease spots upon the kitchen ceiling before. Couldn't they be packed in tin cases? A sure remedy, if they wouldn't bend up. Tied a fork to the hoe-handle, and fished them out one by one. They were very well done upon one side. Directed my attention to the potatoes, which appeared to have grown to the bottom of the spider. I spaded them up with a knife, and soon they were upon the table with the sausages.

Had an elegant dinner—brought on the mince pie for

dessert. It was in a condition to suit all tastes—hot upon the top, ice-cold upon the bottom. For supper, tea cooked in the oyster pail and crackers. Don't have to bother about feeding the cat; can gauge her appetite by the depth of the milk in my three milk pans.

Second day.—Breakfast, coffee with milk and crackers. Looked forward with dread to dinner-time; but it came, and I went to work. Put a mince pie in the oven; put on the potatoes in a basin; set the remaining sausages to spluttering in spider No. 3—the last one I had—and made rapid tracks for the woodshed, to meditate upon how I should ever clean those three greasy spiders. Ate my dinner, found the mince pie almost warmed through—think about a week in the oven would have improved it—put all the spiders upon the stove, filled them up with hot water, opened all the draughts, and soon they were all boiling. Of course the grease would rise to the top, and I could pour it off—nothing more simple; but, alas! it wouldn't do it. Three times did I fill them up, and boil and pour off, and still the sides and bottoms were as oily as the top of the stove or the kitchen floor. Wonder if potash wouldn't do it; didn't feel like further experiment. Supper time came—a happy thought struck me—"oysters!" Anybody can cook oysters; no grease—no splutter. Went over and got a can of "selects"; took half of them raw with crackers and butter; didn't care for tea with the bother of making it. The next morning set the remaining oysters to cooking in the oyster pail over the gas; when they appeared to be done, poured them out, rinsed out the pail, put in my coffee, placed it over the flame and set down to the oysters. Raw oysters are good; stewed are rot bad; but, oysters half cooked! shades of Soyer and Professor Blot, have pity on us! The oyster pail was occupied, so could not re-cook. Pussy took the oysters and enjoyed her breakfast. I didn't do either—crackers and coffee, with a flavor of oyster, and dinner ahead. I was discouraged. The kitchen table was covered with dishes that had been used. No room to put another, and none to put if there had been. Had left just three clean glasses and the soup tureen. The stove was covered with spiders and things; had to wear rubbers* whenever I went into the kitchen to avoid slipping down. I went out to dinner and to tea, and took every invitation seriatim; and when I hadn't any, subsisted upon crackers and water. Something wrong about the milk; kitty wouldn't drink it, and she went to the neighbors for her meals. Warily approached the time for the railroad ticket and the night ride, and the meeting with the wife and little ones; and last, not least, came the Thanksgiving dinner, which I was in an excellent condition to appreciate.

On Friday morning, S. E. J. having made arrangements the evening before, young Steele came around with his top buggy and his blind horse. I borrowed Wilson's pointer, Sam, and we drove out merrily to Mr. Case's. Mr. C. was not at home, so we put the horse in the barn and called upon Mrs. C., who was much pleased to see us, and said "we must be sure and come around to dinner—had a turkey all dressed that she would cook for us." We were thankful, but we had our lunch with us, and could not promise to be around anywhere at any given time. We turned down across the flat and through the tamarack swamp—of old a great place for quail, and things now civilized so much that we did not strike a sign of game—up the creek about a mile to the next swamp, a strip ten rods wide, elms, alders and weeds, high ground upon the left, the creek upon the right. We swept through, starting three partridges, which I missed—a good double shot. Sam had given no warning. Why I missed them I know not, except that I did not hold straight. One went ahead—the others over the hill; started the one again in the thickest and swamiest place there was, covered him well and fired away with No. 10. He did not come down, much to my surprise. The charge must have struck him square, but Steele, who was some distance behind me, and could see over, said "he saw him fly ahead into the open." We hunted out the rest of the swamps, and then went after the dead bird. There was a buckwheat stubble near the spot where he fell, and Steele, who was ahead, walked into a large bevy of quail—twenty or more—killed one at ten feet, missing the second barrel; the rest went into the swamp. I went after them, floundered around in the mud and alders for an hour, flushed one bird, and started one rabbit, which would have jumped over Sam if he hadn't got out of the way. Could have killed dog and rabbit at one shot, but didn't think best. S. E. J. and Steele were calling to me outside, and I went to them. They had found the partridge where Steele had seen him roll over. Going to pick him up he rose, and away he went over the open, and dropped in a very narrow strip of alders by the creek. We went over with the dog, but though they had marked the exact spot we could not find him. Half a mile further some went over a large wheat stubble, not finding anything; but Steele, who crossed a corner that we had not crossed, started a bevy of seven or eight quail. They went into a small swamp, where we followed. We flushed three, of which I killed one, missing the second; could not find the others and gave them up.

Now one o'clock. We ate our lunch—were disgusted—two quail from two bevies. Sam had not been worth a copper; so far he had not found a bird. We then explored a large flat covered with grass. Sam, who appeared to have waked up at last, took a trail, followed it up sixty rods out of the grass, and into a mud field near a barn, where he came to a point. I flushed the birds, getting one with each barrel; the others turned down towards the flat, and flying to the further side dropped in the grass. There we followed them—they gave no scent; we had to walk

three abreast, and tramp them up one by one. I killed them all one after the other, except two who flew across a pond near by—twenty rods in diameter—and into some alders. One of my dead birds fell in the middle of the pond upon the ice, which would not bear the dog, and there after many fruitless efforts for his recovery we had to leave him. I went after the two, flushing one of them. I fired at him; he did not stop, and flew directly back across the pond towards S. E. J., who marked him in the open grass. "There," said S. E. J., "he lies in a direct line between me and that old stump." We searched carefully—no quail. S. E. J. took the bearings again. I walked forward according to his directions. "Stop! now he is not ten feet from you." I threw down my cap to mark the spot, and we hunted dilligently. At last Sam came to a point. I put my hand in the grass, and there was Mr. Quail nearly dead. My cap was just three feet distant. We now had thirteen quail; had lost one out of this bevy; felt encouraged. I proposed that we go straight back to the two first bevies, and see whether they could outgeneral us a second time. We struck the small swamp where bevy No. 2 had taken refuge. Sam took the scent and started five out of a small thicket. I got two of them; the rest dropped near a fence, a few briars and alders. We surrounded them. When flushed they all came my way, and I killed them every one. Sam started another wild, not near us; he flew over the open meadow and out of sight. We then went back to bevy No. 1. Steele started six upon the stubble, where they were at first using both barrels. They went into the swamp, and I after them. By good luck I ran into the rest of the bevy, which rose in very thick cover. I fired at the sound, dropping three; the rest, eight or ten, flew towards the outer edge, most of them well outside. S. E. J. and Steele came down, and for about three minutes it rained quail. Every bird that started rising high, to get back to the swamp, went down dead. At the cry of "mark!" S. E. J. and Steele would come to the present arms, but they did not fire a shot. The six which Steele had started we could not find. As we passed through the swamp upon our return, I killed a partridge and a rabbit. At four o'clock were back at Mr. Case's—twenty-nine quail, one rabbit, one partridge. ALIQUIS.

For Forest and Stream.

AN ADVENTURE WITH ALLIGATORS.

THE following incident, which occurred during my sojourn in Marion Co., Fla., last winter and spring, has been laughed over many a time since by the participants. We had built a flat-bottomed boat some 10 feet long by 2½ feet wide, and started with it in an ox cart for the ponds two miles north of the plantation. Mr. Smith the planter, managed the team, the Deacon and myself managed the boat, Mr. Willis managed the Allen breech-loaders and the oxen. Well, they managed to run the cart over about every fallen tree in the woods, but did not manage to tip us out.

Our object was to obtain the body of a certain alligator "mortally rifled" by your correspondent about two weeks previous, whose fast-decaying carcass lay belly up in the middle of one of the aforesaid ponds.

As we neared the first and smallest of the ponds Mr. Willis, him of the breech-loader, desisted, with the assistance of a powerful opera glass of the double-barreled kind, supplemented by a still more powerful glass of the single-barreled kind, a little orphan alligator sunning himself on the sloping trunk of a tree in the pond.

Mr. W. cautiously approached the water's edge under the protection of the dog fennel (which abounds around the borders of all these ponds) and blazed away. The "gator" fell *kerchunk* into the water, and we who had been anxiously waiting and watching hurried forward with the team and launched the boat; the Deacon assuming command, also acting as crew and all hands. He soon had the noble saurian (?) (he was just thirty inches long) aboard, but found he wasn't quite dead by a good deal; however, he appeared disposed to be quiet, so the Deacon started for the other side where we were to drag the boat across a narrow neck of land to the next pond.

As he was quietly paddling along he saw something move in the moss close by, and out popped the head of another "gator." The Deacon is not naturally belligerent, but to have that "gator" stick his head up and wink at him as he did was too much for the staid Connecticut Deacon; so he went for him with the paddle, and sometimes he hit him and then again he didn't; the boat danced around threatening to upset every moment, while the audience on shore alternately cheered and cautioned. The conflict soon ended by the "gator" showing signs of weakening, and he was lifted into the boat by his tail. The Deacon then paddled ashore and we hauled the boat over to the other pond, when I took a seat in the stern armed with a long pole, in one end of which was an iron hook.

We soon arrived alongside my dead "gator," and I fastened the hook in his jaw preparatory to towing him ashore. Hitherto the two "gators" in the boat had not been very troublesome, though both were alive, but the stench which arose from the body of their dead brother in tow seemed to act as a powerful restorative, and they immediately manifested a disposition to be ugly, in fact, they endeavored to intimidate us. We didn't want to lose our dead and we didn't want to lose our living, nor be *charmed* up by them either, so we compromised by giving the larger one (about five feet long) the outside of the boat, while the Deacon and myself, with the smaller one, retained the inside, and in a few moments reached the shore with our

dead, upon the jaws of which we forthwith performed a dental operation that we might have some kind of trophy to show succeeding generations how their ancestors escaped from the jaws of—an alligator.

This one which I shot measured seven feet in length, but if I had not been able to get him ashore he would have been a twelve-footer to this day. A. A. MOWRY.

OLD TIMES IN MAINE.

CALAIS, Maine, Dec. 12th, 1876.

EDITOR FOREST AND STREAM:—

I was reading to day in your issue of August 10th, 1876, "Moosehead Lake and Vicinity Twenty-five Years Ago," and I wished to bear my testimony to the truth of the picture the writer presents of the plentifulness of moose and other game in that section at the time of which he writes. Having spent seven winters, from 1845 to 1853, in the woods not far from Moosehead Lake, and having seen hundreds of them, some alive and some dead, I can testify that his account is true.

I know that about that time moose meat was sold in the spring of the year at one and a half to two and a half cents a pound, and moose hides sold for one dollar and a half each. Very well do I remember the landlord of the Mt. Kineo House at that time, H. G. O. Barrows, and his son Joe, who acted as your correspondent's guide when he shot the bear; but I wondered why he did not mention mine host's daughters, who should have attracted your correspondent's attention from their grace, beauty and weight, being perfect "chips of the old block."

Neither must I forget to mention "Uncle Ellis," who was known far and wide as a hunter, and of what he did not know about a moose it would be hard to find his tutor; unless old Uncle Lyford excelled him, which was doubtful. Uncle Lyford taking more to bears and bear hunting. Full well do I remember both Ellis and Lyford. I had a brother whose delight it was to imitate Uncle Ellis in hunting and dress, and who was always known by the *soubriquet* of Uncle Ellis. J. E. G.

Fish Culture.

CARP AND SALMON FOR MARYLAND.—By the steamer Leipzig, now over due at Baltimore, the U. S. Fish Commissioners will receive a lot of carp of superior excellence, imported at the instance of the United States Government from ponds bordering on the Danube, in Hungary, which will be transferred to the ponds at Druid Hill Park to "increase and multiply," when they will be distributed in the ponds of Maryland and other States. The carp are in charge of Mr. Rudolph Hessel, an eminent pisciculturist. Regarding this importation, and also as to the distribution of salmon and other fishes in Maryland, we find the following in the Baltimore Sun.

The carp is regarded as the most valuable of all kinds of fish for stocking ponds, because of their quick growth and great increase. They are peculiarly adapted to mill ponds and to the still waters of the flat regions of the eastern shore. It is highly prized as a food fish, and has pre-eminence over black bass, trout, grayling, &c., on account of being a vegetable feeder, and although not disdaining animal matter can thrive very well upon aquatic vegetation alone. They have the advantage over the salmon and herring families in being able to live in warmer and more stagnant waters, and in fact can live for a time without any water. The flesh is firm and flaky, and almost equal to the European trout. The importation was ordered by the United States Fish Commissioner, Spencer F. Baird, at the request of Major Thomas B. Ferguson, Maryland Fish Commissioner. Mayor Latrobe, who is greatly interested in fish hatching, yesterday visited the carp ponds prepared near Crow's Nest, Druid Hill Park, and states that they are now ready to receive the fish. The United States fish commissioner has recognized the fishery at Druid Hill Park as peculiarly adapted for hatching this variety of fish. It is thought they will breed in the coming spring. Two importations of carp were made in 1875, but of an inferior kind. Unfortunately, on account of hot weather and overcrowded tanks all but 22 died on the voyage. Subsequently all died but eight, and from this small number several thousand have already been hatched, and will be distributed in the ponds of the State during next year. They rapidly attain a weight of twelve or fifteen pounds, and are also ornamental, being of a rich golden color.

Some two or three hundred yards from the carp ponds, and between that and Garrett's bridge, is the hatching house and four ponds used for propagating and keeping fish of the salmon family, which spawn during the winter. Operations this fall have been on an unusually large scale, and have been most successful. Over a million of young California salmon have been hatched, and all but about 300,000 have been distributed by Major Ferguson and his assistants, with considerable labor, in the waters of Maryland and Virginia. Up to November 22d last the distribution was mentioned of 394,300 small fish at various points in the Gunpowder, Patapsco, Monocacy, Susquehanna, Patuxent, North Patapsco, Potomac, and Conococheague rivers. From November 22d to the present date, the distributions have been as follows: 16,000 in Bohemia, above Bohemia bridge, Cecil county; 28,300 in Sassafras, above Fredericksburg, Kent and Cecil counties; 83,200 in North Branch Potomac, near Fort Pendleton, Garrett county; 30,000 in Western run, near Cockeysville, Baltimore county; 30,000 in Patuxent, near Laurel, Howard county; 12,000 in Nanticoke, near Federalsburg, Dorchester county; 13,000 in Nanticoke, near Seaford, Del.; 10,000 in Pocomoke, near Crisfield, Somerset county; 30,000 in Pocomoke, near New-town, Somerset, and Worcester counties; 12,000 in Tuckahoe, creek, near Hillsboro', Talbot and Caroline counties; 13,000 in Choptank at Greensboro', Caroline county; 71,000 in the Potomac river, near Point of Rocks; 25,000 in Chester river, near Millington, Kent and Queen Anne's counties, and 25,000 in Elk river, near Elkton, Cecil county. Besides these Commissioner Ferguson has hatched and shipped and deposited in Virginia waters, on account of the United States fish commissioner, 12,000 in Cedar creek, a tributary of the Shenandoah; 37,000 in the Shenandoah at Strasburg; 40,000 in the Shenandoah at Mt. Jackson; 50,000 in Goose creek, Loudoun county; 5,000 in Bull's run, and 10,000 in Broad run, both tributaries of the Occoquan, making in all a total distribution from Druid Hill Park hatching house

of 950,800, and leaving about 300,000 to be distributed during this month. The young salmon will become adult in four years, and will then be allowed to be caught.

Mr. Ferguson has also 30,000 eggs of Lake Erie herring, and will shortly have a quantity of brook trout and salmon trout eggs from New Jersey and Michigan waters. There are now in the ponds fish of one and two years growth, of California, Landlocked and Maine salmon and salmon trout. It is very interesting to see them feed, and the hatching-house is always open to the public. The most of the visitors to the park go to see the fishery, and very many strangers. One of Capt. Cassell's assistants says 341 persons visited the hatching-house one day; he kept a record and it was not a good day neither.

QUEER FISH AT THE AQUARIUM.

No doubt there are queerer fish in the sea than ever came out of it; but some of those that have already been collected for the Aquarium excite a great deal of wonder. Last week we illustrated two of these, from cuts kindly loaned to us by Prof. Wm. C. Coup, the Manager; and we are now again indebted to him for these queer fish below. We will not vouch for the "hell-bender" being a fish, but what the naturalists know of him is herewith stated:—

The *Menopoma Alleghaniensis*, or Hell-bender, as its name indicates, is found in the Alleghany river and other tributaries of the Ohio. It is also known as the salamander of the Alleghanies. The specimens shown in tank were presented to the Aquarium by the Buffalo Society of Natural Sciences, through its Secretary, Mr. A. R. Grote. This gentleman records, in the *American Journal of Science*, the interesting fact that this animal sheds a transparent membrane, which he believes to be the exterior layer of the skin. While observing one in the Aquarium of the Buffalo Society of Natural Sciences, an almost complete skin, all the feet and toes being readily perceived, was seen floating in the water, and later the creature was discovered in the act of swallowing his former covering, a practice which has also been observed in the toad. In a recent communication Mr. Grote describes this operation of shedding the skin, from which we learn that this thin and transparent membrane is first seen to loosen and separate from the entire surface of the body, appearing at this stage like an envelope or glove in which the animal is contained. By a number of wide gapings, during which the mouth is opened to the fullest extent, the skin is parted about the lips, and

COMMON STICKLEBACK.

then commences to fold backward from the head. Convulsive and undulating movements with the body and fore legs are employed to extract these from the loose skin. The skin then readily falls backward, as the animal crawls forward and out of it, until the hind legs are reached, when the menopoma turns round upon itself, and, taking the skin in its mouth, pulls it over the legs and tail. The operation reminds one of taking off clothes. The cast off skin is retained in the mouth and finally swallowed. The operation is quickly performed. The visitor who watches the menopoma, will observe a swaying motion of the body; this action is not yet fully accounted for, though it is possible that it is connected with the animal's desire to rid himself of his ugly skin.

A female hell-bender opened on the 21st of August contained well developed eggs attached by a membrane to the ovary. These eggs are laid in a connected string, and are deposited along the muddy banks of the river.

The two specimens of hell-benders now on view are worthy of special study, and, as in many other cases, we would advise those interested to view them as soon as possible, as already the confinement of the Aquarium has resulted in the death of one rare creature of this class.

The peculiarity of the *Gasterosteus Pungitius*, or common Stickleback, is its nest and mode of livelihood. It is found in ponds, streams, and rivers, and appears equally suited to salt water. It is extremely voracious. An observer, once standing by the side of an ornamental lake, saw a young frog hopping past. He threw it in a short distance to exhibit its powers of swimming to a young bather, anxious to learn the art. The moment it reached the surface of the water, a flash of light seemed to be emitted from the bottom. It was caused by a shoal of Sticklebacks, which pounced upon the unfortunate frog with great fierceness. In a few moments the four legs of the poor creature were eaten away, and new shoals came hurrying from more distant parts of the lake to the prey. The battle that took place round the victim was as desperate as could be imagined. Though pelted at with bits of gravel, they would not leave it, but continued to nibble and battle among themselves as long as a particle remained. This instance of voracity is, however, not surprising, for they do not hesitate to devour one another. An illustrated description of the Stickleback appeared in the first number of the *Aquarium Journal*.

AN AUTOMATIC FISH-FEEDING APPARATUS.

Mr. Otto Hammerle, of Dornbirn in South Austria, has invented a fish-feeding machine with automatic action, and a two years' trial of the same has been attended with such satisfactory results, that he feels justified in recommending it to the notice of brother pisciculturists. The apparatus is actuated by an overshot water wheel supplied from a small cistern above, and the axle of the wheel in question is furnished with a pair of mitre-wheels working on an upright spindle in the food chamber. A metal stirrer attached to this spindle keeps the food (finely chopped meat, liver, &c.) in the tank constantly moving. At the extreme end of the axle will be noticed a worm working on a worm-wheel, which has a tappet or projection on one of its arms. The tappet, in revolving, strikes the upper end of a lever, and by so doing opens a valve at its lower end, and thus allows a certain quantity of food and water to escape at short regular intervals from the food chamber into the pond or basin below. The frequency with which the valve opens in a given time depends on the number of teeth in the worm-wheel and on the velocity the water-wheel is driven at, and the latter can be regulated by letting on more or less water at the cock. At Dornbirn a lin. supply pipe furnishes a sufficient quantity to propel the apparatus at the proper speed, and the valve opens at about every sixtieth revolution of the water-wheel.

As to the two pipes issuing out of the cistern, while the one feeds the receptacle below, the other supplies a stream of water to keep its outside—more particularly that portion of the tank near the valve, and the valve itself—free from particles of meat and other food.

The water in the food chamber should be kept always at about the same level, the quantity delivered by the supply pipe being equal to that discharged on the opening of the valve.

Respecting the position of the apparatus, when circumstances allow, it is best placed a foot above the surface of the water of the feeding pond or basin; and, needless to add, the apparatus will require lubricating from time to time, and must be kept perfectly clean.

To allude, in conclusion, to what Mr. Hammerle regards as the chief advantages connected with the above simple mechanism, they are briefly enumerated as follows:

The apparatus, by allowing but a small quantity of food to reach the fish at a time, and delivering it at short intervals, causes the same to be entirely, or almost entirely, consumed; prevents the fish (as they are apt to do when hand-fed), from alternately gorging themselves and fasting for an over-long period; gives the weaker specimens a better chance of obtaining their share of the nourishment; and, thanks to these two last-named results, produces in the finny stock a quicker growth and greater uniformity of size. The employment of the machine effects an economy not only of food, but also of time and labor in its distribution; and, as particles of meat, &c., but rarely fall to the bottom (and by decomposing pollute the water) of the pond, the latter does not require to be cleaned out so frequently as would otherwise be necessary.

A further incidental advantage in using Mr. Hammerle's apparatus is, that the water which propels the overshot wheel becomes, in falling, thoroughly impregnated with air before entering the pond below. For pisciculturists dependent partly on well water, or on spring water rising in the immediate neighborhood, and therefore deficient in oxygen, this aerating process is a matter of no little consequence. At Dornbirn the machine has been chiefly turned to account in feeding young fry destined for stocking different streams and rivers; it will be found equally or even more serviceable, however, where the main object in view is to grow fish to a marketable size in ponds or water-courses on the spot.—*T. S., in London Field.*

A CUNNING FOX CAUGHT AT LAST.—A farmer of York, Pa., recently set a trap to catch a cunning fox which had been annoying him considerably by its midnight visits among the poultry. At fourteen successive visits to it he found the trap sprung, a stick of wood between its jaws and the bait eaten up. The circumstance, so often repeated, surprised him. There was no other tracks to be seen but his own and those of the fox, and who sprung the trap was a question that puzzled him sorely. By continuing to rebait his trap he hoped to catch the author of the mischief. On the fifteenth night he found a fine old fox hung to it by the nose, and in his mouth was a stick of wood!

What a very foolish fox this was, not to have taken a longer stick in his mouth and so saved his nozzle. He must have been a "young-un", a "green horn" I vow! Try again. York, Pa.

But this story, like most fox stories has a moral—it is, that men like foxes often get caught in their own folly.

—A proclamation appears in the *Canada Gazette* that the Government have caused to be struck for circulation in the Dominion a new bronze cent. The effigy of the Queen, with the words "Victoria Dei Gratia Regina, Canada," is on the obverse, and on the reverse the words "One Cent," with the date, 1876, within a beaded circle surrounded by a wreath of maple leaves. This coin is to be a legal tender to the amount of twenty-five cents in one payment.

Natural History.

ADDRESS OF A. R. WALLACE BEFORE THE BRITISH ASSOCIATION

RISE AND PROGRESS OF MODERN VIEWS AS TO THE ANTIQUITY
AND ORIGIN OF MAN.

Continued.

IT is a curious circumstance that notwithstanding the attention that has been directed to the subject in every part of the world, and the numerous excavations connected with railways and mines which have offered such facilities for geological discovery, no advance whatever has been made for a considerable number of years in detecting the time or the mode of man's origin. The Paleolithic flint weapons, first discovered in the north of France more than thirty years ago, are still the oldest undisputed proofs of man's existence; and amid the countless relics of a former world there has been brought to light no evidence of any one of the links that must have connected man with the lower animals has yet appeared.

It is indeed well known that negative evidence in geology is of very slender value, and this is, no doubt, generally the case. The circumstances here are, however, peculiar for many converging lines of evidence show that on the theory of development by the same laws which have determined the development of the lower animals, man must be immensely older than any traces of him yet discovered. As this is a point of great interest we must devote a few moments to its consideration.

1. The most important difference between man and such of the lower animals as most nearly approach him is undoubtedly in the bulk and development of his brain as indicated by the form and capacity of the cranium. We should therefore anticipate that these earliest races, who were contemporary with the extinct animals and used rude weapons, would show a marked deficiency in this respect. Yet the oldest known crania—those of the Engis and Cro-Magnon caves—show no marks of degradation. The former does not present so low a type as that of most existing savages, but is—to use the words of Professor Huxley—"a fair average human skull, which might have belonged to a philosopher, or might have contained the thoughtless brains of a savage." The latter are still more remarkable, being unusually large and well formed. Dr. Pruner-Bey states that they surpass the average of modern European skulls in capacity, while their symmetrical forms, without any traces of prognathism, compare favorably, not only with the foremost savage races, but with many civilized nations of modern times.

One or two other crania of much lower type, but of less antiquity than this have been discovered; but they in no way invalidate the conclusion which so highly developed a form at so early a period implies, viz.: that we have as yet made a hardly perceptible step toward the discovery of any earlier stage in the development of man.

2. This conclusion is supported and enforced by the nature of many of the works of art found even in the oldest cave dwellings. The flints are of the old chipped type, but they are formed into a large variety of tools and weapons, such as scrapers, awls, hammers, saws, lances, etc., implying a variety of purposes for which these were used, and a corresponding degree of mental activity and civilization. Numerous articles of bone have also been found, including well-formed needles, implying that skins were sewn together, and perhaps even textile materials woven into cloth. Still more important are numerous carvings and drawings representing a variety of animals, including horses, reindeer, and even mammoth, executed with considerable skill on bone, reindeer horns and mammoth tusks. These, taken together, indicate a state of civilization much higher than that of the lowest of our modern savages, while it is quite compatible with a considerable degree of mental advancement, and leads us to believe that the crania of the Engis and Cro-Magnon are not exceptional but fairly represent the characters of the race. If we further remember that these people lived in Europe and under the unfavorable conditions of a sub-Arctic climate, we shall be inclined to agree with Dr. Daniel Wilson, that it is far easier to produce evidences of deterioration than of progress in instituting a comparison between the contemporaries of the mammoth and later prehistoric races of Europe or savage nations of modern times.

3. Yet another important line of evidence to the extreme antiquity of the human type has been brought prominently forward by Prof. Mivart. He shows by a careful comparison of all parts of the structure of the body, that man is related not to any one, but almost equally to the many existing apes—to the orang, the chimpanzee, the gorilla, and even to the gibbons—in a variety of ways; and these relations and differences are so numerous and so diverse that on the theory of evolution the ancestral form which ultimately developed into man must have diverged from the common stock whence all these various forms and their extinct allies originated. But so far back as the Miocene deposits of Europe we find the remains of apes allied to these various forms, and especially to the gibbons, so that in all probability the special line of variation which led up to man branched off at a still earlier period. And these early forms, being the initiation of a far higher type, and having to develop by natural selection into so specialized and altogether distinct a creature as man, must have risen at a very early period into the position of a dominant race, and spread in dense waves of population over

all suitable portions of the great continent—for this, on Mr. Darwin's hypothesis, is essential to rapid developmental progress through the agency of natural selection.

Under these circumstances we might expect to find some relics of these earlier forms of man along with those of animals which were presumably less abundant. Negative evidence of this kind is not very weighty, but still it has some value. It has been suggested that as apes are mostly tropical, and the anthropoid apes are now confined almost exclusively to the vicinity of the equator, we should expect the ancestral forms also to have inhabited these same localities—West Africa and the Malay Islands. But this objection is hardly valid because existing anthropoid apes are wholly dependent on a perennial supply of easily accessible fruits which is only found near the equator, while not only had the south of Europe an almost tropical climate in Miocene times, but we must suppose even the earliest ancestors of man to have been terrestrial and omnivorous, since it must have taken ages of slow modification to have produced the perfectly erect form, the short arms and the wholly non-prehensile foot which so strongly differentiate man from the apes.

The conclusion which I think we must arrive at is, that if man has been developed from a common ancestor, with all existing apes, and by no other agencies than such as have affected their development, then he must have existed in something approaching his present form during the Tertiary period—and not merely existed but predominated in numbers wherever suitable conditions prevailed. If then continued researches in all parts of Europe and Asia fail to bring to light any proofs of his presence it will be at least a presumption that he came into existence at a much later date, and by a much more rapid process of development. In that case it will be a fair argument, that, just as he is in his mental and moral nature, his capacities and aspirations, so infinitely raised above the brutes, so his origin is due to distinct and higher agencies than such as have affected their development.

There is yet another line of inquiry bearing upon this subject to which I wish to call your attention. It is a somewhat curious fact that, while all modern writers admit the great antiquity of man, most of them maintain the very recent development of his intellect, and will hardly contemplate the possibility of men equal in mental capacity to ourselves, having existed in prehistorical times. This question is generally assumed to be settled, by such relics as have been preserved of the manufactures of the older races, showing a lower and lower state of the arts, by the successive disappearance in early times of iron, bronze and pottery; and by the ruder forms of the older flint implements. The weakness of this argument has been well shown by Mr. Albert Mott, in his very original but little-known Presidential Address to the Literary and Philosophical Society of Liverpool in 1873. He maintained "that our most distant glimpses of the past are still of a world peopled as now with men both civilized and savage," and "that we have often entirely misread the past by supposing that the outward signs of civilization must always be the same, and must be such as are found among ourselves." In support of this view he adduces a variety of striking facts and ingenious arguments, a few of which I will briefly summarize.

On one of the most remote islands of the Pacific—Easter Island—2,000 miles from South America, 2,000 from the Marquesas, and more than 1,000 from the Gambier Islands, are found hundreds of gigantic stone images, now mostly in ruins, often thirty or forty feet high, while some seem to have been much larger, the crowns on their heads cut out of a red stone being sometimes ten feet in diameter, while even the head and neck of one is said to have been twenty feet high. These once stood erect on extensive stone platforms, yet the island has only an area of about thirty square miles, or considerably less than Jersey. Now as one of the smallest images eight feet high weighs four tons, the largest must weigh over a hundred tons, if not much more, and the existence of such vast works implies a large population, abundance of food and an established government. Yet how could these co-exist in a mere speck of land wholly cut off from the rest of the world? Mr. Mott maintains that this necessarily implies the power of regular communication with larger islands or a continent, the arts of navigation, and a civilization much higher than now exists in any part of the Pacific. Very similar remains in other islands scattered widely over the Pacific add weight to this argument.

[To be continued.]

For Forest and Stream.

HABITS OF BLACK BASS OF THE POTOMAC.

BEING on a committee to observe the habits of the "Micropterus Salmoides," I send you the result of my observation, as perhaps interesting to some of your readers. The facts noted are only such as an angler would be likely to note and I regret that my knowledge of Natural History is not extensive enough to give a more accurate report. Black bass are not taken in such numbers in the Potomac at this point now as formerly, but are still numerous enough to afford average sport during summer and autumn, and furnish cheap food to a not inconsiderable number of people. They are increasing in Goose Creek, a tributary of the Potomac, and in the small streams flowing into it. This increase will probably continue until their minnow-food gets scarce when the usual retrograde, as to number, will occur as has happened elsewhere. Considerable numbers are taken near the mouths of the branches flowing into Goose Creek, in the creek itself and the river,

with live bait and with the fly. The largest have been caught in the river; those of the creek are smaller as a rule, but not despicable in size, while those in the branches are the smallest of the three. The largest bass captured in the river weighed six pounds and over. The largest in the creek about four pounds; and one of a pound in a branch would be a "big fish." I have no doubt from observations of ova taken from bass of different sizes and at different times, that bass here spawn throughout spring and early summer, prolonging their labors according to the depth of water, &c., in their several sub-districts so as to give instances of spawning as early as March and as late as the 15th of June. I have examined the ova of five or six different sizes of bass ranging from six to eighteen or twenty inches, and found in November, the eggs separately discernible and equally developed in all, though the sacks were of course of various sizes. The ova mentioned above were about as large as blunt pin points, and, I think, would be ready to flow in the last part of February, certainly by the 1st March. The earliest caught last season were taken in May; the latest in the latter part of November. Anglers stop fishing here in December, but I believe bass could be taken even in that month if trial were made. The earliest taken with the fly were taken on 1st of June; the latest, by that means, in November. They can be taken with the fly from June 1st till December, whenever the water is clear enough for the fish to see the fly, and not so clear as to make apparent the angler. They retire to deeper waters as the weather gets cool and are often taken thence with live bait, hellgramites, &c. They may be captured with the fly even in cool weather on the edges of deep pools long after they have deserted the shallows proper. Bass weighing over three pounds have been killed with the fly, and bass of over six pounds with the live minnows. Maj. T. B. Ferguson has killed three at a cast on several occasions and their gameness is unquestioned, both in seizing the lure and in the consequent struggle. To sum up, the bass spend the winter in the deepest waters—begin to ascend the streams in early spring—spawn in spring and summer, and are in their best condition in autumn. The main army have finished the labor by the middle of June. The open season ought to be, in this locality, from 15th June to 1st December until more accurate data may be gathered of their habits. Their food consists of worms, larvæ, flies, beetles, grasshoppers, crickets, and small fish of all sorts. They are very voracious, fierce, and strong. In a good pool they can leap vertically several feet. They have been found above dams four or five feet high after being put in below such structures. The artificial flies most taking with these scaly citizens are the "Ferguson fly," tied by Abbey & Imbrie, red, brown, and ginger hackles and hackles brown and black together. Of the winged flies, the coachman with white wings, flies with peacock herl body, ginger hackle and yellowish white wings with red streaks and red antennæ have been most killing. Most of the "bass flies," sent from the tackle stores are entirely too large and ordinary trout flies tied on Aberdeen and on Sproat hooks of small size are much more effective than the so-called bass flies of the stores. I inclose a very roughly tied fly as a specimen of what takes their fancy here. I call it the "Academy." The commonest caterpillar here in November is black and reddish brown; hackles like it are quite taking.

Leesburg, Va.

NOTE.—Our Angling friends will feel indebted to our correspondent for these very full and well timed notes.—Ed.]

THE RARER BIRDS OF WESTERN, NEW YORK

BY J. B. GILBERT.

THE following list is sent us through Mr. H. G. Fowler, whose interesting catalogue of the birds of Central New York most of our readers will remember. The specimens from which this list is taken are, we are told, all in Mr. Gilbert's collection at Penn Yan, Yates county, New York. This cabinet of one thousand skins, consists wholly of New York State birds, and as will be seen by the list contains several species extremely rare in the State, and one or two which have not hitherto been taken within its borders.

The occurrence of the Barn owl and of Wilson's Plover, both unusual birds in this locality, and besides this not to be expected so far inland, will be interesting to our readers. *Ardea egretta* though it will never of course be common on the lakes of western New York, we should expect to find it occasionally, for we have seen it as far north as latitude 47 degrees in the west, near the Missouri River, and it occurs as a straggler in Connecticut, though rarely.

The most interesting species in the list is, we think, *Porzana jamaicensis*, a bird of extremely rare occurrence in the United States, a widely distributed species it is true, but so seldom taken that it is regarded as one of the greatest prizes a collector can secure. The breeding of *Anthus ludovicianus* within the State, is another fact of too much interest to be passed over in silence.

We take leave to congratulate Mr. Gilbert on the fine collection of New York birds which he possesses, and also on his having been, as we believe, the first ornithologist to take *Porzana jamaicensis* within the limits of New York State.

Poliophtila caerulea. Blue-gray gnat-catcher. Irregular as to numbers, but never rare. Perhaps breeds. Arrives from the south in May.

Anthus ludovicianus. Titlark. Not a rare spring and autumn migrant; a few remain and breed.

Helmitherus vermivorus. Worm-eating warbler. Not a very rare spring and autumn migrant.

Helminthophaga pinus. Blue-winged yellow warbler. Irregular. Not to be found some seasons. Arrives in May.

Helminthophaga chrysoptera. Blue golden-winged warbler. A rare summer visitor. One taken in May, 1872.

Dendroeca tigrina. Cape May warbler. Not an uncommon spring and autumn migrant.

Icteria virens. Yellow-breasted chat. Very rare summer visitor. One taken in the spring of 1874.

Loxia leucoptera. White-winged crossbill. A winter visitor. Irregular as to numbers; found in swamps.

Loxia curvirostra var. *americana*. Common crossbill. Like the preceding, irregular winter visitor; has been taken as late as April.

Chrysomitris pinus. Pine linnet. A rare winter visitor; irregular; has been taken in early part of May.

Plectrophanes lapponicus. Lapland longspur. A winter visitor, generally found in company with the snow bunting. Not rare.

Pipilo erythrophthalmus. Towhee bunting. Not a common summer resident, breeds. Arrives the first week in May, departs in October.

Contopus borealis. Olive-sided flycatcher. Very rare; but one known to have been taken in this locality.

Strix flammea var. *americana*. Barn owl. Very rare; one taken in this locality which is believed to be in Cornell College at Ithaca.

Otus vulgaris var. *Wilsonianus*. Long-eared owl. Not an uncommon resident, breeds.

Syrnium nebulosum. Barred owl. Common resident. Breeds.

Nyctale acadica. Acadian owl. Rare, but one instance recorded of its capture for this locality.

Astur atricapillus. Goshawk. Not a very rare summer resident; used to breed years ago on what is called Italy Hills, Yates county. Perhaps a few remain all winter.

Buteo pennsylvanicus. Broad-winged buzzard. Rare, but one specimen recorded for this locality, taken September 10th, 1875.

Archibuteo lagopus var. *sancti-Johannis*. Rough-legged buzzard. Rare, one taken November 8th, 1876, in this vicinity.

Aegialitis Wilsonius. Wilson plover. Rare; one taken in the spring of 1868.

Lobipes hyperboreus. Northern phalarope. Rare; one taken in May, 1874, at foot of Crooked Lake, Penn Yan, Yates county.

Micropalama himantopus. Stilt sandpiper. Rare; one captured October, 1875.

Tringa canutus. Red-breasted sandpiper. Rare; two specimens captured October 15th, 1874.

Totanus solitarius. Solitary tattler. Common in the spring flight.

Ardea egretta. Great white heron. Very rare; one taken in this locality in the spring, date not recorded.

Porzana noveboracensis. Yellow rail. Rare; one specimen captured September 20th, 1872.

Porzana jamaicensis. Black rail. Rare; two instances recorded of its capture in this locality. One at Penn Yan in 1870, the other on the marsh between Havana and Watkins in 1872; both taken in the spring.

Somateria mollissima. Filder duck. Accidental; one was captured at Branchport, seven miles from Penn Yan, by S. N. Macomb in February, 1873.

Eidemia americana. American black scoter. Rare or accidental; one was captured in autumn on Seneca Lake.

Eidemia persicillata. Surf duck. Not uncommon in autumn. Young birds drop into the lakes on the fall flights south, but do not stay long.

Larus philadelphia. Bonaparte's gull. [Not common; generally seen in spring and autumn.

Sterna hirundo. Common tern. Not rare; has been taken on Seneca Lake at Dresden in June.

Sterna paradisæa. Roseate tern. Rare; but one recorded; captured in this locality.

Hydrochelidon fissipes. Black tern. Rare; but two specimens are recorded. Both were taken in the spring, one on Seneca, the other on Crooked Lake.

ALBINOES.—Our correspondent, "Teal," writing from Salem, Mass., says: "I saw last week in the collection of Dr. Palmer, at Ipswich, several examples of albinism. One was a male wild pigeon, a fine, partial albino; another was a perfect albino Indigo bird, and a third was a full albino of the striped squirrel, *Tamias striatus*. These are very interesting.

Dr. Palmer has also a fine Wood Ibis, taken in New Hampshire some time ago. It seems to us that Wood Ibises are becoming rather common in New York and New England. The chances are that all these specimens came from that one flock of seven noticed in this journal last summer.

SINGING MICE.

INDIANAPOLIS, December 6th, 1876.

EDITOR FOREST AND STREAM:—

[Newspaper accounts of singing mice I have always received *cum grano* salt, and classed with stories of enormous sea serpents, frog showers, &c.

On Monday evening, of the present week, as I sat reading by the fire, I heard what I at first thought was a boy passing along the street imitating the warble of a canary bird. Presently, however, I discovered that the noise was not in the street but in the room where I was sitting, and further, that it was made by a mouse. The little fellow was evidently upon a foraging expedition and was, if one might judge from his song, as light hearted as the canary, whom he so perfectly imitated. I listened in wonder and then proceeded to arouse my family, who had retired, telling them that I wanted them to hear what they had never heard, and what they might never have an opportunity of hearing again. The little fellow seemed very tame, and for upwards of an hour played around my feet, and at hide and seek under my chair, and then probably thinking that it was time for serenaders to be in bed vanished.

I listened very attentively during the whole time to see if the singing might be attributable to any disease of an asthmatic nature, but the tones were as clear as those of a bird, and from the fact that the song was intermittent, I came to the conclusion that mousey sang because he wanted to and not because he could not help it.

ALEX. C. JAMESON.

[On the same day on which we received the above note we noticed, on opening the last number of *La Nature*, an article entitled "*Du Chant des Souris*," which is of interest in this connection. The writer, Dr. A. Bordier, tells in a very pleasant style the story of two singing mice which he was enabled to observe for several months. From this account

it would appear that the first mouse learned to sing from a canary, but the second was taught by the first. This last fact is of great interest. It has for some time been a well established fact that mice can, and often do sing, but the matter requires further study to make all the points clear and we hope that our correspondent will be enabled to continue his observations.—Ed.]

TO CONCHOLOGISTS.

We have received from Mr. Arthur Gray, of Danversport, Mass., the following circular, to which we wish to call the attention of conchologists at large:—

The undersigned being desirous of studying the variations in the following species of shells, viz: *Purpura lapillus*, *Littorina litorea*, *L. tenebrosa*, *L. rudis*, *L. palliata*, *Tritia trivittata*, *Hypanassa obsoleta* and *Buccinum undatum*, respectfully invites aid in procuring specimens of these species. Would like fifty specimens or more of the common species, if convenient from each locality, together with notes in regard to the situations where the specimens were obtained; whether from quiet inlets or from exposed ledges. In collecting specimens select a fair representative of each species, both large and small specimens. Due acknowledgment will be made for all aid rendered.

Danversport, Mass.

ARTHUR F. GRAY.

For Forest and Stream.

THE MINK AS A FORAGER.

THERE had been a heavy storm in the latter part of November, '73, which was looked upon as the entering wedge to a severe spell of weather in these parts. The wind was blowing heavily from the west northwest, and ducks were flying low and with much apparent restiveness, which to a thoroughbred is strong proof of their determination to skip out for warmer latitudes.

It was a blustery, squally day, and there was a good flight. Our decoys were anchored in a bend of the Illinois, not far below Marseilles, near what is known as "Wal-bridges Run," where we were sheltered from the weather, and where the Mallards were well disposed to draw for shelter from the increasing blasts, and at the same time to take a closer inspection of their irresponsible companions as they rode at anchor.

It was a glorious day for ducks, and just such a day as one would find our "Shoddy" sports, who always "know the whole business," safely perched behind the hot stove, reciting an essay on the "ins and outs" of Waterfowl Shooting, etc.

We had been raking in the mallard pretty lively, and our bay was more than once sprinkled with a pair of canvas backs and red-heads, as they swept steadily over our decoys, in their search for a quiet, sheltered spot, wherein to take their parting meal off from the eel grass, which grows so very abundantly thereabouts.

As usual during a brisk flight, or when circumstances compel one to stay under cover, we were unable to pick up many cripples, and dead birds which occasionally fell landward, though a long experience enabled us to mark pretty faithfully every dead or crippled bird that fell beyond bounds. But among the occasional cripples which come to the sod was a large "hen mallard," which, in her descent, came down with a double summersault, landing in a grove of young willows and high weeds just behind us, hiding away at once in the matted grass and drift, where we were compelled to leave her to her fate, which is usually summed up in a handful of bones, well mixed up with choice feathers, all that remains in the morning usually to mark the exit of one of our noble birds.

We were well satisfied with the work of the day, and had counted it about the last "duck day" of the season, ending as it did with a heavy freeze-up, and about an inch or two of snow. Towards winding up the wind lulled; the thermometer marked about 8° above, and the morning broke with about two inches of clear ice on the Illinois, covered with a slight fall of snow. We thought it an admirable time to find our cripples and dead birds that had dropped beyond our circuit of search the day before, and we went for the old ground, full of promise.

The first spot which claimed attention, was where our "hen mallard" had "struck hard pan." Here was a sight! feathers and blood marked the scene of a terrific struggle for what remained of a duck's life. Here, for at least ten feet in circuit, the snow, grass and twigs, were whipped into a confused mass, here and there besprinkled with blood, and quite as often decorated with feathers; then there was a trail, leading directly to the river bank, and out upon the ice; the trail thence proceeded up the bank of the river on the ice for about half a mile, when it disappeared directly in line of a hole in the bank, where we discovered the bird half buried, head foremost, into a hole about one-half the size of the body, frozen stiff. When discovered we worked, not without difficulty, at the extrication of the bird. It required all our force to draw it out, when, as it broke from its fastenings, two large minks suddenly appeared, and darted back into their retreat, the last we saw of the varmints after a half hour of close watching. The ground along the shore was rough, covered with heavy grass, brush, drift wood, and many willows. Here the natural obstacles precluded the possibility of such a trip by land, and the little piece of engineering practiced by this one mink, in capturing and conveying home its prize was truly marvellous. That there was but one mink, the trail bore direct evidence throughout its entire length from the scene of the struggle. As we followed the line, we could easily trace the wide trail of the mallard, as it was dragged bodily along over the fresh snow, and the deep penetration of its claws into the new ice, spoke volumes of the force exerted by that small animal in the completion of so severe an undertaking, and the excessive amount of *mink power* expended in the completion of a successful foraging expedition. Here and there throughout the line of trail were frequent halting places, where our mink had stopped for a rest. Every time there appeared numerous tracks around the body of its victim, as though pleased to inspect its trophy before the next heat, and then as the distance shortened, the strokes of its tail at regular intervals of march, marked upon the snow upon either side of the trail the determined intention of the animal to go through with its meat before it was too cold to squeeze into a small space, where the sharp frost would soon fix it permanently. When drawn out, we found that a couple of "square meals" had been made from the head, neck and breast, and enough left for several days to come.

We expressed some regret at the loss of such a fine mallard, but found ourselves repaid after full consideration of the facts laid before us.

M. A. H. JR.

Streator Ill., Nov. 28th, 1876.

CURIOUS SPIDER.—A correspondent of the *American Naturalist* says: "Just before the late war I was at Col. Oakley Bynum's spring, in Lawrence county, Alabama, near the town of Courtland, where I saw a school of minnows playing in the sunshine near the edge of the water. All at once a spider as large as the end of my finger dropped down among them from a tree hanging over the spring. The spider seized one of the minnows near the head. The fish thus seized was about three inches long. As soon as it was seized by its captor it swam around swiftly in the water, and frequently dived to the bottom; yet the spider held on to it. Finally it came to the top, turned upon its back and died. It seemed to have been bitten or wounded on the back of the neck, near where the head joins. When the fish was dead the spider moved off with it to the shore. The limb of the tree from which the spider must have fallen was between ten and fifteen feet above the water. Its success shows that it had the judgment of a practical engineer."

CURIOUS HABIT AMONG OSTRICHES.—A gentleman writing from Graham's Town, Africa, relates his observation of a curious circumstance:—

"We entered through a locked gate into a large enclosure or paddock, in which were fifty-eight one and two-year old birds. They all looked exceedingly well, and though they did not dance, seemed full of life. They do sometimes favor the spectators with a dance, and it is one of the funniest of all the freaks or habits of animals that evidence a sense of the jokeful we ever beheld.

We once saw some twenty nearly full-grown birds waltzing together. They began with a sort of sidling, slow revolution on their toes, moving their wings gently up and down, and presently they seemed to get into the spirit of the thing without the aid of any fiddler that we saw, and spun round at a rate that would have astonished any one but a dancing dervish. In dancing they swept round and round without ever coming into contact with each other."

A SQUIRREL ATTACKED BY DIPHTHERIA.—A family in this city are the happy possessors of a beautiful flying squirrel, very tame and tractable. Some of the children were attacked with diphtheria recently, and in accordance with his custom, the squirrel sometimes crawled into the bed with them, oftentimes nestling up against their faces and throats. After a while the squirrel was seized with all the symptoms of the disease, and growing worse, apparently went through all the stages of the complaint in just the same manner as the children. While ill it was found necessary to feed him on soft food, in all respects precisely similar to a human being suffering from diphtheria.—*Bridgeport (Conn.) Standard*, Nov. 24th.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDENS DEC. 23RD.—One screech owl (*Scops asio*), presented by John Krider, Philadelphia; one dusky duck (*Anas obscura*), presented by W. H. Zern, Atlantic City; one rough-legged buzzard (*Archibuteo lagopus*), presented by W. R. Miller, Lewisburg, Pa.; ten quail (*Ortyx virginiana*), one squirrel (*Sciurus ludovicianus* (f)); one Lynx (*Lynx canadensis*), and two carolinian grosbeaks (*Cardinalis virginianus*), purchased; one zebu (*Bos indicus*), born in the garden.

ARTHUR E. BROWN, General Supt.

Woodland, Farm and Garden.

DISEASE IN ROOM PLANTS.

One of the surest indications of disease in plants is, when their leaves loose their normal dark green color, and show a whitish or yellowish shade. Stagnant moisture, unsuitable soil, insufficient nutriment, too much or too little light, all induce this change of color. Plants accustomed, under the influence of full sunshine, produce leaves of the deepest green, while the same plants if grown in a shady position generally have the leaves of a lighter color, becoming almost whitish in comparative darkness. On the other hand, plants which naturally grow in shady places, such as Ferns and Selaginellas, if removed into bright sunshine will have the lively green of their leaves changed to a yellowish hue. Whether, therefore, too much or little light be the cause of the discoloration of the foliage, it can be easily remedied by shifting the position of the plant.

Perhaps more plants become unhealthy from error in watering them, than from any other cause. Many think their plants must have just so much water every day, never stopping to think that from the temperature of the room, cloudy weather, the plant being naturally resting, or some other cause, the plant requires much less water at the time than another. Of course, during winter, with but few exceptions, less water is required than when the sun gains more power as the day's lengthen. Plants which are kept too dry during their season of growth, soon loose both their leaves and young shoots; this loss reacts on the roots and they also perish. Many evergreen plants grown in rooms, however, often shed their leaves in quantities. This is usually the consequence of the plants being placed in a position at a distance from the light, or it may follow from the effect of a dry atmosphere, acting on plants probably just brought from a moist greenhouse. The scale that attacks Ivy and other evergreen plants is generally the effect of unhealthy root action, and is rarely seen on a plant in good health. In fact, the whole matter may be summed up in careful attention to watering the plants, sprinkling them overhead occasionally, or sponging the leaves with luke-warm water, and keeping as regular a temperature as possible in the room.

ANTIDOTE FOR POISONOUS MUSHROOMS.—Prof. Schiff, of Florence, states that he has discovered that poisonous

mushrooms contain a common deleterious alkaloid which he has named "muscarine," the effects of which are neutralized by the alkaloids atropine and daturine, which are now sold by Italian pharmacists in those districts in which poisonous mushrooms are common.

WHEAT FROM CALCUTTA.—The Calcutta Wheat trade has grown into enormous proportions. In 1870 the exports amounted to only 2,000 tons, and during the first nine months of the present year 120,000 tons had already been shipped. It is grown chiefly in the Punjab, and is much valued in the English markets, especially on account of its dryness.

SMOKY STOVES.—There is a very simple way of avoiding the disagreeable smoke and gas which always pours into the room when a fire is lit in a stove, heater, or fire place, on a damp day. Put in the wood and coal as usual; but before lighting them, ignite a handful of paper or shavings placed on the top of the coal. This produces a current of hot air in the chimney, which draws up the smoke and gas at once. Not one person out of fifty ever thinks of this easy expedient.

WEIGHT OF CATTLE BY MEASUREMENT.—Multiply the girth in feet by the length from the bone of the tail immediately over the hinder part of the buttock to the front part of the shoulder blade, and this product by 31 when the girth is more than seven or less than nine feet, and by twenty-three when less than seven or more than five feet, and by sixteen when less than five or more than three, and by eleven when more than three. A deduction of 1lb. in twenty must be made for half-fattened cattle, and for cows that have had calves.

CATTLE DISEASE IN NEW BRUNSWICK.—A correspondent writing from Cumberland Bay, Queen's County, says:—"A disease has made its appearance among the cattle of this place which bids fair to be very destructive. Mr. Joseph Reese has lost four animals already, Mr. Hector McLean, three, and Mr. Algee, of the same place, one—all within the last few days. The disease takes hold of the best conditioned animals, and they only live a few hours afterwards. The only thing visible after the carcasses are skinned is a red ring around the neck of the animal which looks like jelly. The disease is causing much alarm among farmers, and when once it takes hold there seems no way of checking it.—*St. John News.*

BRAZILIAN FLOWERS.—Travelers in Brazil speak of Fuchsias fifty and sixty feet in height, blooming from top to bottom; of large bushes of abutilon venosum, bearing a profusion of orange silk streaked with crimson; of huge Daturas, with hundreds of white trumpet shaped and sweet-scented blossoms some sixteen inches in length; of Orchids and Ferns; huge Arums, with shield-like leaves, large enough to cover a man; brilliant red and yellow Bromelias and Tillandsias; Epiphytes and Parasites of all descriptions; Camellias, large enough to climb on to pick the topmost blossoms; and Poinsettias, large bushes, on which the crimson star-like floral bracts measure two feet in diameter.—*"The Garden," London.*

DECAY OF FRUITS.—Recent experiments by Dr. Brefield in Germany, have shown that decay in apples was caused by fungi. *Mucor stolonifera*, *M. racemosus*, *Botrytis cinerea* and *Penicillium glaucum*. But the spores of these fungi would not germinate on sound apples. When moistened with apple juice, however, and placed on sound fruit, they germinate rapidly, or when placed in bruises or artificial wounds; showing that sap escaped from the cells and existing in their interstices was necessary to the germination of the fungi. The obvious lesson is, keep the fruit free from bruises, by carefully handling, and, other conditions favorable, we may expect the fruit to keep well. A lesson learned by practice, but this is a nice explanation of it.

SALT FOR SICK ANIMALS.—One of our most skillful veterinary surgeons says the best remedy for very many kinds of sickness by which domestic animals are afflicted, is a good dose of glauher salts (sulphate of soda); while, at the same time, it is a remedy decidedly inexpensive. The usual dose, as a purgative, is as follows: Horse, one to two pounds; cattle, one half to one pound; sheep and hogs, three to five ounces; dogs, one to two ounces. In these doses it is always necessary to give it as a drench, dissolved in two or three times its weight of water, but when given to horses in smaller doses, as a condiment, diuretic or laxative, it is generally readily taken dissolved in part of a pail of water.

LANGUAGE OF SHEEP.—Both ewe and lambs recognize each other's voices, and, amid the most deafening sounds, run to meet one another. There are few things more amusing than a sheep-shearing. We put the flock into the fold, set out all the lambs to the hilt, and then send the ewes to them as they are shorn. The moment that the lamb hears its dam's voice it rushes from the crowd to meet her, but instead of finding the rough, well-clad, comfortable mamma which it left an hour, or a few hours ago, it meets a poor, naked, shivering—a most deplorable looking creature. It wheels about, and uttering a loud, tremulous bleat of perfect despair, flies from the frightful vision. The mother's voice arrests its flight—it returns—flies, and returns again generally from ten to a dozen times before the recognition is perfect.

LUMBERING IN MAINE.—The Boston *Journal's* correspondence says the Maine lumbermen have commenced their winter's operations in the woods. The prospect is that nearly the same amount of new logs will be cut, as plenty of men can be hired at cheaper wages than have been paid for several years, and supplies are also less in value. There is also every reason to believe that prices for lumber next year will rule higher. The cut of the Kennebec lumbermen will probably be some forty millions. The Penobscot lumbermen will probably cut some sixty millions, and the Androscoggin lumbermen some thirty or forty millions. Quite a number of mills will winter over but few logs, but there are sufficient stocks of manufactured lumber on hand for the opening of business next spring. The past year has been a dull one for the lumbering interests. On the Penobscot business fell off at least one-third as compared with last year. There was an increased demand for lumber as cold weather approached, and prices ruled better.

THE ARECA NUT.—Not only do our canine friends profit by this vegetable growth, but also the natives of the country it is indigenous to. An eastern correspondent says:—

"A very useful head-dress is worn by the inhabitants of the tract of country between Mercara and Mangalore, in the Madras Presidency. A skull cap is made of the leaf of

the areca nut, which is so hard that any weight can be carried on it without the head being injured, while it effectually protects the wearer from the sun. Inside the cap the owner keeps a store of betel leaf and areca nuts, and when hungry, shakes his head and lets his larder drop into his hand. In the evening the treasured head-piece fans the fire for cooking, makes an excellent drinking bowl, and is finally used as a substitute for a tureen." The idea of a tureen is somewhat appalling in such a connection. We have been obliged to camp in the mud and eat in extremely aboriginal fashion, but neither the dire necessity nor the resort are to be commended—when they can be avoided.

TREES VEGETATING AFRESH AFTER A FIRE.—A singular phenomenon is recorded in the German journal *Der Naturforscher*, as having happened in an orchard near the village of Bruchelheim. A large fire occurred in the village in the beginning of September, and four weeks after it numerous trees in the orchard that had been singed by the fire began to vegetate anew, putting forth tender green leaves and blossoms, often by the side of fruits which the fire had spared. On examining the wood with a microscope, it was found that the contents of the cells were transformed into a pulpy mass. Sugar was found to be present both in the singed and unsinged trees.

FARMERS' FRIENDS.—The swallow, swift, and night-hawk, are the guardians of the atmosphere. They check the increase of insects that otherwise would overload it. Woodpeckers, creepers, and chickadees, are guardians of the trunks of trees. Warblers and flycatchers protect the foliage. Blackbirds, thrushes, crows, and larks, protect the surface of the soil; snipe and woodcock the soil under the surface. Each tribe has its respective duties to perform in the economy of nature, and it is an undoubted fact that, if the birds were all swept away from the earth, man could not live upon it, vegetation would wither and die, and insects would become so numerous that no living thing could withstand their attacks. The wholesale destruction occasioned by the grasshoppers, which have lately devastated the west, says the *Dirigo Rural*, is undoubtedly caused by the thinning-out of the birds—such as grouse, prairie-hens, etc.—which feed upon them. The great and inestimable service done to the farmer, gardener, and florist, is only becoming known by sad experience. Spare the birds and save your fruit; the little corn and fruit taken by them is more than compensated by the vast quantities of noxious insects destroyed. The long-persecuted crow has been found, by actual experiment, to do far more good by the vast quantities of grubs and insects he devours, than the little harm he does in the few grains of corn he pulls up; he is one of the farmer's friends.—A.

WONDERFUL ADULTERATION OF SEEDS.—THE GERMANS POSSIBLY AHEAD OF CONNECTICUT.—Mr. E. H. Jenkins, formerly in the Yale Scientific School, who has recently spent some time in the German Experiment Stations, and is now Associate Director and chemist in the Connecticut Agricultural Experiment Station at Middletown, brought over some samples of seed adulterations largely practiced in Germany, which can be seen at the Station by any one interested. The process consists in grinding up quartz-rock, carefully sifting out the particles of proper size, and dyeing them to the color of the seeds to be adulterated. Here are artificial specimens of various clover seeds, for example, so perfect, that only a practiced eye would detect from one-fifth to one-third of the adulterated seeds mixed with the genuine product. These artificial imitations of clover seed are supplied at one to three cents per pound, to be mixed with seeds worth fifteen to twenty cents per pound. Mr. Jenkins and Mr. Warnecke, who also brought over several samples of the adulterations in grass seeds, are now investigating the seeds of this country, not only to see how far such adulterations are introduced here, but also to test the percentage of vitality in those sold in our markets. It is well known by the initiated, that some unscrupulous dealers buy up and mix old lifeless seeds, carried over from year to year, with the new crop, selling all as fresh seeds. This is an additional important work carried on by the Connecticut Agricultural Experiment Station, which will be decidedly useful, not only to Connecticut, but to the whole country. Mr. Warnecke, now chemist at the Connecticut Station, has had much experience in the German Stations, with Prof. Stohmann, in Leipsic, with Pros. Knop, of Tharandt, etc. We are well aware that our leading seedsmen take every precaution to have their seeds of the best quality, and such will be as much interested as any in the exposure of frauds in imported and other seeds.—*Agriculturist.*

SPANISH MOSS AS A PARLOR PLANT.—The long gray mossy-looking article which grows so abundantly over trees in the south, and which, from its appearance, takes the name of Florida or Spanish moss, is often brought north by travelers, who try to grow it and make it come into use as a winter ornament for rooms. It generally dies in the winter season, and hence an idea prevails that it is a parasite—that is, a plant that takes its nourishment from living trees, in which case of course it would be next to impossible to cultivate it.

It is, however, not a parasite, but what is technically called an epiphyte, or that which is simply borne on and nourished by another. It is simply supported in the air by the branches, and a dead tree, or even a telegraph wire, serve the purpose of a support as well as a living tree, and travelers testify that they grow equally as well on all.

That this is really the case, is proved by the experience of a friend who cultivates it perfectly as a window or room ornament. Short pieces of stout branches were obtained, and cut into lengths of about a foot. On this moss was tied, or rather wired, to the thickness of an inch or so, and on this the Spanish moss was lightly tied. It was hung by a wire attached to each end of the little truncheon, and during the summer is suspended from the branches of trees or any other half-shady place. The moss would be watered every day or so, just as and at the same time that other plants are watered. It grows well in this way, and through summer blooms profusely. The flowers are small and green, and exhibit their beauty only to very close observers. In winter the blocks with the moss are hung in windows in rooms with other window plants; watered as regularly as they are.

It is complained by many who have brought this curious plant from the south, and have tried to grow it, that it always dies; and as we have already said, this is the reason why it is supposed to be a parasite; but we fancy it is only those who cannot grow plants in rooms at all that fail with the Spanish moss. Its hard, grayish look suggests perhaps that it ought to do well under hard treatment; and it is only because it resents this that there is reason for the

talk about it being very difficult to grow. It is much more easy than the average of plants. In its native places it prefers to attach itself to trees that grow in swampy ground. In such places there is always a little moisture in the atmosphere, more so than in upland or dry places; and as this plant has to get all its food from the atmosphere, the humidity is of course grateful to it. In cultivation this humid atmosphere is imitated in some degree by the evaporation from the moss about the block. It is really one of the most interesting things for a parlor plant, and we are glad to know that some one can grow it and that its cultivation is so simple.—*Germantown Farmer and Gardener.*

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

—A Nautical Reception will be given on New Year's Day by the Seamen's Protective Association at the residence of Dr. William F. Thoms, the President of the New York Nautical School for the Education and Advancement of Young Seamen, 92 Madison street.

—The largest sail in the world has been made in Dublin. It is rectangular, and measures 180 feet by 60. It is to be used in raising sunken vessels.

CRUISE ALONG THE FLORIDA COAST.—The schooner Alabama, that discharged her cargo here, from New York, some two or three weeks ago, brought a small boat, the Rover. It was rather an odd looking and constructed craft, and its purpose here was for a long time a mystery. It was finally ascertained, however, that it was the property of a party of sportsmen, who would soon arrive and rig the boat for a prolonged cruise south, along the east coast. A large quantity of provisions, &c., accompanied the landing of the boat from the schooner, and were stored in the store of J. W. Allen & Bro. On Friday of last week, four gentlemen registered at the Marion House, that proved to be the party in question. The Rover was rigged and thoroughly equipped for the long cruise, and yesterday left with the hunting party for Matanzas. The boat measured 25 feet in length, 9 wide and 3 deep, and was built at Westport, Mass., by C. C. Briggs, for this special purpose. She is flat-bottomed, full sloop rig, with every imaginable convenience for a pleasure and hunting party. The gentlemen comprising the party were Capt. Cornelius W. Springer, of New Bedford, Mass., Alex. Seabury, Henry Smith, and Harry Smith, of Brooklyn, N. Y. They will be absent three months, and go as far south as Cape Florida, via the Matanzas, Halifax, Hillsborough and Indian rivers, and return north by the St. John's river.—*St. Augustine Press, 16th.*

AN OLD OARSMAN'S VIEW.

SIENA, Italy, November 9th, 1876.

Mr. Editor:—

I am inclined to enroll myself among those who think that an undue prominence is given to the muscular, as compared with the intellectual, in our universities. Assuming, however, for the present, that they are wrong, and that a "stroke oar" is a more enviable man than a "summa cum laude," let us examine the question on the principle that what is worth doing at all is worth doing well.

Rowing, as practised to-day, is a science, and must be studied as such. Crews may differ from year to year in bone and muscle, but these are differences over which we have but little or no control. The energies of Harvard's leading boating-men should, then, be directed to the manner of rowing, or to what the English call "form." Much has been said and written about the famous "Harvard stroke." I do not hesitate to brand such trash with the name of *buncombe*, and I earnestly beg Harvard's aquatic chiefs not to be beguiled by like nonsense. There is but one good way to row; all others are bad. Why did Oxford beat Harvard? Because she was stronger? Not a tit of it. Calm and unprejudiced critics have never held but one opinion, namely, because she rowed better and with more judgment. Why did Yale beat Harvard last year? For precisely the same reason. Nothing can be farther from me than to be personal in my remarks. The anguish of defeat is too great to be augmented by harsh words; but defeat, though unpalatable, is often salutary. Had Americans, and especially Harvard men, instead of deluding themselves with patriotic excuses, taken a wholesome lesson from their plucky and honorable defeat on the Thames, more silk flags would adorn to day our Alma Mater.

As I have already said, rowing is a science, and must be studied as such. Now, if a man wants to acquire a profession, does he not go to the headquarters of that profession, be they at home or abroad? Certainly he does. Where are the headquarters of rowing? Decidedly in England. (Even if in America, the principle would hold good.) Was not Cook, the captain of the Yale crew, shrewd enough to see that, by visiting the Mother Country and studying her oarsmanship, he could eventually whip any American college? The rowing of Yale was much admired by English critics at the Centennial Regatta. The *Field* says:—

"Taken as a whole, the rowing of the American four-oared crews could not compare with that of the English in finish, ease, and elegance, whatever it might do in brute strength, the class of competitors being so utterly dissimilar. No heed appears to be paid to coaching or to form, except in the College crews,—Yale, in particular, being a marked exception to the rule. This has been brought about by the captain of the College Boat-Club, who not very long ago paid a visit of some duration to England, and studied the rowing of the University crews, after which he returned to America and put in successful practice what he had learned in this country; and there can be no gainsaying the manifest superiority of the oarsmanship

of Yale over that of any other amateur crew in the States. It is still capable of amelioration, and, as strength, muscle, and pluck are not wanting, Yale crews may be made even more formidable than they are now."

Why can't Harvard follow the example of Yale, and either send a man to England to acquire the English style, or, if practicable, import an Englishman to Harvard who can coach the crews? In my own time we were fortunate enough to be coached for a short time by an ex-"varsity" stroke from Cambridge, England, and his hints were invaluable.

Before concluding, I must walk on more dangerous ground; dangerous both from the nature of the soil and the scantiness of my information. To what extent the men use such appliances as rowing-weights, I am ignorant. For exceptional cases these weights may be essential, but I have grave doubts as to their universal application. It seems to me that the effects of such galley-slave work, eliminating, as it does, all that is agreeable in rowing, must be depressing,—a result to be deplored, seeing that the spirits of a crew should be raised by all legitimate means. I have heard many a boating-man say that he could pull a stronger oar in the repose of vacation than during the fatigues of the racing season. In former times Harvard men were proverbially overtrained, rarely coming to the starting point with that buoyancy so essential to the sustained efforts of a hotly contested race.

Since we are looking at rowing from a scientific point of view, let the men of the present time not only investigate the question of form, but let them go a step farther and solve a more subtle problem, the mutual effects of mind and muscle. Let them study hygiene, and be conversant with the latest hygienic discoveries. By following these suggestions, Harvard would soon become the cynosure of all rowing men on your side of the Atlantic, and, what is of infinitely more importance, would regain and maintain her supremacy with the least possible expenditure of time and strength.

Most truly yours,

F. Crowninshield, in Harvard "Crimson."

Furs and Trapping.

For Forest and Stream.

TRAPPING IN THE SOUTHERN STATES.—We proffer a few hints on trapping, but our hints for all kinds of fur animals must only be local advice common in the trapping localities south of St. Louis and Cairo. Our first lessons were from H. J. Kimball, one of the best old trappers in Wisconsin, who of late years always spends his winters south of St. Louis in the swamp lands of Missouri, Arkansas, or Northern Mississippi. Finding the pleasure of trapping and woodcraft so enticing in connection with the mild winters compared to those of the far north, we have spent nearly every season in the profession since our first initiation. The common way of fitting out is to have one or two companions, and if going in a country where rivers and lakes are plenty, always have a good light dugout or light bateau. If you have much luggage two will be found necessary, but always aim to take only such an outfit as is only really necessary. Each time we go we find something that we can dispense with, and so lighten our load. To make things comfortable we take a seven-foot "A" tent, made to button up close in front, which, when rightly set, will keep out all cold winds; two pair of good woollen blankets, one good chopping axe for camp use, small straight iron pot, small heavy tin pail to make coffee in, good frying pan with horn handle, and last but not of least importance an "Arkansas skillet" or Dutch oven for baking bread, etc. This is sufficient for the culinary department, with the little etceteras of tin cups, tin plates, spoons, knives and forks. When in camp we have always found the prepared self raising flour just the thing, which can be procured at any large city. The white cornmeal of the South is very nice, and easily prepared either for corn bread or for a good bowl of mush and milk when the latter can be obtained. A supply of fat pork to cook your fresh game with, some salt and a jug of molasses complete the contents of the mess chest. A good double barrel shot gun, or shot gun and rifle, should be along, and a small axe for each man to carry when setting out his traps. In setting traps for muskrat, coon and mink or wildcat, there is little art. The bait must be placed in such a manner that the animal to reach it must walk over the trap. Never put the bait on the trap, but usually from twelve to eighteen inches behind it. The traps should be lightly covered with moss, dry cypress leaves, or any dead leaves pulverized over the trap, by rubbing up between the hands. Be careful that no bits of sticks or twigs are left on the trap to come between the jaws when sprung. In setting for otter or beaver we use no bait whatever, simply setting in the little paths made to and from the lakes, bays, creeks, rivers, etc., their landing places when coming out of deep water to feed or play. For beaver we frequently set on their dams, or cut open one of their houses and put the trap on the landing just inside, then stop up the hole on the top to keep out daylight, for they usually lay inside their houses during the day. For otter we use No. 2, and for beaver No. 4 trap. For coon, wildcat and mink, No. 1, and No. 0 for muskrat, all made by S. Newhouse, Oneida Community, N. Y., which are the best traps made. To make trapping profitable one must tend to his traps, and should visit them every day. In skinning furs we always use otter, mink, coon, and muskrat, and split the beaver. The hides that are cased should be stretched over smooth thin boards of the required length and width, and it is preferable to dry them in the shade, but never before the heat of a fire. In firing up pelts they should be free from all fat, as in the case of coon, when too much fat is left on it becomes reisty, and the pelt often spoils.

Profitable trapping is attended with much labor and often hardships, so that the successful trapper is never a lazy man. Good trappers, where trapping has not been

followed and varmins are plenty, frequently make from \$50 to \$100 a month; yet there are many amateurs who do not make \$75 the whole winter. Southern furs are not worth near as much as those caught North, yet one can make up in numbers what he lacks in price, so that we think from what we can gain, a trapper in the southwest country can make about as much clear money as trappers in Wisconsin, Michigan, or New York.

SLEETHAR-BOZNAI.

VIRGINIA.—That our remarks from time to time upon the abundance of beavers in Virginia were with sufficient foundation would appear to be verified from the following item which we find in the *Brunswick Advocate*, published at Lawrenceville, Va.:

"Messrs. Jones and Kellogg are still making our town their headquarters. The weather has been unusually cold and unpropitious for their business. They are, however, making some 'catches'—seven beaver, one fox and coon having been snared. The fox was caught in a trap which had been set for a mink. We were particularly struck by a remark of Mr. Kellogg in reference to his capture. He said they seemed numerous and would fall an easy and valuable prey, but that he did not design or desire to interfere with the sports of the huntsmen of the country. He says the beavers seem to have been very much more numerous two years ago than they are now, and conjectures that they have made their way higher up the streams. We have had very free and familiar conversation with the 'trappers,' and believe we can ask for them the polite consideration which our people always give to good men. With proper facilities they will rid the country of a pest to the land-owner, and will ask less than our farmers are in the habit of extending to strangers."

—For excellent Furs, in this winter weather, go to C. G. Gunthers' Sons, 184 Fifth avenue. See advertisement elsewhere.

New Publications.

NUTTALL BULLETIN.—The closing number for the year of the Bulletin of the Nuttall Ornithological Club contains a number of interesting articles on the habits of some of our birds, and announces besides the addition of several new species to the fauna of the United States. The need of some such periodical as the one under discussion has long been felt by all ornithologists, and it is a matter for general congratulation that this journal is so well worthy of the support which it receives. It could hardly be otherwise, however, for it is edited by Prof. J. A. Allen, with Prof. Baird and Dr. Cones as Associate Editors, and certainly no periodical could have any stronger ornithological backing than is implied in these names.

Mr. Earnest Ingersoll opens the number with a summary of "Our Present Knowledge of the Nidification of the American Knights." The essay is written in Mr. Ingersoll's usual attractive style, and the suggestion that all ornithologists should be on the watch for the nest of the tiny Reguli is a timely one. We shall before long publish the papers in full in order that such of the readers of FOREST AND STREAM as do not see the *Bulletin* may also be on the alert. Dr. Cooper notices some novel and curious features in the breeding habits of the Western house wren (*Troglodytes aedon* var. *Parkmanni*). Mr. Ridgway furnishes some valuable information "On the Geographical Variation in *Dendroica palmarum*," and describes a new subspecies, the remarkable point of the communication being that the bird in question seems to form an exception to what have been regarded as well established laws governing the size and coloration of birds from the Atlantic coast and the Mississippi Valley respectively. Dr. Merrill, U. S. A., in his "Notes on Texan Birds," adds five new species to the fauna of the United States, and in addition gives the breeding habits, previously unknown, of two species. Dr. Brown's pungent article on the "Birds of New England" closes the number. The General Notes contains several items of interest, notably the capture of *Helminthophaga celata* in Massachusetts, and the occurrence of *Tautatus loculator* in Pennsylvania and New York, the latter interesting fact having been noticed in FOREST AND STREAM at the time (July 20th, 1876.)

It is highly satisfactory to have at last a journal of *Ornithology*; and one, too, which can be relied on. We could wish only to have one change made in the *Bulletin*, and that would be to have it issued each month instead of but four times a year. We hope, at no distant day, to see this alteration made.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

J. J., Milwaukee.—Where can I get a bona fide Dandie Dismont terrier? Ans. We do not know of any pure Dandie Dinmonts for sale. Perhaps some of our readers can inform us.

E. W. F., Wethersford, Conn.—Can you inform me of the number of prizes taken by Saltus' Dash; also when and where taken? Is Bonnet Carre an Irish setter? Ans. 1. At Watertown, '75, and at Philadelphia, '76. 2. Bonnet Carre is half Irish.

J. F. K., Washington, D. C.—I have a breech-loading rifle or carbine marked "Starr's Patent, Yonkers, N. Y." It seems to be a stranger about here. Please tell me where I can get ammunition for it. Ans. By sending to H. C. Squires, No. 1 Courtlandt street, this city.

W. S. S., Pottsville, Pa.—Please say when the close season for pinnated grouse and quail begins in Arkansas, whether there is a State law governing the killing of game, and whether pinnated grouse will live and thrive in this State? Ans. No close seasons in Arkansas, and no State game laws. Pinnated grouse doubtless once inhabited parts of Pennsylvania, and if replaced would thrive there again if unmolested.

C. B., Rochester.—Has the Legislature within the last six months passed any law affecting the hunting of rabbits with ferrets? or is there any old law? I find the game constables in this vicinity are prosecuting all parties they can catch at it. Ans. There have been no amendments to the general laws within six months, but the law of 1875 prohibits the killing of rabbits with ferrets.

T. J. W., Philadelphia.—1. Where on the Chesapeake can I find good duck shooting in January? 2. Give me the address of second-hand book dealers in New York, Boston and Brooklyn. Ans. 1. Crossfield, in Somerset county, Md. The upper part of the bay is frozen solid. 2. In New York, Leggat Bros., No. 3 Beekman street; Brooklyn, N. W. Swaine, No. 126 Fulton street; we do not know the names of dealers in Boston.

J. G. S., Bridgeport.—I want to know exactly what a choke-bored gun barrel is; that is, how far from the muzzle contraction commences, and how much it is contracted; also whether it is a straight taper to the muzzle; in fact, what is the usual shape of the inside of the barrel of a choke-bored gun? Ans. As there are many ways of choke-boring we must refer you to Mr. W. W. Greener's latest work, "Choke-Bored Guns and How to Load Them," which contains descriptive cuts. We can send you a copy; price, \$3.50.

Nix, Fall River.—Where can I address the dealer in aquarium good spoken of in a paper issued a few weeks ago? Ans. Humphreys & Collier, No. 53 Courtlandt street, or Frank Schopp, No. 71 Fourth ave.

GEO. H., Grantville, Mass.—My setter dog is troubled with a dry husky cough, sometimes ending in an attempt to vomit. Will you have the kindness to tell me what I may do for him. Ans. It is probable that your dog is afflicted with worms. Give him 60 grains of powdered areca nut at three doses two hours apart, and six hours after giving the last dose give him one ounce castor oil.

W. E. D., Fall River, Mass.—Will a paper cartridge 3-16th of an inch longer than the chamber of a gun effect the shooting qualities? If this same cartridge is made to fit the chamber with a turn over would it not upon being discharged be forced back 3-16th to as long as at first? Ans. The result would probably be greater recoil. The proper thing to do is to so cut and turn your shell that when opened out by the explosion they will then fit the chamber.

G. C. P., New York.—Please have the kindness to advise me what four sizes of shot are best adapted for up-land and duck shooting, and what is the best brand of American powder? Ans. 10, 8, 6, 4, viz 8 and also 10 for quail, woodcock and snipe, 6 and 8 for ruffed grouse, and 4 and 6 for ducks. We cannot discriminate between brands of powder; you must experiment for yourself.

G. C. T., Sheephead Bay.—I have a fine setter pup about eighteen months old. He has been very bad with distemper. He is all right except a weakness in the small of his back, so weak at times that he cannot stand at all. Can you acquaint me of any relief for him? Ans. Your dog requires strengthening food, such as beef broth, etc., and careful nursing, avoiding all dampness or cold. Distemper frequently leaves its victims as you describe.

W. Y. W. R., Rutland, Vt.—Please inform me of what is requisite to have my dogs recorded in your Kennel Register; what the cost is, and how soon you will have the book out. Ans. Simply send us the pedigree, when a certificate of registration will be returned. We can send you blank pedigrees if you want them; no charge. The book will be issued as soon as we can possibly find time to prepare it; very shortly we trust.

W. H. C., Attleboro.—1. I have a breech loading shot gun about 2½ inches drop of stock. Can I have it bent to about 3½ inches and stay? 2. Where can pure bred beagles be had, and what price? Ans. 1. As a rule gun stocks can be bent by steaming to the extent you mention. 2. Beagles are frequently advertised for sale in our paper, but we know of none at present.

NATURALIST, Lowell.—1. What is the best way to take rust out of my breech-loader, and what kind of oil is the best? 2. What size of shot do you recommend for fox hunting—can as large as "T" be used to any advantage? 3. What is the best way to hunt foxes? Ans. 1. If benzine will not take out the rust marks you will have to use the scratch brush. Belmontyle is as good oil as any to prevent rust, or Eaton's Rust Preventer. 2. "T" shot is as good as any. 3. Foxes must be hunted with hounds.

J. M. W. H., New York.—Will you please inform a reader, what is the best time (amateur and professional) made in the following: One mile walk, 3 mile walk, 7 mile walk, and 10 mile-walk? Ans. One mile, amateur, 6:48; professional, 6:23. Three miles, amateur, 22:15; professional, 20:27. Seven miles, amateur, 53:47; professional, 51:51. Ten miles, amateur, 1:26:37; professional, 1:17:33. It is possible that some of these figures have been slightly lessened during the past year, if so, we will print a revised list next week.

H. L. J., Cincinnati.—I have ample means to initiate or to supplement a plan for building a hotel, or Sportsman's Home, in Florida. This to be a home for our families and a rendezvous for sportsmen. The site I am inclined to, is near the line of the Transit railroad. With whom can I correspond, to carry out my project speedily? and will FOREST AND STREAM co-operate? Ans. Correspond with Col. J. B. Oliver, Genl. Agent Florida Land and Immigration Co., P. O. Box, 5,520, New York city. A proposition for this identical purpose is now under consideration by FOREST AND STREAM. The location agrees with yours and a determination will soon be arrived at which may make it most desirable to have further correspondence with you.

AMATEUR.—1. Will you please explain in your next issue the terms "dropped to wing," and "backed," as used in your report of "Field Trial?" 2. Is the red Irish setter generally an intelligent and tractable dog, and apt to make a good bird dog? 3. Is not the recoil of a choke-bored gun greater than that of the ordinary cylinder bore? Ans. A dog so broken "drope to wing" or comes to the "down charge" when a bird is flushed. To "back," is to sustain the point of another dog; that is to stop or come to a point himself when he finds that the other dog has the scent of birds and is pointing them. 2. Yes, although perhaps requiring more work to keep in proper subjection and discipline than some other breeds. 3. No, not when properly loaded, with the shells fitting the full length of the chamber.

J. F. A., Walnut Grove.—1. I am going off for a little while and I wish you would recommend me a good book that I can take along with me to read at my unoccupied time and will do me good. I wish you would name a book that is a good one for me? 2. I have a nephew, to whom I want to give a gun and I am in doubts between a double muzzle or a single-barrel breech, or Phoenix; he is sixteen years old and as tall and strong as a man; his chief shooting is quail and chicken, with a few ducks in spring. Which do you think I had better get him? 3. Can a Colt's 36-calibre revolver be changed to a cartridge one? and at what cost? Ans. 1. Next to the Bible read "Frank Forester" or Lewis's "American Field Sports." 2. We should prefer a double gun even if it had to be a muzzle loader. 3. The alteration can be made but the Company will not take a single pistol to alter. Ask a gun dealer to exchange it for you.

E. J. R., Wethersfield, Conn.—My setter bitch Bridget has the distemper still and is discharging copiously from the nose. She does not eat well, but has not fallen off in flesh much, and seems quite strong. I keep her out in my kennel as I am afraid to bring her in to the fire for fear of giving fits. Is it best to give her any cooked meat? How long does the distemper last? Is it best to keep her near the fire. The distemper powders you sent to me have helped amazingly, had I better give her more? Ans. Give her enough of the distemper powder to keep her bowels open and by all means keep her comfortably warm; no dog can be cured of distemper, unless he is kept in a comfortably warm clean place. Beef or mutton soup with well boiled rice is as good as can be given; well cooked oat meal mush or cake for a change is well. Sometimes dogs are helped by giving them bones to gnaw, such as they cannot swallow. It is impossible to say how long a case of distemper will last, so much depends upon how the dog is affected by it and the attention and remedies used for her cure.

A. B. C.—Please state in your next issue what a young man can engage in in Florida in the way of fruit growing; say he has \$500 to \$1,000 cash. Is game plenty there? and is there any land to be had for settling on it? Would you advise such a person to go there to seek his fortune? Ans. Possibly 100 miles of the railroad running from Fernandina, on the Atlantic Ocean to Cedar Keys, on the Gulf of Mexico is a busy hive of workers on early vegetable market farms. The average number find watermelons, cucumbers, tomatoes, peas, beans, &c., profitable the first year. These crops are grown on land planted in oranges, bananas, lemons, figs, &c. As soon as these trees come into bearing—say from three to seven years—there is an ever-increasing, steady income, perpetually. The particular advantages that have attracted so many market gardeners to this section are, sure, regular and quick communication by rail and steamships with the northern, eastern, and western cities; lands will grow oranges without fertilizing, and the trees are never diseased; as fine hunting and fishing as any State affords. The lands are very cheap. All such inquirers as A. B. C. will have questions very satisfactorily answered if they will write to Col. J. B. Oliver, General Agent Florida Land and Immigration Co., P. O. Box 5,520, N. Y. city.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

17 CHEATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[POST OFFICE BOX 2882.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

NEW YORK, THURSDAY, DECEMBER 28, 1876.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

Trade supplied by American News Company.

CHARLES HALLOCK,

Editor and Business Manager.

"HAPPY NEW YEAR."

For the fourth time the FOREST AND STREAM has the pleasure of extending this anniversary greeting to its friends and readers; and we may say that it has always been reciprocated in the most cordial and substantial manner. Without admitting the public too far into the penetralia of our household affairs, we may be justified in saying that probably no business relations of whatsoever kind are so pleasurable as those that may be maintained, reciprocally, between the publisher of a journal of the peculiar character of FOREST AND STREAM and those who patronize and sustain it. The latter, by their contributions, and their direct material aid and countenance, become a part of the concern, as it were; so that the welded unit becomes inseparable by its community of interests. The reader of FOREST AND STREAM enters into its weekly topics and current gossip, with the same zest and gusto that he dons his attire when he goes forth into the field, or when he quietly hobnobs with a comrade over the andirons. And so, from first to last they travel on together, like "John Anderson, my Joe," and the intercourse grows more and more pleasant with each scintillating reminiscence or anticipation.

The past year has been a trying one to business men, and FOREST AND STREAM has suffered in consequence. Yet we have faith in the indomitable perseverance and "git-up-and-git" of the American people, especially of those who are lineal descendants of the pioneers of the frontier who wielded the knife and gun when our broad domain was little else than a wilderness. We know that the sky is bright beyond the clouds, and so, while we wish our friends all the good wishes of this Good Will season, and a recurrence of many Happy New Years, we exult as we sing, in our own homely versification and blunt old-fashioned way:

Ring out, merry bells, for the Year that is born!
Dig deeply the grave of the year that is gone!
Let sorrow long past be ever forgot—
Forebodings of evil, cherish them not;
For our lives are weighed down by burdens enough,
Without stopping to sneeze when others take snuff.

Pray what is the use of borrowing trouble?
It brings no relief but makes the load double.
It is better by far to be of good cheer
And make up our minds for a HAPPY NEW YEAR.

—To many women no Holiday Present will be more acceptable than a Wilcox & Gibb "AUTOMATIC" Sewing Machine. It received the highest award at the Centennial Exhibition.

EDUCATION OF WOMEN IN CANADA.

THERE is a great deal of talk and commotion every year in the United States about the higher education of women and their rights to receive a training similar to that given to the opposite sex; but all the oratory and excitement periodically expended in the discussion of the topic seems to lead to nothing, and finally the subject is dropped only to be taken up again at longer or shorter intervals. In refreshing contrast to this course, is that followed on the other side of the line. The ladies of Montreal, without making any great noise about it, have organized an association, have secured the first specialists in that city as lecturers and examiners, and have for five years had most able and thorough instruction in various branches of Literature, Science and Art. The "Report of the Montreal Ladies' Educational Association" gives the details of the lectures and examinations held in that city under its auspices during its fifth session, 1875-6, and a brief review of what has been done during the year is instructive as well as suggestive.

The association numbers over one hundred and twenty-five members, among whom are the most intellectual and highly cultivated ladies of Montreal, not a few of whom have shown their ability to master fully the difficult subjects to which their attention has been called, by passing successfully the stringent examinations of the course. Students' tickets are issued entitling the holders to admission to the lectures and examinations, and the eagerness with which such tickets are sought for is a sufficient proof of the good that is being done by the association. The examination papers are quite difficult, yet a large majority of the students pass in what is called the First class—that is, receive seventy-five per cent. of the full mark.

The past session was opened by Principal Dawson in a lecture entitled Ideal Education of Woman. This was followed by a course of twenty lectures by Dr. Kelly on English Literature, a continuation of the series of the previous session on the same subject. A course of ten lectures on biology by Dr. Wm. Osler came next in order, the lecturer taking for his subject the "Structure and Habits of the Lower Orders of Life." A series of well prepared microscopical objects illustrated this course, and were highly appreciated by the audience. Twenty lectures by the Rev. Principal McVicar on applied logic were followed by a series of discourses by Prof. Armstrong on "Architecture, Historical and Descriptive," these completing the course of instruction for the session. Although a large number of those who attended these lectures took notes, only seventeen presented themselves for examination at the close of the course, many apparently not having the courage to risk passing the examinations when not sure of a First class.

For the session of 1876-7, now opening, the association is promised a rich treat in a course of ten lectures to be delivered by Principal Dawson on "Structural and Systematic Botany." The Rev. Prof. Campbell will at the same time give a series of twenty lectures on the "History and Literature of Ancient Nations." Later in the session will follow twenty lectures on Electricity and Magnetism, which will be illustrated by experiments with the admirable apparatus of McGill University. The Rev. Principal Lobley will close the course with a number of lectures on Grecian History. Altogether the programme for the winter is most attractive, and we take leave to congratulate the members of the Executive Committee of the association on the rare judgment and discretion displayed by them, as well as in the selection of the subjects to be discussed, as in the choice of most competent and eminent lecturers. The association has already done excellent work, and we venture to predict that it will continue to be the power for good that it has already proved itself.

GAME PROTECTION.

CANADA.—We printed recently an abstract of the proceedings in the Legislature of the Province of Quebec, relative to the proposed amendments to the game laws of that Province, not the least interesting portion of which was the views of the President and Secretary of the Game Protection Society. A suggestion to that effect having been made by a member of the Legislature, the Committee of the Fish and Game Protection Club of Quebec place upon record its ideas of what the provisions of the Game Laws should be, by addressing a letter to the Hon. P. Garneau, Commissioner of Crown Lands, Quebec, the substance of which is as follows:—

We desire, first, to bring prominently before you the fact that as we have not here, as in European countries, a class for whom game is to be preserved, so the object to be attained by game laws is the same for the professional hunter and the sportsman, viz: not to preserve game but to protect it. The breeding animal loses in a large measure, as every one knows, its dread of danger, is more easily approached, and consequently a more easy prey to the unscrupulous. For these reasons the open season for any species should as far as possible avoid the breeding time of that species. Apart even from reasons of humanity, there is also the economic fact that in taking the life of the parent at the breeding season, the lives of the offspring are sacrificed. Looking to these facts, the Committee respectfully submits that we have here the basis on which a protective law ought to be framed. With regard to the shooting of game by the poorer settlers in the backwoods, the Committee thinks that very little harm can be done during the close season, if the law strictly defines such shooting to be done solely for consumption by the settler's family and prohibits the sale of such game or the skins of animals so shot. As you are no doubt aware, the rapid extinction of game in the United States has caused vigorous

action to be taken by the various Legislatures to put a stop to its wholesale destruction, and the Club is in receipt of communications from every part of the country describing the means used, the principal and most effective of which is—prohibiting the shooting of breeding animals. Our Treasurer, Mr. Rintoul, has already stated before your Committee on the Game Laws the active measures which have been taken by the Legislatures of Ontario, New Brunswick and Nova Scotia for the protection of Game, and, unless some such measures are adopted here, we shall soon be reduced to the condition of some of the United States, which are, at great expense, not only re-stocking their forests with game but their rivers with fish.

This Committee submits, therefore:—1st. That the close season for elk, moose, caribou, deer and fawn, should extend from 1st January to 31st August inclusive.

2d. That black duck, wood duck, grey duck, mallard and teal, as they breed on the St. Lawrence and its tributaries and commence nesting as soon as they arrive in spring, should be protected at that season.

3d. As regards other species of ducks, also wild geese and wild swan, the law might remain as it is.

4th. With regard to partridge the Committee thinks snaring ought to be prohibited.

5th. In order to make the law of any effect it is absolutely necessary to make it illegal to have in possession any animals or birds or parts thereof during the prohibited seasons.

6th. The Committee desires to make no suggestions with regard to woodcock and snipe, as the subject is a much disputed one, and the law as it stands at present seems to satisfy the majority.

Trusting these suggestions will meet your favorable consideration, we have the honor to remain, sir, your very obedient servants, the Committee of the Fish and Game Protection Club of the Province of Quebec,

Per McPHERSON LE MOYNE, President.

A. N. SHEWAN, Secretary.

MASSACHUSETTS.—Mr. J. Eaton, Jr., Corresponding Secretary of the Massachusetts State Sportsman's Association, whose address is New Bedford, wishes to ascertain the names and localities of the different sportsmen's clubs in his State; also the address of gentlemen, particularly farmers, in different parts of the State, who are really interested in the objects of the association, and through the FOREST AND STREAM requests the different clubs and gentlemen who are not members of clubs to send their addresses to him as above as soon as they can conveniently do so. As the object is to take some united action which will result in furthering the cause of game protection, we trust that our Massachusetts friends will respond to Mr. Eaton's call.

—The West Jersey Game Protective Society are making efforts to procure from South Carolina and elsewhere several thousand quails; also from the West some hundreds of pinnated grouse (prairie chickens), and a few wild turkeys, all of which will be distributed through the southern part of the State.

IMMIGRATION TO FLORIDA.—The following letter is received. The first statement takes us by surprise, the latter is simply astonishing. We had certainly taken credit to our paper for having large influence in Florida, and as receiving the great confidence of that portion of the public interested in Florida, for our services in behalf of that State have been great; but we had no idea that the information which its weekly issues contain, was looked for so generally as the following authentic letter would imply. Such a reputation earned among our merchants and general dealers in merchandize would make the FOREST AND STREAM not only the best advertising medium in the country, but the most lucrative newspaper of all. Most of those who have tested its value thus far have expressed themselves more than satisfied:—

21 PARK ROW, New York City, Dec. 26.

EDITOR FOREST AND STREAM:—

About three weeks ago I saw a statement in FOREST AND STREAM that "an average of three persons per day interested in Florida" visited your office. A competent clerk in my office has been required to keep an exact count of the number of people calling at our office every day to get information about Florida. The number has averaged just *sixty-three* per day. The majority of these were on their way to settle permanently in Florida. Most of the others will go before the winter closes. This is where you are "outdone."

Now here is where you are "outdoing!" Two months ago I inserted an advertisement in seventeen of the great agricultural papers of the United States. At the same time I inserted a similar advertisement in FOREST AND STREAM. I have the letters in my office to show that a larger number have said: "I saw your advertisement in FOREST AND STREAM" than in all the seventeen papers together. (I state this without invidious comparison. It is a fact based upon attainable testimony. Please continue advertisement of Florida New Yorker for one year.

Respectfully,

J. B. OLIVER.

Gen. Agent Florida Land and Immigration Co.

A WORTHY ENTERPRISE.—It is proposed to establish a carrier pigeon service between the islands of Anticosti, Magdalen's, etc., off the Canadian coast and the mainland, to be used in case of shipwreck. These schemes originated with, and will be prosecuted by our valued correspondent, Mr. Phillip Vibert, who is agent for Lloyd's at Perce, on the eastern point of the peninsula formed by the St. Lawrence river and the Bay of Chaleur. Perce is in the Gaspé district, Province of Quebec, and is the nearest point to the islands. Such a service might prove of inestimable value in saving the lives of shipwrecked mariners, and much valuable property besides, as steamers can at once be dispatched in case of wreck. Of course a telegraph would be more certain, but the Dominion Government could scarcely be expected to lay cables when the proceeds would not pay for wear and tear. Mr. Vibert reports, under date of December 14th, that the sea is open as in summer, so that there would be no obstacle to steamers crossing at any time from Perce.

THE NEW YEAR.

THERE would be fewer attractions surrounding Christmas and New Year's Day as holidays, if they appealed less to the feelings in which home is enshrined. We are proud and patriotic as each recurring Fourth of July brings strongly and vividly before us the fact that America is our country. At other festivals we are, or try to be, imbued with the religious feelings befitting the occasion. Christmas and New Year's Day are viewed similarly and yet differently. They carry us back to the most hallowed spots in "mem'ry's waste," and help to keep green the feelings of youth. They are the festival of home, and recall the old home circle, very much narrowed, it may be, since dropped out of the reach of its warmth and love, but remaining fixed and unchangeable in our recollection. Christmas has come and gone, and Santa Claus has whirled away in his car to be seen no more for another year. We can only hope that our readers were each and all honored by one of his mysterious visits, and that he left behind souvenirs of love and friendship before

"He sprang to his sleigh, to his team gave a whistle."

We approach New Year's Day with feelings strangely crossed and mingled. Its morning marks another turn-stile to be passed on the way through life. As we stand at one side we are despondent over retrospection; as we stand at the other we are buoyant with hope and anticipation.

Hope links us to the future—but the link
That binds us to the past is memory.

In either case the contemplation of the past is, although valuable, unattractive or even regretful. If it brought pleasure we bemoan its departure; if it gave us only pain that pain we feel again in memory. If it brought us to conscientious self-examination, however, and the suffering left us chastened and purified, its endurance would be a blessing, and therein lies the advantage of marking at stated intervals the flight of time. We can measure our present with our former selves, and determine whether we have advanced or retrograded. The expiration of a year is thus invested with a certain solemnity which it is well for us to appreciate. It may be the measure of our rise or of our fall, and stands as a milestone upon the way of life. If it leaves us on the height we may look forward to other heights shading off into the unknown beyond, where all our years will mingle again in eternity. If it leaves us in the valley we may look back regretfully to the summit we have left, and forward to the hill we may never reach. But

"Full knee-deep lies the winter snow,
And the winter winds are wearily sighing;
Toll ye the church bell sad and slow,
And tread softly and speak low,
For the old year lies a-dying."

and hardly has the knell been rung before

"There's a new foot on the floor" my friend."

He brings the new-born hope to take the place of the lingering memory. It is a time less for wassail and rejoicing than for high resolve, that 1877 shall leave us higher, purer and better than it found us. It is well, no doubt, to rejoice, to claim the friends that are left us and the benefits we enjoy; but to many the future is terrible because it is hidden. We peer into it fearfully, like children peering into the dark. All that we can do is to step forward with boldness and face our duty with all the consequences its performances may entail. Though we pause upon the threshold of the new year, it need not be in fear, but with determination and an unspoken prayer that the bells which have changed their solemn tolling to a merrier peal may

"Ring out the grief that saps the mind,
For those that here we see no more;
Ring out the feud of rich and poor,
Ring in redress to all mankind."

"FRED BEVERLY'S" EXPEDITION TO THE LITTLE ANTILLES.—Before we can study the ornithology of the islands of the Gulf of Mexico and of the Caribbean sea with profit, we must have a "re-identification" of the species of birds which inhabit the Little Antilles. Dr. Gaudlach has been hard at work in Cuba and Porto Rico for years past, and now Mr. F. A. Ober, of Florida fame, who left New York a short time since, goes to Martinique with the intention of assiduously studying the natural history of that interesting island of the Windward Group. Mr. Ober takes with him his photographic apparatus, with which he will secure negatives of all interesting subjects which will illustrate biology. He goes out under the auspices of the Smithsonian Institution, and will be encouraged in his efforts by two or three scientific specialists well known to American naturalists. Mr. Ober obtained some portion of his outfit from the FOREST AND STREAM proprietors, including arms and ammunition, whereby we have established some claim upon him for letters which he has promised to send us from time to time, as he has opportunity.

—The receipt by us a few days ago of a large club of subscribers from among the West Point cadets, shows that the young fellows have the same appreciation of FOREST AND STREAM as the officers of the Army on the frontier and at Headquarters have. FOREST AND STREAM is now represented at nearly every frontier post.

—Bermuda is one of the most delightful winter resorts readily accessible from New York York. It has an equable temperature of about 70°. The steamers advertised in our journal reach Bermuda in seventy-two hours from time of departure from this port.

A NOBLE PRESENT FROM THE WOODS.—Allan Gilmour, Esq., of Ottawa, Canada, (of the ancient and honorable house of Gilmour, Rankin & Co.) has made us a noble Christmas present. It is an immense moose head, whose spread of horns measures five feet; whose head, from tip of nose to top of the occiput, just back of the ears, measures two feet four inches; and the muzzle, or more technically the muffle, twenty-five inches in girth. The horns themselves are very symmetrical, consisting of two pronged palms whose width measures two feet and over. It is a noble trophy of prowess which Mr. Gilmour should feel as proud to have won as we feel honored to receive from the giver. We shall mount this head in our office as a symbol of our profession, and a tribute to the gentleman who shot it, so that those who visit us hereafter may gaze upon it and recall the happy hunting grounds where noble game woos noble hunters.

A QUAIL BREAKS THE GLASS OF A LOCOMOTIVE HEAD-LIGHT.—While the train on the branch of the Camden and Atlantic Railroad, which terminates at May's Landing, N. J., was running to the latter place one evening about the middle of December, the engineer discovered by the glare of the head-light some object in the centre of the road a short distance ahead. As the object was low enough for the locomotive to clear he did not disturb his speed, but kept a close watch of the object. When the locomotive was within a few feet of the object it suddenly separated in several directions through the air, a component part striking the head light glass with such force as to break it. It was a covey of quails!

"VANITY FAIR."—Very generous to our printers have been the gifts of the manufacturers of the Vanity Fair Tobacco. For the third time, at least, our editors, compositors, and type-stickers—from the head "devil" down to the least—have been the recipients of a large box of this delightful comforter, with the compliments of the the season, and friendly wishes for a "Merry Christmas" and a "Happy New Year." His Infernal Highness, it is asserted, delights in smoke; and hence the admitted appropriateness of the gift, as well as its significance, as no doubt implied in and by the donation. Could the faithful men who have worked with and for us ever since the day when the FOREST AND STREAM was first started, and contributed to its success, be persuaded to speak, they would no doubt express themselves with more fervor than we do, and put their words in proper "form." As it is, although "not an orator like Brutus," we shall simply speak "right on," and the point of our expression will be, thanks renewed, and a hope for the continued prosperity of Kimball & Co., of Rochester, and a belief that their tobacco and cigarettes will find favor with all who test their pungency and flavor.

MORE ORANGES.—What a delightful season the children would have if life was one long eternal Christmas!

Speaking of oranges, we are the recipient of another lot of oranges from Mr. Chas. J. Kendall's grove on Palmetto Island, near Port Royal, South Carolina, and while we are epicurian, and fond of what is luscious, we are philosophical enough to take the "bitter (oranges) with the sweet," just as he sent them, remarking *sofio voce*, "Such is Life," of which there can be no mistake

This Port Royal fruit is very fine and while we think that of Homosassa is better, we are free to say that we have seldom seen as good in Florida.

MRS. BEECHER AND FLORIDA.—Col. J. B. Oliver, Managing Editor of the "Florida New Yorker," having recently presented to Mrs. Henry Ward Beecher forty acres of land on the Transit Railroad in Central Florida, that lady, in a graceful letter of acceptance, wrote the following endorsement of Florida:

BROOKLYN, Nov. 13.

Col. J. B. Oliver, Editor Florida New Yorker:

DEAR SIR: Permit me to thank you for the forty acres in Central Florida, that you are willing, through me, to place in my son-in-law's hands, Rev. Samuel Scoville, in trust, for his children.

I have great faith in, and affection for, Florida. I love this land of beauty, her hospitable, warm-hearted people, her exquisite flowers, her luscious fruits, her sweet and brilliant birds, her wonderful productiveness. This land, whose soft and balmy air brings health and strength and hope to the invalid, making life a pleasure far more appreciated than in our dear, but less genial, climate.

Under skillful management I am confident that Florida can give to those who create a home on her soil all, and more than your Florida New Yorker promises. Besieged, daily, by those unfortunates who come to our door for help, I see that the little one can give is but a crumb among so many; and I wish till my heart aches, that I had the means to transport those who only beg for work to this land of promise, and sure fulfilment for all who bring to it efficient industry.

You could scarcely have given me greater pleasure than by presenting this land to my daughter's children, for I have seen and do know what can be done in Florida, and what her soil is capable of giving back in return for honest labor.

Yours respectfully,

MRS. HENRY WARD BEECHER.

In his public and private lectures throughout the Northern and Eastern cities, as well as by the use of his well-directed pen, as Managing Editor of the Florida New Yorker, Col. J. B. Oliver is accomplishing a work for the State of Florida that can only be measured by millions of money, and thousands of good settlers whom he is inducing to go to that genial clime. From the business relations which this gentleman has had, and now has, with the FOREST AND STREAM, as agent and correspondent, we are

willing to express much faith in his abilities and integrity of his efforts to build up Florida.

PEACE AND QUIET IN FLORIDA.—Some of our correspondents have asked us, seriously, if it will be safe for Northern men to visit Florida this winter. We have spared ourselves and them the mortification of a reply. But here is what Mrs. Harriet Beecher Stowe says in the last number of the Christian Union:—

"We find Florida extremely quiet. Nobody seems to be thinking much of anything but their own business. Everybody is longing and praying for the Northerners to come down to buy their goods, to fill their hotels, to occupy their boarding-houses, and to keep business stirring generally.

"Florida is quiet and will stay so. This is not the kind of atmosphere to breed tumult, and whichever way the election goes we expect a sunny time here. One large new hotel in Jacksonville has arisen since we were here last. We hear of others arising at Green Cove and Palatka. New boats are running on the St. Johns, and the old are not diminished. The beautiful river is full of life and everybody seems to be of opinion that, come what may, it is best to keep good-natured; which is good philosophy both for Florida and life in general."

A letter from Dr. F. D. Lente, dated at Palatka, Dec. 20, says:—

"If any of your friends have any apprehension about coming to Florida on account of political troubles you may assure them that they will be as free from molestation, or even from unpleasant associations or remarks connected with politics as in New York. There is no excitement in this part of the State whatever, nor do I hear that there is in any other.

SPORTSMEN MURDERED.—It is very rarely that we are called upon to record an incident of the character of the one described in the letter printed below. If the particulars as given are correct, we should think that the people of Tennessee would, for the reputation of their State, organize themselves into vigilance committees and exterminate the outlaws:—

NASHVILLE, Tenn., December 6th, 1876.

The intelligence of the murder of four sportsmen from Kentucky, on the Cumberland mountains, was received in this city a day or two ago. They left Kentucky a few days previous, and upon reaching the mountains hunted all day. While sitting around a fire at night, they were suddenly attacked by a band of outlaws who infest the hills near where the unsuspecting hunter's were. They made a desperate resistance, but were finally forced to yield to the greater number. They were all shot and stabbed, and left lying dead upon the scene of their fancied security of a few hours previous. The robbers took their hunting accoutrements and departed. The bodies of the murdered men were discovered next morning by a man who passed by them, and who soon summoned a number of other persons to the place. When the pockets of the unfortunate men were examined, their names and places of residence were ascertained from letters and papers. Their relatives in Kentucky were notified of the fate of the sportsmen, and immediately took steps to have the bodies taken to their homes.

ROBERT J. MILLER.

OUR WASHINGTON LETTER.

FROM OUR OWN CORRESPONDENT.

DUCK SHOOTING ON THE POTOMAC—DISTRIBUTION OF SALMON AND CARP IN MARYLAND AND VIRGINIA WATERS—THE SALMON FISHERIES OF THE COLUMBIA RIVER—PROTECTION OF BUFFALO, ETC., ETC.

WASHINGTON, D. C., December 23d.

WE have just had another Polar wave, which brought the mercury down to the neighborhood of zero, and as a consequence sportsmen in this vicinity have done but little shooting recently. Usually in this latitude December is one of the mildest winter months, but this year it has been extremely severe. We have already had ice from six to eight inches thick, and at least half a dozen snow storms, though all of them were light, but sufficient to render walking over country fields disagreeable. The followers of aquatic shooting in many instances have been deprived of trips down the river, which they oftentimes enjoy about this period, on account of the extreme cold having frozen the river to a distance of twenty or thirty miles below the city. Before the freeze several parties who spent a day or two at various points below Mount Vernon had good sport. Accounts from the Lower Potomac and Chesapeake Bay are to the effect that ducks, swan and geese are as numerous as they are every season on this beautiful river, the products of which in the shape of fish and fowl supply our tables to such an extent. Many points might be mentioned between Mount Vernon and the mouth of the river which are celebrated as good feeding places, and where canvas-backs, red necks, mallard and other varieties are abundant. Not many years ago there was good duck shooting in the waters of the Potomac and Anacostia adjacent to the city, but the big guns have been used to such an extent that the ducks have been driven off and now they are not to be found near the city in large flocks as in former days. Good canvas-back ducks are now sold in our markets at \$2.50 a pair, red necks at \$1.50, and mallards at \$1.25. Swan are selling at \$1.50 each, and wild geese at \$1.00. Referring to our market brings to mind the fact that the people of Washington are blessed with as abundant supply of fish and game as those of any other city in the Union; besides that above mentioned we have partridges, wild turkeys, pheasants, venison and other game. In the way of fish we have cod, white and blue-fish, haddock, halibut, drum, rock, perch, smelt and other varieties, and all to be obtained at prices very reasonable. There is quite a large and successful trade carried on in these luxuries, and heavy consignments arrive daily for the dealers.

Partridge shooting is about over for this season. There were two or three pleasant days a week or so ago, and some of our sportsmen took advantage thereof to have another shot at the birds. Some of them had fair luck, and returned home with a respectable showing. The birds are fully grown now, well feathered, and able to get out of the way with lightning rapidity, besides they have been shot at so much that they have become very wild and remain in cover most of the day. The season in Virginia closes, I believe, on the 1st of January, and in Maryland on the 15th. We have no shooting then until the jack snipe put in their appearance early in the spring on their way north.

In a recent letter I gave the history of the introduction of California salmon in the Potomac by Prof. Baird, the U. S. Fish Commissioner, and am glad to say that the good work is being pushed forward by the Maryland authorities, who are increasing the supply in the headwaters of this river. Major Thomas B. Ferguson, the Maryland Fish Commissioner, has distributed this fall nearly one million young salmon, which were hatched in the propagating waters at Druid Hill Park near Baltimore. Of this number 71,000 were placed in the Potomac near the Point of Rocks, 83,200 in the north branch of that river, and smaller lots in various tributaries of the stream. They were also distributed extensively in the Gunpowder, Patapsco, Monocacy, Susquehanna, Patuxent, North Patapsco, and other Maryland waters, as well as adjacent streams. He has also shipped and deposited in Virginia waters on account of the U. S. Fish Commissioner about 163,000 young salmon, and many of these were placed in the Shenandoah, whence they will come into the Potomac, and the probabilities are that this river will soon be crowded with salmon. The Maryland authorities are taking a great interest in pisciculture, and are rapidly stocking the waters of that State with food fishes. An order was recently given by the U. S. Fish Commissioner at the request of Major Ferguson for the importation of a lot of carp from ponds bordering on the Danube, and they will be placed in ponds prepared for them in Druid Hill Park to "increase and multiply," and will then be distributed in ponds in Maryland and neighboring States. These carp are said to be peculiarly adapted to the ponds and still waters of the eastern shore of Maryland. It is highly prized as a food fish, and has pre-eminence over black bass, trout, grayling, etc., on account of being a vegetable feeder, and although not disdaining animal matter can thrive very well upon aquatic vegetation alone. They have the advantage over the salmon and herring families in being able to live in warmer and more stagnant waters. Two importations of carp were made in 1875, but of an inferior kind. Unfortunately, on account of hot weather and overcrowded tanks, all but 22 died on the voyage. Subsequently all died but eight, and from this small number several thousand have already been hatched in the ponds at Druid Hill Park, and will be distributed in the ponds of the State during next year. They rapidly attain a weight of twelve or fifteen pounds, and are also ornamental, being of a rich golden color. The carp, on account of their quick growth and great increase, is regarded as the most valuable of all fish for stocking ponds. Prof. Baird, the U. S. Fish Commissioner, is favorably impressed with the hatching establishment at Druid Hill Park, as being peculiarly adapted for hatching this variety of fish.

Senator Mitchell, of Oregon, has introduced in the Senate a bill for the protection and preservation of the salmon fisheries of the Columbia river in that State, which makes it unlawful to fish for salmon by any means whatever from the 1st of August until the 1st of May, the first offense to be punished by a fine of not less than \$500 nor more than \$1,000, and any subsequent offense by a fine of not less than \$1,000 and imprisonment at the discretion of the court for a term not exceeding six months. It also makes it unlawful to fish for salmon in that river during the months of May, June and July, in any manner whatever, except by means of the seine, the meshes of which shall not be less than eight and one-half inches diagonally from one corner to the other when extended. Any violation of this section to be punished as prescribed in the former section, except that the term of imprisonment may be extended to one year. The bill also appropriates \$25,000 to enable Prof. Baird, the U. S. Fish Commissioner, to have erected an establishment for the artificial hatching of salmon at such points on the river as he may select, and \$10,000 to carry on such establishment. It was referred to the Committee on Commerce. As the bill now stands it prohibits angling for these salmon, but should it receive the attention of the Senate several amendments will be added to it, among them one to permit their capture with hook and line, to which the mover will make no objection. It is not his intention to prevent them being taken in this way, but it is his desire to prevent all trapping, spearing, and such means for their capture. The use of lines set in the stream with numerous hooks attached to them will also be prohibited.

In your foreign letter of a recent date I notice your correspondent quotes an article from the London *Field* in favor of immediate steps by our Government for the protection of the buffalo. The initiatory step has already been taken, the House of Representatives having passed a bill in February last to prevent the useless slaughter of buffalo within the territories of the United States. This bill was sent to the Senate for the concurrence of that body, where it was referred to the Committee on Territories, and has not yet been reported back. It makes it unlawful for any person not an Indian, to kill, wound, or in any manner destroy any female buffalo of any age. It

also forbids the killing, wounding, or destroying of any greater number of male buffaloes than are needed for food by the persons killing them, or than can be used, cured, or preserved for the food of other persons, or for market. It is further made unlawful for any person to assist, or be in any manner engaged or concerned in or about such unlawful killing, wounding, or destroying of buffaloes, or for any white person to employ or procure, directly or indirectly, any Indian to kill any buffalo forbidden to be killed by the act. The penalty for violating the law is a fine of \$100 for each buffalo killed, and for a second offense the offender may be committed to prison for a period not exceeding thirty days.

OCCASIONAL.

OBITUARY.—We are pained at having to record the death of Wilbur F. Parker, of West Meriden, Conn. Mr. Parker's name is familiar to our readers not only in connection with the "Parker" gun so generally used throughout the country, but also as the originator of the *American Sportsman*, a contemporary, now known as *Rod and Gun*. Mr. Parker had at heart the interests of field sports, and devoted himself almost entirely, until illness required a change of scene, to their furtherance. He was active in the organization of the National Sportsmen's Association, and acted as Corresponding Secretary until the last year. Mr. Parker's death occurred in Florida a few days since.

Rifle.

THE IRISH RIFLE ASSOCIATION.—The Duke of Abercorn has been, until recently, Viceroy of Ireland, and also President of the Irish Rifle Association. Previous to his departure from Ireland the event was made the occasion of a visit from a deputation from the Association, during which Major Leech, so well known in this country, made one of his felicitous speeches. After referring to the various contests in which the Associations had been engaged during his Grace's presidency, he alluded as follows to the great matches shot in this country:—

"In 1873, so great was the improvement in our marksmanship, that we were emboldened to throw down the gauntlet to the Americans, long known for their skill as marksmen. The history of that and subsequent expeditions across the Atlantic by our riflemen is now well known through the medium of the public press. Two months since our team stood side by side with the Americans, Scotch, Australians and Canadians, in the greatest rifle contest ever held, and beat three of the competing teams, being close up to the Americans at the finish. During this great contest some of our members made scores which are unprecedented for continuous accuracy. The Americans retain their laurels, and are as yet unconquered; but the Council feel that the representatives of the Association achieved successfully the most important object of their visit, which was to show to the American people (by joining with them in celebrating the Centenary of their independence) that we rejoice at their progress, and are proud of their success, and to bind still more closely the feeling of mutual regard already existing between the two countries."

Major Leech, in continuing his remarks, hoped that his Grace would remain as President of the Association, which the Duke in reply consented to do, as well as to act as Captain of the Irish eight in the next contest for the Elcho Shield.

RHODE ISLAND.—The fourth competition for the champion marksman's badge (200 yards) took place on the 15th inst. at Newport, and was again won by Mr. W. M. Farrow, the conditions being 10 shots each at 200 yards. He has now won it three times and the badge becomes his property. The day was very unfavorable for off-hand shooting, being cold with a very heavy northwest wind blowing. The scores were as follows:—

Name.	Total.	Name.	Total.
W. M. Farrow.....	42	Ira Brightman.....	38
W. R. Landers.....	41	E. H. Potten.....	37
H. Bull, Jr.....	39	G. S. Slocum.....	36

—The Hartford *Post* says that the subject of adopting the range of the Connecticut Rifle Association, known as the Willowbrook Range at Berlin Junction, as a State rifle range for the use of the National Guard at target practice, will, it is said, be brought before the military committee at the coming session of the Legislature.

Game Bag and Gun.

GAME IN SEASON IN JANUARY.

Hares, brown and gray.	Wild duck, geese, brant, &c.
FOR FLORIDA.	
Deer, Wild Turkey, Woodcock, Quail, Snipe, and Wild Fowl.	

A WORK OF ART!—Believing that our readers take the same interest as ourselves in anything in the gun line, we wish to describe to them a gun we have had the pleasure of inspecting at the store of Mr. H. C. Squires, in this city. The gun was made by Mr. W. W. Greener, which is of itself a guarantee as to its quality, but the chief beauty of it is in the complete adaptability of all its parts for every description of shooting. There are two sets of barrels of the finest Damascus, one 12-gauge, 28 inches, with the right barrel cylinder bored and the left slightly choked, and the other 10-gauge, 30 inches, both barrels full choked. With the first pair the gun weighs 8½ pounds; with the other 9½. The workmanship is as fine as anything we have seen; the stock a beautiful piece of walnut, and, of course, the gun has every improvement in the way of patent fore end, action, etc. It is worth a moderately long journey to see it.

—The Oswego *Times* of Dec. 18th says: "Don't shoot partridges now, it is illegal." As the close season does not commence until Jan. 1st, the *Times* is just thirteen days too soon with its notice. After New Years, however, we hope the line will be kept standing for eight months.

—Any parties who will see fit to accept Mr. Kendall's invitation to Palmetto Island, Port Royal, S. C., to shoot ducks should bring a portable light boat, provided with Lyman's bow facing rowing gear, with short oars for narrow channels. Double plates should be put on the boat, at the centre when one alone rows and shoots and halfway from centre aft for oarsman alone with the gunner at bow of boat. Besides this gear common iron or brass sockets and rowlocks should be on the gunwale towards the bow for use in case of breakage of the Lyman gear. Also a short pair of sculls for such an emergency.

—The Germantown *Telegraph* says that: "Milford, and the region thereabouts in Delaware, has this year become quite a center for the shipment of game to this city and even to New York. Thus far some 8,000 partridges, 2,000 rabbits and 2,500 ducks have been sent north." Now if it would only tell us how many of the partridges were illegally snared and how many lawfully shot, the item would be one of suppassing interest.

—Rabbit shooting must be fine sport in Connecticut. The Norwich *Courier* says:—

"Seven gentlemen went up the road Wednesday rabbit shooting. They stopped at Stafford and after hunting all day they started two rabbits which were driven into their burrows. The sportsmen tried to dislodge them, but being unsuccessful they were obliged to dig them out which was accomplished after an hour's labor. The game was hard to kill so the sportsmen cut their throats with a pocket knife. The spoil was worth forty cents."

CAPT. BOGARDUS IN CALIFORNIA.—Through means of a telegram to the *Herald* we are placed in possession of information regarding the movements of the champion on the Pacific Slope. Under date of December 23d it says:—

"In the pigeon match for \$500 to-day, at Oakland Park, between Captain Bogardus and Crittenton Robinson, the champion of California, the former won after a close contest. Conditions sixty single birds each and forty double. California rules. There was a good attendance, and excellent order prevailed. Bogardus led off with thirty-five birds to Robinson's twenty-seven, but Robinson later on outshot his Eastern rival, scoring fifty-four birds of the sixty, against fifty-one for Bogardus. Hitherto betting was light, but, as Robinson is generally excellent at double birds, investments were made on terms. The birds were all strong on the wing, and on the first ten pair Robinson held his own, but in the next five Bogardus made up the difference, and they were even 74 each on the last five. Bogardus killed every bird; Robinson missed three; but the match could have been a tie until the last two barrels. The score was 84 to 81. Both contestants declared themselves satisfied with the decision. The winner was instantly challenged to repeat the match for \$1,000 a side.

NEW YORK—Hornellsville, Dec. 18th.—Not much shooting now of any kind, a number of deer have been killed near here, also three snowy owls. John Tenney last week killed a white rabbit or hare that weighed nearly 15 pounds.

"JOHN."

NEW JERSEY—Wenonah, Dec. 25th.—A late issue of your paper says that quite a number of deer and bear have been killed in South Jersey this season. This is partly true and partly a mistake. I have been all over the southern part of the State within a few weeks, and believe I state facts when I say that a large number of deer but no bear have been killed. The latter are not plenty, though a few have been seen during the past summer and autumn. Under the rigorous protection of the West Jersey Game Protective Society the deer and other game are steadily increasing. Immense numbers of quails have been killed during the season just closing. During the past week or ten days we have had a succession of severe snow and sleet storms, which is likely to prove very destructive to quails.

MILTON P. PEIRCE.

WISCONSIN—Westfield, Dec. 21st.—Deer have been unusually plenty in the Northwestern portion of this county, and in Adams County. Quite a number of fine deer have been killed recently on Buck-Horn and Pleasant Prairies, in the latter county. Two youths of that section killed a huge black bear a short time since under the following circumstances:—The boys were hunting rabbits with a Colt's revolver and a rifle, when the lad with the revolver, upon turning a point of rock, came suddenly upon a bear, whose head and shoulders protruded from his den. Bruin growled savagely, but the youth, with amazing coolness, fired point blank into the face of the brute and the ball penetrating the brain, killed the bear instantly. Had the ball erred in its mission the daring youth would have answered in all probability for his temerity with his life.

Ruffed grouse, quail and rabbits have been, and are now, comparatively abundant, though but little pursued for sport. "Bob White" will never, in all probability, be again seen in their former abundance in the Badger States. Deep snows, trapping and snaring have done the work of annihilation, and the beautiful *Ortyx* is but a shadow of his former abundance in Wisconsin.

FRED.

KENTUCKY—Newport, Dec. 23d.—Ducks are very plenty, also turkeys, within a radius of 10 miles. The cold weather has brought Mallard to us so that we can make a respectable bag.

Spoon trolling for Southern Black Bass very good, 40 lb. catch in 8 hours not unusual.

H. C. S.

NORTH CAROLINA—Newberne, Dec. 20th.—Wild fowl fill our streams and ponds. I never saw them so thick here before, while from Portsmouth (on the coast) I have the same accounts; geese, brant, and ducks, by the million.

J. E. W.

PIGEON MATCHES.

IOWA.—A very interesting and closely contested pigeon match occurred at Orange City, Ia., on the 18th inst. Two captains were chosen, the losing side to pay for the birds; 10 birds allowed each man; 21 yards rise, 80 yards bound

any. The following gentlemen acted as judges: C. Lewis, J. Pierce. Scorer, W. C. Wyatt. The score stood as follows:—

Name.	Total.	Name.	Total.
M. Pierce.....	8	C. Hospers.....	6
A. L. Beach.....	6	G. M. O'Key.....	8
F. W. Mahren.....	7	F. Le Cocq, Jr.....	7
L. O'Key.....	4	H. Slikkerveer.....	4
W. R. Plumb.....	6	G. Roozenboom.....	7
Total.....	34	Total.....	32

Having a surplus of birds, the day's sport was concluded by the shooting of three double birds each, which score as follows:—

Name.	1st pair.	2d pair.	3rd pair.	Total.
M. Pierce.....	00	01	11	3
A. L. Beach.....	10	01	11	4
F. W. Mahren.....	00	01	11	3
L. O'Key.....	01	11	11	5
W. R. Plumb.....	11	01	00	3
C. Hospers.....	01	11	01	4
G. M. O'Key.....	01	01	01	3
F. Le Cocq, Jr.....	11	00	11	4
G. Roozenboom.....	01	01	01	3
C. H.				

HUNTING AT SPIDER LAKE.

EDITOR FOREST AND STREAM:—

I intended taking a deer and moose hunting trip to Spider Lake (Maccannamack) about the 10th or 15th January, and should be glad of the company of one or two respectable amateurs accustomed to snow shoeing. Spider Lake is just on the Canada side, southeast of Lake Megantic and nearly west of Moosehead Lake, distant from here 80 miles. This is the terminus of the Connecticut and Passumpsic River Railroad, and a station on the Portland and Montreal end of the Grand Trunk Railway. Also the terminus of Quebec Central and International Railways. The International at present shortens the distance 25 miles. I have spent from two to four weeks fishing in Spider and vicinity every September for the last 14 years, and have on every occasion seen large game or "big signs." Last September I saw three moose on Spider Inlet. And the banks were well worn with moose and deer tracks. A good man or two can be had for \$1 to \$1.50 per day. I shall be happy to furnish any further information on application, and take the liberty of referring to W. W. Secombe, 155 Broadway, New York, with whom I have had the pleasure of camping out. Expenses (dependent on one's ability to help himself) \$20 to \$40 each (ten to fifteen days) for a party of three or four. Snow shoes and all camping out requisites can be obtained here.

Sherbrooke, P. Q., Dec. 10th, 1876. D. THOMAS.

GUNS AT THE CENTENIAL.

EDITOR FOREST AND STREAM:—

The display of sporting firearms at the Centennial Exposition was very fine and by far surpassed any collection of guns ever seen in the country. Several of the eminent London makers exhibited for the first time. The old firms Purdy, Charles Lancaster, Rigby, Alfred Lancaster and Alexander Henry were represented by cases of beautiful weapons, perfect in materials, workmanship and finish, fully maintaining their high reputations. The prices charged by these makers, with the exception of Henry, are high, and although they give us perfection, yet we must pay very liberally for their reputation. The difficulty we labor under in this country is, that we have to pay in a depreciated currency or exchange, and outrageous duties. Were it not for these impositions the guns of even the best makers would not be beyond the means of most sportsmen. When we consider that a pound sterling is four dollars and forty-four cents in England, and is increased by the causes mentioned above to about eight dollars here (a difference of three dollars and fifty-six cents on each pound), we can but shrink from paying £60 for a gun, or \$480, while in London the same weapon costs but about \$266. Why sportsmen are thus taxed it is difficult to see, especially as strictly first-class guns are not made in this country.

The exhibit of Purdy fully sustained his high reputation, and his guns were perfect in materials and workmanship. The third generation, which now represents the house, seems determined that the laborious fidelity of their ancestors shall be maintained, and in their hands there shall be no depreciation in quality.

Rigby, of Dublin and London, offered a case of guns and rifles equal to the best, and at moderate prices. His style of picking the barrels and finishing in smoke brown, although not as attractive to the eye, is yet much admired by a large class of sportsmen, as it obviates glimmering, which is an undesirable feature when game is shy and difficult to approach.

Charles Lancaster makes and exhibits as perfect weapons as ever. The *flint-lock* fowling-piece in his case is beautiful in all its details, and carries one back to a former generation, and awakens a desire to own, if one will not use, the weapon of his father.

Alfred Lancaster, whose reputation for fine work and extraordinary shooting powers is so great with the Harlingham and other fashionable pigeon clubs, had a small case fully sustaining his well-earned honors. Alexander Henry, of Edinburgh, had a display of guns and rifles equal to the best, and, prices considered, he stands at the head of the strictly first-class makers. He is one of the few who have a reputation to lose, and it certainly will not suffer by this exhibit. W. W. Greener, of Birmingham, displayed some gorgeous inlaid work, and a fine collection of medals awarded to his late father, yet he exhibited but one gun which could be considered in competition with other makers, and of that nothing special can be said. The crowning glory of the display was the case of W. & C. Scott & Sons, of Birmingham. This firm has sent more good guns to this country during the last few years than any other, and they especially commend themselves to American sportsmen from the fact that they furnish good guns, honestly made, and of high shooting powers, at very moderate prices. Their best quality, with case and apparatus complete, at £42, was certainly the cheapest gun in the exhibition. The materials and workmanship were equal to the fashionable London makers, while the balance, feel, and solidity remind one of the best work of Wm. Greener, who, alas! departed. Many years ago Greener, in his work on guns and gun making, said, "as good guns have been and can be produced in Birmingham as in London, and the facilities the Birmingham maker possesses in the choice of materials, and the ease with which parts are supplied will always tell in the competition, and guns of equal quality can be produced for less money than in London." He il-

lustrated the truth of his opinion when he established himself at Aston Newtown, and by the production of honest guns at reasonable prices rapidly secured the best American trade, and had he lived would have held it against all competitors. Scott & Son have followed Greener's policy, and in guns suited to the American market, their exhibit was unequalled. Their plain "field" gun, which is retailed at one hundred dollars, is sound and good, and will supply a want long felt in this country for a good, honest piece, at a price within the reach of all sportsmen.

The new patent triplex lever grip fastening, combining the double bolt below the barrels with a strong hook cam, gives the advantage in one action of the systems of Purdy and Wesley Richards. It works smoothly and easily by a top lever moving from left to right. This movement experience proves to be the most convenient ever adopted and is fast superceding all others. This action combines in the highest degree strength with simplicity, and it must rapidly secure the favor of all who test its merits. The quadruple fastening exhibited by Scott greatly mars the beauty and symmetry of the gun, and the application of two side bolts does not give as great strength as the extended rib. It must be classed with the thousand and one conceits to which the revival of breech-loaders have given rise. Among the same conceits must also be placed the hammerless gun which, while showing great mechanical skill and beautiful workmanship leads invariably to one end—*cui bono?*

The compensating lump to counteract any wear on the pivot bolt is a well known and appreciated invention, and although a new bolt is not expensive or difficult to supply when a gunmaker is available, yet with a simple turn screw the sportsman is independent, and can in an instant correct any looseness. These inventions show conclusively that Scott is alive to progress, and that he is in the foremost rank of good and cheap gunmakers, and if he will continue the good work so auspiciously begun he will find the American market a rich mine which will well repay faithful working.

The exhibits of Reiley, Lang, Green and Williams & Powell were all good, but possessed no striking merit either in materials or workmanship. In low-priced weapons the Belgian display would stand first, but guns ranging from one dollar and eighty cents to sixty dollars do not please the average American, and cannot have a permanent hold on this market.

Forty-five.

[During the early days of the exhibition we commented upon the various gun exhibits at the Centennial, and although our correspondent's views agree mainly with our own we gladly print his letter as coming from one who as a judge of awards in the gun department had such superior facilities for examining and arriving at sound conclusions.—Ed.]

The Kennel.

NORTHERN DOGS IN SOUTHERN STUBBLES.—The shooting for the present season being about over in these parts, many of our more prominent breakers are moving South with the young dogs placed for tuition in their hands. A Newark correspondent writes as follows regarding one of them:

I met my friend, T. D. Gadson, of Boonton, N. J., on Thanksgiving Day on his way to Virginia with the following dogs. He intends taking up his quarters there during the winter and spring for the purpose of working his dogs, where game is more plentiful than around here. As near as my memory now serves me, I noticed Dr. Fleet Speer's, of Brooklyn, two setters "Joe" and "Fan;" Mr. Chas. Raymond, of N. Y., setter bitch "Check;" Mr. E. D. Brainard's, of Albany, setter bitch "Fanny;" Mr. Geo. Colburn's, of N. Y., setter "Don;" Mr. L. J. Gaines, of Meriden, Ct., setter "Blue;" Mr. V. V. Powers, of N. Y. city, setter bitch "Nelly;" Dr. W. S. Webb, of N. Y. city, pointer bitch "Daisey;" Mr. Geo. De F. Grant, of N. Y. city, pointer dog "Pat;" Mr. Fisher Howe, of N. Y. city, pointer dog "Rex;" Mr. H. R. Bishop, of N. Y., setter bitch "Biddy;" pointer dog "Short" and pointer bitch "Vick." All of his own stock I learned he left at home, in order to give his whole attention to the completion of these named with him. I have heard but once from him since his departure, and he mentions being well located, among plenty of birds and dogs all working finely.

"JERSEY."

That well-known sportsman and breaker, Mr. E. S. Wanmaker, of Sufferns, N. J., also sailed for the South on Saturday last, Charleston being his present destination, although he will take up his permanent quarters in whatever locality promises to afford the most game. He has with him Mr. Nelson's setter dog Quail (by Colburn's Dash), Shot, a fine Gordon puppy belonging to Mr. Jerome Marble, of Worcester, and by his dog Grouse; also another puppy of Grouse's belonging to a gentleman of Worcester, a fine red dog owned by Mr. Johnson, of Poughkeepsie, and several others.

DOGS OF CHINA.

EDITOR FOREST AND STREAM:—

My attention has been drawn to the latter part of your correspondent "Vaquero's" communication contained in FOREST AND STREAM of this week regarding the wonderful similarity existing between the Esquimaux dog and those of the South of China, and I may add Japan.

This remarkable likeness in countries the antipodes of temperature has been the subject of much remark, and is certainly inexplicable unless we accept the theory he advances, and in which I confess I concur. The general belief that the representative dog of China is constituted in the "hairless" specie, and that of Japan confined to a small broken-nosed spaniel is purely erroneous. The prevailing breed in both countries is almost a perfect simile of the Esquimaux animal—sharp muzzle and ears, long, thick straight hair and curled tail, and withal a powerful stocky brute, weighing about eighty-five pounds. These animals are frequently seen in Japan in packs, or droves of a dozen or more in rice fields, and are to all intents and purposes in a semi-feral state, preying upon whatever may fall in their way, even, as authenticated cases on record

prove, attacking moribund beggars, who while in their death throes are unable to resist the onslaught, and are consequently devoured by these ferocious brutes. They are quite able to withstand the heat of the south of China, being as "cool as a cucumber" in the most intensely hot weather, and, singularly enough, if rabies is generated by excessive heat Canton, then, ought to be full of dogs with the hydrophobia, but I have never heard of, much less seen, a rabid animal during a residence of some years there. Perhaps from having become acclimated generations ago the dog of China and Japan, while retaining all the instincts and peculiarities of his predecessors, even to cold, finds in this very same long coat of hair a certain amount of coolness, which if denuded of would make the heat insupportable.

If, then, we are forced to accept this as the only valid explanation of the genealogy of these dogs why is it not possible that the famous breed of King Charles spaniels are lineal descendants of that ugly little brute, the spaniel of *Dai Nippon*.

TOJIN.

December 22d, 1876.

[One of the authorities on the dog, we believe it is Idstone, advances the theory that the progenitors of the King Charles spaniel were imported from the East, and we quite agree with that conclusion. We have seen Japanese dogs that were almost identical with the King Charles except in color, the former being almost invariably black and white. With regard to rabies in the East, we have a theory that its absence is owing in a large degree to the peculiar diet of the people and their dogs. When rice forms the staple article of food, and meat is partaken of, if at all, very sparingly, the blood must be in a condition to resist the attacks of certain poisons. That rabies do sometimes occur in China we have had an ocular demonstration, followed by a rather singular illustration of our theory regarding the ability of Chinese to resist the influence of poisons. Many years ago the writer, while living at Kiu Kiang, on the banks of the Yang Tsze Kiang, possessed a bull terrier, the joy of his heart and the terror of predatory Chinamen. One day the bull terrier showed unmistakable symptoms of rabies, and after running a-muck through the servants' quarters finally took refuge under one of their beds. The surgeon of the place, an educated Scotchman, and if we remember rightly the surgeon of a British gun-boat in port, both examined the dog and pronounced him unmistakably mad. While preparations were being made for his destruction, our personal servant, or "boy," crawled under the bed and dragged the dog out, not without being bitten in at least half a dozen places. The dog was killed, and most anxiously we awaited the first symptoms of hydrophobia on the part of the faithful A-kow; but although he remained for some years in our service he always enjoyed the most perfect health. To be sure the dog might not have had rabies, but the probabilities are that it had, and it must be remembered that the terrier was of English extraction and pampered by being fed from the table. We should be glad to hear further from "Tojin" on the subject of the dogs of the East. Has he ever met the little "sleeve," or Mandarin dog of Pekin? The wife of our once consul at Hankow, Mr. C. D. Williams, had a very fine specimen.—Ed.]

—Mr. W. Humphrey's red Irish setter bitch Belle has just visited Mr. R. Robinson's famous red dog Duke, a full brother to his Jack. The produce should be something very fine.

—Mr. G. Hills, of Hudson, N. Y., has received from Dr. Goldsmith a pair of puppies, three months old. Their sire is Plunket and dam Nell, (known in the stud book as Jobling's Nell) and are a very promising pair.

—We understand that Mr. Brooks, the well known owner of the celebrated dogs, Bismarck, lately shot over one of his progeny (Bismarck's) near Dover, Delaware, and in a day's hunting bagged 21 partridges and 21 woodcock. The latter he found unusually numerous.

—Mr. Wm. F. Steel, of Piermont-on-Hudson, claims the name of Pride of the Hudson for his liver and white setter dog puppy, whelped November 1st, 1876, by Pride of the Border out of Fairy.

THE ST. LOUIS BENCH SHOW.

St. Louis, Mo., December 21st, 1876.

EDITOR FOREST AND STREAM:—

My attention has been called to the communication of Wm. F. Steel, owner of "Flake," published in your issue of December 14th, and I am surprised that Mr. Steel should make such statements without more foundation. I agree with him in thinking that the awarding of a pointer dog a prize over another, because he had a thicker hide, as absurd in the extreme; but all his charges or insinuations against the St. Louis Kennel Club are false in nearly every particular.

1st. He says the St. Louis Bench Show was held under the auspices of the St. Louis Kennel Club.

That is not true. It was held under the auspices of the St. Louis Agricultural and Mechanical Fair Association, and the St. Louis Kennel Club had nothing to do with it except as exhibitors.

It is true that two members of the Club assisted the Fair Association in some of the details at their request, but had no more to do with it than Mr. Whitman or Mr. Waller with the Chicago Bench Show held last winter.

2d. Mr. Steel says, "The show was a success, but will another one be under the same management, when the public sees that the dogs, or the progeny of dogs belonging to the Club, or members of the Club, took most of the prizes?" "It seems to be a Club for the mutual admiration of each others dogs." Now, Mr. Editor, what an outrageous insinuation is involved in the above quotation. It means, in plain English, that it was arranged or "fixed" by our Club, either by bribing the judge or otherwise, so

that our Club could take all the prizes. How will honest men, who have any self-respect, continue to exhibit at our Bench Shows, if they are to be subject to such insinuations, made by respectable men? What sense or justice is there in any man making such a charge, who was not an exhibitor himself—who was not at the show—and I think I am safe in saying, is not acquainted with a single member of our Club or any other exhibitor?

The imputation is false in every particular. Now, as to the facts: The premium list or arrangement of classes was almost identical with that of the Springfield, Massachusetts, Show, making champion classes. Our Club was exhibiting in the imported English setter class, Rock, Dora and Rose. In the imported Irish class, Elcho, Erin, Loo II and Rose. Rock had won first at Chicago and at Springfield. Was it strange he should win first here in the Champion class, with Smiths', Burges', and other imported kennels absent? Dora won first because she had no competition. We do not consider her a Bench Show bitch, but she is the dam or grand dam of all the blue blooded English setters that have won a prize in a field trial in this country. Elcho and Loo II had both won first at Chicago. Is it strange that they won first here in the Champion class, with so little to compete against? Erin won nothing. Rose, the Irish bitch, had a tumor on her face, and was withdrawn. Now, as to the mutual admiration part. Mr. Adams won first and second, with Drake and Régent in the open class for imported English setters. They are good dogs, but they had no competition. Mr. Turner, I believe, won two second prizes in the imported Irish class. These are the total winnings of the different numbers. The real reason, Mr. Editor, of our winning so many prizes, was because we had so little competition.

Having so little competition was no fault of the Fair Association. The show was freely advertised and liberal premiums offered, and Mr. Turner and I did all in our power to secure a large number of entries, for we think our Club dogs are able to win their share, in good company, whether on the bench or in the field. I think Mr. Steel must have been either misinformed, or have drawn unwarranted inferences, for I cannot believe him willing to charge men, with whom he has no acquaintance, with being corrupt tricksters or dog jockeys.

Yours, respectfully,
C. L. STERLING,
Member St. Louis Kennel Club.

ARECA NUT FOR WORMS.

COLUMBUS, Ohio, Dec. 18th. 1876.

EDITOR FOREST AND STREAM:—

In your last issue, and for the third or fourth time during our twenty-two months acquaintance with FOREST AND STREAM, we read of the failure of areca nut to rid a dog of worms. In the last volume also some writer laid the death of a number of puppies to the use of this same drug. Now we don't believe it possible that the nut can prove inefficacious if employed with judgment, or fatal in any dose or doses likely to be administered for worms. [We once gave a nine week's puppy 105 grains of it between 7 p. m. Saturday and 9 a. m. Monday. It produced no unpleasant effects, nor did it cause the expulsion of a single worm; yet two 15-grain doses two hours apart (the following Wednesday) and before the administration of the oil, was followed by the expulsion of a small handful of the teres or round worm, with a large number of the little maws.]

While it is extremely doubtful if the worms, except by absorption, take in any large amount of the nut, yet we find it acts more promptly and certainly if given in, or followed by, a draught of sweet milk.

Our method of procedure is to deprive the dog of all solids and fluids for some little time—if a full-grown animal twelve to fifteen hours, if a puppy four to six hours—previous to giving the vermifuge; then give the powder, and immediately thereafter the milk. In two hours' time give a second dose, and two hours later the third. Now fast the dog for at least eight hours, at the end of which time give a full dose of oil.

We well know that in the greater number of cases so much trouble is uncalled for, as the nut, give it how we may, is sure to do its work, but we would ask a trial of the above method after the common mode of administering areca has failed.

How does areca nut act? is a question frequently put to us. We cannot say how it does act. Areca nut is a tonic as well as an astringent, and besides its effect upon the worm, be it what it may, it undeniably gives a certain tonic to the muscular fibres of the intestines which enables them to dislodge the worms, the oil by its effect—a purely mechanical one—carrying them with or before it, and finally expelling them.

OLEUTANGY.

We endorse the opinion of our correspondent that the areca nut, although it may occasionally fail in individual cases, is, as a rule, a certain remedy for worms in dogs. Where we have reported to us one case of failure there are a hundred in its favor, and were we to publish the letters received each week testifying to its efficiency the Kennel Department would have space for nothing else. Our correspondent's suggestions as to administering it are sound, although eight hours seems to us to be an unnecessary length of time to wait before giving the oil.

HYDROPHOBIA EXTRAORDINARY.

THREE HORSES, THREE DOGS AND A GOAT, DIE OF THE DISEASE.

Remarkable cases of hydrophobia have occurred in Brooklyn within the past few weeks, in the neighborhood of Baltic and Nevins street. Mr. J. S. Loomis, who lost three valuable horses, thus describes the ravages of the disease in his stables. He says:—

"About the first of November, I discovered on the rump of my coach dog a circular sore, which appeared to annoy him greatly. The wound was a complete circle, and looked as though a piece had been cut out with some sharp instrument. The dog was continually licking it, and would run from place to place in a dazed and frightened manner, as though he was trying to run away from it. The idea gained credit with my hostler and drivers that he was mad, and they killed him. I also had in my stable a Newfoundland dog, which soon afterward grew sick, and, fearing that he might have been bitten by the coach dog, I had him killed. On the 17th of November one of my horses

refused his food, and appeared sick in the same manner as the Newfoundland dog. In a few hours he began to grow violent and to snap at whatever came within his reach. I had him placed in an outside stall and offered him food, which he attempted to eat, but could not. I sent for the veterinary surgeon, Mr. Waters, of Raymond street, who attempted to administer an opiate pill, which the horse was powerless to swallow. He was then offered water, which threw him into convulsions, and he died in great agony within thirty-six hours from the first symptoms. After death a large quantity of froth and mucus blubber was emitted from his mouth and nostrils. Mr. Waters pronounced the malady a clear case of hydrophobia.

"On the 1st of December a valuable Canadian pony which I had used for light driving about the city was affected in the same manner. I had her placed in a box stall in my stable and tied securely. With her its development was less violent. She was exceedingly restless and continually working her mouth and grating her teeth; at times she would gather herself for a tremendous bound and appear to be intent on butting her head violently against the partition; but the effort would exhaust itself, and result only in a slight scratching of the board with her teeth. These demonstrations continued throughout the day. Her eyes were wild and brilliant. Her hair assumed a darker, glossier color, and the excitement soon started her into perspiration. To the sound of human voices she was keenly susceptible. When her name was spoken she would turn her head in recognition, and act as though she was appealing for succor. Both food and water were offered her, and though she acted as though she would partake of them, she was powerless to eat or drink. Either effort would produce a shuddering movement of the muscles and increase the general restlessness and twitching of the lips. She died in the night, and, to all appearances, had fallen over as she stood, and died without a struggle after the fall, as the straw at her feet was undisturbed. Her body was fearfully swollen when discovered by the watchman.

"On the 20th inst. a large and valuable truck horse was attacked with the malady, which developed rapidly and with great violence. I immediately had him placed in this box stall, which he had soon kicked partly to pieces. Fearing that he would fight his way out, I had my stables emptied, and sent word to the station house to have a man come down and shoot him. While the messenger was gone, Dr. George K. Smith, of Joralemon street, came in, and, upon looking at the animal, pronounced it one of the worst cases of hydrophobia which had ever come to his notice. The executioner arrived soon after and shot him, but failed to kill him, and an ax finally did the work. Soon after the death of my second horse, a dog and goat belonging to Mr. Morris, on the opposite side of Baltic street, showed symptoms of hydrophobia and were instantly killed. To what extent the malady will go I cannot foresee. In the last of my horse cases, it was known that he had been bitten by the coach dog, the bite having been inflicted upon the nostrils. In the first two cases there was no evidence that they had been bitten. The dog had been around the stables for several months, and was in the habit of lying around in the stalls. I suppose the horses had been nosing him and had received scratches in that way.

"There is a report current in the neighborhood that the dog had been in the habit of fighting more or less with neighboring dogs. It seems to me that the only safe way would be to kill all the dogs in the vicinity, and thus give to human life the benefit of every doubt which may exist as to danger."

Sea and River Fishing.

FISH IN SEASON IN DECEMBER.

SOUTHERN WATERS

Pompano, *Trachinotus carolinus*. Grouper, *Epinephelus nigritus*.
Drum—two species. Family Sciaenidae. Trout (black bass) *Centropomus at-
idae* *rarius*.
Kingfish, *Menticirrhus nebulosus*. Striped bass or Rockfish, *Roccus
lineatus*.
Sea Bass, *Sciaenops ocellatus*.
Sheepshead, *Archosargus probato-* Twilorfish, *Pomatomus saltatrix*.
cephalus. Black Bass, *Micropterus salmoides*.
Snapper, *Lutjanus caxxa*. *M. nigricans*.

FISH IN MARKET.—Fish of all kinds are very scarce. The only novelty we have to report is a large catch of Spanish mackerel made at Key West, a large portion of which was forwarded to E. G. Blackford, of Fulton market. We quote: Striped bass 20 to 25 cents per pound; smelts, 25 cents; bluefish, 12½ cents; salmon (frozen), 40 cents; mackerel, 25 cents each; shad (southern), 75 cents each; white perch, 15 cents per pound; green turtle, 20 cents; terrapin, \$15 per dozen; frostfish, 8 cents per pound; halibut, 20 cents; haddock, 8 cents; kingfish, 15 cents; codfish, 10 cents; blackfish, 15 cents; herring, 8 cents; flounders, 12½ cents; sea bass, 18 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 25 cents; scallops, \$1.75 per gallon; whitefish, 20 cents per pound; pickerel, 18 cents; salmon trout, 18 cents; sunfish, 12 cents; yellow perch, 12 cents; hard shell crabs, \$4 per 100; soft shell crabs, \$1 per dozen.

GREENWOOD LAKE.—The Greenwood Lake Sportsman's Club has been for some time engaged in hauling out the stumps from a certain part of the lake where they interfere with navigation, and to facilitate the work has drawn off the water so as to expose and leave dry certain shoals, whereby large quantities of pickerel, bass, and other fish are left in the holes and hollows. People who jump at conclusions, without being fully cognizant of the facts, have assumed that great quantities of fish must perish in consequence, and that the lake will have to be restocked before the members of the club can do any more fishing. The state of the case is: that Greenwood Lake is seven miles long and fully seventy feet deep in portions of it, so that the quantities of fish left high and dry by the drainage would not seriously lessen the aggregate, were they left to perish; which they are not, as a man is kept constantly employed to gather up the stranded fish and remove them to deep water. In some days as many as twenty barrels have been removed, and among them some fish weighing several pounds.

ANGLING IN CANADA WATERS.—A valued correspondent at Nouvelle, Canada, writes the following pleasant gossip on angling:—

"It is useless for gentlemen to come for one day, strange to the river, flies, etc., and expect to do much. The whole time is wasted in fishing parts of the river where there are no fish, and their flies are useless. If anyone comes with me I can guarantee them a perfect surfeit of large trout any time in July and August. By-the-way, if you know any gentlemen who require salmon or trout flies for next season of the real patterns for Canada and New Brunswick, I know an Irishman who is very poor, who makes them beautifully, of the best possible materials, and cheaper than they can be bought in the States. He makes them from my patterns, and I have fished every river worth fishing in the whole country. The great mistake is, the flies are too small that most gentlemen bring, only fit for very low water. I should be much obliged if you would mention about the flies to your friends, and if they ordered any I would forward a few samples for them to see. It would be a real benefit to the man.

I see by your paper that there has been a decision in the "Miramichi" case that owners of land on the banks have a right to fish on their own land. It seems absurd ever to have doubted it. How will that affect the lessees of Restigouche and Matapedia? I saw a salmon last summer in this river, and as Mowatt put some young ones in, I hope it may become a salmon river in time. I think grayling would do well here. I wish there was some means of getting them here. I never heard what size the largest grayling arrive at in the Michigan waters.

I saw some time ago that one of your correspondents considered it strange to find a tape worm in the stomach of a salmon. I can safely say that out of the thousands of salmon and sea trout that I have seen split open I never yet saw either one or the other whose stomach was not a knotted mass of such worms.

I have also wondered at the name of land-locked salmon for the trout of Scoodic lakes and the St. Croix river, as they can only be a peculiar and superior variety of lake trout. They never could have got up the St. Croix from the sea, and as to their being originally a salmon, we know that salmon will not live away from the sea more than two years, and all that time deteriorating, whereas these Scoodic trout are always in the most perfect condition towards the end of May. I have fished every lake and branch of the St. Croix river and the best place was the northeast branch at the end of Grand Lake (not Scoodic branch) but the boundary line between New Brunswick and Maine. That was in 1864. I hear now that tanneries and other abominations have entirely destroyed the magnificent fishing there used to be there. It ought to be looked to a once and the law enforced."

—We notice a new improvement to the Orvis Reels—a new click that will not break. The manufacturers request all parties having the Orvis Reels to send to them, by mail, the cap which covers the square spring "click" on the reel, and they will return a new pattern click, free of charge. The new pattern "click" has circular spring and solid steel "dog." With this improvement we feel warranted in claiming that the Orvis Reels will give satisfaction in all cases. The address of the firm is C. F. Orvis & Co., Manchester, Vermont.

—During a recent storm an enormous number of eels in a pond near Setauket, L. I., attempted, during high tide, to cross the beach to the Sound. The tide left them stranded on the beach, and great quantities were secured in baskets, wheelbarrows, and farm wagons.

AN OYSTER FAMINE.—We learn from the Baltimore Sun that the harbor of Baltimore, the Patapsco river and the Chesapeake bay to Sandy Point are closed to navigation, except by the use of the iceboat Maryland or strong tugs to break a channel for outward and inward bound vessels. The embargo is more complete than it has been since the early part of 1874.

It is feared the embargo on oyster dredging will result very speedily in an oyster famine. Nearly all the pungies and schooners engaged in this trade are detained below from one cause or another. The packing houses have bought up nearly every bushel in port, sweeping the fleet at Light street and crying for more. Annapolis harbor is blocked for half a mile out, so that cargoes cannot reach the rail. The price for oysters at Annapolis last Monday rose from 35 to 75 cents a bushel. The operations of the ice-boat in keeping the channel open will relieve the market, as it will be practical for schooners in that case to come up by a tow, which the state of the market will warrant, considering the holiday demand and the scarcity.

✓ A correspondent sends us the following very interesting reminiscence:—

TROUTING WITH HON. DANIEL WEBSTER IN MARSHPEE RIVER OVER THIRTY YEARS AGO.—When I was some twenty years old there used to be some very nice trouting down on the Cape, and many a brook trout was caught that tipped the beam at four pounds, either in Smelt brook, Jones river or Turner's brook, Swan hole or Indian or Marshpee river. The Hon. Daniel Webster, who was beloved by all that knew him here, of whatever political creed, was always welcomed by the smiling faces and extended hands of all who met him, whenever he came home to his Marshfield farm, and as I was quite an expert in trouting and shooting, he used to always send for me to dance attendance on him while he was here to enjoy himself and relieve his mind from the toil and tumult of Congress; and many a jovial, high old laugh, resounded through the woods as we tramped either after partridges, or from brook to brook for trout, seldom in parties less than three, sometimes eight or ten of us in all. I usually carried his lunch basket, containing among other good things a large flat bottle full of—something when once outside of a little of it one never caught cold, however wet or muddy he might be—and somehow I never tasted anything so splendid and strength-giving as it was; and so nice with a

little loaf sugar in it, and with such a hidden power to bring a smile to one's face. By jingo! the recollection of it makes my mouth water. One day he came for me to go to Marshpee river, on a two day's trouting trip; we arrived there at night, and in the morning we were at the brook or river at eight o'clock, and pulling on the long rubber boots (he always furnished them): they were very long kept in position by a kind of suspenders over the shoulder. We stepped into the brook and waded down stream, fishing with live bait (mummy chubs); he went ahead and caught all the large ones. I followed behind fishing, and caught what escaped his hook and carried a net, and among other things, that wonderful bottle. We had been fishing for a couple of hours with good success, when I heard him call, George, George, come here quick! I have got a mighty fellow hooked! I hurried down to him, and saw his line leading under the bank. I riled up the water with mud above so the trout could not see me, then run my net under the bank and scooped out the trout; he was a noble fellow, weighing at least three and a half pounds. "Ah! ha!" says Webster, "we have him! Look at him, George, did you ever see such a big fellow?" Yes, says I, I have caught as big a trout as that. "Confine yourself to the question," said Mr. Webster; "did you ever see so big a trout, George?" Yes, says I. "Seen as big an one?" says he. Yes, says I, I have seen and caught as big a trout as that. Mr. Webster surveyed me, as I stood there deep in the water, and said: "Ah, George! I fear I shall never make anything of you! You are an amphibious creature. You lie in the water, and you lie out of the water. Where is that bottle, George? Come, let's start home." G. F. W.

DOINGS OF THE FISHING FLEET.—The weather for the past week has been unfavorable for the operations of the shore fishermen, and under the stimulus of light receipts and an improved call, fresh fish have reached top prices, the latest fares selling at 4½ cents per lb. for cod and 3½ for haddock. The fishing arrivals continue small, as is usual in December, only eight having been reported for the past week—five from the Banks and three from La Have. The extreme high rates for Irish halibut noted last week broke on the arrival of the first Bank fare, though good prices have been obtained for all that have been landed, the last sales being at 13 and 9 cents per lb. for white and gray. There is no change of importance in other departments of the fish market. The fish receipts for the week have been about 116,000 lbs. Bank halibut, and 30,000 lbs. cod and 3,000 lbs. halibut from La Have Bank. No shore fish of consequence landed.—*Cape Ann Advertiser, Dec. 23d.*

ALBANY, December 19th, 1876.

EDITOR FOREST AND STREAM:—

Either by your error, or mine, that portion of my article describing the fighting of the black bass, in your issue of Dec. 14th reads: "The former I have always attributed to the clearness of color caused by living in pure swift water, and their rage to the fact that there was not depth enough for them to go down very far." It should read: "The former I have always attributed to the clearness of color caused by living in pure swift water and their rage. The latter to there not being depth enough for them to go down very far." Please correct and oblige your truly,
DEXTER.

Rational Pastimes.

A NEW EQUESTRIAN VENTURE.—Mr. Fred J. Engelhardt, the proprietor of the Central Park Riding School, has made a venture in which we wish him individually a Happy New Year and all manner of success. He has secured the American Institute building and converted it into the "Metropolitan Riding Academy and American Tattersalls." A track of one eighth of a mile will thus be provided for the purpose of teaching, training and exercising. A special feature of Mr. Engelhardt's enterprise is a weekly public entertainment, at which competitions of all kinds, wrestling, and other athletic feats are promised. The first of these will be given on Friday evening of this week for the benefit of the poor of New York. The Central Park Riding School will be maintained as hitherto.

GREAT RACQUET TOURNAMENT.

ANNUAL HANDICAP OF THE NEW YORK RACQUET COURT CLUB.

At a meeting of the officers of the New York Racquet Court Club, held upon the 12th of last month, it was resolved that the annual handicap matches for a first and second prize should be begun upon the 23rd ult. The entries closed three days previously, when it was found that twenty-five gentlemen had given in their names. Two matches were played on the opening day, and from that time unto Tuesday last, when the final tie was played, the court was almost daily occupied by the contestants. That the game is rapidly attaining a high degree of popularity may be attested by the attendance, on successive days, in the galleries, which were graced by numbers of ladies. The play throughout was highly creditable, and in some individual cases showed great proficiency and skill. On Thursday evening the prizes, which consisted of two beautiful sets of even buttons of very unique design, were presented to the winners, Messrs. J. T. Soutter and George T. Dixon. The following is the complete score of all the matches:—

FIRST CLASS. FIRST TIE.

Names.	How handicap'd	Scores.	Winners.
J. T. Soutter.....	Scratch.....	15, 15, 17.....	J. T. Soutter.

CHESS.

A CHAPTER FOR BEGINNERS.—The game of chess is played by two persons, with sixteen pieces each, of opposite colors, on a checkered field of sixty-four alternate white and black squares. The forces are divided by the color line—black and white.

The board must be placed with a white corner at the right hand. The lines of squares running upwards are termed "files," while those from left to right, or right to left are called "ranks." The line of squares running obliquely are designated "diagonals."

The forces in chess consist on each side of a King, a Queen, two Rooks, two Bishops, two Knights, and eight Pawns. In the corner squares are placed the Rooks; a Knight is stationed next to each Rook, and a Bishop next to each Knight; the King and Queen occupy the two center squares of the line, observing that the white Queen always stands on a white square and the black Queen on a black square; the Kings are consequently opposite.

The eight Pawns on either side are placed on the squares in front of the superior pieces. For the sake of distinction the pieces on the King's side of the board are called King's Bishop, King's Knight, and King's Rook; and the Pawns on the same side are the King's Pawn, King's Bishop's Pawn, King's Knight's Pawn, and King's Rook's Pawn. The pieces and Pawns on the Queen's side are named in a similar manner from the Queen; as Queen's Bishop, Queen's Rook, etc.

The King can move in any direction, but only one square at each move, except in castling, as will be explained elsewhere. Supposing the King to stand on his 4th square, he could move to King's 3d, King's 5th, or to King's Bishop's 3d, 4th, or 5th, or to Queen's 3d, 4th or 5th. The adverse Kings can never move on to squares adjoining each other. No piece can move to a square which is already occupied, except to take a man.

The Queen is the most powerful piece on the board. She has the advantage of moving in straight lines, forward, backwards, sideways and diagonally to the extent of the board in all directions. Place her alone in the center of the board and it will be seen that she has command of twenty-seven squares besides the one she occupies.

Next in power to the Queen is the Rook (sometimes called the Castle). It moves in a straight line forwards, backwards or sideways to the extent of the board, having the same power as the Queen except in moving diagonally.

The Bishops move diagonally forwards or backwards to the extent of the board, consequently they must travel on squares of the same color throughout the game as the ones they stand on when the game commences. Place a Bishop at King's 3d and you will see that he commands eleven squares.

For beginners the moves of the Knight are most perplexing and difficult of explanation. He is the only one of the pieces which has the power or privilege of leaping over a man. His move is one square in a straight line and one in an oblique direction. Or, as a horse man once expressed it, while being taught the moves: "That horse takes one step and then shies out." Place the King's Knight on his own square, and there are three squares he can move to, viz.: King's 2d, King's Bishop's 3d, and King's Rook's 3d. Or better, place the Knight on either of the four center squares, and he commands eight squares. Place him on White King's 5th square, and he commands White King's Bishop's 3d and 7th, Knight's 4th and 6th, Queen's 3d and 7th, and Queen's Bishop's 4th and 6th. If the beginner will place the Knight on King's 5th square, and move him first to King's Bishop's 3d, and then back again to King's 5th, and so on, until he makes the eight moves named above, he will have conquered the difficulty.

The Pawn can only move forward in a straight line, except in capturing, when it moves obliquely. The Pawn can only move one square at a time after the first move. On the first move it makes it is optional with the Pawn to move one or two squares. The Pawn is the only man which cannot move backwards.

In capturing, you lift off the adverse man and place your own man on the square it occupied. To illustrate: Place the white Queen on her square, and then place the black Queen on white King's Rook's 5th. White may now take black Queen by removing her from the board and placing his own Queen on the square thus vacated by the black. As we said before, the Pawn captures obliquely, thus: Place a black Pawn on white King's Bishop's fifth, and one on white Queen's fifth; then place a white Pawn on King's fourth, and supposing it is white's turn to move, the white Pawn can capture either one of the black Pawns but if it were black's turn to move, the white Pawn might be captured. Capturing a piece, however, is never compulsory, when any other move can be made, except to

relieve your King from check. Then you are very often forced to capture a piece.

The following abbreviations are used in all English chess books, magazines, and newspapers: K for King, Q for Queen, R for Rook, B for Bishop, Kt. for Knight, P for Pawn, and Sq. for Square.

Castling is a compound move which you have the privilege of playing once in each game, under certain restrictions. It is done by the King and Rook. To castle with the King's Rook you move King to King's Knight's square and place Rook on King's Bishop's square. To castle with Queen's Rook you move King to Queen's Bishop's square and place Queen's Rook on Queen's square. Thus in either case the King moves two squares while the Rook is brought round the King to the square adjoining. To be enabled to castle, your King must not be at the time in check, neither of the squares the King traverses or rests upon must be checked or commanded by a hostile man, the squares between the King and Rook must be empty or unoccupied by friend or foe, and neither King nor Rook must have moved.

The King is in check when attacked by any piece or Pawn. He is attacked when in the range of any piece or Pawn; and when the King is unable to get out of the range of an attacking piece he is checkmated. The King is the objective point. There are but three ways of parrying a check. I. By capturing the checking piece. II. By interposing a man between your king and the checking piece. III. By moving your king out of check. If the situation is such not to allow any of these methods you are checkmated and the game is ended.—*Harford Times.*

The Publishers of FOREST AND STREAM very naturally think that a year's subscription to this paper is a very acceptable Holiday Present to anyone fond of sport or fresh air.

—“Sailing Directions.—Old gent (in the vicinity of the docks): Can you direct me to Charing Cross? Ancient mariner—Charing Cross? Le's see, wind's about norwest by northe—you keep the sun on your weather bow and you'll jist about fetch— Old gent hurries off.

—The St. James Hotel at Jacksonville, Fla., has more guests at this time than in any year previous to 1875. There were more arrivals in November and December last season than any other season.

HOW TO PET THE CANARIES.—Says a writer on Canaries: In this way I answer the question, "How I had such luck with the birds?" Simply by allowing the birds to attend to their own affairs, and by letting them understand that their mistress would never harm them. Also, by accustoming them to plenty of light and air and company, rather than, as recommended in books, keeping the cage in a dark room, for fear of frightening the birds. Make just half the fuss directed in bird-books over the matter, and you will have, doubtless, better success in raising birds. Never give them sugar, but all the red pepper they will eat. It is the best thing for them. And if your birds feel hoarse at any time, put a piece of fat salt pork in the cage, and see how a little fellow will enjoy it. Give him flax seed once in a while, and if he appears dumpy occasionally give a diet of bread and water, with red pepper sprinkled in. Open the cage door, and give your pets the freedom of the room; soon they will come at your call, and fly to meet you whenever your voice is heard. I had one who came regularly to my desk as I sat writing each day, and disputed with fluttering wing and open beak, my humble right to the ink stand. He would take his bath as I held the cup in my hand, and coolly dry himself on my head. Another would fly down or up stairs to me whenever I called him, and many a time, when I have been out, he has welcomed my return by flying down the stairs, and singing at the top of his voice all the while, until at last, perched on my shoulders, he would accompany me to my room.—*Spirit of the Times.*

Tiffany & Co., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. The Boston Shooting Suit.

MANUFACTURED ONLY BY

G. W. SIMMONS & SON,
Boston, Mass.

SOLD everywhere in the U. S. by all first-class dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT,"
made by

G. W. Simmons & Son.

This new design of WATERPROOF SHOOTING SUIT, made from extra quality duck, has attained such popularity as to be called for from all parts of the country, and even from England.

"Shipping clothing to England strikes us very much like sending 'Coals to Newcastle,' but the merits of the 'BOSTON SHOOTING SUITS' have been heard of in the Old Country, and that land of sportsmen has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—*Boston Paper.*

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is water-proofed by a new patent process. The seams and pocket corners are securely fastened, and nothing neglected to render the suit perfect in every respect.

THE PRICE HAS BEEN FIXED AT \$13, TO INCLUDE HAT OR DOUBLE VISOURED CAP, DETACHABLE HAVELOCK, COAT, VEST, AND PANTALOONS.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skillfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

PERSONS ORDERING FROM A DISTANCE NEED SEND ONLY THE FOLLOWING TO BE SURE OF A PERFECT FIT: BREAST MEASURE, WAIST MEASURE, INSIDE SEAM COAT SLEEVE, INSIDE SEAM PANTALOONS; MENTION HEIGHT AND WEIGHT.

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of Waterproof Shooting Suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp at Philadelphia Centennial Exhibition. It has grown gray in service, but is good for use yet. This suit is known as the 'Boston Shooting Suit,' in contradistinction no doubt, from the garments which are manufactured out west and at Washington, each of which has a local demand of its own. It is said that the western prairie fowl can distinguish any sportsman who visits their domain by his clothes. They can tell him 'by the cut of his jib,' and the old educated birds (which no one cares to eat, by the way,) know exactly what distances to keep from the rail shooters, the brant men, and the chicken-killers respectively, to be safe. They have 'got them all down line.' This used not to be so before the waterproof shooting suits were invented. Bostonians, Hoosiers and Buckeyes all stood the same chance then. But now it is—with a sarill pipe to leeward by the old-weather cock—here comes a Simmon; cheese it! or, 'Ere's a 'Enning-lie low!' or, 'Look out for Holabird! Scatter! you beggars, scatter!'—FOREST AND STREAM.]

THE AMERICAN NEWS COMPANY, AGENTS.

BULLETIN OF THE NUTTALL ORNITHOLOGICAL CLUB.

A QUARTERLY JOURNAL OF ORNITHOLOGY.

This journal (now entering upon its second volume) is at present the only serial publication in America devoted to GENERAL ORNITHOLOGY. While it is intended to serve primarily as a medium of communication between working ornithologists, it also contains matter of a sufficiently valuable character to interest all who take any interest in the general subject of which it treats. Although devoted mainly to North American Ornithology, it will be so far general in its character as to give notices of all the more important works or memories relating to Exotic Ornithology. The list of contributors to its pages already embraces nearly all of the leading ornithologists of the country. Among them are Dr. Elliott Coues, Mr. Robert Ridgway, Mr. George N. Lawrence, Dr. T. M. Brewer, Dr. T. Hale Streets, Mr. H. W. Henshaw, Mr. William Brewster, Capt. Charles Bendire, U. S. A., Dr. J. C. Merrill, Dr. J. G. Cooper, Mr. E. W. Nelson, and numerous others more or less well known to ornithological readers. Its editorial supervision is in charge of Mr. J. A. Allen, assisted by Prof. S. F. Baird, and Dr. Elliott Coues. Although published by the Nuttall Ornithological Club of Cambridge, Mass., it is not in any narrow sense the organ of any section or locality. It being conducted as a MAGAZINE OF ORNITHOLOGY, its department of reviews gives prompt notices of all papers relating to North American Ornithology, as well as of all important ornithological works or memoirs wherever appearing; while its department of "General Notes" is rich in notices of rare or little known species of North American birds, and gives the latest and fullest intelligence attainable respecting the progress of ornithology in our own country. It is hence a journal no one interested in ornithology can well afford to be without.

Terms: \$1.00 a year (including postage), strictly in advance; single numbers, 30 cents. Back numbers can be supplied. Circulars, giving a list of contents of Volume 1, sent on application. Address Mr. H. B. BAILEY, Newton, Mass. Dec21

OF

Natural History

FOR OBJECT TEACHING IN SCHOOLS

And

PARLOR ENTERTAINMENT.We are prepared to furnish the first sixty numbers of
the first series of**Animals and Birds of North America.**To these will be added a second series of foreign
specimens, and various animals and birds in grotesque
attitudes, never, however, violating their natural in-
stincts.We offer these views, not as pictures only, but as
studies from nature. One of the great moving ele-
ments in our modern system of education is object
teaching. The unerring fidelity of the stereoscope
transfers the animals and birds from their natural
habitat to the rooms of the student and the fireside
of our homes, where they cannot fail to have a last-
ing impression of the form, color, habits, and local-
ity of each specimen.An experience of more than twenty-five years as
Taxidermist of the New York State Cabinet of Nat-
ural History, and in gathering his large collection of
native and foreign specimens, enables Mr. Hurst to
combine in every view the locality of the specimen,
with its appropriate rocks, woods, or water, and col-
oring from the originals.CORNELL UNIVERSITY,
ITHACA, March 14th, 1870.I must congratulate you upon your great success in
his new educational enterprise. If we can arrange
our amusements so as to make them impart instruc-
tion to the mind, it will be a step in advance in edu-
cation.

pense, by using our**Patent Slate Paint.**

(Fifteen Years Established.)

MIXED READY FOR USE.**Fire-proof, Water-proof, Durable, Eco-
nomical and Ornamental.**A roof may be covered with a very cheap shingle,
and by application of this slate made to last from 20
to 25 years. Old roofs can be patched and coated,
looking much better, and lasting longer than new
shingles without the slate, for**One-third the Cost of Re-shingling.**The expense of slating new shingles is only about
the cost of simply laying them. The paint is FIRE-
PROOF against sparks or flying embers, as may be
easily tested by anyone.**It Stops Every Leak,**and for tin or iron has no equal, as it expands by
heat, contracts by cold, NEVER CRACKS nor scales.
Roofs covered with Tar Sheathing Felt can be made
water-tight at a small expense, and preserved for
many years.

This Slate Paint is

EXTREMELY CHEAP.Two gallons will cover a hundred square feet of shingle
roof, while on tin, iron, felt, matched boards, or
any smooth surface, from two quarts to one gallon
are required to 100 square feet of surface, and al-
though the paint has a heavy body it is easily applied
with a brush.**No Tar is Used in this Composition**therefore it neither cracks in winter, nor runs in
summer.On decayed shingles it fills up the holes and pores,
and gives a new substantial roof that will last for
years. CURLED or WARPED shingles it brings to their
places, and keeps them there. It fills up all holes in
felt roofs, stops the leaks, and although a slow dryer,
rain does not affect it in a few hours after applying.
As nearly all paints that are black contain Tar, be
sure you obtain our genuine article, which, for shingle
roofs, is**CHOCOLATE COLOR,**when first applied, changing in about a month to a
uniform slate color, and is, to all intents and purpo-
ses, SLATE ON**TIN ROOFS**our red color is usually preferred, as one coat is equal
to five of any ordinary paint. For**BRICK WALLS**OUR BRIGHT RED is the only reliable Slate Paint ever
introduced that will effectually prevent dampness
from penetrating and discolored the plaster.These paints are also largely used on out-houses
and fences, or as a priming coat on fine buildings.Our only colors are CHOCOLATE, RED, BRIGHT RED
and ORANGE.**NEW YORK CASH PRICE LIST**1 Gallon, can and box.....\$1 50

TO MY COUSIN JACK.

[The following lines were addressed twenty-one years ago to Hon. John Pierpont, since then, and still, Chief Justice of the Supreme Court of Vermont.]

COUSIN, more years have flitted by
Than we might choose to tell,
Since, sworn moss-troopers, you and I
Have lived beneath each summer sky
So heartily and well,
And little cared we all the while
How fast these years were flying.
And little marked how youth's bright smile
That did their flight so well beguile,
From off the world was dying.

Worthy of thine old-fashioned race,
Well hast thou borne thy part,
And, spite the gathering years, we trace
Few wrinkles on thy manly face
And none upon thy heart.
In sooth, old Time has hardly cast
A shadow on thy track,
Though, as life's summer day flies past,
The harvest moon is rising fast
Above us, Cousin Jack.

The woodcock in the tangled brake
Marks well thy whistle's note;
The deer that by the wood-fringed lake
A moment halts his thirst to slake,
For thee looks sharply out;
The wild duck, as he scuds along,
Seeth thine eye of black,
And cries with shrill despairing tone,
"Don't shoot, o d boy, I'm coming down,
I know you, Cousin Jack!"

Thou should'st have lived in that old day
Long formed in song and story,
Of baron bold and lady gay,
Of tournament, and feast and fray,
Love, chivalry and glory,
When faces were of hearts the token,
And hearts were true, like thine,
When manly thoughts were boldly spoken,
And healths were drunk, and heads were broken,
O'er sparkling Rhenish wine.

Those bluff and hearty times are gone
From off the changeful earth,
Their monuments have tumbled down,
And the sham virtues, then unknown,
Are now of passing worth.
But in the few and rare like thee,
Left to this modern day,
We sometimes yet are fain to see
That frank, old-fashioned chivalry
Has not all passed away.

When o'er the woods another fall
Its lingering charm has thrown,
My gun will hang upon the wall,
My horses learn another's call.
My dog a stranger's tone.
But still may thou, aye kindly known
On Champlain's glorious water,
Till many a year has come and gone,
Wake the wild woodland echoes on
Dead Creek and little Otter.

E. J. PHILLIPS.

For Forest and Stream.

History and Habits of the Wolverene.

(*Gulo luscus*.)

BY DR. ELLIOTT COUES, U. S. A.

THE written history of the glutton or wolverene dates from the middle of the sixteenth century, about which time the animal is mentioned by several writers in much the same extravagant terms. Olaus Magnus, to whom is commonly attributed the earliest mention, although he appears to have been anticipated a little by Gesner, gives a most extraordinary account, made up of the then current popular traditions and superstitions, and tales of hunters or travelers unchecked by any proper scientific inquiry, although, to do him justice, he does not entirely credit them himself. We may be sure that such savory morsels of animal biography did not escape the notice of subsequent compilers, and that they lost nothing of their flavor at the hands of the versatile and vivacious Buffon. Endorsed for two centuries by various writers, each more or less authoritative in his own times, and moreover appealing strongly to the popular love of the marvellous, the current fables took strong root and grew apace, flourishing like all "ill weeds," and choking sober

accounts. Coming down to us through such a long line of illustrious godfathers they were treated with the respect generally accorded to long years, and furnished the staple of professedly educational text books. Probably no youth's early conceptions of the glutton were uncovered with romance; the general picture impressed upon the susceptible mind of that period being that of a ravenous monster of insatiate voracity, matchless strength and supernatural cunning, a terror to all other beasts, the blood-thirsty master of the forest. We cannot wonder at the quality of the stream when we turn to the fountain head of such gross exaggeration. We find it gravely stated that the brute will feast upon the carcass of some large animal until its belly is swollen as tight as a drum, and then get rid of its burden by squeezing itself between two trees in order that it may return to glut itself anew—an alleged climax of gluttony to which no four-footed beast attains, and for a parallel with which we must refer to some of the most noted gormandizers of the Roman Empire. We have indeed reliable accounts of such gastronomic exploits, but they are not a part of those records, which are generally accepted as zoological. In one of the old zoological works of some celebrity there is a very droll picture of a wolverine squeezing itself between two trees, with a most anxious expression of countenance, the fore part of the body being pressed thin, while the latter is still distended, and the large pile of manure already deposited being rapidly argumented with further supplies. Still in the track of the marvellous we read how the glutton, too clumsy and tardy of foot to overtake large ruminants, betakes itself to the trees beneath which they may pass, and there crouches in wait for its victim; it drops like a shot upon the unsuspecting elk, moose, reindeer, and, fastening with claws and teeth, sucks the blood and destroys them as they run. That nothing may be left undone to insure success the animal has the wit to throw down moss and lichens to attract its prey; and to employ the friendly services of foxes to drive the quarry beneath the fatal spot. I allude to these things, not that such gross exaggerations longer require refutation, but because they are a part, and no inconsiderable one, of the history of the species; and because, as we shall see in the sequel, a perfectly temperate and truthful narration of the creature's actual habits sufficiently attests the possession of really remarkable qualities, which need be but caricatured for transformation into just such fables. We may remember also that the history of the wolverene is mixed in some cases with that of other animals, some of whose habits have been attributed to it. Thus Charlevoix (Voy. Amér., 201) speaks of the "carcajou or quincajou, a kind of cat," evidently, however, having the cougar (*Felis concolor*) in view, as appears from the rest of his remarks. Such habit of lying in wait for their prey is common to the cougar, lynx and other large cats. Not to prolong this portion of the subject I may state briefly that the animal whose characteristics will be fully exposed in the course of this article is simply an uncommonly large, clumsy, shaggy marten or weasel of great strength without corresponding agility, highly carnivorous like the rest of the tribe, and displaying great perseverance and sagacity in procuring food in its northern residence where the supply is limited or precarious, often making long uninterrupted journeys, although so short-legged. It is imperfectly plantigrade, and does not climb trees like most of its allies. It lives in dens or burrows, and does not hibernate. It feeds upon the carcasses of large animals which it finds already slain, but does not destroy such creatures itself, its ordinary prey being of a much humbler character. It is a notorious thief, not only of stores of meat and fish laid up by the natives of the countries it inhabits, the bait of their traps, and the animals so caught, but also of articles of no possible service to itself; and avoids with most admirable cunning the various methods devised for its destruction in retaliation.

All the earlier accounts referred to the animal of Europe and Asia. We do not find the terms "carcajou" and "wolverene," nor any allusion to the American form until early in the eighteenth century. La Hontan speaks of it in 1703, likening it to a large fierce badger. Lawson has been quoted in this connection, he having attributed to the lynx some of the fabulous accounts of the glutton; but it is evident that his remarks neither apply, nor were intended to apply to the wolverene. Catesby speaks of an animal "like a small bear" which exists in the Arctic portions of America; the reference is among the earlier ones to the wolverene, those which confound it with other

species being excluded*. We have other definite accounts of the wolverene, near the middle of the eighteenth century, as those of Klein, Ellis Dobbs Edwards and Brisson; and the species may be considered to have been well known from this period, although it was for a long time very generally supposed to be different from the glutton of Europe and Asia.

The various American biographies of this animal are without exception more or less incomplete and unsatisfactory; even those which are shorn of obvious exaggerations are in large part a compilation of earlier statements. They have, however, steadily improved, the latest, that of Audubon and Bachman, being by far the best, although Sir John Richardson's was an excellent contribution. The account which Pennant gave in 1784 (*Arct. Zool.* pp. 66-8) is purged of some of the fables, yet curiously shows how their effects will linger. He scouts the idea of such excessive gluttony as has been attributed, yet relates the moss-throwing story, and represents the wolverene as "a beast of uncommon fierceness, the terror of the wolf and bear; the former, which will devour any carrion, will not touch the carcass of this animal, which smells more fœtid than that of the pole-cat." Pennant traced its distribution as far north as Copper river to the countries on the west and south of Hudson's Bay, Canada, and the tract between lakes Huron and Superior. He gives a fair description, and adds that "it hath much the action of the bear, not only in the form of its back, and the hanging down of its head, but also in resting on the hind part of the first joint of its legs." The Kamtschatkans" he naively continues, "value them so highly as to say that the heavenly beings wear no other furs." Richardson gives some interesting particulars, among them none, so far as I am aware, that are not accurate. In a passage he quotes from Graham's MSS., we see a probable basis for the fabulous accounts that the fox is the wolverene's provider or abettor in the chase—for it is well-nigh universal that fable is founded on facts exaggerated, distorted or perverted. Alluding to the wolverene's notorious habit of following marten roads, Mr. Graham remarks that the animal tears the captured martens to pieces or buries them at a distance in the snow. "Drifts of snow often conceal the repositories thus made of the martens from the hunter, in which case they furnish a regale to the hungry fox, whose sagacious nostril guides him unerringly to the spot. Two or three foxes are often seen following the wolverene for this purpose." Richardson very properly discredits the accounts which had come down from Buffon of the destruction of beavers by the wolverene; "it must be only in summer," he says, "when those industrious animals are at work on land that it can surprise them. An attempt to break open their house in winter, even supposing it possible for the claws of a wolverene to penetrate the thick mud walls when frozen as hard as stone, would only have the effect of driving the beavers into the water to seek for shelter in their vaults on the borders of the dam." Hearne gives a much more credible account of the depredations of the wolverene upon another of the valuable fur bearing animals of the North—the fox—during the period of reproduction. Being directed by scent to the burrows of the fox, which its great strength enables it to enlarge if necessary, it enters and destroys the whole family. In evidence of its amazing strength of that sort most effective in pulling, pushing and prying, the same author mentions that a wolverene had been known to upset the greater part of a pile of wood nearly seventy yards around in order to get at some provisions which had been deposited in the cache. Audubon's article, although interesting and accurate, is chiefly a compilation from previous accounts, as he appears to have met with the animal in a state of nature but once, the result of which occurrence is his principal contribution to the subject. This was in Rensselaer county, near the banks of the Hoosac river. He tracked a wolverene in the snow to its den, which was among rocks, and shot it after prying away some heavy fragments. "There was a large nest of dried leaves in the cavern which had evidently been a place of resort for the wolverene during the whole winter, as its tracks from every direction led to the spot. It had laid up no winter stores, and evidently depended on its nightly excursions for a supply of food. It had, however, fared well, for it was very fat."

*The wolverene has been confused, not only with the lynx and cougar in early times, but also quite recently with the American badger, *Taxidea americana*. Thus, F. Cuvier (Suppl. Buffon, 1831, 267) treats at length of "Le Carcajou, ou Blaireau Americain;" his whole article being based upon the badger, to which he misconstrues the name Carcajou to belong. Gervais also speaks of the *Conkajou* ou Blaireau d' Amerique (Proc. Verb. Soc. Philom. Paris, 1842, 30.)

The fur of the wolverene is highly valued both by civilized and uncivilized people. A number of skins sewn together makes a very beautiful carriage robe. The Indians and Esquimaux use the fur as they do that of the wolf, for fringing their garments, the skin being cut in strips for this purpose.

The wolverene is an animal of circumpolar distribution in both hemispheres. In North America it exists in all suitable countries north of the United States to the Arctic coast; its southern limit has been fixed more properly between 42° and 43°; this is probably nearly correct for the eastern portions of the continent, aside from what recession of the species northward may have recently occurred, although, as we shall see, the species reaches farther south in the west. In Massachusetts, according to Mr. Allen, it still lingered a few years since in that portion where the Canadian, as distinguished for the Alleghanian, fauna is represented. But the Massachusetts reports are all probably traceable to a Hoosac mountain record some years prior. Dr. Hitchcock and Dr. DeKay both quote Dr. Emmons for this, although the species is not given in the latter's report. In New York it was rare in the time of Audubon and DeKay; the former notes specimens from Rensselaer (1810), and Jefferson (1827) counties. Dr. Thompson, writing in 1853, states that it was then extremely rare in Vermont, none having been met with to his knowledge for several years. Though occasionally found when the country was new in all parts of the State it was never very plentiful, and for years had been known only in the most wooded and unsettled parts. I have met with but few record of its presence in the United States west of New York to the Rocky Mountains, though it is to be presumed that it inhabits, or has lately done so, the wooded portions of our northern frontier. Maximilian speaks (*l. c.*) of the occurrence of the species on the western border of Canada, and near the mouth of the Red River of the north, and surmises that the species may extend to the Missouri river, especially as he saw a skin, but without indication of locality, at one of the trading posts. I never saw the wolverene in Dakota or Montana, where most of the country is altogether too open. Baird, however, speaks of its occasional occurrence in the Black Hills, and registers a specimen from "Northwest of Fort Union" (probably Montana, towards the base of the Rocky Mountains); and Mr. C. H. Merriam procured a specimen on the Yellowstone river, Wyoming, in August, 1872.

In the Rocky Mountains, as was to have been expected, its extension southward has been traced to the furthest known point, between 39° and 40°. Prof. Baird notes a specimen obtained by Captain Stansbury from the Great Salt Lake, Utah, which lies wholly south of 42°. It is probable that its extreme limit is even somewhat further than this, reaching in the mountains to the borders of Arizona and New Mexico, and corresponding latitudes in California. Of this I was assured by hunters, whose statements I had no reason to doubt, and who were evidently acquainted with the species. But I could not confirm their statements by actual observation, and, for all that is positively known, the Salt Lake record remains the southernmost, excepting that very recently furnished by Mr. Allen. He saw the skin of an individual taken in the vicinity of Montgomery, Colorado, near the limit of timber, and the animal was stated to be not uncommon. This locality is somewhat south of 40°, and the occurrence is strongly corroborative of the accounts I received, as just mentioned. I have no record from the region west of the main chain of the Rockies in Oregon or Washington Territories, although it is not to be presumed, upon this negative evidence, that the species does not occur there.

The wolverene ranges, as we have seen, in greater or less abundance all over the northern portions of this country. It appears to be particularly numerous in the Mackenzie river region, and it fairly infests the whole country bordering the lower portions of the river and the west side of the mountains. From this country many accounts have reached me, from various officers of the Hudson's Bay Company, through the liberality of the Smithsonian Institution, which placed in my hands all the matter represented in its archives upon the animals of the far north. These manuscripts witness the wonderful cunning and sagacity of the beast, as well as its ferocity; and represent it as the greatest enemy with which the hunter's and trappers have to contend in the pursuit of fur-bearing animals. Macfarlane, Ross and Lockhart, have each recorded their experiences, which together afford the material for a complete biography.

The hunter, says Mr. Lockhart, may safely leave an animal he has killed for one night, but never for a second time without placing it in a strong cache of logs. The first night the wolverene is pretty sure to visit the place, but will touch nothing. The next night he is certain to return, and if he can possibly get at the meat he will gorge himself and then make away with the rest, which he cunningly hides, piece by piece, under the snow in different directions. At every cache he makes he voids his urine or drops his dirt, probably to prevent foxes, martens, or other animals, from smelling the hidden meat and digging it up. Caches must be made of green wood and exceedingly strong, or the animal will certainly break into them; he has been known to gnaw through a log nearly a foot in diameter, and also to dig a hole several feet deep in frozen ground, to gain access to the coveted supply. Should he succeed in gaining entrance for himself, and yet be unable

to displace the logs sufficiently to permit of removal of the meat, the brute will make water and dirt all over it, rendering it wholly unfit to be used. Even a dog will then scarcely touch it.

To the trapper the wolverenes are equally annoying. When they have discovered a line of marten traps they will never abandon the road, and must be killed before the trapping can be successfully carried on. Beginning at one end, they proceed from trap to trap along the whole line, pulling them successively to pieces and taking out the baits from behind. When they can eat no more, they continue to steal the baits and cache them. If hungry, they may devour two or three of the martens they find captured, the remainder being carried off and hidden in the snow at a considerable distance. The work of demolition goes on as fast as the traps can be renewed.

The propensity to steal and hide things is one of the strongest traits of the wolverene; to such an extent is it developed that the animal will often secrete articles of no possible use to itself. Besides the wanton destruction of marten traps, it will carry off the sticks and hide them at a distance, apparently in sheer malice. Mr. Ross, in an interesting article, has given an amusing instance of the extreme of this propensity. "The desire for accumulating property seems so deeply implanted in this animal, that, like tame ravens, it does not appear to care much what it steals so that it can exercise its favorite propensity to commit mischief. An instance occurred within my own knowledge, in which a hunter and his family having left their lodge unguarded during their absence, on their return found it completely gutted—the walls were there but nothing else. Blankets, guns, kettles, axes, cans, knives, and all the other paraphernalia of a trapper's tent had vanished, and the tracks left by the beast showed who had been the thief. The family set to work, and by carefully following up all his paths recovered, with some trifling exceptions, the whole of the lost property."

Though very clumsy animals, the wolverenes manage to capture at times such prey as hares and grouse, and they successfully attack disabled deer. We have already seen how they destroy foxes in their burrows, and they are usually found in excellent condition. They also feed on offal or carrion—in fact anything they can catch or steal. Their own flesh is only eatable in the extreme of starvation. They bring forth in burrows under ground, probably old bear-washes, and have four or five young at a birth. It is very rarely that they are discovered at this period or while suckling their young. One reason, however, may be that they reproduce late in June and early in July, when the mosquitoes are so numerous that no one who can avoid it goes abroad in the woods. The rutting season is in the latter part of March. The female is ferocious in the defense of her young, and if disturbed at this time will not hesitate to attack a man. Indeed, Indians have been heard to aver that they would sooner encounter a she bear with her cubs than a carcajou under the same circumstances. In October, when the rivers set fast, the wolverene's re-appear in families, the young still following their dam, though now not much her inferior in size. They are full grown when about a year old. In early infancy the cubs are said to be of a very pale color.

The wolverene may be captured in wooden traps similar to those used for martens, but of course made on a much larger scale, as the animal's strength is enormous, even for its size. The traps are sometimes built with two doors. But so great is the cunning and sagacity of the beast, that the contrivance for its destruction must be very perfect. The traps are covered up with pine brush, and made to resemble a cache as much as possible; the wolverene is then likely to break in and get caught. The bait, ordinarily the conspicuous feature of a trap, must in this instance, be concealed, or the animal will either break in from behind, or failing in this, will pass on his way. It is sometimes also taken in steel traps, or by means of a set gun; but both these methods are uncertain, great "medicine" being required to outwit the knowing and suspicious beast. The eyesight of the wolverene is not very bright, but his sense of smell is extremely acute.

"The winter I passed at Fort Simpson," writes Mr. Lockhart, "I had a line of marten and fox traps and lynx snares, extending as far as Lac de Brochet. Visiting them on one occasion, I found a lynx alive in one of my snares; and being indisposed to carry it so far home, determined to kill and skin it before it should freeze. But how to cache the skin till my return? This was a serious question, for carcajou tracks were numerous. Placing the carcass as a decoy in a clump of willows at one side of the path, I went some distance on the opposite side, dug a hole with my snow shoe about three feet deep in the snow, packed the skin in the smallest possible compass, and put it in the bottom of the hole, which I filled up again very carefully, packing the snow down hard, and then strewing loose snow over the surface till the spot looked as if it had never been disturbed. I also strewed blood and entrails in the path and around the willows. Returning next morning, I found that the carcass was gone, as I expected it would be, but that the place where the skin was cached was apparently undisturbed. 'Ah! you rascal,' said I, addressing aloud the carcajou, 'I have outwitted you for once.' I lighted my pipe, and proceeded leisurely to dig up the skin to place in my muskymoot. I went clear down to the ground, on this side and on that, but no lynx skin was there. The carcajou had been before me, and had carried it off along with the carcass; but he had taken the pains to fill up the hole again and make everything as smooth as before."

"At Peel's River, on one occasion, a wily old carcajou

discovered my marten road, on which I had nearly a hundred and fifty traps. I was in the habit of visiting the line about once a fortnight; but the beast fell into the way of coming oftener than I did, to my great annoyance and vexation. I determined to put a stop to his thieving and his life together, cost what it might. So I made six strong traps at as many different points, and also set three steel traps. For three weeks I tried my best to catch the beast without success; and my worst enemy would allow that I am no green hand in these matters. The animal carefully avoided the traps set for his own benefit, and seemed to be taking more delight than ever in demolishing my marten traps and eating the martens, scattering the poles in every direction, and caching what baits or martens he did not devour on the spot. As we had no poison in those days, I next set a gun on the bank of a little lake. The gun was concealed in some low bushes, but the bait was so placed that the carcajou must see it on his way up the bank. I blockaded my path to the gun with a small pine tree which completely hid it. On my first visit afterward I found that the beast had gone up to the bait and smelled it, but had left it untouched. He had next pulled up the pine tree that blocked the path, and gone around the gun and cut the line which connected the bait with the trigger, just behind the muzzle. Then he had gone back and pulled the bait away, and carried it out on the lake where he laid down and devoured it at his leisure. There I found my string. I could scarcely believe that all this had been done designedly, for it seemed that faculties fully on a par with human reason would be required for such an exploit, if done intentionally. I therefore re-arranged things, tying the string where it had been bitten. But the result was exactly the same, for three successive occasions, as I could plainly see by the footprints; and what is most singular of all, each time the brute was careful to cut the line a little back of where it had been tied before, as if actually reasoning with himself that even the knots might be some new device of mine, and therefore a source of hidden danger he would prudently avoid. I came to the conclusion that that carcajou ought to live, as he must be something at least human, if not more. I gave it up, and abandoned the road for a period.

"On another occasion a carcajou amused himself, much as usual, by tracking my line from one end to the other and demolishing my traps as fast as I could set them. I put a large steel trap in the middle of a path that branched off among some willows, spreading no bait, but risking the chance that the animal would 'put his foot in it' on his way to break a trap at the end of the path. On my next visit I found that the trap was gone, but I noticed the blood and entrails of a hare that had evidently been caught in the trap and devoured by the carcajou on the spot. Examining his footprints I was satisfied that he had not been caught, and I took up his trail. Proceeding about a mile through the woods I came to a small lake, on the banks of which I recognized traces of the trap which the beast had laid down in order to go a few steps to one side to make water on a stump. He had then returned and picked up the trap, which he had carried across the lake, with many a twist and turn on the hard crust of snow to mislead his expected pursuer, and then again entered the woods. I followed for about half a mile further and then came to a large hole dug in the snow. This place, however, seemed not to have suited him, for there was nothing there. A few yards further on, however, I found a neatly built mound of snow, on which the animal had made water and left his dirt; this I knew was his cache. Using one of my snow shoes for a spade I dug into the hillock and down to the ground, the snow being about four feet deep; and there I found my trap, with the toes of a rabbit still in the jaws. Could it have been the animal's instinctive impulse to hide prey, that made him carry my trap so far merely for the morsel of meat still held in it? Or, did his cunning nature prompt him to hide the trap, for fear that on some future unlucky occasion he might put his own toes in it and share the rabbit's fate?"

This propensity of the wolverene to carry off traps receives confirmation from other sources. In Captain Cartwright's Journal (II, 407) a similar instance is recorded in the following terms; "In coming to the foot of Tabee Hill I crossed the track of a wolvering with one of Mr. Callingham's traps on his foot; the foxes had followed his bleeding track. As this beast went through the thick of the woods, under the north side of the hill, where the snow was so deep and light that it was with the greatest difficulty I could follow him even on Indian rackets, I was quite puzzled to know how he had contrived to prevent the trap from catching hold of the branches of trees or sinking in the snow. But on coming up with him I discovered how he had managed; for after making an attempt to fly at me he took the trap in his mouth and ran upon three legs. These creatures are surprisingly strong in proportion to their size; this one weighed only 26 pounds and the trap eight, yet including all the turns he had taken he had carried it six miles."

The ferocity of the wolverene, no less than its cunning, is illustrated in some of the endless occasions on which it matches its powers against those of its worst enemy. A man had set a gun for a carcajou which had been on its usual round of demolition of marten traps. The animals seized the bait unvarily, and set off the gun; but owing to careless or improper setting, the charge missed or only wounded it. The carcajou rushed upon the weapon, tore it from its fastenings and chewed the stock to pieces. It is added to the account of the exploit that the beast finished by planting the barrels muzzle downward, upright in the snow; but this may not be fully credited. The

*This locality (Fort Union) frequently mentioned in the works of Audubon, Baird and others, no longer exists as such, being now a heap of rubbish; it is replaced by Fort Buford, commanding the mouth of the Yellowstone, at the extreme southwest corner of Dakota, adjoining the southeast corner of Montana.

stories that pass current among trappers in the north would alone fill a volume, and they are quite a match for those that Olaus Magnus set down in his book centuries ago. How much wiser are we in our generation? Is there any thing new under the sun? But we need not go beyond the strict fact to be impressed with the extraordinary wit of the beast, whom all concur in conceding to be "as cunning as the very devil."

With so much for the tricks and the manners of the beast behind our backs, roaming at will in his vast solitudes, what of his actions in the presence of man? It is said that if one only stands still, even in full view of an approaching carcajou, he will come within 50 or 60 yards, provided he be to windward; before he takes the alarm. Even then, if he be not warned by sense of smell, he seems in doubt, and will gaze earnestly several times before he finally concludes to take himself off. On these and similar occasions he has a singular habit—one not shared so far as I am aware, by any other beast whatever. He sits on his haunches, and shades his eyes with one of his forepaws, just as a human being would do in scrutinizing a dim or distant object. The carcajou then, in addition to his other and varied accomplishments, is a perfect skeptic—to use this word in its original signification. A skeptic, with the Greeks, was simply one who would shade his eyes to see more clearly. To this day, in sign language among some of the North American Indians, placing the hand to the forehead signifies "white man"—either in allusion to his habit, or to the shade given the eyes by the straight vizor of the military cap which the Indians see oftener than they desire. Mr. Lockwood writes that he has twice been eye witness of this curious habit of the wolverene. Once, as he was drifting down stream in a small canoe, he came within a short distance of one of the animals on the bank; it stopped on perceiving him, squatted on its haunches, and peered earnestly at the advancing boat, holding one forepaw over its eyes in the manner described. Not seeming to take alarm, it proceeded on a few paces, and then stopped to repeat the performance, when Mr. Lockwood, now sufficiently near, fired and killed the beast. On another occasion when the same gentleman was crossing the Rocky Mountains, a wolverene, which had become alarmed and was making off, stopped frequently and put up his paw in the same manner, in order to see more clearly the nature of that which had disturbed him.

On other occasions the wolverene displays more boldness than this in the presence of man. It has been known to seize upon the carcase of a deer, and suffer itself to be shot, rather than relinquish possession, though the hunter had approached within 20 yards of his game. When pressed by the pangs of hunger, still bolder exploits are sometimes performed, as in the instance narrated by Capt. J. C. Ross. In the dead of an Arctic winter, his ship's company were surprised by a visit from a wolverene, which clambered over the snow wall surrounding the vessel and came boldly on deck among the men. Forgetful of its safety in the extremity of its need for food, the animal seized a canister of meat, and suffered himself to be noosed while eating.

For Forest and Stream.

CAMPING ON THE KANKAKEE.

"NOW boys, shove her off," was the order that came from one of a group, the leader of a party of three, who had just launched their boat after a cruise of twenty miles on the bosom of the Kankakee river. "I wonder if the fish will bite as well as they used to," continued the same speaker. "They took very freely when I was here about eight years ago."

The boat in which the three young hunters were about to start was one of those flat-bottomed constructions called a scow, capable of holding four very comfortably, with all their camping out "fixings." These consisted of the usual appurtenances that a party requires on either a shooting or fishing excursion, namely, a good canvas tent and a cooking stove after the newest patent—that is, one fitted up with all necessary articles, which can easily be packed again in the same space. Now to enumerate the members of the party as they take their seats in the boat: Harry Babcock, the leader and originator of the expedition, who took his place in the centre of the boat, was a young man about thirty years of age, 5 feet 8 inches in height, with a well-knit frame, dark hair and blue eyes, a good oarsman and a dead shot. Next to him comes Tom Brown, two inches taller than Babcock, but not by any means as strong, of fair complexion and light hair and eyes. He was *par excellence* the fisherman of the party, though his rather excitable nature and want of patience prevented him from securing some of the fish which he had the good fortune to hook, while Griffith, the youngest of the triad, was more like his leader than his other companion, though shorter than him by three inches. He was a good oarsman and a sure shot, and like Harry, very much tanned by exposure to the sun; his place was at the bow. There was another member of the party whom I must not forget—Harry's dog Dash. He was a black setter of the Irish breed, and very fond of his master, whose side he never left. This was his first trip out west, Babcock having brought him along to break him on English snipe, which he knew were to be found in plenty on the marshes bordering the stream.

This river, which runs through parts of the States of Illinois and Indiana, is very picturesque in some parts, and in others quite the reverse, owing to the flatness of the surrounding country, which is one vast marsh for miles on either side. Then, all of a sudden, its banks are

darkened by the heavy forests of Indiana, which fringe the stream for a considerable distance, while now and then an opening glade gives a glimpse of the blue sky above. The river itself is winding and rapid, being deep in many places and in others quite shallow, so much so, indeed, that boats cannot pass over, and have to be carried by their occupants. In other places the wild rice grows all across the shallows, this generally occurring when the surrounding land lies low, uninteresting to the eye, but forming the home of myriads of wild fowl of all sorts. There are also plenty of fish in the stream, chiefly pickerel and black and speckled bass.

The boat, having been successfully launched, Will, stationed in the bow, kept a sharp look out for ducks, while Harry pulled slowly in order to enable Tom, who was seated in the stern, to put out a troll, so that between them they might furnish enough for a satisfactory dinner and supper. They had not proceeded past half a dozen bends of the stream, when the report of Will's gun caused Harry to stop and turn round to see what he had fired at, and on looking ahead he saw a duck of the mallard species lying on the water. "By jove! that's a mallard," he cried; "I can tell him even from here" by the brightness of his plumage," an assertion which proved correct. "I tell you what, Will, if we were to anchor under this bank in the afternoon we would get any amount of shots, for I judge by the quantity of wild rice here that the evening flight of ducks must be quite large." "Very true," replied his friend, "so I propose—provided we don't find anything better—to camp here on the night of our return. It's but a short distance from here to where Jack is to meet us with the wagon, and we can easily do it in a morning's pull. See! there goes a flock over yonder clump of willows, and they are all mallards too. I bet they will light not far from here."

Our party pulled on in silence till Tom suddenly cried out, "I've got him this time," and commenced to haul in his line, which proved on a nearer view to be weighted with a three-pound pickerel, and in a few seconds he flung his victim flopping to the bottom of the boat, much to the disgust of Dash, who, not liking the sundry flops he received, got up and retired to the other side of his master. "What a beauty he is," exclaimed Harry, admiringly, "I'll bet he is over three pounds. 'If you will pull nearer the shore and keep about an oar's length from those lilies yonder I'll get another bite," said Tom. "I wish the river had not so many turns in it, for I could do much better if I had a longer line out. How do you like those new spoons I have? Do you think they are as good as the old pattern?" "No, I do not," replied Harry, "I like the old sort best, and I've killed more fish with them. Now while you are getting your hook out of that fish, I'll row up and get that duck Will has shot. What a beauty he is!" and a few strokes of his paddle brought him alongside of the quarry. "I say, Griffith, you've hit him hard, for both his wings are broken," he remarked. "I'm sorry, for I would have tried to stuff him to-night in camp and take him back east with me, as a memento to a friend of mine who wants one. 'A lady friend, I presume," said Will. "Is that the young party whose photograph you showed me the other day? 'Which do you mean?" inquired Harry, "for I have a good many ladies' photographs?" "I mean the one with the overtowering hat on; you're a sly fellow, wanting to pretend you don't know which I mean." "Frankly, Harry, were you ever in love?" "Oh! don't talk nonsense, Will, you know I am too fond of my liberty and hunting to tie myself down to any woman, though I don't deny that I have been in love once in my life. I made a fool of myself, for the girl never cared two straws for me, though she led me to believe she did. Some time at night, over our camp fire I'll tell you about it; but now, if I don't mistake, we are coming near that low land I spoke of this morning, which will afford us some good snipe shooting. There it is over yonder; now who is going to stay with the boat? Tom, you don't care to shoot snipe, so you had better remain; Will and myself will try it for a couple of hours. Hie over, Dash, and hunt close, old boy. Ah! that's a good lookout for birds," he exclaimed, as each shot down a snipe right and left; "We are in luck, Will." Our two hunters returned after a couple of hours. "What do you think of this, Tom?" asked Will. "Harry has 58 and your humble servant 30 birds. Harry would have had more, only his shot gave out, and I did not bring enough for my gun." "Well, I've not been idle in your absence, as you may see, Will," said Tom, and our hunters on looking into the boat saw the proof of his assertion, for there lay ten fine speckled bass. "You've done well, Tom," said Will. "I wish that we could camp here to-night," remarked Babcock, "I'd like to try this marsh again to-morrow, and would were it not that we run a great risk of catching the chills and fever. Heigho! I suppose we must start; it will take us some time to reach that clump of trees. Will, it's your turn now to take the oars. I'll take your place at the bow and keep a sharp lookout for ducks." So on they went, and by the time they reached the timber spoken of Harry had shot some twenty ducks, and Tom had brought on board half-a-dozen fine pickerel. "Let us land here," said Will, "and pitch our camp; we can erect our tent under those big trees. They will serve to keep off the rain, which, if I mistake not from the looks of the horizon, we shall presently have." Accordingly our party having landed, proceeded at once to pitch their tent. After doing so the next thing was to attend to the fire; so they commenced to look around for a good sized piece of wood to form what is called a back log, which serves to keep the fire in all night. This having been procured after some trouble and put in its proper place in front of the tent, sufficiently

far away to prevent an excess of heat, very soon they had a good fire crackling away. It being now nearly sunset, and just the time for the evening flight of ducks, Harry and Will started off for the nearest bend in the river, leaving Tom to attend to the preparations for supper, and promising to be back by dark. They had quite a long stretch of woods to pass through before they came to the bend, and night had settled down before they returned, but they had some splendid sport. They found Tom and a good supper of fried fish and broiled ducks, which he had cooked, and they were not slow to attack the viands. After supper was finished and the party then retired for the night, one staying up for an appointed time, at the expiration of which he would call one of the others, who would take his turn, and again be relieved by the third. In the morning the friends reluctantly turned their faces homewards, and arrived safely at the point from which they started. Here they found Jack and the wagon waiting. Then came the counting of all they had shot, which amounted to 164 ducks and 117 snipe, as well as three dozen pickerel and a dozen bass, all of which were safely stowed away in the wagon and the horses' heads turned for home.

Now, my readers, if you wish to enjoy similar sport you must go out west for it. The writer has tried all points of the compass, and has never been able to find better sport than the Western States afford. Should any of you contemplate a like expedition you must be prepared to rough it in more ways than one, but if you love sport you will be amply repaid for all fatigue and hardship.

CHARLES MATTHEWS.

"HOLD THE FORT."—Why talk of hard times and lack of work when the following advertisement appears in the *Clipper*: "I want a man of courage, who is willing to take chances, to take charge of and hold a disputed silver claim in Mexico. Free transportation there, and good compensation will be allowed. No labor—nerve the only qualification requisite."

A RAID INTO BUTLER.

EDITOR FOREST AND STREAM:—

Agreeably to promise, I send you some notes concerning a recent hunting incursion into the Slipperyrock region, in the neighboring county of Butler.

Leaving this place at 7 a. m. on the Atlantic and Great Western Road, we reach Shenango Junction in a few minutes, which point is the northern terminus of the Shenango and Allegheny road, connecting the oil and coal fields of Butler with the longer routes on the north and west. At Shenango we are joined by our companion, John Homer, who succeeded in missing the train at Greenville, but "got his work in" nobly over the tides, just in time to be on hand to hear the conductor's significant "All Aboard." Our party thenceforward consisted of our two selves, and two dogs—one a pup, belonging to the subscriber, who, before our hunt was through with, showed himself to be worthy of his training. The distance from Shenango to our objective point, (Centerville Station,) was about 35 miles, which, through the agreeable treatment of conductor and brakeman, and the excellent accommodations generally, was as pleasant a ride as we remember having taken for some time.

At Centerville we took to the woods, having some three miles to make "over land," in order to reach the mecca of every true sportsman who journeys down that way. The hospitable home of Mr. John Keuster, an honest Pennsylvania Dutchman. But we didn't walk these three miles for nothing—we got several rabbits along the route, besides getting deuced hungry. But all was more than lovely upon reaching Keuster's mill. The worthy host met us at the door and shook us heartily, strangers as we were, though my companion had felt that hearty shake repeatedly before. An old-fashioned country dinner was now steaming before us, altogether to our satisfaction. Whether it was owing to that dinner or to the inclemency of the weather, we can't say, but certain it is we didn't take to the woods worth a cent that afternoon, but rather preferred to hang around the comfortable quarters of the jolly miller. And to further encourage this neglect of duty, some neighbors dropped in conveniently during the evening, and then it was "euchre cards" until the "weesma" morns ayant the twae."

But next morning we got down to business. We rowed across the Slipperyrock in a skiff, to the thickets on the opposite side, where pheasants and rabbits most do congregate, and returned toward evening with well-filled bags. In our tramp we came across an abandoned camp on the bank of the stream, which a few weeks before had been occupied by a party of hunters and fishermen from Greenville, among them your piscatorial correspondent, "Amateur Angler." The headquarters of the party consisted in two old log shanties, joined like the Siamese twins, with a covered passage way, and selected quite out of humanity's reach. In fact, it seemed like a very "lunsum" place, and after taking in the situation, we thought we could realize their woeful tales of strange noises in the night—how that they would lie on the pallets of straw listening to the screams of the catamounts at the shanty's door, expecting that every moment would be their next. Their only relief was to pile on the wood and make the blaze shoot out of the chimney—for the establishment was supplied with a huge old-fashioned fire-place.

These waters are famed for their abundance of pike. Being until recently quite inaccessible by rail, they have

been to a great extent unfished. The stream for some ten miles is one succession of dams, all of them broad and deep. It is encouraging to an angler to know that such places as these do keep turning up now and then, otherwise we would grow hopeless for the future.

The next morning saw a repetition of the one first mentioned, until at noon we were sufficiently loaded down with game to start for the railroad. This we did reluctantly, even as a man hates to give up any good thing. But Keuster's is the place for real old sport. The region round about has been a sealed book until lately. At the proper time duck and geese are plenty there, with squirrels, hares, and in short all kinds of small game. N. H. B.

For Forest and Stream.

SQUIRRELS IN FLORIDA.

I HAVE hunted the black squirrels in Canada, the grey and fox squirrels in Central Virginia, the grey squirrels in the chestnut woods in Connecticut, but I never saw as many in an all-day travel in either of those places as I have seen at one time standing in a hickory hammock in Florida. Last year about the 10th of November I was in the hammock known as Hutching's hammock, which adjoins the thrifty farm of Yankee Smith in Orange Dale, Marion County, I counted thirteen large grey squirrels gathering nuts on one tree, and on every tree all around they seemed equally as abundant. I stood in one place, and having one of Stevens hunters' pets, No. 22 calibre, I exhausted my shells, and the squirrels seemed as plenty as when I commenced to shoot. I counted out fifteen fat squirrels on my return to the house. Here let me say to any and every one visiting Florida to take with them a strong light folding camp stool; one needs it everywhere while calling wild turkeys, or shooting squirrels, or waiting for ducks to gather into crowds, or shooting deer. I never had anything that was more convenient. I afterward learned that one of your correspondents, A. A. Mowry, shot a noble wild turkey from off one of the very hickory trees that I bagged my squirrels. The fox squirrels abound in the pine woods in this vicinity; they are very large and beautifully variegated, some with black back and brown belly, and others brown back and a black head and belly. With a good squirrel dog I think one could readily get a dozen fox squirrels on any two hours' cruise.

And here let me say to any one visiting Florida for health that I found Marion County superior to any other part of the State. I was twenty days in the saddle on one trip through the State, and prefer Marion County to any other county I visited. The land is high and rolling, and as it is a grazing, cattle-raising country the farmers burn the grass off every winter. This has destroyed all snakes and annoying insects. In conversation with a Mrs. Ross, the postmistress, she said she had never yet seen a rattlesnake the 27 years she had lived near Orange Dale, and she had walked two miles through the woods to church most every Sunday. But I am getting away from the squirrel question, but will say that last winter Mr. McGault, standing on the piazza of my house, shot a very large variegated fox squirrel with brown black, reddish sides, with white muzzle and throat, black ears and belly. I will also say that any one desiring to know about the west central part of Florida, by inclosing postage stamp and writing their questions, I will cheerfully tell them to the best of my knowledge, as I am very familiar with that country. Putnam, Conn. G. F. Ws.

CATCHING A DEER BY THE TAIL.

From the Lake City Leader.

Mr. Fowler, of Mazeppa, relates to us an incident that occurred out in his neighborhood the other day, which betrays pluck, chance, luck, and that a tail hold has again proven its excellence as a hold. A young man named Albert Bright—a neighbor of Mr. Fowler's—was sauntering along the bank of the romantic Zumbro a few days ago and, in the absence of a gun, he was enjoying a little hunt with an old Colt's revolver and a hatchet, which he had slung in a belt. Upon turning a bend in the stream, he saw a short distance in advance of him two deer standing in the edge of the stream. He quietly crept up and, taking careful aim he fired, wounding the largest of the two somewhere in the leg. At the crack of the old pistol the deer made a spring for deep water, and young Bright, in the flush of excitement—his first case of genuine "buck fever"—made a leap into the stream in pursuit of his prize. Strange as it may seem, he reached the plunging animal, grasped hold of its tail, and hung on for dear life—and about this stage in the proceedings the ball opened and the fun commenced. The deer, more frightened than hurt, now commenced a frantic voyage of discovery—trying to discover what style of raring and plunging was best calculated to liberate its narrative from the firm grasp of young Bright. It swam into deep water and into shallow water, across the stream, up the stream and down the stream but to no purpose. Bright could sometimes touch bottom and sometimes he couldn't, but he held on all the same. The deer tried to kick him off, but being in the water the force of its kicking did not avail much. After towing young Bright all over the stream and down about a quarter of a mile, the deer seemed to resolve on a new style of tactics. It every little while made a frantic effort to turn about and combat its foe with its front feet and horns, and the young man had to do some tall "swimming around the circle" to prevent the accomplishment of its designs. After it had tried this repeatedly, Mr. Bright struck an idea that he thought might win, which was that as soon as he struck bottom again where he could get good footing he would court this turning-around notion of the deer and kill the animal with his little hatchet. So, as they went sailing along through a deep channel, he succeeded in getting his hatchet out of his belt, and they soon struck a bar, where both found good footing. The deer no sooner touched bottom than it made a turn on him again, and Bright, letting up on the tail, allowed it to turn and "come for him," and as it did so he delivered it a well poised blow that "laid it out." After getting his breath a little, he dragged his fine prize ashore, and went home to change his clothes and get a team to take it home. This beats all the deer hunting we have had to record lately, and young Bright can justly claim the champion's belt until some fellow actually catches a deer in his hat.

Fish Culture.

AMERICAN SALMON IN NEW ZEALAND WATERS.

THROUGH the courtesy of Prof. Spencer F. Baird, U. S. Fish Commissioner, we are enabled to lay before our readers the following interesting correspondence relative to the efforts of the Government of New Zealand to introduce our salmon to those waters, efforts which have been ably seconded by the U. S. Fish Commissioners, and which are duly recognized. The first is an autograph letter from the Colonial Secretary of the Colony, and the others from the President and Secretary of the Auckland Acclimatization Society. Together with the newspaper extracts following, they so fully detail the proceedings that no further explanation is required:—

COLONIAL SECRETARY'S OFFICE,
WELLINGTON, N. Zealand, Nov. 16th, 1876.
✓ PROF. THE HON. SPENCER F. BAIRD, Chairman U. S. Fishery Commission, Smithsonian Institution, Washington, D. C.:

SIR—Upon the return of Dr. Hector from the Centennial Exhibition at Philadelphia, and having received his report of his proceedings in the United States, it becomes my gratifying duty to tender to you the thanks of the Government of New Zealand for the eminent and valuable assistance rendered by you to this Colony in the person of its representative at the Exhibition.

I desire further to thank you for the hearty co-operation of the Commission over which you preside in the efforts of this country to obtain a stock of food fish from America. You will be glad to hear that the first consignment to the Government of 84,000 salmon ova contributed by Mr. Stone, the officer in charge of your establishment at the McCloud river, has arrived safely and in good order, so far as yet reported on. You will no doubt be informed of the result of the separate shipments to private order from Auckland, Hawkes Bay and Canterbury, by the local administration societies at those places.

I shall have pleasure in doing you advices of the further progress of the Government importation by future opportunities. I have instructed Mr. Creighton to ascertain from Mr. Stone, and to draw for any amount that may be due from the Government of this Colony to the United States Commission on account of the shipment of ova per "Zealandia" in October.

We shall be very glad to receive, through your kind offices, a shipment of whitefish ova in February next, as has, I understand, already been arranged for by Dr. Hector, and shall always be thankful to yourself, the Commission, and the United States Government for your further co-operation and assistance on future occasions in our endeavors to increase the stock of food fish in New Zealand by importation from America. I have the honor to be, sir, your most obedient servant,
DANIEL PELLE.

AUCKLAND, New Zealand, Nov. 20th, 1876.
THE HON. SPENCER F. BAIRD, U. S. Chief Commissioner of Fisheries, Smithsonian Institution, Washington, D. C.

SIR—I have the honor to inform you that the salmon ova forwarded by your kind instruction from the United States Fish Commission from its establishment at the McCloud river, California, have arrived in excellent condition.

I have also to inform you that the barrels of ova intended for Dr. Hector and the Napier and Canterbury Societies, were duly forwarded. I am advised that the two former lots arrived in good order, and have since hatched out well. From Dr. Hector I have not heard. The Auckland portion have been placed in hatching houses erected by our Acclimatization Society in very suitable localities under my personal supervision. You will be glad to learn that, owing to the almost perfect fecundation of the ova, and the admirable arrangements made by Messrs. Crop & Co., of San Francisco, for their safe transport, the hatching has been most successful.

There is now, I think, every probability that the great experiment of introducing California salmon into the rivers of New Zealand will be a splendid success. For this result we are entirely indebted to the noble generosity of the United States, more especially is the Colony indebted to you, under whose charge the U. S. Fish Commission carries on its most useful and wide-extended labors.

On behalf of the Auckland and Canterbury Acclimatization Societies I beg to tender you the warmest thanks for your generosity in supplying the Colony of New Zealand with the king of fishes.

The consignment of last year also came from you, of which, at the time, we were ignorant. I inclose a slip giving some particulars of their disposition. Regarding this shipment, I may say that young salmon seven to eight inches in length have been seen in the rivers in which I placed the ova last year. I have the honor to be, sir, your obedient servant,
J. C. FIRTH,

President of the Auckland Acclimatization Society.

AUCKLAND ACCLIMATIZATION SOCIETY,
AUCKLAND, Nov. 17th, 1876.
✓ PROF. SPENCER F. BAIRD, Commissioner of Fish and Fisheries, Washington, D. C.:

SIR—I am directed by the Council of the Auckland Acclimatization Society to convey to you their very hearty thanks for the consignment of California salmon ova forwarded to us, under your directions, by Mr. Commissioner Stone, and which was duly received by the last mail steamer. You will be glad to hear that the consignment arrived in excellent condition, and has been hatched with an unusually small percentage of loss. The young fish are now doing well, so that we have every reason to hope that your kind and liberal action in this matter will be the means of enabling us to establish in our rivers a fish of great economic value, and thus confer a benefit of lasting value on the whole community. I inclose an extract from the *Daily Southern Cross* newspaper, published in this city, that may perhaps interest you; and again expressing my sense of the obligations under which you have laid this Society, I beg to subscribe myself yours most obediently,
T. J. CHEESEMAN, Secretary.

SAN FRANCISCO, Dec. 15th, 1876.
HON. SPENCER F. BAIRD, U. S. Commissioner of Fish and Fisheries, Washington, D. C.

DEAR SIR—By the last steamer from New Zealand I received a few lines from the Hon. J. D. Ormond, Government Agent for the Province of Napier, in which he says: "The ova per steamer Zealandia was received in splendid condition by the Hawkes Bay Acclimatization Society, and the fish are now hatching rapidly. Will you kindly report to the proper authorities at Washington the success of the experiment so far, and express on behalf of the H. B. A. Society our sincere thanks for the very liberal treatment we have received. A proper official acknowledgment shall be sent to the Hon. Spencer F. Baird so soon as we are able to report the hatching and turning out of the fish." I can only add my own thanks to those of the H. B. A. Society. I have the honor to be, yours respectfully,
ROBT. P. R. DUFF.

The following extract from the *Daily Southern Cross* of November 7th, alluded to above will be found interesting.
ARRIVAL OF LARGE CONSIGNMENT OF SALMON OVA.

It is satisfactory to learn that a large consignment of salmon ova from California has arrived by the mail steamer in excellent condition. This consignment consists of 400,

000 ova, forwarded to New Zealand by Professor Spencer F. Baird, chief of the United States Fish Commission, from their establishment at McCloud river, California, forwarded under the management of Mr. Livingstone Stone. We may mention that the colony is extremely indebted to Professor Baird for his thorough good nature and public spirit in the matter of this important consignment which has been furnished the New Zealand Societies by the United States Government free of cost, excepting the charges attending the transit from McCloud river to San Francisco. There is greater reason of indebtedness in the fact that last year through inadvertence, the consignment shipped with such characteristic generosity to the Napier Society, and so successfully managed by the Auckland Acclimatization Society, was credited to Columbia river, instead of to the United States Fish Commission, a mistake that might naturally cause some annoyance. We are therefore more anxious to render honor to whom honor is due in the matter of such magnanimous spirit in the distribution of this valuable article—salmon ova. The 60 boxes of ova now received have to all appearance arrived in very excellent condition, due perhaps in a great measure to the forethought of Mr. J. C. Firth, who has taken great interest in the matter. The Auckland Society has had the practical management of the consignment, and in anticipation directed the preparation of moveable ice houses for convenience of transshipment at Kandavu. These arrangements were made under the active and cordial superintendence of Messrs. Cross & Co., an eminent English firm in San Francisco. The New Zealand Societies are also largely indebted to Mr. R. J. Creighton for his active co-operation in the matter, and in overcoming all preliminary difficulties naturally attending the procuring the shipment of a consignment of such magnitude. To Captain Ferries, of the 'Zealandia,' and Captain Cavarly, of the 'City of New York,' and their officers, a meed of praise is due for their careful attention to the precious charge. This is more especially due, as it must be borne in mind that the transshipment of the ova from the 'Zealandia' to the 'City of New York' had to be made at Kandavu under a tropical sun. Mr. Firth had taken the precaution to ship from Mr. Gledhill's establishment a quantity of ice, which was extremely fortunate, as the ice on board the 'City of New York' had nearly run out. All parties concerned will now be glad to learn that the ova has reached here in splendid condition, and, so far as present appearances go, there is only a very small percentage of loss. Of the 150,000 ova consigned to Auckland, and which have been received by Mr. Abercrombie, the curator, 70,000 were yesterday deposited in the society's boxes at the Domain. This morning about 30,000 will be deposited by Mr. J. C. Firth in the Oratea or Swanson creek, in the boxes prepared at the expense of the society, and by which it is hoped the Waitemata and all the small streams falling into it will be peopled with the king of fishes. The balance (50,000) will tomorrow be taken under the charge of Mr. Firth to the Raparara—a perfect little salmon stream in the Patetere district, from which the Thames river, with all its tributaries will be supplied. With regard to the southern portion, fresh ice having been put on board, the consignments, consisting of 60,000 ova for Napier, 80,000 for Dr. Hector, Wellington; and 100,000 for Canterbury have gone down under charge of Mr. Bach, the Curator of the Canterbury Acclimatization Society. With this gentleman's care, and a fresh supply of ice, there is little doubt the ova will reach their several destinations in first-class order. Here the hatching process is expected to take place in less than a fortnight, and we shall watch with interest the result. The public are deeply indebted to Mr. Firth for the interest, trouble, and attention he has bestowed on the matter, and for the onerous duties he has willingly undertaken.

The following details refer to the distribution of and progress made with the California salmon eggs sent to New Zealand from the U. S. Salmon Hatchery Establishment in 1875, and will be found exceedingly interesting:—

DISTRIBUTION OF THE SALMON OVA.

To the Editor of the Herald.

SIR—Many persons having asked me to publish an account of the results of my expedition to place the California salmon ova in the rivers of the Thomas and Waikato country, on behalf of the Auckland Acclimatization Society, I forward you a copy of a letter I have addressed to a sporting friend of mine in England. I hope your readers will be good enough to excuse the somewhat familiar style of the communication, as I have not leisure to write an account perhaps more suitable for a newspaper.

I am, &c.,

J. C. FIRTH.

AUCKLAND, November 19, 1875.

"My dear C—, —Let me give you a rough sketch of an expedition I have just made to place salmon ova in some of the head-waters of four of our chief rivers in this part of New Zealand. You will perhaps be more interested when I tell you that in this colony there is a remarkable absence of plants, animals, or fish natural to the country suitable for the food of man. To remedy this deficiency in some measure, we started, some years ago, an Acclimatization Society, whose object is to introduce useful plants, animals, birds, and fishes. Our society was greatly encouraged by the success which had attended the efforts of one of our worthy citizens, Mr. Thomas Henderson, to introduce the pheasant. Thanks to him, this noble bird has covered the country, and we can give you, and all sportsmen who may come this way, almost as good shooting as you can get in your preserves at home. You would be delighted to see so many of your old favorites, which we have introduced with great success—the finches, linnets, blackbirds, yellowhammer, buntings, the unjustly abused house-sparrow, and above all, that most charming of English song birds—the sky-lark. Latterly our society has turned its attention to the introduction of trout and salmon—both brown trout and salmon trout are promising to succeed, and in a few years I hope to see the disciples of gentle old Izaak Walton having many a day's good sport. Hitherto our efforts to introduce salmon have been total failures. About a week ago, however, fortune favored us. It happened in this wise: The mail steamer Vasco de Gama arrived with 40,000 salmon ova for the Acclimatization Society at Napier. Unfortunately the supply of ice had run out, and the gentleman in charge, fearing a total loss if the ova were sent on, kindly and wisely, as it has turned out, offered us half the consignment. Late one night our curator called at my house and informed me of the state of affairs, and we immediately placed 10,000 of the ova in our fish-house to be hatched. The remaining 10,000 we could not accommodate. I pro-

posed to place them in some of the Southern rivers in this province, but as none of the Council could go, or, perhaps, knew the rivers so well as myself, I volunteered to see the work done. Not an hour was to be lost when I took it in hand. I had some ice made at once, and setting Tremain, one of my workmen, to make the necessary appliances, in a very short time I was off with my precious cargo. The railway and a river steamer put me 100 miles South in a few hours. I had telegraphed to a sporting friend to have his trap ready; and next morning we started bright and early for the mountain streams. Fortunately the weather turned bitterly cold, and by dint of constant attention and an abundant use of ice and cold water, I kept the ova in the prime and healthiest condition. Besides my sporting friend, Mr. R. Kirkwood, I had requested my manager at Matamata, Mr. Williams, and Mr. Chitty, of the Armed Constabulary, to be ready to lend a hand. This latter gentleman, besides being a true sportsman, is a most excellent officer, whom I hope to see shortly get the promotion he well merits. Besides these, I had pressed into the service O'Neill, an A.C., well up in salmon, Bob, one of my own Maoris, and Turner, a fine specimen of the half-caste. My little party were a hearty lot, and went at it *con amore*. We had two day's real hard work but very pleasant nevertheless. Up in the morning early, with the help of good horse-flesh, cushions of elastic fern to prevent vibration, ice, water, and bundles of fern to keep out the heat, we conveyed our ova over long distances and rough roads as tenderly as though we were conveying delicate children. Fortunately, the sun considerably kept well behind the clouds, while the bright moonlight of the clear cold nights served us admirably. During these two days and nights, with two meals a day, and very little time for sleep—though what we had was sound enough, as you may fancy—we got through an amount of work which pleased me greatly. Nothing could be finer than the *esprit* of the whole party. I do not know when I enjoyed anything more. The enemies we had to fear were wild ducks, shags, and eels. The apparatus I had provided to defend our little *proteges* from their attacks was very simple, and I hope may be effective. It consisted of twelve sets of boxes and covers—boxes three feet long and nine inches broad, with a ledge running round each. The covers were of two boards same length, nailed together, ridge-board fashion, with each end closed by wire netting of half-inch mesh. A keen sportsman like you will not think me tedious if I describe how we made our plants. The streams were high, and the water intensely cold. Taking off our boots and coats, rolling up trousers and shirt-sleeves, Kirkwood made a smooth bottom, and spread some sand and pebbles in the box, while I prepared the ova, which is like semi-transparent red peas. Scattering the ova among the sand and pebbles in the box, I held it on the bottom of the stream at about two feet deep, to provide against the stream falling and leaving our plant high and dry, which, of course, would have ruined the whole thing. Kirkwood had the cover ready, and placing it firmly on the box, I held it down, while he piled over it heavy boulders to keep it in position. Both now set to work to make a little breakwater of boulders and shingle up stream, to defend our little ark from the rapid current, and, scattering a further supply of ova among the shingle to give a double chance to the experiment, the operation was complete. In one stream we had a great fright. We had just got the ark into position, I holding it firmly down, while Kirkwood was piling boulders over it, when he suddenly called out, "Here's a big trout—a regular monster." I could not let go, as the whole thing would have been adrift. "Nonsense," said I; "why, I only put salmon trout into this stream a year ago, and they can't have developed into monsters already." "Look for yourself, then," he roared out, and sure enough there *was* a monster, but, instead of a trout, a black, hideous eel, four feet long, rubbing his slippery sides against Bob's naked legs, and waiting, like a *gobemouche*, for our poor little ova. "Seize him, Bob," I shouted; "grab him behind the fins." This he did in a twinkling, but the ugly reptile glided out of his hands, like a slippery eel as he was, and we saw him no more,—giving me a proof of the value of the little arks I had provided for the ova. I didn't feel easy about that eel, however, until, at night, on relating the circumstance, Chitty declared his days were numbered, for he would have him next night. I hope he got him. Some of the points we chose were charming. One took my fancy particularly. We had started before breakfast, and, after a drive and a tedious tramp on foot, we reached the stream. We had completed our preparations, and in two minutes more our *plant* would have been made, when a loud voice, in broad Scotch, hailed me with, "Hey, mon, ye manna pit the sawmon in there; that place is foo' o' eels; the Maori chiefs catch bushels o' em." Looking up I said, "My good man, what do you know about salmon?" "Eh, mon; I cam frae Blair Athol, an' I ken a' aboot sawmon; dinna pit 'em there. I can show ye a muckle better spot. Come wi' me and I'll show it the noo." The old man was so earnest that, though I was anxious to put them under water without delay—for the sun on this last morning was coming out hot, and our ice had just run out—that I at once put up my ova and told the old man to lead the way to a better place. Slowly we toiled up the hill, carrying our traps as best we could, and, mounting our trap, our conductor taking a short-cut. When the trap could go no farther we alighted, and trudged after him in the broiling sun. At length I began to feel hungry and angry, for I feared the ova would hatch before I could get them under water. "Bide a' wee, bide a' wee, mon, yonner it is." There was nothing for it but to keep moving. At last he led us down to the stream—and a very charming spot it was. "Ah, now," said I, "I shall forgive you," for I felt the old man knew the ground better than I. We quickly and joyfully made our plant, and, sitting down on a huge moss-grown rock in mid-stream, round which the clear cold water rippled and dashed with sweet and cheery music, I could not help saying to my companion, "What rare sport some of those who come after us will have in this glorious spot, if our little friends do their duty and grow into big fishes." I am no sportsman, but had I been an artist I would have sketched the scene with myself and Bob sitting on the grey old stone with our legs dangling in the clear cold water as it rippled by. Gathering up our traps we turned joyfully homewards, for we noticed that the ova were already hatching, coming out of their shell as we put them in the water. The King Maoris, and, indeed, everybody, were delighted with our work—the former greeting us with "Kapai te hamona; all same as the tin"—meaning, that salmon was very good, being like salmon preserved in tins, which they appreciate highly. I ought

to say that at every stream where I made a plant, I posted up a notice in Maori and English requesting everyone not to disturb the ova, so that in a few years there might be abundance of food for both Maori and European. And now our work was done. We had been enabled to place this salmon ova in ten streams falling into the rivers Thames, Piako, Waikato, and Waipa, in the hope that, by God's blessing, this "king of fishes" may, in coming time, increase and multiply, so that abundance of food may be provided for poor as well as rich, for—

All things living He doth feed,
His full hand supplies their need.

Pardon this long, but I hope not tiresome story, and believe me—Yours truly,
"J. C. FIRTH.
"AUCKLAND, N. Z., Nov. 16, 1875."

CARP FOR OUR WATERS.—We mentioned in our last issue the fact that the steamer Leipzig was due at Baltimore having on board a consignment of carp for the fishery establishment at Druid Hill Park, Baltimore. The steamer has since arrived, and we find in the Baltimore *Sun* the following account of the fish:—

Mr. Rudolph Hessel, an eminent pisciculturist, brought to Baltimore yesterday, by the steamship Leipzig, 44 live carp, out of 200 with which he started from Europe, 156 dying on the voyage. These fish were brought to this country at the instance of Major Thomas B. Ferguson, Maryland fish commissioner, and were ordered by Spencer F. Baird U. S. fish commissioner. The importation includes several varieties of the carp family, and came from ponds bordering on the Danube, in Hungary. On shipboard they were kept in large tanks, and were frequently supplied with fresh water. The rough weather the steamer encountered and the water, it is thought, were fatal to so many of the fish. Major Ferguson had the 44 survivors, some of which are of full size, taken at once to the carp ponds prepared near Crow's Nest, Druid Hill Park. The fish resemble the mullet in appearance, and are prized as a food fish, taking rank with black bass, trout, etc. They are vegetable feeders. The United States fish commissioner has recognized the fishery at Druid Hill Park as especially adapted for hatching carp. Should they thrive, it is thought they will breed next spring. Two importations of carp, of an inferior kind, were made in 1875, twenty-two of which died on the voyage from hot weather. All but eight subsequently died, and from these several thousand have been hatched, and will be distributed to the ponds throughout the State next year. They attain a weight of twelve or fifteen pounds when full grown, and are of a rich gold color. The carp is considered valuable for stocking ponds, because of its rapid growth and increase in numbers. Much interest is manifested in the success of their propagation.

[Our Washington correspondent referred to this matter in his letter last week.—E.E.]

SHAD IN LAKE CHAMPLAIN.—A correspondent, whose letter has been mislaid, sometime since asked us the question whether shad had ever been placed in Lake Champlain. Mr. Seth Green informs us that shad had been placed in that Lake, but gives us no dates.

—Thirty thousand young salmon trout from Lake Michigan were placed in the Alabama river at Montgomery a few days ago. The fish were about an inch long, and a few weeks old and quite lively.

Natural History.

ADDRESS OF A. R. WALLACE BEFORE THE BRITISH ASSOCIATION

RISE AND PROGRESS OF MODERN VIEWS AS TO THE ANTIQUITY AND ORIGIN OF MAN.

Continued.

THE next example is that of the ancient mounds and earthworks of the North American continent, the bearing of which is even more significant. Over the greater part of the extensive Mississippi Valley four well marked classes of these earthworks occur. Some are camps or works of defense, situated on bluffs, promontories, or isolated hills; others are vast inclosures in the plains and lowlands, often of geometric forms, and having attached to them roadways or avenues often miles in length; a third are mounds corresponding to our tumuli, often seventy to ninety feet high, and some of these covering acres of ground; while a fourth group consist of representations of various animals modelled in relief on a gigantic scale, and occurring chiefly in an area somewhat to the northwest of the other classes, in the plains of Wisconsin.

The first class—the camps or fortified inclosures—resemble in general features the ancient camps of our own land, but far surpass them in extent. Fort Hill, in Ohio, is surrounded by a wall and a ditch a mile and a half in length, part of the way cut through solid rock. Artificial reservoirs for water were made within it, while at one extremity on a more elevated point a keep is constructed with its separate defenses and water-reservoirs. Another, called Clark's Work, in the Scioto Valley, which seems to have been a fortification, incloses an area of 127 acres, the embankments measuring three miles in length, and containing not less than three million cubic feet of earth. This area incloses numerous sacrificial mounds and symmetrical earthworks, in which many interesting relics and works of art have been found.

The second class—the sacred inclosures—may be compared for extent and arrangement with Avebury or Carnak, but are in some respects even more remarkable. One of these at Newark, Ohio, covers an area of several miles with its connected groups or circles, octagons, squares, ellipses, and avenues, on a grand scale, and formed by embankments from twenty to thirty feet in height. Other

similar works occur in different parts of Ohio, and by accurate survey it is found not only that the circles are true, though some of them are one-third of a mile in diameter, but that other figures are truly square, each side being over 1,000 feet long; and what is still more important, the dimensions of some of these geometrical figures in different parts of the country and seventy miles apart are identical. Now this proves the use, by the builders of these works, of some standard measures of length, while the accuracy of the squares, circles, and in a less degree of the octagonal figures, shows a considerable knowledge of rudimentary geometry, and some means of measuring angles. The difficulty of drawing such figures on a large scale is much greater than anyone would imagine who had not tried it, and the accuracy of these is far beyond what is necessary to satisfy the eye. We must therefore impute to these people the wish to make these figures as accurate as possible, and this wish is a greater proof of habitual skill and intellectual advancement than even the ability to draw such figures. If, then, we take into account this ability and this love of geometrical truth, and further consider the dense population and civil organization, implied by the construction of such extensive systematic works, we must allow that these people had reached the earlier stages of a civilization of which no traces existed among the savage tribes who alone occupied the country when first visited by Europeans.

The animal mounds are of comparatively less importance for our present purpose, as they imply a somewhat lower grade of advancement; but the sepulchral and sacrificial mounds exist in vast numbers, and their partial exploration has yielded a quantity of articles and works of art which throw some further light on the peculiarities of this mysterious people. Most of these mounds contain a large concave hearth or basis of burnt clay, of perfectly symmetrical form, on which are found deposited more or less abundant relics, all bearing traces of the action of fire. We are, therefore, only acquainted with such articles as are practically fire-proof. These consist of bone and copper implements and ornaments, discs and tubes—pearl-shell, and silver beads, more or less injured by the fire—ornaments cut in mica, ornamented pottery, and numbers of elaborate carvings in stone, mostly forming pipes for smoking. The metallic articles are all formed by hammering, but the execution is very good; plates of mica are found cut into scrolls and circles; the pottery, of which very few remains have been found, is far superior to that of any of the Indian tribes, since Dr. Wilson is of opinion that they must have been formed on a wheel, as they are often of uniform thickness throughout (sometimes not more than one-sixth of an inch) polished and ornamented with scrolls and figures of birds and flowers in delicate relief. But the most instructive objects are the sculptured stone pipe, representing not only various easily recognizable animals, but also human heads, so well executed that they appear to be portraits. Among the animals not only are such native forms as the panther, bear, otter, wolf, beaver, raccoon, heron, crow, turtle, frog, rattlesnake, and many others, well represented, but also the manatee, which perhaps then ascended the Mississippi as it now does the Amazon, and the toucan, which hardly would have been obtained nearer than Mexico. The sculptured heads are especially remarkable, because they present to us the features of an intellectual and civilized people. The nose in some is perfectly straight, and neither prominent nor dilated; the mouth is small and the lips thin; the chin and upper lip are short, contrasting with the ponderous jaw of the modern Indian, while the cheek bones present no marked prominence. Other examples have the nose somewhat projecting at the apex, in a manner quite unlike the features of any American indigenes, and although there are some which show a much coarser face, it is very difficult to see in any of them that close resemblance to the Indian type which these sculptures are said to exhibit. The few authentic crania from the mounds present corresponding features, being far more symmetrical and better developed in the frontal region than those of any American tribes, although somewhat resembling them in the occipital outline; while one was described by its discoverer (Mr. W. Marshall Anderson) as "a beautiful skull, worthy of a Greek."

The antiquity of this remarkable race may perhaps not be very great as compared with the pre-historic man of Europe, although the opinions of some writers on the subject seem affected by that "parsimony of time" on which the late Sir Charles Lyell so often dilated. The mounds are all overgrown with dense forest, and one of the large trees was estimated to be eight hundred years old, while other observers consider the forest growth to indicate an age of at least one thousand years. But it is well known that it requires several generations of trees to pass away before the growth on a deserted clearing comes to correspond with that of the surrounding virgin forest, while this forest, once established, may go on growing for an unknown number of thousands of years. The 800 or 1,000 years estimated from the growth of existing vegetation is a minimum which has no bearing whatever on the actual age of these mounds, and we might almost as well attempt to determine the time of the glacial epoch from the age of the pines or oaks which now grow on the moraines.

The important thing for us, however, is, that when North America was first settled by Europeans, the Indian tribes inhabiting it had no knowledge or tradition of any preceding race of higher civilization than themselves. Yet we find that such a race existed; that they must have been populous, and have lived under some established government; while there are signs that they practiced agriculture

largely, as indeed they must have done to have supported a population capable of executing such gigantic works in such vast profusion—for it is stated that the mounds and earthworks of various kinds in the State of Ohio alone amount to between eleven and twelve thousand. In their habits, customs, religion and arts they differed strikingly from all the Indian tribes; while their love of art and of geometric forms, and their capacity for executing the latter upon so gigantic a scale render it probable that they were really a civilized people, although the form their civilization took may have been very different from that of later people subject to very different influences, and the inheritors of a longer series of ancestral civilizations. We have here, at all events, a striking example of the transition over a large extent of country from comparative civilization to comparative barbarism, the former having left no tradition and hardly any trace of influence on the latter.

As Mr. Mott remarks: "Nothing can be more striking than the fact that Easter Island and North America both give the same testimony as to the origin of the savage life found in them, although in all circumstances and surroundings the two cases are so different. If no stone monuments had been constructed in Easter Island, or mounds containing a few relics saved from fire, in the United States we might never have suspected the existence of these ancient peoples. He argues, therefore, that it is very easy for the records of an ancient nation's life entirely to perish or to be hidden from observation. Even the arts of Nineveh and Babylon were unknown only a generation ago, and we have only just discovered the facts about the mound builders of North America.

But other parts of the American continent exhibit parallel phenomena. Recent investigations show that in Mexico, Central America and Peru, the existing race of Indians has been preceded by a distinct and more civilized race. This is proved by the sculptures of the ruined cities of Central America, by the more ancient terra-cottas and paintings of Mexico, and by the oldest portrait pottery of Peru—all alike show markedly non-Indian features, while they often closely resemble modern European types. Ancient crania, too, have been found in all these countries, presenting very different characters from those of any of the modern indigenous races of America.

[To be continued.]

THE LAKE MAGOG MONSTER.

WEST HOBOKEN, Dec. 28th.

EDITOR FOREST AND STREAM:—

Although not a seafaring man, dear Editor, yet I have hunted a great deal, and been fortunate enough in my travels to come across a similar monster, and cheerfully answer your appeal to throw some light on the subject, and herewith relate my experience and successful battle with the unknown monster of the deep:

In the fall of 1870 I was in the lumber business in Pike Co., Pa., in the vicinity of Promised Land, about nine miles west of Blooming Grove Park. There is quite a lake here noted for its fine pickerel; which run from two to six pounds in weight. It was a dark, foggy day when our engineer and myself set out for a mess of pickerel. We had trolled with some success, and were nearing the middle of the lake, I standing in the bow intently watching the motion of the spoon; a light fog had settled on the water and made it hard to distinguish objects at a distance. Suddenly the exclamation "Great heavens! see that snake," whispered by the engineer, startled me. And there truly, from the left shore came a monster snake, so distinct that no doubt was possible.

Dear Editor, the beast looked awful. Imagine a snake, seemingly 30 or 40 feet long, the body the size of a barrel, coming at you when you think that you know every beast, rock and rattlesnake in the country.

I was thunderstruck. I rubbed my eyes, and took another sharp look. "By heavens! it's a snake!" The motion of the boat had stopped the paddle, and we gazed in awe. Apparently the monster had not noticed us and was crossing our bow about forty yards away. I counted seven distinct waves of his body, appearing porpoise-like above the water.

Many a man, dear Editor, would have fled in terror. The sight was actually enough to shake the stoutest nerve. I reached for my gun, both barrels were loaded with buckshot, and I felt easier. Right ahead laid a log in the water, and the snake was heading for it. A moment more, and when the large, horse-like head, about three feet in length, appeared above the log, my finger touched the trigger. Anxiously I peered through the smoke and fog, ready with the second barrel at close quarters, expecting to see a head like an alligator's, with flaming eyes as big as soup plates, and fangs like canthooks. But, thank God! no such sight appeared. The smoke cleared. We heard a shrill whistle. A lot of heads bobbed up; the monster went in seven pieces, and seven badly scared otters were diving for dear life from

WHIPPOORWHILL.

P. S. Try five drachms of powder and a corresponding number of buckshot on your Lake Magog monster, if hooks won't hold him, Mr. Hubbard, and if you don't blow him in sundry seven pieces, my name be Davy.

FAUNA OF THE ARCTIC REGIONS.—The results of the British Arctic Expedition show that, as to human life in these desolate lands, no traces of Esquimaux could be found north of lat. 81 deg. 52 min., where these people appeared to have crossed the water—here only about fifteen miles wide—into Greenland. The northern limits of the haunts

of wild animals was evidently almost reached. At the winter quarters of the Alert, six musk oxen were shot, seven hares, three foxes, one seal, and eighty-eight birds. The naturalists of the expedition think that birds do not migrate beyond Cape Joseph Henry, which is on the American coast of the Frozen Polar sea, in lat. 82 deg. 52 min., north. The ermine and numerous owls were met with in Greenland, near where the Discovery wintered.

For Forest and Stream.

INTRODUCTION OF A WESTERN RODENT INTO NEW JERSEY.

THE *Spermophilus Franklini* of Richardson, known in the Northwestern States as the gray gopher, has become a permanent resident in Little Egg Harbor Township, Burlington county, on the sea coast of New Jersey. This rodent's proper habitat is northern Illinois, Wisconsin, Iowa, and to the Saskatchewan. Including tail it is less than fifteen inches long; the body being about nine inches in length. Upper parts of body light yellowish-brown; head and neck gray. Under parts of body, whitish. Appearance, squirrel-like, with small and not prominent ears, and well-developed cheek-pouches. To persons unacquainted with rodents in general, this *spermophile* might be mistaken for a gray squirrel, though the tail would seem insignificant when compared with that of the latter animal. Of the habits of this animal when in its true habitat I can say nothing; but I am aware that some of the members of the same genus are so destructive to western farmers that a sum of money is paid to encourage their destruction.

During September, 1872, while harvesting a cranberry crop, at my plantation in Manahawken, New Jersey, a friend presented me with two rodents which were new to me. They had been trapped on a farm two miles south of Tuckerton, Little Egg Harbor Township. The owner of the farm had not heard of the existence of the gopher upon his premises, and though they still abound there he does not believe to this day that they exist in his vicinity. The habit of observation frequently needs cultivation. About this time Mr. Samuel Jillson, the well-known taxidermist of Hudson, Mass., purchased a shore-farm and moved into the locality inhabited by the gophers. He trapped several pairs, in their holes on his farm, and sent me two stuffed specimens. The first pair that came into my possession I contributed to the Academy of Natural Sciences of Philadelphia, and they were kept alive for several weeks in the building of the society, and were then stuffed for the museum. They commenced to hibernate during the last of September, remaining dormant for a few days at a time, then venturing from their nests in search of food. These interruptions to sleep grew less frequent, and by the time cold weather set in had almost ceased.

Mr. Samuel Jillson informs me that this rodent destroys his young turkeys and chickens, besides eating his corn, &c. I have searched out the history of the introduction of this animal after much inquiry.

About the year 1868 Mr. Sylvester Mathis, of Mathistown, (a hamlet near Tuckerton, N. J.) returned from a visit to the west and brought a pair of gophers, which soon after his arrival gnawed out of their cage and escaped to the fields where they propagated their species until the animal now ranges over, probably, two square miles of territory. It burrows in the open field—not in the woods. Years hence, when this little pest shall have extended his field of occupation, and shall have entered neighboring States, this simple record of its early history may prove of interest to our descendants.

N. H. BISHOP.

Lake George, Warren county, N. Y., Dec., 1876.

MICHIGAN NOTES.

ANN ARBOR, Mich., Dec. 11th, 1876.

EDITOR FOREST AND STREAM:—

In your issue of Nov. 30th, your correspondent, Thomas H. Howell, of Sreator, Ill., tells us of the capture of a specimen of the short-eared owl (*Brachyotus palustris*), which he says is a bird of considerable rarity in the United States. Now I beg to differ with him in regard to this matter. I have been engaged in the work of collecting ornithological specimens for the past seven years and have always found it to be the most common of all our owls in this vicinity, nesting about May 20th, laying four or five dull white eggs, which measure about 1.50 inch in length by 1.25 inch in breadth. In one instance I found the nest of this bird built on the ground in a small opening in a tamarack swamp; it was composed of a few sticks, feathers, and grass, and contained five eggs of the above description. Whether this was a departure from the general rule, I cannot say, but the other nests of this bird I have always found built in trees, generally using the abandoned nest of the common crow (*Corvus Americanus*). I have found this bird to be of a very sociable disposition. For instance, last Christmas day (1875) I procured seven of these individuals without moving more than ten rods, but enough of *Brachyotus* for this time, and I will finish with a few general items. Snowy owls (*Nyctea nivea*) are quite common here, and have been all the fall. Gunners report them common about the Monroe ducking marshes and Lake St. Clair flats. The weather has come on very cold and had a careful observer noted the action of the winter birds he would have been forewarned of its approach. For the past two weeks the woodpeckers and jays have been working more diligently than before, secreting acorns, kernels of corn, beetles, &c. This might have been noticed especially in the jays not trooping about the country in bands scolding and quarreling about trifles, but each working silently and alone with a suspicious air as if fearful that some of his comrades were watching him. The red-poll linnet and snow bunting have not as yet made their appearance, but at this date of writing we are having a heavy fall of snow and I shall expect them in a short time.

ADOLPHE B. COVERT.

WHAT IS IT?—"Huntington," a Bridgeport correspondent, sends the following description of a bird which he wishes us to determine. If he will tell us where it is to be seen, we will try to arrange to examine it ourselves, and will let him know what it is. We cannot tell from his description. Can it be a coot, *Fulica*?

Mr. John Bache, of Stratford, Connecticut, has shown me a mounted specimen of a water bird which he shot this fall, which has puzzled all the experts in ornithology

hereabouts; stands one foot high; has slightly web feet; has head and beak similar to a young pigeon; has long black legs similar to yellow leg snipe, breast mottled white and blueish; brown back, nearly black, shading steel brown.

ENGLISH SPARROWS IN COLD CLIMATES.—A correspondent, "P," writes from Nashua, New Hampshire, saying:—

"Your correspondent, 'Bob,' writing from Minneapolis, Minnesota, is curious to know how the English house sparrow will stand the climate in that locality. Perfectly well, I think, as they are to be found in great numbers in Montreal, where they appear to thrive well, notwithstanding the severity of the climate, the thermometer frequently falling 30 degrees below zero."

[We think the climate of Minnesota scarcely more trying to these birds than the climate of New York, where they are very numerous.—Ed.]

Woodland, Farm and Garden.

PRESERVATION OF CUT FLOWERS.

THE question is so often asked, "How shall I keep my cut flowers fresh," that the best method of doing so ought to be known by all who are fond of floral decorations. Of course to those who possess large green-houses from which to cut daily, this is not so much of an object. Still, even these may require to send or take flowers some distance, and, unless they are properly packed they will, at the end of the journey, prove worthless. When possible, flowers should always be cut from plants that are well hardened off, avoiding as much as possible those grown in stove heat. In Ferns well matured, fronds only should be cut, as young fronds are certain to shrivel up in a few hours after being used, and consequently spoil the effect of any decoration in which they may be employed. In cutting them a sharp knife should always be used in preference to scissors, which crush and close up the minute tubes or veins through which the moisture is drawn up, while, if cut with a knife, they remain open. If required to be kept for only a day or two, the flowers should be cut early in the morning, each variety tied into bunches by itself, and then placed in earthenware jars or wide glasses, filled with cold water, which should be put in some dark cool place till required. A cool, dark cupboard in a cellar, is an excellent place to keep them, sprinkling the shelves and sides first, and keeping the whole place as moist as possible. Many flowers, such as Rosebuds, Gardenias, Eucharis, etc., keep better if cut and put in water, or laid on damp moss, than if left growing on the plant. Others, like Heliotrope, Tuberoses, etc., spoil much more rapidly if wet overhead, though the greater variety of flowers used are all the better of a good sprinkling before being placed away. It is an excellent plan with the many of the finer Ferns, such as *A. Adiantum* or Maiden's Hair, to leave them in water for an hour or so before using them; they thus get thoroughly saturated, and will keep a whole day without wilting. When loose flowers are arranged in vases or dishes, it will be found a good plan to lift them out and place them in a basin of cold water in a cool, close place; then, in the morning, cut a short piece off the end of each, in a slanting direction, to keep the ends of the tubes open, arranging them again in fresh, cold water. Vases of flowers can be kept fresh for a week at a time if they are thus treated. Bouquets and baskets of flowers, such as come from the florists, if well sprinkled every evening and placed in a cool, damp closet, as before described, will keep fresh a much longer time than if left in a warm airy room over night.

CANADIAN APPLES IN ENGLAND.—A lot of 4,000 barrels of Canadian apples is reported to have been recently sold in the Liverpool market at prices ranging from 14s. to 16s. sterling per barrel. The apples were a choice lot, especial care having been devoted to their packing. The fruit arrived in splendid condition, and the English agent paid the skipper a compliment for his great success, as of several hundred lots received, this one was the best. For such a superior lot of apples the prices received were certainly very low—barely remunerative, we should say. The *Ottawa Times*, which furnishes the information, states that the freight from Montreal to Liverpool is something like six shillings sterling per barrel, other charges would add another two shillings. This would give the shipper, at the higher price, only eight shillings sterling per barrel. There were large shipments of this fruit from the Upper Provinces to England last winter. The result was almost ruinous to those engaged in the trade; and from the prices just reported it would seem that the prospects were not much better this season. Notwithstanding appearances, the *Ottawa Times* is still of opinion that if due care was taken in the selection of the fruit and in the packing, a profitable market for Canadian fruit might be secured in Great Britain. "Baldwins" and "Greenings," our Ottawa contemporary thinks, are the best kind for shipment, as they stand rough handling, and generally keep well.

PLANTS FOR HOME DECORATIONS.

EDITOR FOREST AND STREAM:—

Your article on plants for home decorations gave me great pleasure, and among the numerous plants suitable, I know of none that gives such universal satisfaction as the common Ivy. In England, where it is seen on every wall and old ruin, and where the necessity for such strong fires in winter does not exist, it is not so much used; but, in this country, where it does little good out of doors, it is of great service, and being strong and hardy it will bear

neglect, though, if well cared for, it will amply repay the attention. Ensnored in a pleasant nook by the window, it will show a wonderful vitality, and enhance the beauty of the room tenfold. The leaves may easily be cleansed from dust, etc., with a wet sponge, and the plant itself kept cool and moist, will thrive to suit the most eager expectations of our home Botanists. REX.

HOW TO GET RID OF TREE STUMPS.—General Colquitt, of Georgia, in a recent address, gives the following two ways of doing them: "To remove stumps from a field, all that is necessary is to have one or more sheet-iron chimneys, some four or five feet high. Set fire to the stump and place the chimney over it, so as to give the requisite draught at the bottom. It will draw like a stove. The stump will soon be consumed. With several such chimneys, of different sizes, the removal of stumps may be accomplished at merely nominal labor and expense.

"In the autumn bore a hole an inch or two in diameter, according to the girth of the stump, virtually in the center of the latter, and about eighteen inches deep. Put into it from one to two ounces of saltpetre; fill the hole with water and plug up close. In the ensuing spring, take out the plug, and pour in about one or two gills of kerosene oil and ignite it. The stump will smoulder away, without blazing, to the very extremity of the roots, leaving nothing but ashes."

COMPOST HEAPS.—It is now a proper time to look to making compost heaps; and from the various inquiries as to how is the best mode of making these heaps valuable, we hope farmers will give their views and plans upon so important a subject. One writer says for making leaf mould, that leaves "laid in small heaps will decompose sufficiently in a few months to mix with good soil as compost for plants. To hasten decomposition, turn the leaves over occasionally, and mix with a small quantity of loam at each turning. At the end of twelve months leaves are sufficiently decomposed for potting purposes; but they are not thoroughly so until during the second year. Leaf mould is too open and becomes finally too close and saturated to be employed alone."

Another says a "good compost for common house plants can be made up of one part clean sand, free from salt; one part mould from thoroughly decayed leaves; one part cow manure, well rotted and pulverized; two parts rich garden soil, or better, well decayed turf mold. About one-fifth of the pot may be filled with materials for drainage, composed of oyster shells, charcoal, or broken bits of crockery. A small quantity of moss placed over these prevents the earthy washing through."

CRASSULA LACTEA A GOOD PLANT FOR WINTER DECORATION.—This is a plant which is not so generally grown in gardens as one could desire, seeing that it flowers in the greatest profusion, even in mid-winter in a cool greenhouse or window, for the ornamentation of both of which it has few equals. Small plants of it are, as a matter of course, comparatively ineffective, but, after they have attained size, so as to produce from sixty to eighty white star-like flowers on a plant, it becomes an object both attractive and striking. We have plants of it here three years from the cutting stage in eight-inch pots, that are each producing the number of blooms just mentioned, and which we found useful for the decoration of the conservatory, in which they are much admired. The culture of this succulent is so easy that nobody need experience any difficulty in the matter. It is readily propagated, and grows freely in sandy-loam, in which there is an admixture of broken soft brick and lime refuse—materials more suitable than crocks for this class of plants. The pots should be well drained, and, in order to secure thorough maturity, Crassulas are benefited by being exposed for a time after they have made their growth under glass. Water should be administered sparingly when they are in bloom, but when in active growth they require a liberal supply. A good companion plant to *C. lactea* is *C. quadrifida*, a pretty pink-flowered kind.—*Arthur Coombes, in the Garden, London.*

MANURING ORCHARDS IN THE FALL.—Last week we gave several considerations in favor of manuring orchards in Autumn, but left the subject unfinished. There are other advantages in addition to that of applying fertilizers to feed the trees and plants, to be gained from fall manuring. One that we wish to specially consider in this article, is that of *mulching*.

We mulch in the summer to retain the moisture in the soil, and to prevent the burning effects of the sun's severest rays; but why should we mulch in winter?

1. For the same purpose that we mulch in summer, to retain the moisture in the soil. It is an unquestionable fact that the roots of trees often receive injury from drouth in winter. We doubt whether there was ever a summer's drouth that destroyed so many long-established trees and plants as did the winter's drouth of 1874-5. True, the immediate cause of the death of the trees was frost, but the prime cause was drouth. We come to this conclusion because, while we have had much colder winters when the frost penetrated to a greater depth, we do not remember another so dry a winter, nor one in which so many hardy, full-grown trees were killed.

A few inches of partly rotted manure spread over the roots in Autumn would do much toward preventing the moisture from evaporating. The cold wintry winds will dry out the soil as certainly, if not as rapidly as the warm winds of summer, and a mulch would be a beneficial protector. Trees planted but one, or a few years, would be especially benefited by a mulch covering the roots, from the trunk outward.

2. We would mulch to prevent the escape of heat, as well as moisture, from the soil. If an animal is ever frozen, it is because of the escape of heat from its body. The human body we cover with warm woolen clothing in winter to prevent the too free escape of heat. Nature clothes the brute with hair, fur or feathers, which grow longer and thicker in winter than in summer, thus securing his comfort. When we see how much nature and man have done to prevent the too great reduction of the animal temperature, may we not take the hint and do something to prevent the escape of heat from the soil in which is embedded the roots of trees and plants?—*Rural Home.*

THE CATALPA TREE.—Whether or not this handsome-flowering native is entitled to the many eulogies of late bestowed upon it because of the supposed value of its timber, it has one advantage over some other species now propagated for this purpose, and that is as an ornamental specimen for the lawn. Among the various species of trees at present undergoing test on the great western plains, we may notice

such objectionable kinds as the *Ailanthus* or "Tree of Heaven," which is so offensive to most persons that its cultivation, even for useful purposes, is open to severe objection.

Even the *Catalpa* is not entirely free from fault, the crooked habit of growth being very much against it, both for ornament and timber. By a systematic training, however, this objection may to a great extent be overcome, as we have seen specimens of this species, as well as of even more intractable trees such as the Weeping Beech, entirely changed into the most desirable round-headed form. A limb tied into shape here, another removed there, or a third cut back somewhat, will assuredly bring the most unsightly head into entire subjection. The main point, however, is to start right, by cutting the young tree down to within a few inches of the ground after being planted out, say two years. It will then exert all its energies to form a straight stem of several feet in length, which is very desirable in its cultivation for any purpose. It is a native of the South, but, being quite hardy at the North, is frequently found in cultivation in the Middle States, and in some localities here has become quite naturalized.

The showy white flowers are prettily tinged with violet and spotted in the throat; they are produced in large open panicles, and are followed by pods twelve inches in length. The seeds are flat and furnished with fringed wings. It is not difficult to propagate, provided the seeds are not covered too deeply; the slightest sprinkling of soil over them will be sufficient to induce germination. During summer the young and tender plants must be sheltered from the sun, and in winter from the frost. The latter not unfrequently kills the immature seedlings to the ground if not covered with pine brush or some other loose material. It can also be increased by means of root cuttings.—*Ex.*

—The first day of the second century of the American Republic will be ever memorable for its snow storm, which for extent, severity, and accumulation of gelid deposits, is almost without parallel. It is twenty years since such a fall of snow visited this city.

—To free your stove of clinker, push down a few oyster shells between the burning coals and the body of the stove

—The fear of an invasion of potato bugs from America has caused such a scare in England that the custom house officials at the ports of that country have been supplied with photographs of the insect. Aided by these, they are keeping a sharp look-out for the pests on incoming vessels.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

G. W. F., New Galilee.—Did you receive pedigree of the dog Staunch sent you some time ago? Ans. Yes, and certificate will be sent you in a few days.

J. H., Jr., New York.—Can you inform me if partridges are known to be treed by dogs in the region of thick and unfrequented woods? Ans. Yes, they are frequently shot in this manner.

J. L. E., Memphis, Tenn.—What is good to give my dog? He has a slight attack of distemper. Ans. Have mailed to you a remedy for distemper which rarely fails to cure.

C. H. N., Cranston, R. I.—Will you please give me the name of the maker of the turkey call, as described by Mr. Vanderburgh in your paper of Dec. 21st, page 35? Ans. Dr. G. A. Stockwell, Port Huron, Michigan.

C. B. Y., Indianapolis, Ind.—Would like address of one or two parties of whom I could get all the different egg preserving and bird skinning instruments. Ans. J. Wallace, 19 North William street, New York, and A. M. Decker, 113 Third street, Chicago.

J. T. B., Stamford, Ky.—Please give me the address of Professor Coons, keeper of "Egmont Lighthouse" on southwest coast of Florida. I desire to obtain valuable information touching his immediate vicinity. Ans. Prof. Eugene Coons, Egmont Key, Hillsboro county, Florida.

J. W. R., Philadelphia.—Please be kind enough to reply through your columns where I can get Everhart's poem on the Fox Hunt. Ans. Can some of our correspondents answer this? Col. Skinner don't know, and what he don't know about matters pertaining to fox hunting we won't pretend to know.

W., Waterbury, Conn.—Can you inform me of whom I can procure yearling trout? I wish to place some in a pond in each spring, and procure them from some party nearest to this locality. Ans. All the Fish Culturists have fish and spawn for sale. Apply to Stone & Hooper, Charlestown, N. H., who are reliable and near.

N. F., St. Louis.—Please inform me where soft shell crabs are caught this time of year, and the cheapest place to purchase them? Ans. The only soft crabs in market at this time of the year are the rock crabs that shed their shells during Dec. and Jan. They are not so large as the common blue crabs that shed their shells during June, July, August and September. The soft shell rock crabs can be bought at \$1 per doz. Blackford, Fulton Market, can supply you.

A. B. D., Bronson, Florida.—I have made the acquaintance of a gentleman here owning some very fine hounds, one of which is affected badly with the mange, and thus far he has been unable to effect a cure, and having seen your notices in regard to the disease many times, think you might be able to furnish a copy of your paper containing instructions for cure. Ans. In an answer to T. E. L. you will find an excellent remedy for mange.

W. H. S., Bangor, Me.—A parrot, of fine breed, about two years ago, to tear out its feathers. The bird, as far as I can see, is perfectly healthy and clean. It tears out all the feathers it can reach on its back and breast. Can you suggest a remedy or assign any cause for the habit? Ans. It is probably owing to the presence of some parasite on the feathers causing an irritation. Procure some of Steadman's insect powder, advertised by Holberton & Beemer, and dust under the feathers.

L. H., Jr., Philadelphia.—Will you please inform me whether the quail shooting is best in Virginia or North Carolina, and if the latter, what particular place can you recommend; also how much longer does the season last? Ans. The general close season for quail commences in Virginia on January 1st; in North Carolina April 1st. Our reports do not indicate a very great abundance of birds. Probably Weldon, which is easily reached from Norfolk, would be a good place for headquarters; or Greensboro.

W. H. S., Philadelphia.—1. Is the No. 6 shot that the English gun makers use in testing their guns at a 30-inch circle, the same size as Tatham Bro's. American standard shot of the same number, and if not, which of Tatham's comes the nearest it? 2. What time does spring duck shooting commence near Philadelphia, and what is the best size shot to use? 3. Is Dupont's No. 1 duck shooting powder too coarse to use in a 12-gauge breech loading gun, and if so what is the best size? Is 4 drachms too much? Ans. 1. English No. 6 shot has 270 pellets to the ounce; Tatham's 290. 2. Much depends upon the state of the weather, but generally the duck make their appearance in the Delaware about the first of March. No. 3 and 4 shot is generally used. 3. Dupont's No. 1 ducking powder is a good size, and if your gun weighs 8 pounds or more, 4 drachms is not too much.

H. G., New York.—Can you tell me if there is any deer hunting now; if so, where is the best place to go, and about what would be the cost; also what is a deer hound worth? Ans. There is good deer hunting to be had in some parts of Virginia and North Carolina, also in Northwestern Pennsylvania. For the latter go to Olean, Catteraugus county, this State, and there inquire for Charley Garr, who lives at the mouth of Two Miles. Isaac M. Bradley, Eldred, Sullivan county, says there is good deer hunting in his vicinity. You can buy a deer hound for \$50. Some advertised this week.

J. H. R., Woburn, Mass.—1. What is the address of J. C. Cooper whose name appears in an advertisement in FOREST AND STREAM of the 27th ult.? Would a letter addressed to Limerick reach him? 2. Are there any real English Beagles in this country? If so, of whom can they be bought, and for how much? Ans. 1. J. C. Cooper, Cooper Hill, Limerick, Ireland, where letters will reach him. 2. For Beagle hounds address Nathan Drake, corner One Hundred and Thirty-Eighth street and Third avenue, N. Y. Have written you.

G. V., Philadelphia.—I have a new nine-ounce duck sail of about 100 yards, which has been bleached, and notwithstanding the greatest care during last summer has slightly mildewed along the head and foot. How can it be removed? What is the best kind of cover for a sail? Ans. We question whether anything will remove mildew; but it can be made less unsightly by dipping the sail in lime water. Take a piece of lime weighing say two pounds, and slake it in a barrel, after which fill the barrel with soft water and dip the sail in it; or it can be applied with a broom. A painted canvas cover is as good as any.

J. B. M., New York.—I have two pointer bitches, about four months old, from good stock and seemingly in good health. But when I take them out, after walking a short distance their fore legs give from under them and they fall forward on their nose, and lie there a few seconds. Their legs from the first joint to the shoulder are rather large for dogs of their age. Please explain the cause, and suggest a remedy. Ans. It is not an unusual thing for pups to be affected as yours are. Give them moderate exercise and good strong nourishing food and they will come all right.

ENQUIRER, Albion, N. Y.—1. In loading shells for breech-loading rifle with 50 grs. powder and 275 grs. lead, what size powder of the Orange brand would be best? (distance to be shot 300 yards). 2. How would the Dittmar powder answer at such range? 3. What kind of powder and what size is used at Creedmoor in long range shooting? 4. Where can I get swedged balls, 40 cal., 275 to 300 grs. weight and what would they cost? 5. Is the Maynard rifle considered equal to the Sharps or Remington for accuracy at 500 or 600 yards? Ans. 1. F. G. Rifle. 2. Answer well if rightly loaded. 3. Mostly Hazard's F. G. See shoot ing. 4. Most any of stores in N. Y.; cost 1.20-100. 5. Yes.

J. E. S., Philadelphia.—I have a bitch pup ten weeks old, who appears to be suffering from worms. Her excrement now and then contains a white stringy substance very resembling a worm, about six inches long and as thick as a knitting needle. This and an occasional slight disturbance in her throat, and biting at the root of her tail are the only indications of any trouble. Her health and appearance are good; she eats well, and is very lively. I should like to have your opinion, and if you advise areca nut, please give directions as to its use and where to get it. Ans. Give your pup ten grains of powdered areca nut every two hours until she has taken three doses, and five hours after giving the last dose give enough castor oil to purge. If you cannot get the remedy there we can send it.

C. L. J., Philadelphia.—I desire some information about a Frank Wesson rifle I possess, viz: it being a 22 calibre, will it shoot accurately at 100 yards? 2. How must I regulate the rear sight for different distances, it having twelve marks on the sight frame, each mark measuring the sixty-fourth of an inch? It also has an extra set of sights. The front one is a bead sight, and the rear one inserted in the top of the stock at the grip, is a peep sight, held by a set screw; how are they to be adjusted? Ans. 1. It will not, with any wind blowing. 2. The only way to adjust your sights is by actual firing at a target, and raise or lower your sight till you get it right; then mark it so you will know next time where to set it for the same distance. The marks on sights are not to be depended upon. You had better commence firing with sights too low, as then you can see where your balls are striking.

G. A. E., North Brookfield, Mass.—1. Do you think it is sportsman-like to shoot ruffed grouse under the snow, as it takes some good judgment to guess their whereabouts? 2. What success did Mr. S. Newhouse have trapping beaver in the fall of '75? 3. When is Ira expected home across the pond? Ans. 1. We consider the sport legitimate, when the birds are kicked up out of the snow and shot on the wing. The practice is common in the northern and eastern States, in shooting ruffed grouse, and also in Minnesota and Manitoba, with ptarmigan. 2. Mr. Newhouse got about \$800 worth of pelts. 3. Ira Paine returned from Europe a month ago, and was in this city as recently as a fortnight ago, at which time he expected soon to return to Europe again.

J. E. S., Boston.—Being a constant reader of your paper I wish to ask you if you will please inform me of the nature of the disease with which my setter dog (six months old) is afflicted. The symptoms are: Running away from his plate of food, and trying to bite under his neck, and then standing and looking all around in a dazed sort of a way; then opening and shutting his mouth, emitting a quantity of froth, etc.; eyes looking very bad, etc. Ans. Your dog is probably afflicted with worms. Give him 60 grains of powdered areca nut, 20 grains at a dose, every two hours, and five hours after giving the last dose give him one ounce castor oil. If you cannot get the remedy, then we can send it to you by mail.

T. E. L., New York.—I have a mastiff pup three months old who has never received any other food than bread and milk. He is growing rapidly and is perfectly well, but a slight eruption appeared about six weeks ago under his front legs and upon his forehead, which causes him to scratch almost incessantly. Is he likely to outgrow it, or must I dose him with medicine? He has been several times washed with carbolic soap, which seems temporarily to allay the itching. Ans. Take 2 ozs. Baileton ointment, 1/2 oz. flower of sulphur, and spirits of turpentine enough to make an ointment of the proper consistency to be well rubbed into the parts affected. Wash the dog occasionally with carbolic soap, and when dry apply the ointment.

J. C. N., Hastings, Minnesota.—A few weeks ago, while on a hunting trip, I came across a double-barrel, breech-loading, shot gun, 10 gauge, with an extra barrel rifled (calibre say 40) and properly proportioned so as to admit of its being inserted in one of the shot barrels. Do you suppose the rifle attachment would remain a good fit? Be kind enough to mention some reliable maker in this country to whom I could refer in case I should decide to have one. Ans. We have recently heard of a shot gun made on the principle mentioned by our correspondent, but cannot recall the maker's name. It will probably soon be heard from through these columns. The National Guard of this city have been using for gallery practice, a sub calibre rifle, viz., a barrel of 22 calibre fitted inside of the regulation piece. If suitable for this service we see no reason why it should not be made available for shot guns.

BUTRIZ, Newton.—Is there any land to be had in Florida for settling on it? What are the provisions of the Homestead Law? Ans. We quote:—Under the Homestead Law, any person over twenty-one years of age, male or female, native or foreign born—married woman excepted—may take 160 acres of Government land on payment of \$14 fees, and after a residence of five years on the land they can have a clear deed of it from the Government. After six months' residence, if they choose, they may pay \$200 and get a deed without further residence. Soldiers may deduct the time spent in the service of the Union, not to exceed three years. By the pre-emption act any person over twenty-one years of age—except a married woman—may take 160 acres of Government land on paying of \$2 fees, and after residing on it six months, or for any time not exceeding three years and a half, may get a deed on payment of \$200 and making proof of settlement and improvement. The timber culture law gives 160 acres to any one planting one-fourth of it in trees and cultivating for eight years; 40 to 80 acres may be taken on like conditions. The fees are the same as for homesteading.—*Edg.*

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

* * * Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, JANUARY 4, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible. Trade supplied by American News Company.

CHARLES HALLOCK,

Editor and Business Manager.

FOREIGN GAME FOR OUR COVERS.—We have of late received a number of letters from gentlemen in various parts of this country relative to procuring English hares, pheasants, etc., to be turned out in our covers for the purpose of propagation. Regarding hares, we erroneously replied to our correspondent B. E., week before last, that they could not be procured in this country. Since then we have learned from Messrs. Chas. Reiche & Bros., the great firm of wild animal and bird importers, that they not only have a few English hares on hand, but in eight weeks time they could import any number. And the same with English pheasants, they can be brought over, although difficult birds to handle in confinement. The experiment has frequently been tried, of breeding pheasants in this country, but not with much success. Mr. Robert L. Maitland once had a large number on his island home at Newport. They should be turned out in the proportion of one cock to four or five hens, but the great trouble here is that they will not remain unmolested. Southern California would be a capital place in which to propagate this fine bird. That they can stand a great amount of cold is beyond question, as in China, their original habitat, they are found in some of the northern provinces where the winters are very severe. If any society or sportsman's association desires to try the experiment of propagating pheasants, Messrs. Reiche & Bros. very liberally authorized us to say that they will furnish them at the mere cost of importation.

At Messrs. Reiche's a few days since we saw a two-horned rhinoceros, the first ever brought to this country. Indeed, we believe, there is but one in all Europe. This beast, which is a young female, was captured by Mr. Reiche's men in Nubia, near the Abyssinian border.

We do not propose to advocate the "turning out" of the rhinoceros, or as a juvenile friend calls him, "rhinocerosis," in our covers. His proper place is in the menagerie, but his prototype is sometimes seen by the sportsman in the shape of an irate farmer armed with a pitch-fork. This variety, according to our friend Orvis, is likely to increase in Vermont since the passage of the trespass act.

ALCOHOL IN ARCTIC REGIONS.—One of the curious facts brought out since the return of the late Arctic Expedition, is that relating to the ability of the teetotallers among the crew to stand the extreme cold, and also the attacks of scurvy, as compared with those who took their regular "tot" of grog. It will be remembered that that dreadful disease, scurvy, attacked the crew, and was indeed the

primary cause of the abandonment of the expedition. Six of the men were "abstainers." Some of them were engaged in the most arduous sledge work, one of them doing as much as 110 days continuous sledging, and yet they were not attacked by scurvy, and were only weakened by hard work. One man succumbed to temptation and broke his pledge, and he was the only one of the Templars belonging to the expedition who was attacked by scurvy. The moral is, that although the habitual use of stimulants may last for a life-time without producing injurious effects, yet the moment the system is called upon to resist the attacks of disease, or to undergo some unnatural strain, it readily succumbs.

AN IMPORTANT ANNOUNCEMENT.

IT is not too much to say that the information which we publish this week from Mr. N. H. Bishop, of the introduction into New Jersey of a noxious western rodent, is one of the most important facts in Natural History that has been made for a long time. Its interest to the naturalist is great, while to the farmer the announcement has a practical value that can hardly be overestimated. The amount of worry, annoyance, and real damage that these pestiferous little beasts cause, wherever they abound, to the agriculturist has never been put into figures, but the absolute loss cannot amount to less than millions of dollars annually. The various sections of the West have each their peculiar species, and from Illinois to the Pacific are to be found thousands of spermophiles, pocket gophers, woodrats and squirrels to every square mile of territory. The South, too, has a fair sprinkling of these injurious animals by far the most important of which is the enormously abundant "salamander."

Although universally execrated by the farmer, but little, with our present knowledge, can be done to check the ravages which these animals everywhere commit. Most of them work chiefly during the hours of darkness, many never appear above ground at all and those that do are seldom seen far from their burrows. Traps, firearms, and even poison have been employed against them without success, for, as has been said, man is hopelessly at a disadvantage in dealing with these destructive pests. It will, as the West becomes more thickly settled, be a serious question as to what means shall be taken by farmers for the protection of their crops, and indeed this point has for several years occupied the attention of agriculturists in California. It is no exaggeration to say that in many sections of that State one may see in a mile's ride ten thousand ground squirrels (*Sciurus fessor*), and yet these accomplish but a small part of the damage done to the vegetation, by far the greater portion of the injury being effected by the silent, unseen, yet constantly working pocket gopher (*Thomomys*). Thus plants and vegetables are destroyed, the roots of trees gnawed off and an incalculable amount of damage done to the most important industry of the State. The Californians have tried all the ordinary means for ridding their fair land of these plagues, and in some sections have even imported cats in large numbers to see if they would not be able to meet the enemy by night and beat him on his own ground. But the snares and the poison proved, as elsewhere, of no avail; and the cats apparently thought it less trouble to catch and eat the birds than to hunt the gophers; at all events they destroyed many of the former and caused no sensible diminution in the numbers of the latter, and so this agent failed. We were recently informed by one of the largest land owners and farmers of Santa Barbara county, that it would be an economy for the people of the State to organize a corps of hunters who should devote all their time to shooting these animals; in this way alone, he said, could the squirrels be exterminated. The pocket gophers are not to be shot, as they never do more than just protrude the head above ground, and different measures would have to be taken to wage a successful war against them.

Those rodents which, throughout the country at large, accomplish the greatest amount of injury, are the spermophiles, the different species of which are all included in western parlance under the name gopher, and the Geomyidae, which are the pocket gophers to which we have so often referred. The word gopher seems to be a corruption of the French *gaufre*, a honeycomb, referring of course to the way in which the ground is pierced in every direction by the burrows of the animal.

The Geomyidae, though poorer in species than the spermophiles, are enormously abundant in individuals. They are provided with large cheek pouches, the pockets, in which they transport food, and perhaps, thought this last is not certain, the dirt from their burrows. An interesting and exhaustive account of this family, its structure and habits, is given by Dr. Coues, in Chapter XIII of Major Powell's recently published report on the Exploration of the Colorado river of the West.

Although *Spermophilus Franklini* may do considerable damage in New Jersey, the farmers of that section have abundant cause for gratitude that it was a pair of spermophiles that were turned loose on them, and not a pair of pocket gophers. The latter would do more damage than ten times their number of the former, and would be more than ten times as hard to fight. We would recommend the adoption of vigorous measures tending toward the destruction of these involuntary colonists of our sister State, for the more time that they have in which to establish themselves, the more lasting and successful will be their struggle for existence. We must be allowed to congratulate Mr. Bishop on the success and value of his observations on

this species, and it is pleasant to ourselves that FOREST AND STREAM is made the vehicle of a communication of such great practical importance.

SALT IN ITS RELATION TO MANKIND.

NATURE, in its benignant charity, has bestowed upon man no greater boon than the apparently insignificant grains of salt which are daily required to make his food palatable and wholesome, and without which the world would be infested with disease. Its mysterious and potential influence extends and permeates to the inmost recesses of our world, endowing elements of its own creation with inherent natural affinities, which in turn produce complex substances necessary for the welfare of mankind as well as wondrous in form, beauty and usefulness. Yet how little do men know of its importance, of its history, or of the many different uses to which it is put.

In the eastern part of Europe, imbedded amidst picturesque wooded slopes and gently undulating hills, rests the little town of Wieklicza, rendered famous the world over by the presence of its ancient and extensive salt mines. Underneath the town lies a "city of salt," mapped out into its streets-like passages, almost interminable in extent. On every side are seen palaces in miniature, with a mimicry of thrones rivaling the famed Aladdin's; interiors of cathedrals enshrining images of patron saints; the high pulpit and great organ with its crystal fifes; lofty columns with towering cornices, counterparts of those above ground, all formed from pure rock salt, which has been chiselled out by the hand of man or moulded by nature. They glisten and shimmer in the rays of the miner's light like ice in the setting sun, rendering the scene enchantingly beautiful, and more like the idealization of a dream than a reality. Again are seen overhanging towers, with delicate sculpturing of the crystal-like substance, while at their base lies a miniature lake, black as the Styx, whose dark placid waters have never known the presence of living thing, and whose eternal silence speaks wonders withal. This famous mine was first discovered in 1250, since which time it has been constantly operated, furnishing for many years the greater amount of salt used throughout Europe. Some idea of its mammoth proportions may be formed, when it is known that its subterranean excavations extend upwards of three miles, and have a depth of 1,800 feet, with an aggregate length of shaft of 2,250 miles. The mine itself consists of four stories, underlying each other, supported by immense pillars of salt, and communicating with each other by means of stairways cut out of the solid salt. The annual production from the mine is estimated at 60,000 tons, while the bed of which it forms but a slight portion is reckoned at 500 miles in length, 20 miles in width, and with an unknown depth.

There are also many other celebrated resources of salt in various parts of the world. Thus, at Cardiena, in Spain, there are vast rugged precipices of pure salt, which tower above the plain to the height of 500 feet, and which resembled huge icebergs, reflecting beautiful prismatic hues in the sun's rays. In Cheshire and Northwich, England, immense quantities of salt are annually exhumed from beds where it has been deposited in penticular masses instead of in the usual geological strata. Again, there are also enormous deposits of salt in Punjab, India, on both sides of the Carpathian mountains, and throughout wide districts in Austria, Armenia and Syria.

In the United States especially, nature has dispensed this essential to human comfort with a liberal hand, in order that even the poorest of its creatures may not be without it. This is evidenced by the numerous salt mines, lakes and springs, which abound in various sections of the country, and which, although not as well known as those in the old world, yet rival any for their yield and purity.

Near Austin, Nevada, there is a vast deposit of salt, known as the Humboldt mine, which stretches away in the distance like a frozen lake, without a single flaw or crack, for not less than 20 miles, and having a breadth of about 12 miles, covering in all 52,920 acres of land. The annual yield from this immense bed of salt is between two and three million bushels. In Michigan there are three immense beds or "lakes," as they are termed, the principal one being a mass of angillaceous gypsums and pyritous shales, 11 to 20 feet in thickness, with an aggregate thickness of 200 feet. Its body describes an irregular circle, underlying an area of 17,000 square miles. The yield from this source alone is almost 2,000,000 bushels per annum, obtained by means of springs and wells, both natural and artificial. Again, in Louisiana, are found irregular looking "mountains" of natural formation, which are termed "islands" in local parlance. The purest and most important of these islands, "Petit Anse," is said to have first become known in 1698; but, singularly, knowledge of its existence seems to have been forgotten until the late civil war. At that time, residents of the interior, unable otherwise to procure an adequate amount of salt, resorted thither for the purpose of boiling down the waters, which came gurgling from the base of the elevation. In this way it was discovered that the entire island was composed of salt, and for two years the whole trans-Mississippi country was supplied with salt from this source, 21,000,000 pounds having been taken from it in three months. The salt itself is unusually pure, analysis showing it to contain 99 per cent. of pure salt.

In addition to these mines and deposits there are hundreds of salt springs and lakes in Pennsylvania, Ohio, Virginia and Florida. The most remarkable salt lake in the world is the "Great Salt Lake" of Utah, lying 300 miles

beyond the Rocky mountains, and surrounded by lofty peaks of other mountains, which throw their rugged shadows athwart its deep blue bosom, it lies like a giant basin, elevated 4,200 feet above the sea level, having an area of 2,000 square miles. The water of the "great salt lake" is a nearly saturated solution, being in bulk about one-third salt. There are also the great salt springs at Syracuse, in this State, which cover many acres, and produce annually more than 300,000 tons, thus largely exceeding any other in the world. From estimates which are made from time to time, the total amount of salt contained in the waters of the earth has been computed at 95,000 million million tons, or 142,000 million million cubic feet, an amount which our comprehension can scarcely grasp, so enormous is it. Yet, were it not so, these same waters would soon become vast fields of corruption, sending disease and death throughout the length and breadth of the land.

The processes for the manufacture of salt differ according to the location and country. In some instances it is dug and mined like coal, while in others borings are made into the earth, penetrating to certain depths until saline streams are met with, which force themselves above the surface. The water is then caught in large shallow iron pans and evaporated to crystallization. Re-solution and re-crystallization are generally performed until the salt is freed from all impurities in the form of beautiful transparent crystals. In countries where fuel is scarce and high-priced—as in Germany and France—the salt-impregnated water is first subjected to a process called graduation. This is done by placing the brine in large tanks, erected at a suitable elevation, from which it is allowed to flow over a series of large files, or stacks of faggots, arranged in suitable buildings protected from the rain, but freely exposed to the winds. By this means a large surface is exposed to evaporation, until the brine is brought to a high state of concentration, when the process is continued in the usual manner by heat.

In cold countries, such as Prussia, Sweden, or Siberia, nature is made subservient to the wants of man, as water in freezing separates from itself all impurities and substances held in solution. Then the salt, evaporating as a strong briny solution, is collected and boiled down to salt. In the salt manufactories of the Mediterranean the "Solar system" is generally adopted; but this can only be done in localities where the sun's rays are very powerful. Numbers of ponds, or "brine pits," as they are termed, are dug along the shore. These pits are divided by long banks of earth two feet in height and one or two in thickness, communicating with each other by means of sluices, the bottoms of which are composed of hard beaten clay. The sea water is first conducted into a large pond, where it attains a certain degree of concentration by evaporation from the influence of the sun's rays, after which it is conducted successively through the series of smaller ponds, in each of which certain salts are deposited, until finally the water is led into compartments, where it soon begins to deposit pure salt.

From experiments which have been made it has been ascertained that man can take into his system and assimilate about one ounce of salt per diem, although the amount varies slightly in different countries, as for instance, an American is supposed to consume about fifty pounds per annum, a native of Britain twenty-two pounds, and a Frenchman only fifteen pounds. In climes where salt is scarce the natives subsist almost entirely upon meat, which contains a greater percentage of salt than vegetable matter; and even then the Indians of our own country are in the habit of placing a certain kind of stone which contains slight saline properties in the pot with the boiling meat. In olden times, in Holland, criminals of a certain class were frequently condemned to be fed on bread without salt, and their sufferings are said to have been intense, as in a short time the entire human system was taken possession of by worms, and was covered with the most loathsome sores. In this way we are led to realize the importance of salt for the well being of man, and are not surprised that it should have been held as an emblem of purity from time immemorial, or that an old Mosaic law directed it to be used in sacrifice. The Roman church to this day holds it in high esteem, and places it in the water used for blessing and other church purposes. It has also been put to many interesting mechanical uses, as in the early days of Mormonism, when the followers of Joe Smith are said to have used large transparent flakes of salt as a substitute for glass window panes; while in Caramania and Arabia rock salt is sometimes used for building houses or huts. There are many other curious uses to which salt has been put, all tending to show how little the majority of mankind know about the commonest things which surround them on every side, and upon many of which they are actually dependent for a continuance of health and strength, even down to an insignificant looking "grain of salt."

—The annual meeting of the Missouri State Sportsmen's Association will be held at Jefferson City on January 11th prox.

—The *Florida Agriculturist* says that the late cold weather was so severe that a rattlesnake four feet long was found frozen to death near Chattahoochee.

—Capt. Boyton has successfully accomplished his greatest voyage in his life-saving dress by swimming down the River Po from Castel Duovo to Ferrara, 280 miles, in ninety-six hours, without a break.

CONGRATULATIONS.—"Dom Pedro," a Pottsville, Pa., correspondent, who recently became a subscriber to *FOREST AND STREAM*, writes us a long letter which is most enthusiastic in its praise of our journal, and earnest in good wishes for its continued life and prosperity. It is not the only one of like character which we have received at the beginning of this new year. It would occupy too much of our space to print the half of them, but we cannot but appreciate the high motives that actuate our friends. We trust that they, too, may "live long and prosper," and that they and theirs may continue in the good missionary work, now progressing, of inculcating in men and women a healthy interest in out-door recreation and the study of natural objects.

AN INVITATION.—We acknowledge, with thanks, an invitation from the Cuvier Club, of Cincinnati, to be present at this, their third annual New Year's reception. But for the intervening distance, we should surely have availed of it.

We desire also to acknowledge the receipt of an invitation to the first game dinner of the Hawkeye Gun Club of Clinton, Iowa, which was given at the Revere House in that place on the 30th ulto. From the very appetizing bill of fare which accompanied the invitation we judge it to have been a true "hunters' feast," with all the accompaniments of jollity and good fellowship.

MAINE.—Our Portland correspondent writes us under date of December 23d, as follows:—

EDITOR *FOREST AND STREAM*:—

Venison has been plenty in this market this month, but the season for deer closes with the year. It is hoped that with the constantly increasing public interest in the protection of game, that the slaughter of these innocents annually committed during the deep snows of winter may be prevented. There are many sportsmen in the eastern part of the State who are alive to the importance of taking active measures in enforcing the present laws, and an association of sportsmen in Machias will do much towards this end. Deer are abundant this season, and for lack of employment many men are hunting who may be tempted to disregard laws that have not been heretofore observed. But notices of the game law have been posted throughout the State, and let the poachers beware. For several years a business of netting ducks was carried on in Washington county, with the result of some of the resorts of waterfowl being entirely deserted. This year two old offenders made extensive preparations for resuming their nefarious pursuit, by preparing a feeding bed at a secluded sheet of water in the town of Whiting, where they were obliged to carry corn a mile or more through pathless woods on their backs. This coming to the knowledge of the members of the Machias Sportsmen's Club and other parties, steps were taken to trap the trappers. But, owing perhaps to threats made by some persons of driving them off, *à la armis*, they took the alarm, and were "non comatible in swamps," although the wires were already set to receive the nets, and a large quantity of corn was left uncalled for at a farmhouse in the vicinity, the headquarters of the would-be-poachers.

The experiment of stocking some small lakes with black bass, was made in the vicinity of Machias, this year, by several gentlemen of that town, who purchased two sheets of water, apparently well adapted to the purpose, and which they intend to guard zealously, hoping thus to obtain a few year's hence good sport, both fishing and duck-shooting. May they well succeed, is the wish of

ROAMER.

Sporting Notes From Abroad.

FROM OUR OWN CORRESPONDENT.

LONDON, Dec. 18th.

Now that racing, at least on the "flat," is over until the early spring handicaps chase shall again inaugurate the season, it is in order to count up the winnings and see how much the successful owners are to the good. Not that the figures given represent all profit, for the expenses of a first-class racing stable must be enormous. Winners of large stakes are also apt to be prodigal to trainers, jockeys and all who have contributed to the victory. Nor do the amounts named include what has been won in bets, for in this country the odds given frequently determine whether a horse will start or not, and the bets are of far more consequence than the stakes. Strange to say, a French stable, that of Count de Lagrange, heads the list with the handsome sum of £17,650. Next comes Lord Dupplin, with whom rumor mentions as confederate a gentleman of your city once prominent in Pacific Mail; he wins £14,310. Lord Roseberry, a frequent visitor to your side of the pond, is third, with £13,190. Mr. A. Baltazzi, who carried off the Derby, is credited with but little more than the value of that stake; yet the "Mineral Colt" is a bonanza with which most owners would be satisfied. And so the list goes down until a modest three figures is reached. Perhaps some day we may see Mr. Sandford's name higher up—all Americans hope so, and congratulate themselves that so worthy a gentleman is representing them on the British turf.

This is the last day of the Birmingham annual dog show. Last year there was an immense amount of grumbling among the press representatives and this time it was almost as bad. The judging is done in private, not even the reporters being admitted or furnished with catalogues; the latter, indeed, being kept from the judges until their work is done. Rather in contrast is this with your Bench shows, where owners are allowed to "buzz" the judges to their hearts content and the awards are not made until everybody has gone home. As you will get a full report from the English papers, I will not go into detail. The show was a success in every respect, there being even less than

the usual amount of grumbling at the awards. The pointers were a very fine lot and it is astonishing the improvement made in these dogs since the days of the rough old Spanish breed. The champion was Mr. Whippell's Wog, who only repeated his former successes. Although Wog is of a color I am not partial to, liver and white, the award was the right one. The second in the open grip class, Mr. Bagnoll's Blair, would have been a prize for some American breeder, being ticketed at only six guineas. The setters were a very fine lot, many of the celebrities of the day being present. Mr. Llewellyn's kennel was in strong force, taking four prizes, with Phantom, Countess Bear, Remus, and Puzzle. Old Palmerston, the champion red Irish setter, as usual, headed his class.

The "Roast Beef of Old England" is likely to be transferred into the "Roast Beef of Yankeeland." American beef is in such demand here that it sells for the same price as English. In fact it is said that some of the fashionable butchers of the West End keep no other as their aristocratic customers will have it. Unquestionably some of the well selected of your beef, which has been seen at Smithfield, is quite equal to the English, but it is rather a drop from his extreme conservatism for John Bull to come down to imported beef. Suppose he was to swallow some republicanism with it, what might not happen? The high tariff men would have to take it in hand. Beef reminds me of the markets, and the markets begin to show that Christmas is at hand. Soon there will be another exodus from London for those country houses in the possession of which England has no rival in the world. For an account of one of the real old-fashioned, unpretending kind read Dickens' description of the Wardles and Mr. Pickwick's visit there. A good book for the holidays by the by, and one that will bear reading again and again. If Mr. Dickens did lie in a most unmitigated manner about our country merely to pander to a morbid taste on the part of certain of his countrymen, such humor as is found in "Pickwick" is inevitable and will be immortal. There are many less interesting things than a walk through Leadenhall or Covent Garden markets at this season, albeit the walking at these presents is something simply fearful. At the former are displayed long rows of poultry and game in most tempting array. As it may be interesting I will give you the prices of some of the latter that you may compare them with your own. Pheasants are worth in your money, from \$1.25 to \$1.50 per brace, but this is an unusually low price and is caused by the large supply. When you read, as you will presently, of the large bags of game made on this or that nobleman's or gentleman's estate, you must not imagine that all the birds go to his lordship's larder or to his friends. On the contrary, from His Grace the Duke to the simple Squire, one and all ship the bulk of their birds to a London poulterer; as I have known gentlemen at home who sent the surplus roses from their greenhouses *sub rosa*, so to speak, to New York florists. Partridges are worth anywhere from thirty to fifty cents each and hares a dollar; the latter in strong contrast to wild rabbits which are about twenty-five cents. With the exception of grouse from the Northern moors, which sell for 75 cents to \$1, these are about all the game there is, (and rabbits and hares are not called game), for the few woodcock and snipe which find their way into market are scarcely worth mentioning. There are wild ducks to be sure, generally understood to mean mallards, but not in such profusion as with you, and the succulent canvas back is, of course, known only by tradition. But Covent Garden, so celebrated for its bouquets, is where the eye may feast on good things. Magnificent hot-house pineapples worth from \$5 to \$10 each, but sold here by the pound weight; grapes, melons, pomegranates and bananas from the Mediterranean, and in fact nuts and fruits of almost every known description; and America comes in again with her Newtown peppins, considered here the choicest of apples, as well as Spitzbergens, Greenings, etc. There is no question, however, but that nearly everything in this line is much dearer than with you. How would you like to pay \$6 a dozen for cucumbers?

I mentioned just now that English sportsmen send their game to market. If not, what did the Maharajah Duleep Singh do with the 8,141 head recently killed at Elvedon in three days? The following is the paragraph, it may be interesting:—"The following is the return of game killed on the Elvedon Estate, Suffolk, the following guns shooting:—H.R.H. the Prince of Wales, H.H. the Maharajah Duleep Singh, the Duke of Athole, Marquis of Ripon, Earl de Grey, Lord Walsingham (two days), Lord Holmesdale, Lord Powerscourt, Marquis of Bowmont. December 5—Pheasants, 2,352; partridges, 127; hares, 304; rabbits, 246; woodcock, 1; ducks, 22; home beat, nine guns. December 6—Pheasants, 2,204; partridges, 75; hares, 251; rabbits, 283; Albemarle beat, nine guns. December 7—Pheasants, 1,462; partridges, 10; hares, 230; rabbits, 254; woodcocks, 8; Warren Wood, eight guns. December 8—Pheasants, 50; partridges, 237; hares, 1; rabbits, 6; ducks, 18; Thetford beat, eight guns. Total—6,068 pheasants, 786 hares, 789 rabbits, 9 woodcocks, 40 ducks; aggregate total, 8,141. The Maharajah certainly does things in style. The Duke of Hamilton was not far behind for "during six days" shooting at Hamilton Place, the Duke and party bagged 5,000 head of game. On Lord Hill's Estate at Hawkstone, Shropshire, his lordship and party, a few days since, shot a few short of 1,800 pheasants in three days, and many other bags almost equally large are reported.

I had many other items of interest that I proposed to communicate to you, notably some remarks on the American College challenges to Oxford and Cambridge, but as I have already exceeded my space they must remain over

until next week. One thing, however, I must mention. Keen, the champion bicyclist, lately in a match, rode twenty-three miles, making each mile inside of four minutes, the fastest being 3m. 5s. and the slowest in 3m. 40s.; total time 1h. 15m. 46s. There are few trotting horses that could equal this.

VAQUERO.

Rifle.

A NEW MARKSMAN'S BADGE.—The Adjutant-General has approved of a communication from the General inspector of Rifle Practice, requesting leave to substitute a bronze marksman's badge in the place of the embroidered rifles, now worn on the sleeve; the latter having been found not to be sufficiently durable. The new badge has been designed by Col. Wingate. It the size of a silver quarter, and is suspended from a clasp bearing the word "Marksman," and the date 1876. On one side it bears the coat of arms of the State (the same die being used as that of the Adjutant-General's medal), and on the reverse has the words "National Guard State of New York," forming a circle enclosing the figure of the regiment. These badges will be of gold bronze, and similar in color to the Inter-State and Seventh regiment team badges.

They will be required to be turned in every year by those winning them, and will be re-delivered to the men every time they qualify, a new clasp or cross-bar being added for each successive year; and will finally become the property of the winner on the expiration of his term of service. This substitution of a neat military medal for the present rather awkward decoration worn on the sleeve, has been received with much pleasure by the National Guard, and will undoubtedly do much to stimulate interest in rifle matches, and to make the Marksman's badge an honorable trophy. The badges are being manufactured by Messrs. Tiffany & Co., and will be ready for delivery in about three weeks.

—The British steamer King Arthur, which departed from New Haven harbor on Dec. 28th for Constantinople direct, took with her for the Turkish Government 10,080,000 cartridges, 10,000,000 bullets, 10,001,600 Martini-Henry shells, 40,600 guns, 40,000 scabbards, 50,000,000 gun-wads and 48 packages of miscellaneous merchandise. The total value of the cargo is \$1,344,000, the most valuable cargo ever taken out of this port. The cartridges, bullets, shells, etc., were manufactured at the Winchester Arms Company's factory in New Haven.

Game Bag and Gun.

GAME IN SEASON IN JANUARY.

Hares, brown and gray.

Wild duck, geese, brant, &c.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, and Wild Fowl.

FIRST EXPERIENCE WITH A BREECH-LOADER.—Warner Lewis, Esq., editor of the Brunswick *Advocate*, published at Lawrenceville, Brunswick Co., Virginia, is a gentleman well known as an enthusiastic sportsman of the old school—one who has hitherto held small opinion of modern "scatter guns," much preferring to knock over his squirrels with a Kentucky rifle, either for sport or meat, full stakes or no wager. Mr. Lewis is a modest man withal, and his modesty does not prevent him from telling the truth, even at the expense of exposing his own ignorance of new-fangled ways and modern improvements.

It seems that there are some respectable trappers in his vicinity, who were attracted thither by the reports, printed in *FOREST AND STREAM*, of beavers found there; and being endorsed and encouraged by the residents round about, they are having a good time, if they don't get much fur. It may be observed (in parenthesis) that whatever success they have had has been secured, rather by gentlemanly bearing on their own part, than by fur-bearing on the part of their fur-bearing friends. "Jess so." This, however, may be no joke; if so, we shall hear from Virginia anon. As we were proceeding to say, one of the trappers, Mr. Kellogg—But let friend Lewis tell his story in his own way:—

"On Wednesday, Mr. Kellogg, the trapper," says he, (says Mr. Lewis), "lent us his breech-loader and gave us twenty-five shells. We had seen but never shot one of these guns. It was of the Remington patent, perfect in its mechanism, and much heavier than our own muzzle-loader.

"A bout ten in the morning, with our old bitch, Beulah, and Tom Price's brute, Bristow, we started on our tramp. For two hours, over a country perfect in its appearance, and where we had never failed before to find birds, we followed the dogs, who worked beautifully. At length Beulah put her nose on the ground for a moment, trailed a few yards, threw up her head, trotting in a stately way into a cedar thicket and came to a full point. We followed with the young dog, who, seeing her suddenly, backed her handsomely, coming down at once from a swinging trot. Crushing through the brush a small covey of about eight birds got up wild and disappeared in the tangled evergreens about as soon as they arose.

"We had come to shoot. Two claps of thunder gave impetus to their flight, and a little man found himself faced to the rear by the recoil of the gun. The shells had been charged for larger game, and we had fired carelessly, forgetting that we were not using our 16 gauge bird gun. Following, several of them again flushed, and one rising above the pines and showing himself some thirty yards off we let drive—a cloud of feathers drifted down the wind and the bird went forward as if he had been struck with a mallet.

"The question now was to find the game. The gun would do its work and we could use it. Quickening our pace and cheering the dogs, we pushed forward. After half an hour's brisk walking we missed the young dog. Approaching the head of a ravine, where we had last seen him, he was found standing like a stone wall. The old dog drew up and backed. The birds were before us and not a stick in the way—three arose from under us, and again forgetting the size of the gun, we riddled one of them at about twenty paces. The recoil reminded us that we should hold the piece more firmly, and turning we killed the second cleanly at about fifty yards. Following the covey to a swamp we put the dogs in cocker style and killed three more at long snap shots before they could get off. The cover was so heavy and dense that the dogs could not drive up three others which we had seen light in it. Another small covey, however, was flushed while we were still at work upon them, and drew off our attention. As they got up we killed the first bird and missed a winding shot with the second barrel in consequence of the gun's weight. The fun now became fast and furious, and one covey was hardly scattered and disposed of before another was on the wing.

"In something less than an hour we had exhausted our ammunition, killing seventeen birds (Virginia partridges, known at the North as quail) and a lark, which we had shot experimentally in the early part of our hunt. Where the shots were plain and in open ground we experimented with the gun. We believe it will kill cleaner and more surely at fifty yards than any we have used at thirty-five or forty. The facility and rapidity of loading adds fifty per cent. to the chances of game and increases the pleasure of shooting a thousand fold—for it makes the work not only pleasant but clean. The danger to the gunner himself is rendered absolutely naught with any care, as he is under no necessity to get before his own gun, or even to keep it loaded except when in hot pursuit of his game. Except for the poverty of our people the muzzle-loading gun would soon be classed among the things that were."

GAME IN PENNSYLVANIA.

POTTSVILLE, Pa., December 26th, 1876.

EDITOR *FOREST AND STREAM*.—

We fancy that there are few places among the many noted gaming regions throughout this State that are favored with as great a quantity and variety of game, and the well drilled battalion of hunters able to "bag" them, as Schuylkill county. Very recently a dozen hunters from this section shot twenty-six deer in four days, one of the deer weighing 196 pounds. Partridges abound in unlimited numbers. Rabbits, wild turkeys, geese, ducks and pheasants, are very plentiful, but as they command a ready market with us, and prices firm, the unabated pressure of hunters so much reduced their number that, at the close of the limited period made by provision of the game law, they are scarce as fish on land. The other day a hunter brought to market 200 partridges, a dozen in a bunch, and established his price at \$2.50 per dozen. It seemed an exorbitant price, but met with little opposition, as the birds were of an extraordinary size and quality; though fine was his stock, and quick were his sales, he met with difficulty in the midst of fortune, by a circulated report that his "game" had been trapped contrary to law. They had the appearance of being probed by a stub-pointed needle. The Market House Club arrested him, but, upon examination, found the birds to have been legally shot. The game law in this State is very strict, and rigidly enforced, yet many hundreds cannot remember the provisions. The law is too long to be given entire, but the following extract is very much to the point just now (though rather late to give it), and may be of interest to the journal readers:—

The squirrel shooting season is from July 1st to January 1st; the deer season from October 1st to January 1st; the rabbit season from October 15th to December 15th. Penalty for killing squirrels and rabbits out of season, \$5; for killing deer, \$50. The wild turkey and pheasant shooting season is from October 1st to January 1st; the partridge season from October 15th to December 15th; the woodchuck season from July 4th to January 1st; and the plover season from August 1st to January 1st. Penalty for shooting any of the birds out of season, \$10. Hunters must now stop killing rabbits and partridges. DOMPEDRO.

ADVICE TO THOSE VISITING FLORIDA.

MILLTOWN, Me., Dec. 24th, 1876.

EDITOR *FOREST AND STREAM*.—

I see by your journal the tourist, invalid and sportsman, have for sometime been going South, and the advice of one who has spent so many winters there may be of use to them.

I can assure them that what they will most want will be some resources within themselves, some pleasing outdoor pursuits to occupy their minds, and the very best reading and instruction they can get from the *FOREST AND STREAM*. It will give them a taste for natural history, botany, shooting, fishing, collecting, etc., etc., and without such pursuits a winter life in Florida is a monotonous one; but if they can combine amusement and instruction they need seldom know a dull hour. I often meet persons afflicted with mortal diseases prolonging their lives far beyond what their conditions warranted by taking to the pursuits of natural science or engaging in useful occupations which keep their mind and body constantly employed in healthy and improving studies, and I have always observed that persons of inactive minds who see nothing to interest or instruct, who sit about the hotels and find fault hasten the fatal termination. Florida is no place for such cheerless and unhappy beings to such persons. The South and Florida is tedious, and most likely unprofitable; but the tourist in search of health or pleasure, the painter, antiquarian, naturalist and sportsman may find ample scope for his researches, and enjoy the winter months in a climate second to none in this country. The lazy and indolent had better remain at home. Who that has spent a season at Enterprise can forget the delightful climate, neither too hot or too cold? such beautiful mornings, the sun dissipating, the moisture as it rises, and the beautiful

afternoons, delicious and short-lived sunsets, with the long lines of white ibis, white egrets, pelicans and cormorants gliding close to the surface of the lake as if skimming over glare ice, so near that their great wings almost touch the water, while higher are observed numerous fish hawks, eagles and other wildfowl holding their course up the great river! After making winter visits to the West India Islands, South America and California, I much prefer Florida, the distance and expense being much less, and climate all you could ask.

GEO. A. BOARDMAN.

MASSACHUSETTS—Salem, January 1st.—For me to know that I have the best wishes of my friends is to enjoy a great deal. Therefore, permit me to offer the compliments of the season, and a real live New Year for you and our paper as the best that "Teal" can do. Last Saturday, December 30th, while it was snowing fast, with a heavy northeast wind, a large bunch of geese (B. Canadensis) flew up across the frozen harbor and over the city to the southwest. This is rather unusual at this late season.

"TEAL."

PENNSYLVANIA—Hamburg, Berks County.—A very large number of partridges have been shot here this season. The farmers protected many, otherwise I fear the entire stock would long ago have been exterminated. All kinds of game is scarce, though rabbits were abundant for a short while. The snow was their death to them, as the large game bags indicated after the sportsman's return home. Home Berks County hunters have been successful in Centre County hunting grounds, and report to your representative that their trips were entirely satisfactory.

PERE NIXON.

ILLINOIS—Peotone, Dec. 25th.—Game in this vicinity has been fairly abundant; the following bags have been brought into town, by two shooters, as the result of a single day's shooting: One day, 44 quail, 5 chickens, 10 rabbits; again, 20 chickens, 7 quails, 10 rabbits; again, 10 rabbits; again, 27 mallard and teal, 7 quails and 1 rabbit. The snow is pretty deep now, and but little sport can be had.

D. H. E.

MISSOURI—Osceola, Mo., Dec. 27th.—On Monday last the grand Christmas hunt came off, and from the amount of game brought in by the sportsmen it is evident that the game birds have not all been killed or run off to more western sections. On Sunday snow fell several inches in depth, being of a light, downy fall, which necessarily compels quail to "bunch" together. Monday cleared off bright and sunny—being a day which delights the heart of a hunter and proves a bad one for small game. It is surprising that not a deer was killed and but two turkeys, but the cause may be explained by the fact that very few dogs were used. W. J. Perrin carried off the honors for making the largest score, netting 175 points; next comes Mat. Henley with 125 points. The following amount of game was killed by these twenty gentlemen.

Kind.	Total	Kind.	Total
Rabbits.....	97	Turkeys.....	2
Quail.....	91	Prairie Chickens.....	1
Owls.....	7		
Squirrels.....	5	Total.....	306
Ducks.....	3		

We think very few sportsmen can beat this hunt, as it figures up a total of 1,240 points. After the counting had been finished the entire Club sat down to a bounteous supper tendered them by the members of Hicks' Club.

WHANK.

TEXAS—Gainesville, Dec. 22d.—A "Merry Christmas" to you. A wagon load of wild turkeys in town to-day, selling at 40 cents each! Who would not take Christmas?

G. H. RAGSDALE.

Gainesville, Dec. 27th.—Six inches of snow have covered the ground since the 23d, and "chickens" are plentiful in town. On the 25th I got 14 inside the corporate limits in two hours and then quit lest I should become a "pot hunter." The snow is melting fast to-day and will likely all be gone by to-morrow evening. One man got 17 jack rabbits in one day and another got 78 "cotton-tails" since the snow fell.

TEXAS.

CALIFORNIA—Nicasio, Dec. 20th.—Quail and deer are quite plentiful, with but little shooting. There are plenty of ducks about the bays. Geese have been abundant on Point Keyes, mostly Canada geese, with some white and Huchins.

T. H. E.

The *Toronto Globe* says that Miss Gilmour, daughter of Rev. J. Gilmour, Doe Lake, while out in a canoe late this autumn, saw a large deer in the water, upon which she immediately gave chase, and after more than an hour's pursuit she succeeded in capturing him. When weighed he was found to be over 200 pounds. The young lady is only seventeen years of age.

PIGEON MATCHES.

MARYLAND—A shooting match at Owing's Mills, Md. Dec. 25th resulted in a tie, darkness intervening. Regulation rules, 12 birds. Following is the score:—

Names.	Score.	Total.
Marshall.....	0 1 1 1 0 0 0 1 1 1 1 1	9
Tyene.....	0 1 0 1 1 1 0 1 0 1 1 1	8
Total.....		17
F. Painter.....	0 1 1 1 1 0 1 1 1 1 0 0	8
H. Painter.....	1 0 1 1 0 0 1 1 1 1 1 1	9
Total.....		17

SAN FRANCISCO, Cal., Dec. 24th.—Capt. Bogardus and Crittenden Robinson shot a pigeon match yesterday, sixty single birds at twenty-one yards, and forty double at eighteen, boundary of eighty yards. Bogardus killed 51 single and Robinson 50; Bogardus, double, 33; Robinson, 27.

—The Blue Wing Shooting Club, of Englewood, Ill., had their second shoot of the season Christmas Day, with the following scores:—

Name.	Score.	Total.
George N. Chase.....	1 1 1 1 1 1 1 0 0	1-8
J. W. Evans.....	0 0 1 1 1 1 1 0 0	1-7
A. A. Trumbull.....	0 0 0 0 0 0 0 0 0	0-1
E. Wilkes.....	1 1 0 0 0 0 1 1 0	0-4
R. J. Colburn.....	1 1 1 1 1 1 1 1 0	1-9
Charles Haines.....	1 0 0 1 1 1 1 1 0	1-7
George A. King.....	0 1 1 1 1 0 1 1 0	0-7
Charles Timm.....	0 0 0 0 0 1 1 1 0	0-3
R. T. Sales.....	0 1 0 1 0 1 0 1 0	1-5
W. W. Emery.....	0 1 0 0 1 1 1 1 1	1-7
Philip Balte.....	1 0 0 1 0 1 1 0 0	1-5

After which sweepstakes were indulged in, won respectively by Messrs. Chase, Evans, Haines, Sales and Colburn.

ANOTHER TURKEY CALL.—A correspondent who writes from Newport, Arkansas, says:—

"I wish to contribute a little information which is simple and useful to sportsmen. Seeing an article in your paper explaining a certain way to make a turkey call, I will tell you how to make one that will make an old gobbler ashamed of himself, viz: Take a piece of dry cedar two inches long and one and a half inches wide and a quarter inch thick, and with a narrow chisel hollow this out so that the sides are about as thin as a piece of tin or it may be a little thicker, so that it is not too delicate. It should be hollowed out within a quarter of an inch of the bottom and end, and your caller is complete. Take both ends between your thumb and fingers and rub it cross-wise against the butt plate of your gun, or rub it on your gun barrels. You require no rosin or anything else; simply the naked wood as made. In one hour's practice you can perfectly imitate a gobbler or a hen at your pleasure. One beauty about this is, you never make a miss-call or screech; it is perfect every time. Let some of your readers try it."

AN INDIAN'S WONDERFUL SHOT.—It is a well known fact that the sloughs in this region are filled with ducks at this time of the year, and hunting them affords rare sport. Recently four young men from Virginia stopped here on their way back from the eastern part of the State, bent on duck shoot. After a long day's tramp they bagged but one bird. When returning to town, foot sore, hungry and disgusted, they met an Indian, and the idea struck them that he might be pressed into service to fill their game bags, or at least that they could have a little fun with him. One of the party thereupon double-shot his gun, and, handing it to Mr. Indian, asked him to take a shot. Lo, not suspecting the trick, was happy. He seized the gun and started off in pursuit of game. He had hardly proceeded a thousand yards when he was seen to stop, raise his piece, take aim, and bang! bang! went both barrels simultaneously. At the same time the Indian went over the bank into the slough, the gun flying in an opposite direction. The sportsmen waited some time for the reappearance of the Indian, but no Indian showed himself. Then they became anxious; they reproached the party who had loaded the gun; and finally all started to the rescue. As they approached the spot where the Indian had disappeared, they spied him just crawling out of the slough, thoroughly drenched, and loaded down with fifteen ducks. The sportsmen congratulated and praised him, asking him how he liked the sport, what sort of a gun it was, and so on. The Indian merely replied: "Me shoot 'em; kill 'em heap, dam." Then casting a suspicious look at the gun, added: "One more shot, no more ducks, no more Indian! Kill 'em all!"

The sportsmen rewarded the Indian, bagged the ducks, and proceeded to town, claiming the game as the result of their own shooting.—*Virginia City Chronicle.*

The Kennel.

THE LAVERACKS.

A correspondent writing from Georgetown, D. C., under date of December 24th, sends us the following good account of the working of one of the Laverack dogs in this country. We should be glad to hear of the field performances of some of Pride of the Border's get. Our correspondent, however, while he changes his opinion regarding the working qualities of the imported dogs, does not retract what he says regarding the superiority of English bred dogs over American setters as regards "nose, staunchness and pace." Herein we must join issue with him, and claim an equality, at least, for our native dogs. When they have been crossed with the carefully bred imported strains, we believe that their superiority will be generally admitted. Without going into a lengthy argument, we will at present merely make the point, that notwithstanding the difference in cover, game and ground, our dog is expected in this country to do the same amount of work as is demanded from a brace, or perhaps two in Great Britain. If this does not indicate superior pace, it certainly speaks well for their staying powers and ruggedness. As for nose and staunchness, we believe there is but little difference.

EDITOR FOREST AND STREAM:—

Shortly after my return to the United States, having used and shot over several of the best strains of setters in Great Britain, I stated to a number of my shooting friends here that, in my opinion, English bred dogs would never answer for field purposes in this country, notwithstanding their superiority over American setters as regards nose, staunchness and pace, especially in Delaware, Maryland and Virginia, where dense growths of green briar and like cover are ever found, while partridge or quail shooting. At the time, I was aware that several gentlemen, living in this country, had imported "Laverack" setters in their kennels, and knowing the excessive closeness with which Mr. Laverack breeds his dogs, I feared they would disappoint their owners when taken into the field. If I may be allowed space in your columns, I would wish to retract what I have said, after having seen the wonderful staying qualities, staunchness, and grit of the little Laverack bitch "Magnet," imported by Mr. Westcott, of Philadelphia, with whom I have been shooting for the past two weeks. Her performance really deserves notice. She appears to never tire, and while companion dogs moved sulkily and lazily from their straw, in the morning, after a three day's run, she was as active as a kitten, dancing to be uncollared. "Magnet" is undersized, very finely coated, and the personification of close breeding, yet she takes the briars bravely, and points staunchly single birds wherever they may have sought a hiding place.

As an illustration of "Magnet's" great staunchness and nerve, while lashed to Mr. Westcott's "Dash," on our way to Greenwood Station, where we were to take the train for Wilmington, Delaware, she pointed some single quail in the hedge on the roadside, fairly holding "Dash" back and keeping her point, while the larger and stronger dog struggled to follow on after the waggon. W. E. C. M.

—Mr. F. B. Farnsworth, of Paris, Ontario, writes us that his imported Field Trial bitch Rose, whelped on the 19th inst. two dogs and four bitches, sired by his Laverack setter Carlowitz.

CANINE PATHOLOGY.

MEDICAMENTS DISINFECTANTS FOR KENNELS, ETC.

EDITOR FOREST AND STREAM:—

Of late there has a good deal been said of disinfectants for kennels. I subjoin herewith a prescription which answers every purpose and can not be excelled:—

Tinct. Camphore.
Tinct. Myrrhæ, a a zili.
Tinct. Saponis Camph. zii.
Acid. Acetic Glacialis, m. clx.
Oleii Picis, zi.

Mix, adding in the above order and agitate thoroughly. Two tablespoonsful agitated with a bucket of warm water and sprinkled about kennel or stable will not only disinfect but assist in the extermination of vermin; a teaspoonful added to a pint of warm water, forms an excellent tar water, as well as deodorant, and if such is used as an enema in a sick room—that of a typhoid fever patient for instance—will completely deodorize stools previous to their extra-intestinal existence. This dilution will be found particularly valuable as an enema for dogs suffering with diarrhœa or dysentery. As a general disinfectant it is unsurpassed.

Now I want to say a word or two about the medication of our canine friends. This is carried on altogether too extensively. Readers of Frank Forester's works will remember that he advocates the idea of leaving a dish of water in which a piece of roll sulphur has been placed, near the dog, from which he can slake his thirst at any time; this is simply a most excellent idea, as assisting in the preservation of health and worthy of extended consideration. It is best, however, to change the water at least once a day.

Next I wish to call your attention to the giving of sweet spirits of nitre. The drug usually sold under that name will certainly promote the action of the kidneys, but is after all not only unfit to give to dogs, much less human beings, being strongly acid, and farther, not being sweet spirits of nitre at all. I know of but one make worthy of physicians use, whether for man or beast. This is manufactured by Dr. E. R. Squibb, of Brooklyn, N. Y. If you will procure a sample of this and one of any other American manufacture and simply taste, you will be convinced. You will find this preparation of a pale straw color, and furthermore is put up in brown glass bottles. Do not allow your pharmacist to deceive you, with statements to the contrary. He knows them to be false. Any army or navy surgeon will tell you the same, as will any educated pharmacist, unless he have pecuniary reason for otherwise stating.

The Diana Club of East Saginaw, Michigan, offers a reward of \$25 00 for evidence that will convict any one of killing deer during the close season, also a reward of \$10 00 for information that will convict of any other violation of the game laws. Gentlemen, please do not weary of well-doing? ARCHER.

SPEYING.

SOUTH ABINGDON, Mass., Dec. 27th, 1876.

EDITOR FOREST AND STREAM:—

In connection with your answer to "J. W. K. Ayer, Mass.," in Correspondents Column of FOREST AND STREAM, of Dec. 21st, I would say that Mr. Aaron A. Healey of this town is performing the operation (speying) spoken of there with good success. There are three sluts in this place, all out of Chas. H. Bickford's black and white slut Fanny, (setter,) which he has operated on; owned by Dr. J. Y. Copeland, Mr. William Tilson, and myself. They are all in the best of condition and splendid working dogs; the two latter are one year and a half old. Operation performed when they were six months old.

I have a setter dog which is broken out all over, (humor I think,) his hair falls out and he scratches continually and smells bad. Please print the remedy in your next issue and oblige N. C. S.

Our correspondent will find the remedy he wants in an answer to T. E. L., in another column.—ED.

EXPRESS FARES FOR DOGS.

WASHINGTON, D. C., Dec. 26th, 1876.

EDITOR FOREST AND STREAM:—

I wish to have the following information promulgated through the columns of your paper, for the benefit of the sporting community at large. Being somewhat interested in the Baltimore Bench Show, I had occasion to call at the branch office of the Adams Express Company, in this city, situated on F, near Fifteenth street, for the purpose of gaining information relative to the transportation of dogs to Baltimore. I asked the Agent what the cost of sending one dog to the above named city would be, and he politely informed me that it would cost \$2.50. Now, can you tell me why the expressage on a dog, say fifty pounds weight, costs more per hundred miles than any other freight? I think it a great outrage, to say the least, which is drawing it gently on the Express Company, that they thus take such an advantage over a patronizing class. If this meets the eyes of the Express Company officials, I am quite sure that they will have the remedy applied as soon as practicable. To show then, the officials, the inconsistency of their action in this case, I will here state that I had shipped for me from the State of Vermont, a dog which only cost, delivered here, \$2.75. Certainly the distance is seven or eight times greater than from here to Baltimore. I think this imposition has gone quite far enough, and the Express Companies should be shown up to the world through the columns of such a valuable sporting paper as yours. I am glad to learn that one of our western railroads has opened the ball, and I hope ere long to see that others will not stop its onward course, but give it a push and accelerate its motion. If this "tax" on the sporting gentry is to be continued, I am confident that Sporting Emporiums will not reap a harvest, as it will make a hunting trip exceedingly expensive, and have a tendency to put it at a discount. Show 'em up, dear Editor, and you will please us, one and all, whoever owns a dog. "O. S. K."

[We are very glad to have this subject agitated, and we trust that the Express and Railway Companies will give it some consideration. There is no doubt that on many Railway lines, and by some Express companies, an unjust discrimination is made in the carriage of dogs as freight. The case we printed week before last of a gentleman's experience in North Carolina, is one in point.—ED.]

A ST. BERNARD.—We were invited last week by Mr. Edwin Thorne to inspect a magnificent specimen of the true St. Bernard dog, the property of Mr. T. W. Pearsall, and brought by him from Europe a few days previously. Fido, as he is named, is certainly one of the most splendid dogs we have ever seen. Although not yet a year old he is almost as large as a pony, and withal as gentle and playful as a kitten. He is of the short-haired breed now almost universally bred, and was bought by Mr. Pearsall in the neighborhood of Mount Simplan. For curiosity we took some of his dimensions which were as follows: Length from nose to end of tail, 65 inches; height at shoulder, 31 inches; breadth of chest, 13 inches; around head, 22 inches. When our New York Bench Show (which we hope soon to announce) occurs Fido, will be one of the "lions" exhibited.

MACDONA'S DOGS FOR SALE.—Attention is called to the advertisement in another column, of the Kennel of G. de Landie Macdonna, which he offers for sale, and which includes the celebrated dog "Ranger," which combines the best blood in the United Kingdom. American fanciers should not look indifferently upon this rare chance to secure what Englishmen have so long been proud to claim as their own.

—Mr. G. P. Whitman of Rockport, Mass., claims the name of "Lill" for his cocker spaniel bitch, bred by S. J. Bestor, Hartford, Conn., and whelped August 8th, 1876. Lill is by imported Snip, out of imported Juliette, and in color is white and liver.

—Mr. Nicholas Leonard, of Boston, Mass., claims the name of "Florrie" for his black setter bitch pup, ten months old, out of the Gordon bitch Queen Bess, of Foxboro, by Copeland's Pete.

BIRMINGHAM DOG SHOW.—This show was held at Curzon Hall, Birmingham, on the 18th December, and following days. The entries numbered 1,600. The judges in the sporting classes were, for pointers: The Right Hon. Viscount Combermere and Tom Ll. Brewer, Esq. Deerhounds and grayhounds: Samuel Mallaby, Esq. Setters and foreign sporting dogs: W. Lort, Esq. Spaniels: Major H. Willett and the Rev. A. L. Willett. Retrievers: R. B. Moore, Esq. Otterhounds, harriers, beagles, dachshunds, Dalmatians, and foreign non-sporting dogs: Mr. John Fisher. Fox-terriers; Mr. W. Cropper, and Mr. John Walker.

Many celebrities on the bench and in the field were exhibited. We append a list of winners in setters and pointer classes among which our readers will recognize many familiar names:—

POINTERS—LARGE SIZE CHAMPION CLASS.—Dogs: 1, T. Whippell (Wagg). Bitches: J. J. Broomhall (Neil). Open Class.—Dogs: 1, C. H. Mason (Viscount); 2, J. M. Champion (Jock); *hc*, G. Pilkington (Faust); W. H. Walker (Devon). Bitches: 1, C. H. Mason (Lady Isabel); 2, J. J. Bagnall (Blair); *hc*, W. Arkwright (Primula); *c*, G. Moore (Midge). Small size champion class.—Dogs: 1, J. H. Whitehouse (Pax). Bitches: 1, J. H. Whitehouse (Lady Pearl). Small Size Open Class.—Dogs: 1, J. H. Whitehouse (Sleaford); 2, G. Brewis (Roy); *c*, L. Nicholls (Rap). Bitches: 1, G. Furnace (Forest Blossom); 2, G. Pilkington (Fancy); *hc*, H. D. Brandreth (Ada); *c*, Duke of Westminster (Sall). Bitches with pups under three months old: 1, D. M. Norrish (Belle).

SETTERS—ENGLISH—CHAMPION CLASS.—Dogs: cup, S. E. Shirley, Rock. Bitches: cup, R. Ll. Purcell-Llewellyn, Phantom. Open Class.—Dogs: 1 and cup, R. Ll. Purcell-Llewellyn, Remus; 2, G. de Landre Macdonna, Blue Prince II; *hc*, R. Ll. Purcell-Llewellyn, Prince Royal; *hc*, T. E. Issard, Shot, C. S. Fauntelroy, Pring, P. Higson, Peter, J. F. Walton, Banker, R. Ll. Purcell-Llewellyn, Prince Regent, *c*, J. W. Morison, Sancho. Bitches: 1, 2, and cup, R. Ll. Purcell-Llewellyn, Puzzle and Countess Bear; *hc*, H. Barclay, Noll; *hc*, R. Price, Betsey Hicks, J. Bishop, Beatrice, T. E. Issard, Flame; *c*, T. E. Issard Snow, G. de Landre, Macdonna, Pera. Black and Tan.—Champion Class.—Dogs: cup, T. C. Meyrick, Rock; *hc*, R. W. Nevill, Grouse. Bitches: cup, T. C. Meyrick, Ruin; *hc*, C. B. Hodgson, Regalia; *hc*, E. L. Parsons, Floss. Open Class.—Dogs: 1 and cup, R. Thorp, Young Lang; 2, R. Trevethick, Ronald; *hc*, E. L. Parsons, Floss. Open Class.—Dogs: 1, and cup, R. Thorp, Young Lang; 2, R. Trevethick, Ronald; *hc*, E. L. Parsons, Grouse; *hc*, The Earl of Yarmouth, Rifle, A. Brocklehurst, Glen, Captain F. W. Rankin, Monarch; *c*, S. L. Seckham, Rollo, J. Taylor, Jock, A. Pearson, Bang, H. Fowler, Don. Bitches: 1 and cup, Sir B. Dixies, Bart. Flame; 2, Capt. Priestley, Pearl. Irish—Champion Class. Cup, T. M. Hilliard, Palmerston; *hc*, R. Ll. Purcell-Llewellyn, Lilly II, G. McHaffie, Mina; *c*, Major R. Cooper, Ellie. Open Class.—Dogs: 1 and cup, J. Waddington, Shot; 2, J. S. Skidmore, Grouse; *hc*, R. Ll. Purcell-Llewellyn, Kite, Capt. P. Priestley, Trump; *hc*, J. S. Skidmore, Dick, F. A. Bird, Shot, G. F. Ward, Dash, late Grouse; *c*, G. McHaffie, Flame, T. G. Mead, Rake, Capt. E. Priestley, Truth. Bitches: 1 and cup, J. S. Skidmore, Duck, late Cora; 2, Major R. Cooper, Nelly Carew; *hc*, J. Kennedy, Lilly III, G. McHaffie, Bella.

A CURE FOR HYDROPHOBIA.—Mrs. Jane Swisshelm writes to the *Pittsburg Commercial* concerning a recipe for the cure of hydrophobia, which has been known as the Chester Valley Cure. The ingredients are elecampane and new milk. The particulars of the origin of the cure she gives as follows:—

"In Chester county, Pennsylvania, lived a German named Joseph Emery, who used to be sent for, far and wide, when any one had been bitten by a rabid animal. He went to his patient carrying something understood to be a root, which he himself dug in the woods. He milked a pint of milk fresh from the cow, put the root into it, boiled it, gave it to the patient, fasting; made him fast after taking it; gave

a second and third dose on alternate days, and never failed in effecting a cure. In some way his secret transpired, and the root was known to be elecampane.

The story, current in the country, was that an old German made the discovery in the days of Penn. and applied to the Pennsylvania Legislature for a grant of \$300 for making his secret public. His offer was treated with contempt, and he resolved that his knowledge should die with him; but a drunken son knew it, wrote out the recipe, making a number of copies, and tried to sell them at \$1 a piece. He only succeeded in selling two, one of these to the man who made such effective use of it. So well did he establish the local reputation of his specific that in his neighborhood folks were not afraid of mad dogs.

The people of Chester Valley are not of a class likely to be misled by superstition, and it was a general or universal belief that Jacob Emery never failed to cure or prevent hydrophobia. In one case the spasms had begun before the first dose was given, and the patient recovered.

The medicinal properties of elecampane are very powerful. Milk itself is a specific for many poisons, and while the medical faculty know no cure for this terrible disease we should open every avenue of light into the dark subject.

THE OTHER SIDE.—While no one is a warmer friend of a good dog than myself, I can hardly subscribe to the sentiments of "Teal," who seems to argue upon the principle that all dogs are valuable, but I respectfully submit that good dogs are in the minority. Curs—many without homes, and others with worse than none—are forced to forage for sustenance, and by their lawless acts serve to bring their respectable brethren into ill-repute. This class are certainly not "protectors of life and property," are never "faithful servants," and their "sagacity" is at a very low ebb, and if a sneaking, mongrel cur, sets his master (if he has one) a good example, we must acknowledge examples are very scarce. No, no! Mr. Teal, give us a dog tax high enough to root out this class, and we not only shall have a better class of dogs, but shall rapidly thin the ranks of anti-dogists.

VERD-MONT.

We are inclined to agree with our correspondent, that there are dogs of both low and high degree, and as many variations in quality as are found in the human family. Root out the curs, and let only the well-bred remain, and we shall have less sheep killing, less hydrophobia, and less yelping and barking at night.

THE BALTIMORE BENCH SHOW.

AS we go to press the Bench Show of the Maryland Poultry and Fancier's Association is in progress at Maryland Institute. Below we give the substance of a telegram from our correspondent, with the latest information as to the progress of the show.

"The show is a success. Entries 260, and remarkably fine in character, particularly pointers. Old Maryland kennels are well represented."

We also print the list of entries in the sporting classes, all that our space will permit of this week:—

ENTRIES.

CLASS 1—IMPORTED ENGLISH SETTER DOGS—First Prize, \$25; Second Prize, \$15.—Pedigree, C. S. Westcott, West Philadelphia; Tramp, E. L. Kinney Washington; Snipe, R. E. McClenahan, Port Deposit, Md.; Rock, St. Louis Kennel Club, St. Louis.

CLASS 1—IMPORTED ENGLISH SETTER BITCHES—First Prize, \$25; Second Prize, \$15.—Magnet, C. S. Westcott, West Philadelphia; True, M. Von Culin, Delaware City, Del.; Belle, John C. Higgins, Delaware City, Del.; Brenda, Capt. J. W. Foster, Leesburg, Va.

CLASS 1—IMPORTED ENGLISH SETTER DOG PUPPIES—First Prize, \$10.—Capt. Foster, George H. Nixon, Leesburg, Va.; Sam Tilden and Wade Hampton, Capt. J. W. Foster, Leesburg, Va.—BITCHES—First, \$10.—Pixey, E. L. Kinney, Washington; Minna, Capt. J. W. Foster, Leesburg.

CLASS 2—NATIVE ENGLISH SETTER DOGS—1st, \$25; 2d, \$15.—Mack, George Brown, Brookland Wood, Baltimore county, Md.; Dick, Alex. D. Brown, do.; Dash, J. Addison Smith, Baltimore; Buff, Bang and Shot, John E. Reyburn, Philadelphia; Leo, Charles E. Haddaway, Bay Hundred, Talbot county, Md.; Dinks, E. B. Towson; Baltimore; Dexter, Philip Rogers, Baltimore; Milo, Anthony M. Johnson, Jr., Ellicott City, Md.; Tramp, Henry A. Rodewald, Baltimore; Ned, John P. Flayton, Baltimore; Dash, T. W. Warfield, Baltimore; Gen. R. E. Lee, W. R. Tilghman, Baltimore; Bingo, James H. Price, Langford, Kent county, Md.; Tramp, E. L. Kinney, Washington; Dash, M. Gilet Gill, Baltimore; Tom, S. G. Spofford, Baltimore; Frank, W. H. Lithicum, Baltimore; Tell, J. H. Stromberg, Baltimore; Cobb, Edward Malley, New Haven, Conn.; Snooks, Dr. E. R. Baer, Baltimore; Fritz, A. K. Shriver, Baltimore; Drop, R. H. Smith, Baltimore.

CLASS 2—NATIVE ENGLISH SETTER BITCHES—First prize \$25; second \$15; Bess and Vic, Nisbet Turnbull, Baltimore; Fanny and Flirt, Geo. Brown, Brookland Wood, Md.; Belle, Chas. E. Coffin, Muirkirk, Md. Bess, Chas. F. Bancroft, Baltimore. Heart, Anthony M. Johnson, Ellicott City, Md. Peg, John P. Clayton, Baltimore. Fanny B. W. Gilmor, Baltimore. Fannie, Edmund P. Welsh, York, Pa. Dot, Jas. H. Price, Langford, Kent county, Md. Girl, Chas. T. Megee, Baltimore. Mollie, Chas. S. Keller, Washington. Rose, Robert Murray, Baltimore. Diana, J. H. Stromberg, Baltimore. Kate, St. Louis Kennel Club, St. Louis.

CLASS 2—NATIVE ENGLISH SETTER DOG PUPPIES—First \$10.00.—Guy, Alex. McComas, Baltimore; Brush, W. R. Abell, Baltimore. BITCHES.—First \$10.—Pixey, E. L. Kinney, Washington; Fleet, R. E. McClenahan, Port Deposit, Md.

CLASS 3—IMPORTED IRISH SETTER DOGS—First Prize \$25; second \$15.—Buck, Chas. Z. Miley, Lancaster, Pa.; Elcho, St. Louis Kennel Club, St. Louis. BITCHES.—First \$25; second \$15.—Kelpie, H. W. Gause, Wilmington, Del.; Fire Fly, M. VonCulin, Delaware City, Del.; Kathleen, Dr. Wm. Jarvis, Claremont, N. H.; Floss, Chr. Z. Miley, Lancaster; Loo and Rose, St. Louis Kennel Club, St. Louis.

CLASS 3—IMPORTED IRISH SETTER BITCH PUPPIES—First \$10.—Shiela, B. F. Dorrance, Wilkesbarre, Pa.

CLASS 4—NATIVE IRISH SETTER DOGS—First \$25; second \$15.—Shepherd and Flash, J. Addison Smith, Baltimore; Grouse, Thomas A. Symington, Baltimore; Lin, Edwin Schenck, Baltimore; Flute, George Mor-

gan, Frederick City, Maryland; Spot, Frederick Von Kapff, Baltimore; Flash, Thos. Balderston, Baltimore; Trump and Peculiar, O. D. Foulks, Chesapeake City, Cecil county, Md.; Socks, S. N. Hyde, Boothby Hill, Harford county, Md.; Top, Chas. H. Reeves, Baltimore; Buff, Chas. D. Fisher, Baltimore; Bob, E. G. Vanhorn, Baltimore.

CLASS 4—NATIVE IRISH SETTER BITCHES—First Prize \$25; second, \$15.—Dream, Edmund P. Walsh, York, Pa. Belle, Walter Humphreys, New York.

CLASS 4—NATIVE IRISH SETTER DOG PUPPIES—Prize, \$10.—Rowdy, J. Addison Smith, Baltimore; Dash, Henry S. Zell, Baltimore; Shantie, Edmund P. Welsh, York, Pa. BITCHES—Prize, \$10.—Hebe, J. Addison Smith, Balt.

CLASS 5—GORDON SETTER DOGS—First, \$25; second, \$15.—Ben, L. R. Cassard, Baltimore; Mack, A. McComas, Baltimore; Lee, Howard Ridgely, Baltimore; Hela and Dash, Alfred Jenkins, Jr., Baltimore; Count, Benj. Glenn, Baltimore; Hero, B. W. Jenkins, Baltimore; Gypsum and Joe, S. Fleet Spier, M. D. Brooklyn; Cap, Edmund P. Welsh, York, Pa.; King, Henry B. Voeke, Baltimore; Grouse, Jerome Marble, Worcester, Mass.; Grand Duke, J. H. Whitman, Chicago. BITCHES—First, \$25; second, \$15.—Maggie, L. R. Cassard, Baltimore; Bess, Lawrence Curtis, Boston, Mass.; Fly, Richard Torpin, Jr., Philadelphia; Alice, B. W. Jenkins, Baltimore; Lou, William M. Tileston, Forest and Steam, New York; Fan, S. Fleet Spier, M. D., Brooklyn; Kate, Edmund P. Welsh, York, Pa.; Belle, M. Gilet Gill, Baltimore; Blanche, Lemuel Willey, Baltimore; Queen, Henry S. Zell, Baltimore.

CLASS 5—GORDON SETTER DOG PUPPIES—Prize, \$10.—Romeo, Leo and Renara, S. Fleet Spier, M. D., Brooklyn. BITCHES—Dream and Beulah, J. Addison Smith, Baltimore.

CLASS 6—POINTER DOGS (over 50 lbs.)—First, \$25; second, \$15.—Ponto, Charles E. Coffin, Baltimore; Dash, J. W. Downey, M. D., New Market, Frederick county, Md.; Fritz and Ned, Frederick Schuchardt, New York; Don, Capt. J. E. Mowbray, Baltimore; Sensation, Westminster Kennel Club, New York; Tom, Frederick Schuchardt, New York; Sale, St. Louis Kennel Club, St. Louis; Dash, John A. Smith, Baltimore.

CLASS 6—POINTER BITCHES (OVER 50 LBS.)—First, \$25; Second, \$15.—Daisy, Westminster Kennel Club, New York; May, Chas. H. Tilghman, Easton, Talbot county, Md.; Belle, Columbus Kennel Club, Columbus, Ohio.

CLASS 7—POINTER DOGS (UNDER 50 LBS.)—FIRST PRIZE, \$25; SECOND, \$15.—Bashaw, R. H. Smith, Baltimore; Tell, J. J. Turner, Jr., Baltimore; Bob, Chas. E. Coffin, Muirkirk, Md.; Bragg, Geo. Morgan, Frederick City, Md.; Captain, Arthur P. Baer, Baltimore; Flake, Edmund Orgill, Memphis; Rex, Fisher Howe, Jr., New York.

CLASS 7—POINTER BITCHES (UNDER 50 LBS.)—FIRST PRIZE, \$25; SECOND, \$15.—Snap, W. C. Odeome, Muirkirk, Md.; Jule, M. VonCulin, Delaware City, Del.; Whiskey, Westminster Kennel Club, New York; Sue, J. W. Ronstrom, Baltimore; June, Chas. H. Tilghman, Easton, Talbot County, Md.; Fan, Columbus Kennel Club, Columbus, Ohio; Lilly, St. Louis Kennel Club, St. Louis.

CLASS 8—POINTER PUPPIES (DOGS OR BITCHES UNDER 12 MONTHS.)—PRIZE, \$15.—Joe, J. J. Turner, Jr., Baltimore; Brooks, Wm. Ahrens, Baltimore; Oscar, Stella II, Arthur P. Baer, Balti.; Jim, Fred. Schuehardt N. Y.; Rush, Rose, Edmund Orgill, Memphis; Mark, Geo. H. Read, Baltimore; Jack, J. A. Williar, Baltimore; Dinah, Westminster Kennel Club, New York; Flora, W. H. Lithicum, Baltimore; Snipe, Thos. A. Symington, Baltimore; Black Prince, Columbus Kennel Club, Columbus, Ohio.

CLASS 9—FOX HOUNDS (IN COUPLES, DOGS OR BITCHES.)—FIRST, \$10; SECOND, \$5.—Logan, Hunter, George W. Scarff, Magnolia, Md.; Rover, Chorus, H. S. Zell, Baltimore.

CLASS 10—HARRIERS (IN COUPLES, DOGS OR BITCHES.)—FIRST, \$10; SECOND, \$5.—New Jersey Fly, John E. Diehl, Beverly N. J.

CLASS 11—BEAGLES (DOGS.)—FIRST, \$10; SECOND, \$5.—Lottie, J. Addison Smith, Baltimore; Centennial Lucy, John E. Diehl, Beverly, N. J.

CLASS 12—DACHSHUNDS (DOGS OR BITCHES.)—FIRST, \$10; SECOND, \$5.—Unser Fritz, Schnapps, Gretchen, Dr. L. H. Twaddell, West Philadelphia; Max, Columbus Kennel Club, Columbus.

CLASS 13—CHESAPEAKE BAY DUCK DOGS OR BITCHES.—First, \$25; second, \$15.—Bob and Bess, J. J. Turner, Jr., Baltimore; Nep and Fanny, Charles E. Easter, Baltimore; Monday, O. D. Foulks, Chesapeake City, Cecil Co., Md.; Jim, S. N. Hyde, Boothby Hill, Hartford Co., Md.; Prince, Frank J. Aher, Baltimore; Dan and Drake, Frank J. Tyson, Baltimore; Watch and Rose, Dr. W. H. Keener, Baltimore; Turk, John Stewart, Baltimore; Jack, Henry Moale, Baltimore; — and —, Charles H. Tilghman, Easton, Talbot Co., Md.

CLASS 14—IRISH WATER SPANIELS. (DOGS.)—First, \$10; second, \$5.—King of the River and Sinbad, J. H. Whitman, Chicago. BITCHES—First, \$10; second, \$5.—Bridget, J. H. Whitman, Chicago.

CLASS 15—COCKER SPANIELS. (DOGS OR BITCHES.)—First, \$10; second, \$5.—King and Queen, J. J. Turner, Jr., Baltimore.

CLASS 16—RETRIEVING SPANIELS. (Other than pure Irish Dogs or Bitches.)—First, \$10; second, \$5.—Dash, Thomas A. Symington, Baltimore; Scamp, R. Stewart Latrobe, Baltimore; Bob, J. H. Whitman, Chicago; Snider, T. A. Howe, Chicago.

CLASS 17—FOX TERRIERS. (DOGS OR BITCHES.)—Fitch, Robert Hume, Richmond, Va.; Dom Pedro, Wm. M. Tileston, FOREST AND STREAM, New York; Tricksey, Charles Walton, New York.

DIVISION NO. 2.—NON-SPORTING DOGS.

CLASS 18—MASTIFFS. (DOGS OR BITCHES.)—First, \$10; second, \$5.—J. Haward McHenry, Pikesville, Baltimore County, Md.; Lion, John T. Chrystal, Waverly, Baltimore County; Dido, Julius Tischinger, Pikesville, Baltimore County.

CLASS 19—ST. BERNARDS. (DOGS OR BITCHES.)—First, \$10; second, \$5.—Rover, J. H. Brown, Baltimore; Nero, Isaac Jacobs, Baltimore.

CLASS 20—NEWFOUNDLANDS. (DOGS OR BITCHES.)—First, \$10; second, \$5.—Cesar, D. W. Taylor, Perrymanville, Md.; Rover, John J. Strine, Baltimore; Neptune, Thomas Philbin, Baltimore; Nelson, Henry S. Zell, Baltimore.

CLASS 21—SIBERIAN OR ULM DOGS. (DOGS OR BITCHES.)—First, \$10; second, \$5.—Tiger, E. Lloyd Howard, M. D., Marine Hospital, Brooklyn, Anne Arundel County, Md.; Nero, Willie E. Morton, Prince Frederick, Md.; St. Elmo, Samuel T. Clark, Baltimore.

CLASS 22—DALMATIAN OR COACH DOGS. (Dogs or Bitches.)—First, \$10; second, \$5.—Major and Frank, Charles J. Moore, Baltimore.

FLAKE.—Mr. W. F. Steel, the owner of Flake, in a letter a few weeks since, stated that his pointer would not be at the Baltimore Show. Since then he has written us as follows: "While in Memphis, Mr. Edmund Orgill entered my lemon and white pointer dog 'Flake,' in the Baltimore Bench Show, supposing I would have no objection; and as the dog has been catalogued I have consented to let him go, being assured the show would be managed fairly and the best dog win. Yours, truly, WM. F. STEEL.

—"Pere Nixon," an occasional correspondent, writes:—

"A fine poultry show at Reading has on exhibition partridges and South American quail, which attract much attention. A half-wild turkey, half-wild ducks, etc., win much admiration. The 'dog show' contains some fine specimens of several classes. Such canines as 'Beecher,' 'Tilton,' 'Moody,' 'Sankey,' and others, naturally, are examined with great curiosity by the visitors, who endeavor to determine why these names have been bestowed."

Furs and Trapping.

HOW TO CATCH BEAVERS.—The St. John N. B. Telegraph tells how they catch beavers in the Dominion:—

"We know of scarce any animal possessing more instinct than the beaver. A very small pond they dam up in such a way as to render approach to their habitations almost impossible. A house is constructed of rafts laid across a main beam and covered with bushes and turf. It is divided into two compartments, one for the animal to dry itself in after coming out of the pond, and another to eat and sleep in. It is entered through a passage-way communicating with the outer edge of the pond (but in such a way as not to admit of water entering the house) and about midway between the surface and the bottom. On the least indication of danger he leaves his house by this subterranean passage, and does not rise to the surface till far beyond the reach of danger on the other side of the pond. The only plan, therefore, is to cut a number of stakes, drive them closely together in the bottom of the pond and close to the bank; then take the roof off the house, and, in some part of the passage way, the family, which consists of three or four, may be found. In this way a man from Nackawick got four a few days ago."

TO TAN SKINS.—To prepare skins for fur, mix bran and soft water sufficient to cover the skins. Immerse the latter and keep them covered for twenty-four hours; then remove, wash, clean, and carefully scrape off all flesh. To one gallon of water (hot) add one pound of alum and three-quarter pounds of salt. When dissolved and cool enough to admit entrance of the hand, immerse the skins for twenty-four hours, dry in the shade, and rub. Stir the liquor again, immerse the skins for twenty-four hours, dry, and rub as before, immerse for twenty-four hours in oatmeal and warm water, partially.

FISH IN MARKET.—Our quotations for the past week show no material change, although the severe storms on the coast have interfered somewhat with the operations of fishermen. We quote: Striped bass 20 to 25 cents per pound; smelts, 25 cents; bluefish, 15 cents; salmon (frozen), 40 cents; mackerel, 25 cents each; shad (southern), 35 cents each; Spanish mackerel, 25 cents; white perch, 15 cents per pound; green turtle, 20 cents; frostfish, 8 cents per pound; halibut, 20 cents; haddock, 8 cents; codfish, 10 cents; blackfish, 15 cents; flounders, 12½ cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 25 cents; scollops, \$1.75 per gallon; whitefish, 20 cents per pound; pickerel, 18 cents; salmon trout, 18 cents; sunfish, 12 cents; yellow perch, 12 cents; hard shell crabs, \$4 per 100; soft shell crabs, \$1 per dozen.

—An immense school of Spanish mackerel was struck off the Florida coast last week, several tons of which were delivered to our fish dealers in prime order.

AMERICAN SALMON RODS FOR ENGLISH WATERS.—Our occasional correspondent, "Homo," writes from Philadelphia:—

"It may be interesting to American anglers to learn that orders are being received from England by our manufacturers of fine fishing tackle for their handiwork. At Uncle John Krider's, Philadelphia, we noticed a box marked Sir Henry Clarvering, London, England, and on inquiry found it contained a split and glued salmon rod 18 feet 6 inches in length, reel, line and appurtenances complete. This is not the first of these rods that our friend Uncle John has exported."

TOLLING SHARKS.—A correspondent writes regarding shark fishing as follows:—

"Major Sarasota need not go so far as Florida to find blood used for the purpose of tolling up sharks, as is mentioned in his last interesting article. The writer has often done the same on the shark grounds of Nantucket and Vineyard sounds, and the practice is general there."

—It is reported that twenty-four smacks are engaged in fishing in Florida waters for the Havana market.

—The accounts of the disastrous failure of the herring fishery on the western coast of Newfoundland are confirmed by the latest advices. Many of the inhabitants of the western coast of Newfoundland are already in absolute destitution.

—The following extract from a letter from a friend at Old Mission, Grand Travers county, Michigan, may be of interest: "When I tell you that the water in our bays is so clear that it is not unfrequently we are able to distinguish a pin at a depth of thirty feet, and a plate at sixty feet, you will see that there is little chance for duck weed or wild celery. There are very few water-fowl about here, although there may be some on the mainland, but I doubt it. Deer and bear are very common. Venison sells in Travers City at six cents per pound. It is too far north for turkeys, but there are any number of partridges and pigeons, and our brooks are full of trout. This is getting to be quite a summer resort for those who are lovers of the FOREST AND STREAM."

MOVEMENTS OF THE FISHING FLEET.—The herring fleet have begun to arrive home, four arrivals having been reported since our last issue, one from Newfoundland, with salt herring, and three from Grand Menan, with frozen herring. One cargo has been broached to bait the Bank fleets. The number of arrivals from the Banks for the week has been six, and from Georges and LaHave ten, making a total of twenty fishing arrivals for the week ending this morning. The receipts have been about 12,000 pounds Bank and 120,000 pounds Georges and LaHave codfish, 68,000 pounds Bank and 14,000 pounds Georges and LaHave halibut, one salt and three fresh herring cargoes. Shore fish are in rather better receipt, and prices have eased off a little since our last issue. There is no change to note in other departments of the fish market.—*Cape Ann Advertiser, Dec. 29th.*

—The losses of property and lives in the Gloucester Fisheries during the year 1876, while not above the average of the previous year has been 116, including 71 in lost vessels, 21 lost overboard, and 24 lost in dories while attending to their trawls.

THE POTOMAC FISHERIES.—The inspector of marine products has transmitted his annual report to the Washington Board of Health. It says: The decrease of the shad and herring fishery of the Potomac during the past season has been of a most alarming character. Very few of the large seine fisheries have been continued throughout the season, something unprecedented in these waters. The gill nets and pound nets have continued as usual, though with very meagre results for their labor and investment. The cause of the decrease is, without doubt, the great amount of fishing done. Within a few years the gill nets especially have multiplied many times. It is not relative to this report to attempt to show the influence of the different kinds of nets in bringing about this state of affairs. Very little of the water coming through the Potomac reaches the Chesapeake without passing through meshes of numerous nets, and it is scarcely possible for fish to ascend the river without capture, especially as there is no general interim, most of the nets being in active use at all hours of the day and night. This is the most probable cause of the decrease in the supply of shad and herring. Very many laws have been proposed for the purpose of remedying the evil, by legislative action in general, each line of fishing or different net interest advocating laws which bear upon the opposing interests. The State of Maryland proposed a law during the early spring, which, if it could be carried out and enforced, would have largely solved the problem. The report closes by saying: "Some legislation or congressional action, looking to a remedy of this great over-fishing of the waters of our river, is urgently demanded, and one thing is certain, unless some action is speedily taken the immense business of fishing on the Potomac will soon dwindle away to nothing."—*Baltimore Gazette.*

For Forest and Stream.

TWIN LAKES, CONN.

WINTER has spanked down upon our pretty Twins like the hand of a very "stern parent." It is not often that they are frozen fast in a single night, and snowed under at the same time; but, in fact, parts of the shallow lake have been ice-bound for a week past, and the ways in which the boys are picking out the small pickerel are as various as they are nefarious. Large numbers have been "skated down" and knocked on the head (or rather the ice over their head), and still more "snagged" out by hook or crook, and all of too small size (5 to 7 inches) to tempt any but very mean sportsmen. It is surprising that there should be any fish in the lakes at all, when perch, pickerel and bass are fished for by everybody all summer long, and hooked out by the sleigh-load by the winter ice fishers; but, since the sportsmen have been measurably stopped off, every kind of fish appear to be on the increase, especially in the deeper lake, where they are not so easily got at by the pot fishers, and the pickerel are worth at least as much as the bait that is fed to them.

Now if anybody can invent a bait that will lure the white fish (Osego bass), there will be a fish worth the eating, as proved by the few three-pounders got out before the species were tripped up. Apropos of this beautiful fish, a specimen about a foot long was picked up on the shore a few days since that had evidently been jabbed by the sharp bill of a loon while on the spawning bed, and got away only to die. The fish had a narrow escape from being sardined in oil by the artist, E. Sherman Pease, who found it, but that night there was a black cat about and next morning the white fish was not—nor eke the picture.

J. IVES PEASE

—In Texas snow laid several inches deep on the ground for several consecutive days during the month of December.

Rational Pastimes.

SKATING.

There have not been such facilities afforded for enjoyable skating during the Christmas holiday season for some years past as this year. On Christmas day last, the lakes and the drives at Central Park in this city, and at Prospect Park in Brooklyn, presented pictures of winter out door recreation no other cities in the world can present. Thousands upon thousands went on the ice to skate, until it was almost difficult to glide along without colliding with some one. Everything, too, passed off pleasantly. It was Christmas time, for one thing, when the best side of human nature is generally exhibited, then, too, the day was fine for the sport and the ice was thick and hard, and to cap the climax the moon shone out at night. At the inclosed skating localities, such as the Capitoline Lake and Union Pond at Brooklyn, and the Windsor pond in this city a rushing business was done. At all these places there is such a thick and solid foundation of ice that no snow storm will long obstruct skating, not for over a day at most. Carnivals are on the tapis at the Brooklyn ponds.

CURLING.

This Scotch national winter sport is being fully engaged in this winter. Last season there was no ice fit for the purpose at Central Park, and only a few days curling was at command at Prospect Park. But this year the facilities for the sport are unusually great, and the result is that the sons of Auld Scotia, who are votaries of the game—and what Highland "Cheel" is there who is not—are in their glory. On January third, the grand annual contest, North vs. South, takes place at Central Park, and the chances are that about twenty-five rinks will be occupied on the occasion.

PIQUET.

The game of piquet is one of the most fascinating played with cards, and yet probably the one least known in this country. We have had the following queries regarding it propounded to us which we confess we are unable to reply to, but publish them in hope that some of our correspondents who are better posted will reply to them:—

EDITOR FOREST AND STREAM:—

In Bohn's capital collection of Standard Games, the Editor of PIQUET says, in his general description, "The number of points in each game is now 100; it used to be 101: fifty (50) saves the lurch,"—and, in his advice to young players, "Saving your lurch, or lurching your adversary, is so material you ought to risk some points to accomplish either of them," but nowhere does he state what may be gained (i. e. what number of points) by "lurching your adversary," or what lost by failing to "save your lurch." Will you oblige more than one of your constant readers here by kindly explaining the present signification of these terms.

In Deschappelles' exhaustive analyses of the Laws of Whist, the great French master explains the meaning of "the lurch" as applied to that game, but he adds that "the word lurch is a term used in backgammon, the force of which in passing into other games has become somewhat changed." On turning to Bohn's treatise on Backgammon I find no mention whatever of this term.

MR. MICAWBER.

A. is elder hand at Piquet, he holds all the clubs and a quint major in spades. B. holds all the hearts and a quint major in diamonds. No point, sequence, or quatorze can be counted. A. counts 13 for the tricks and 40 for the capot—53. B. counts nothing. Does A. also count for a "pique?" Again: A. and B. play piquet; both are at 90. A. is elder hand and can count only a quatorze of aces. B. has a quint major. Which wins the game? WM. H. S.

—British Custom house officials have been supplied with photographs of the American potato beetle, and warned to keep a sharp lookout on incoming vessels, in order to destroy the invader.

—Scattering flakes of snow fell in Tampa on the morning of the 1st inst.—something never before known.

New Publications.

MAGAZINES.

The Popular Science Monthly for January, 1877, contains an unusual number of valuable articles by eminent men. Among the contributors to this number are Prof. Hitchcock, Herbert Spencer, Prof. Huxley, Prof. Draper, and a number of other almost equally well known men of science. In "The Earlier Forms of Life" Prof. Hitchcock discusses quite fully the Eozoon of Dawson, and concludes that there is no doubt of its organic origin, a point which many geologists and paleontologists will be disposed to dispute. The article, however, is replete with interesting facts, and deserves a careful reading. "Theories of Primitive Marriage" by Herbert Spencer, is not only interesting but very amusing as well, and gives us not a few glimpses into feminine nature under all sorts of conditions and circumstances. Of Prof. Huxley's third lecture it is needless to speak at length. Some of the remaining articles are "The Study and Teaching of Biology" by Prof. Martin, of the John Hopkins University; "Science in America" by Prof. John W. Draper; "The Medical Profession in Modern Thought," Prof. Maudsley. Mr. Schumacher contributes a valuable article on the "Aboriginal Settlements of the Pacific Coast," which will be read with pleasure by the archaeologist. The Editor's Table is in Prof. Youman's usual happy style, and his leader on "Philanthropic Fanaticism against Science" should be read by all. It is a telling argument against the recent absurd legislation in England against vivisection.

In Scribner's for January we have a continuation of Clarence Cook's papers on "Beds, Tables," etc., the present being confined to the arrangement of the bed room and the china question. Much solid information can be gained from Mr. Cook's articles. The other illustrated papers are "Norway and the Norsemen" by Hyalmer H. Boyesen, who gives a graphic picture of domestic life in the land of fjords and long winters, and the first of a series entitled "A Winter on the Nile" by Gen. George B. McClellan. The latter promises to be a very interesting description of Nile life, and the General develops no mean powers as a raconteur. We have the second instalment of Dr. Holland's new serial, "Nicholas Minturn," which, barring a certain improbability of both character and incident, promises to be an interesting story. In the illustrated articles we omitted a very funny sketch called "Papa Hooms Tulip" with very comical pictures drawn in silhouette. It requires some twenty-six papers to make up the list of contents in Scrib-

ner's, and those we have failed to enumerate are fully up to the high standard maintained by this unsurpassed magazine.

St. Nicholas for January contains the second of Prof. Proctor's simple lessons in Astronomy, one of the most valuable contributions to juvenile literature we have ever met with. It is rather a remarkable fact in the history of civilization and progress when such men as Prof. Proctor, William Cullen Bryant and others, will write for the edification, instruction, or amusement of children, and would infer that the coming generation with such opportunities at command should be one of remarkable culture. Mr. Trowbridge's story, "His Own Master," is continued, and we can already foresee much tribulation for the hero. Mr. Henry Baldwin contributes a very funny poem in "The Modern and Mediaeval Ballad of Mary Jane," illustrated with silhouettes of a most comical description. We cannot enumerate all the good things St. Nicholas contains, but all are capital of their kind and abundantly varied.

In the Atlantic Mr. Henry James, Jr.'s, very interesting story of Parisian Life "The American" reaches a climax. Mr. Aldrich contributes a sketch entitled "From Ponkapy to Pesh," in which many incidents of foreign travel are related in a manner totally different to the old familiar guide book style. Bayard Taylor is also a contributor, and the poetry comprises "The Herons of Elmwood," by Prof. Henry W. Longfellow; "Birthday Verses," by James Russell Lowell, and some shorter pieces. Mrs. Francis Anna Kemble continues her "Old Woman's Gossip," and there are contributions by George P. Lathrop, E. C. Steadman and others. The writer's names to be found in the Atlantic's table of contents compose a galaxy of celebrities not often met with at one time.

With its January number the Galaxy enters upon its Twenty-third Volume, and notwithstanding its venerable age, displays an unusual amount of brightness and activity. By this we mean that its articles are of a more lively and cheerful description than is always the case. Mr. Gideon Welles's papers on the political questions which agitated the country during the war are continued, and in the present instalment we are given a view of the minor workings of Mr. Lincoln's administration. All Bohemia will thank Mr. Young for his article on "Beer," and the Teuton should raise a monument to his memory; for is he not the champion and defender of the refreshing lager? Mr. Young claims that beer reverses the influence of alcohol, by which it loses its irritating properties on the mucous membrane of the stomach. Whether he refers to the alcohol contained in the beer, or that previously absorbed by the drinker, is not stated. Mr. William Black's story, "Madcap Violet," is concluded, and ends most pathetically. Mr. John Burroughs has a paper entitled "Our Rural Divinity," which turns out to be a cow. There are numerous other entertaining sketches, and the poetical contributors are Joaquin Miller, Howard Glyndon and William Winter.

In Lippincott's we have, first, an illustrated and very excellent article from Mr. Edward King, entitled "Pictures from Spain." There is no bullfight in it, but types depicted which are not found in every handbook of travel. The other illustrated paper is "Our Flow of Fire," by E. C. Bruce, depicting some of the wonderful volcanoes which give vent or act as chimneys to subterranean fires. Mrs. Ellen W. Olney's serial story, "Love in Idleness" is concluded with the usual marriage bells and orange flowers. We shall also lose with this month the charming "Letters from South Africa" of Lady Barker. No better descriptions of life in the bush or among wild scenes have ever been written. Mr. George MacDonald's story "The Marquis of Loois" is continued, and the name of the author is a sufficient guarantee of the quality of the work. Sidney Lanier contributes some poetry (not a Centennial ode) and the "monthly gossip" is as interesting as usual.

Appleton's opens with an illustrated sketch entitled "The Falls of the Northwest," which will be a revelation to many readers. Most beautiful are the falls of the picturesque Willamette, and the Columbia and its tributaries. "The Heir of Mondolfo" is an interesting story by Mrs. Shelly. Junius Henrie Brown discourses of Heinrich Heine; H. M. Robinson tells about "Lake Travel by Dog Sledge," with some capital portraits (pen) of the half-breed guides of the northwest. George Sand's novelette, "The Tower of Percefont," is continued; Albert Rhodes has a sketch entitled "Between Two Fires;" Mr. George du Toit tells about Turkestan and its people. Temple Bar is illustrated and described by C. E. Pascoe. Mr. N. Robinson contributes a sketch, "Dick Nugent's Wager" which, although smacking somewhat of Jules Verne, is somewhat novel in conception. Two English officers (totally unlike English officers) wager at their club in London eight days before the close of the Centennial Exhibition, that they will see the closing ceremonies. Arrived at Jersey City in time, they make the acquaintance of a young American girl, who, in revenge for some slighting remark by one of the officers, horrifies him by talking such slang as no American girl ever talked, and winds up by making them both fall in love with her and marrying somebody else.

TO SPORTSMEN:

THE PENNSYLVANIA R. R. COMP'Y
Respectfully invite attention to the

Superior Facilities

afforded by their lines for reaching most of the TROTTER PARKS and RACE COURSES in the Middle States. These lines being CONTINUOUS FROM ALL IMPORTANT POINTS, avoid the difficulties and dangers of reshipment, while the excellent cars run over the smooth steel tracks enable STOCK TO BE TRANSPORTED without failure or injury.

The lines of The Pennsylvania Railroad Company also reach the best localities for

GUNNING AND FISHING

in Pennsylvania and New Jersey. EXCURSION TICKETS are sold at the offices of the Company in all the principal cities to KANE, RENOVIA, BEDFORD, CRESSON, RALSTON, MINNEQUA, and other well-known centers for

Trout Fishing, Wing Shooting, and Still Hunting.

Also, to TUCKERTON, BEECH HAVEN, CAPE MAY, SQUAN, and points on the NEW JERSEY COAST renowned for WALT WATER SPORT AFTER FIN AND FEATHER.

THE SPORTSMEN'S ROUTE.

Chicago & Northwestern Railway.

This great corporation now owns, and operates over two thousand miles of road, radiating from Chicago. Like the fingers in a man's hand, its lines reach in all directions, and cover about all the country north, northwest, and west of Chicago. With one branch it reaches Racine, Kenosha, Milwaukee, and the country north thereof; with another line it pushes through Janesville, Watertown, Oshkosh, Fond du Lac, Green Bay, Escanaba, to Nagaunee and Marquette; with another line it passes through Madison, Elroy, and for St. Paul and Minneapolis; branching westward from Elroy, it runs to and through Winona, Owatonna, St. Peter, Mankato, New Ulm, and stops not until Lake Kameska, Dakota, is reached; another line starts from Chicago and runs through Elgin and Rockford to Freeport, and, via the Illinois Central, reaches Warren, Galena and Dubuque, and the country beyond. Still another line runs almost due westward, and passes through Dixon, Sterling, Fulton, Clinton (Iowa), Cedar Rapids, Marshalltown, Grand Junction, to Council Bluffs and Omaha. This last named is the "GREAT TRANS-CONTINENTAL ROUTE," and the pioneer overland line for Nebraska, Colorado, Utah, Idaho, Montana, Nevada, California, and the Pacific Coast. It runs through the Garden of Illinois and Iowa, and is the safest, shortest, and best route to Omaha, Lincoln, and other points in Nebraska, and for Cheyenne, Denver, Salt Lake City, Virginia City, Carson, Sacramento, San Francisco, and all other points west of the Missouri River.

TO SPORTSMEN: THIS LINE PRESENTS PECULIAR ADVANTAGES—FOR PRAIRIE CHICKEN, DUCK, GEESE, AND BRANT SHOOTING, THE IOWA LINE TO-DAY OFFERS MORE FAVORABLE POINTS

than any other road in the country, while for Deer and Bear Hunting, and for Brook Trout, Lake Salmon, Pike, Pickerel, and Bass Fishing a hundred points on the Northern and Northwestern lines of this company will be found unsurpassed by any in the West. Sportsmen's Goods.

The Boston Shooting Suit.

MANUFACTURED ONLY BY

G. W. SIMMONS & SON,
Boston, Mass.SOLD everywhere in the U. S. by all first-class
dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT,"

made by

G. W. Simmons & Son.

This new design of WATERPROOF SHOOTING SUIT,
made from extra quality duck, has attained such
popularity as to be called for from all parts of the
country, and even from England."Shipping clothing to England strikes us very much
like sending 'Coals to Newcastle,' but the merits
of the 'BOSTON SHOOTING SUITS' have been
heard of in the Old Country, and that land of sports-
men has sent an order to Messrs. Simmons & Son,
which will doubtless be followed by many others."—
Boston Paper.The design embraces the best points of the English
and French Suits, combined with the necessary re-
quirements for American service. Particular atten-
tion has been paid to color.Each suit is water-proofed by a new patent process.
The seams and pocket corners are securely fastened,
and nothing neglected to render the suit perfect in
every respect.THE PRICE HAS BEEN FIXED AT \$13, TO IN-
CLUDE HAT OR DOUBLE VISORED CAP, DE-
TACHABLE HARELOCK, COAT, VEST, AND
PANTALOONS.One hundred suits will be kept ready in stock, so
that we can furnish to order any size required, at a
moment's notice.In the Golden Rule (Rev. W. H. H. Murray's paper)
the enthusiastic editor writes:—"We were shown, the other day, a new water-proof
suit, specially adapted for sportsmen, designed and
made up by Simmons & Son, of Boston, and to which
we call the attention of all brethren of the out-door
and shore-shooting fraternity, because it meets the
demand of personal comfort and convenience beyond
anything of home manufacture seen by us before.
As a sportsman, we give it our unqualified endorse-
ment, as combining the best points of the English
suits, and in addition skillfully adapted to the neces-
sities of the American service. It is a most admirable
and satisfactory contrivance in color, style, water-
proof quality and capacity. The coat is a marvel
in this latter respect."PERSONS ORDERING FROM A DISTANCE NEED
SEND ONLY THE FOLLOWING TO BE SURE OF
A PERFECT FIT: BREAST MEASURE, WAIST
MEASURE, INSIDE SEAM COAT SLEEVE, IN-
SIDE SEAM PANTALOONS; MENTION HEIGHT
AND WEIGHT.G. W. SIMMONS & SON,

G. W. SIMMONS & SON, Oak Hall, Boston, Mass."THE BOSTON SHOOTING SUIT.—One of the most
successful manufacturers of Waterproof Shooting
Suits is the firm of G. W. Simmons & Son, Oak Hall,
Boston. We had one of their suits on duty at Hun-
ter's Camp at Philadelphia Centennial Exhibition.
It has grown gray in service, but is good
for use yet. This suit is known as the 'Boston
Shooting Suit,' in contradistinction no doubt, from
the garments which are manufactured out west and at
Washington, each of which has a local demand of its
own. It is said that the western prairie fowl can
distinguish any sportsman who visits their domain
by his clothes. They can tell him 'by the cut of his
jib,' and the old educated birds (which no one cares to
eat, by the way,) know exactly what distances to
keep from the rail-shooters, the brant men, and the
chicken-killers respectively, to be safe. They have
'got them all down fine.' This used not to be so be-
fore the waterproof shooting suits were invented.
Bostonians, Hoosiers and Buckeyes all stood the same
chance then. But now it is—with a sarill pipe to lee-
ward by the old-weather cock—'here comes a Sim-
mons; cheese it!' or, 'Ere's a Scanning-lie low!' or,
'Look out for Holbird! Scatter! you beggars, scat-
ter!'—FOREST AND STREAM]

WIND-PROOF

Leather Vest and Jackets,
Flannel-Lined.(Made and sold only by Messrs. G. W. SIMMONS &
Co., OAK HALL, BOSTON,) are considered the most
sensible protectors ever devised for winter wear. They
are especially adapted to the requirements of sporting
men, whose rapid walking is likely to be followed by
frequent halts in the cold wind. Price, Vest \$7;
Jacket \$9. Measurements required are Waist, Breast
and Inside Seam of Sleeve. Mention Height and
Weight.

LADIES LEATHER VESTS AND JACKETS

dec28 lt 1105 Filbert street, Philadelphia, Pa.

THE "FLORIDA NEW YORKER."

Published at 21 Park Row, New York,

Is read by everybody in the North, East and West in-
terested in Florida. There is no better medium for
advertising any Southern property for sale or rent.
Advertising rates very low. Subscription price \$2
per year; single copies, 10 cents. Every Floridian—
every Southern man—ought to feel a pride in sustain-
ing this able and influential advocate of Southern in-
terests. The number for Nov. 1st, with immense
map and beautiful Florida views, is a Centennial pro-
duction which, as the New York Graphic says,
"places Florida one hundred years ahead." dec23BULLETIN OF THE NUTTALL OR-
NITHOLOGICAL CLUB.

A QUARTERLY JOURNAL OF ORNITHOLOGY.

This journal (now entering upon its second volume)
is at present the only serial publication in America
devoted to GENERAL ORNITHOLOGY. While it is in-
tended to serve primarily as a medium of communica-
tion between working ornithologists, it also contains
matter of a sufficiently valuable character to interest
all who take any interest in the general subject of
which it treats. Although devoted mainly to North
American Ornithology, it will be so far general in its
character as to give notices of all the more important
works or memories relating to Exotic Ornithology.
The list of contributors to its pages already embraces
nearly all of the leading ornithologists of the country.
Among them are Dr. Elliott Coues, Mr. Robert Ridg-
way, Mr. George N. Lawrence, Dr. T. M. Brewer,
Dr. T. Hale Streets, Mr. H. W. Henshaw, Mr. Wil-
liam Brewster, Capt. Charles Bendire, U. S. A., Dr.
J. C. Merrill, Dr. J. G. Cooper, Mr. E. W. Nelson,
and numerous others more or less well known to or-
nithological readers. Its editorial supervision is in
charge of Mr. J. A. Allen, assisted by Prof. S. F.
Baird, and Dr. Elliott Coues. Although published by
the Nuttall Ornithological Club of Cambridge, Mass.,
it is not in any narrow sense the organ of any section
or locality. It being conducted as a MAGAZINE OF
ORNITHOLOGY, its department of reviews gives prompt
notice of all papers relating to North American Or-
nithology, as well as of all important ornithological
works or memoirs wherever appearing; while its de-
partment of "General Notes" is rich in notices of rare
or little known species of North American birds, and
gives the latest and fullest intelligence attainable re-
specting the progress of ornithology in our own
country. It is hence a journal no one interested in
ornithology can well afford to be without.Terms: \$1 00 a year (including postage), strictly in
advance; single numbers, 30 cents. Back numbers
can be supplied. Circulars giving a list of contents
of VOLUME 1, sent on application. Address Mr. H.
B. BAILEY, Newton, Mass. Dec21

ON THE PRAIRIE.

For Forest and Stream.

O'er the wide rolling prairie, where wild flowers grow,
And the zephyrs of health and liberty blow;
With feet in the stirrups and hands on the reins,
We'll chase the wild buffalo over the plains;
O'er the wide rolling prairie, untrammelled by care,
Like the beasts of the chase we rove everywhere;
Leaving mountain and valley and forest behind,
And camping at night by each river we find.

When evening comes on and our hunting is o'er,
How sweet to recline upon nature's green floor!
To encamp on the marge of some beautiful lake,
Whose rippling waves in sweet melodies break
On its pebbly shore. On its smooth shining breast
The heron and duck in tranquillity rest;
And the vestige of day with expiring beam,
Leaves beauty and peace to embellish the scene.

THOMAS ROBERTS.

THE USE OF FLOWERS.

BY MARY HOWITT.

GOD might have made the earth bring forth
Enough for great and small,
The oak tree and the cedar tree,
Without a flower at all.

We might have had enough—enough
For every want of ours;
For luxury, medicine and toil,
And yet have had no flowers.

The ore within the mountain mine
Requireth none to grow;
Nor doth it need the lotus flower
To make the river flow.

The clouds might give abundant rain;
The nightly dews might fall,
And the herb that keepeth life in man
Might yet have drunk them all.

Then wherefore, wherefore, were they made
All dyed in rainbow light,
All fashioned with supremest grace,
Upspringing day and night:—

Springing in valleys green and low,
And on the mountains high,
And in the silent wilderness
Where no man passes by?

Our outward life requires them not:
Then wherefore had they birth?
To minister delight to man,
To beautify the earth;

To comfort man—to whisper hope
Whene'er his faith is dim;
For who so careth for the flowers
Will much more care for him!

For Forest and Stream.

Big Horn Hunting in California.

WE had a good camp at the "smoke-house," on Pine Flat, wood and water handy, plenty of brush for the burros, and the camp well shaded with big pine and red cedar. Some of these trees are ten or twelve feet in diameter at the butt, and taper slowly to the first limbs which are in some cases seventy or eighty feet from the ground. One of the largest cedars is hollow, for fifteen or twenty feet, at the butt, with walls including bark not more than two feet thick, and a gap large enough for a man to walk right in at the ground. This tree we use as a meat smoke-house, when blow-flies are bad, and it gives the camp a name. Many a time in the winter rains I've camped in its hollow with a good camp outfit, had a fire inside, and room to spare. Leaving camp early one morning and Boze to watch it, Tom and I, with an Irish prospector who had come up over night, started out for sheep meat. The big horns stay mostly on the highest mountains among steep precipices and bluffs. Clear Fork heads in the Main Range nearly opposite Pine Flat, and falling two thousand feet in less than a mile, threads its way down to the main river through a country so rough and rocky that its water is seldom muddied by the heaviest rains. At the head of this Fork the mountain has been torn down and washed out by water-pouls to a depth of nearly a thousand feet, and for a space of about half a section or maybe 400 acres. This is rough and ridgy enough at the bottom and is corralled on three sides by terraced precipices and broken off spurs and ridges, mostly bare rock; but wherever a pine or cedar can

take root, one is standing or clinging, fighting, oftentimes, with manzanita and madroños for foot hold. In patches of green among the rocks are wet places, growing sheep grass, short and coarse but sweet. This the sheep is extremely fond of, and the nature of the ground suiting the place is a sort of pasture for them. On the top of the ridge separating Pine Flat from this layout, we divided, Tom and Barney circling the main ridge and I going down into the bottom. Half way across I struck sign. Following slowly and carefully, it led through an awful rough country to a ciénega where the grass was fresh bitten, then back down across the main cañon, and straight for the steepest precipices in the country. On an immense bald knob of granite in the right direction, and nearly a mile distant, I thought I could make out a band. By careful climbing I reached the first terrace, and as I could get no higher just there, was crawling along upon it looking for an easier climb, when the band I was following jumped up, the nearest within thirty feet of me, and led by the largest old ram I ever saw, tried to take the back track, two of them nearly running over me, but turned down, running and jumping with graceful ease where I could hardly climb. I took a flying shot at the big ram, but missed him clean. About fifty yards further my terrace gave out, breaking off short on a deep gulch, on the other side of which the mountain was broken up in large masses of rugged granite, so steep and rough as to be apparently impassible. With great difficulty I climbed down towards the main cañon, keeping as close as possible to the edge of the gulch. When within thirty feet of the bottom I found a reasonably well defined sheep trail, striking into and across the gulch and leading into the broken rock. On this I made better progress and soon found it leading diagonally up the mountain and towards the table knob before mentioned; but the rocks were so large I could seldom see more than ten or fifteen feet ahead.

Creeping noiselessly along this trail, I was startled by a loud bleat, apparently not more than ten feet off. Looking cautiously around an angular piece of granite, I saw a yearling ewe not more than the length of two rifles from me, standing on a rock, all four feet together, looking down and bleating at something I couldn't see. At the crack of the rifle she dropped out of sight so quick that for half a second I almost feared I was mistaken. I never got so close to an unhurt sheep before, and felt considerably excited at so unusual a circumstance. A light wind blowing across the face of the mountain must have cut off the scent completely. Reloading, I took her place on the rock, and found myself, to my further surprise, at the south edge of the broken rock and immediately overlooking the main cañon. About 150 feet below me lay the dead body of the sheep. No others were in sight, and as I had heard none run off, I concluded that the ewe had got accidentally parted from her band and was bleating for her companions. Between me and the sheep was a straight up-and-down place for about half the distance, after which the broken rock commenced again and sloped gradually to the bed of the cañon. Through this slope ran a pretty clean washout, about six feet wide, tolerably smooth, and filled in with debris from the larger rock. Down this the ewe had rolled until stopped by a projecting rock. About sixty feet farther down was the bed of the cañon, here about twenty feet wide and partially filled by a jam of tree tops, branches, and trash washed down from the mountain. By tracking back a little higher than I stood, I saw that I could reach a broken spur which intersected the Main Range about half a mile from where we divided in the morning. Leaving my rifle, I climbed down to get my meat, half afraid I would never be able to climb back with it. Just as I reached the easier slope my foot slipped and started a loose boulder which narrowly missed the carcass and went crashing into the canon below, I saw then why I got so close to my sheep. An old he Grizzly that in a minute loomed up as big as a barn, rose up out of those logs and seeing me hanging to the cliff, turned every bristle the wrong way and sent up a snort halfbred between cussing and questioning. I didn't feel like saying anything myself, but kept perfectly still and thought how infernal dull my butcher knife was. After admiring each other until one of us at least got mighty tired of the interview, "old Ephriam" got down on all-fours and moved off up the canon. As he was out of sight in ten steps and I didn't know but what he was looking for an easier place to get up, I didn't fool away any more time than I could help in gutting that sheep, nor roll any more rocks to speak of. Then with the meat on my back, I climbed back to my rifle more easily and quicker than would have been possible but for the bear.

On the spur I found sign plenty, but had all the meat I cared to pack, and didn't hunt for more.

The spur was tolerable smooth but steep. Just before getting to the steepest place near the top, I stopped to breathe, I had stuck the liver inside of my shirt and had a piece of jerked venison in my pocket. Making a little fire (I never could eat raw liver,) I was sitting by it, eating when I heard the rocks roll just above me, and looking up saw a large ram standing on a point about sixty yards off, and looking straight at the fire. My rifle lay handy and he tumbled to its music, shot through the heart. I knew so well where I had hit him that I finished eating before going to where he was lying (here's a good chance for some fellow to say that I'd ought to have gone at once and bled him.) He was middling fat, in good eating order, but for size wasn't a patching to the patriarch I had missed in the morning. I took the ewe to the top of the Main Range first, went back for the ram, left him hanging up with shirt tied to a swinging limb near him, and got into camp with the ewe soon after sun down. Tom and Barney beat me into camp about an hour, bringing the hide and meat of a very large ram which Tom had knocked down, stunned with a bullet in the forehead, and which coming too, as the little Irishman was cutting its throat, struggled off of a shelf some sixty feet high, taking the butcher with it about half way, bruising one of his shoulders badly, and giving him something to talk about for the balance of his life.

OPOSSUM HUNTING.

"The squirrel has a bushy tail,
And stumpy grows the hair;
The old 'coon's tail is ringed around,
An' de possum's tail am bare."

Old Plantation Melody.

IN the happy, antebellum days, while the old plantation darkey yet dwelt upon the earth, 'possum hunting was a favorite pastime with them, and was also enjoyable by "young Massa" and Mars. Tom, Dick and Harry. As soon as the first white frost fell—and ripened the persimmons, and sweetened the wild grapes—the smiling marsupial waxed fat, and the season for hunting him commenced. Then sallied forth at night, the darkies, young and old—usually accompanied by some of the "young white folks"—with two or three good *varmint* dogs, trained to run nothing but "coon and 'possum." These dogs were of the bench-legged variety, with enough admixture of hound to give them fair noses, and invariably named Bose, Bull, or Tige. I never saw a first-class 'possum dog with any other name. Some patriarchal Ethiopian headed the hunt, carried the horn, managed the dogs, and curbed the impetuosity of young whites and niggers.

At the time of the full moon was not considered by the sable autocrats as the most propitious for catching 'possums, for, said they, "De full moon gib too much light; 'possum powerful cowardly; he feared ob his own shadder." Their favorite haunts were well known along the borders of the old fields, where the persimmon trees grew thickly from the uncultivated soil; in the bushy hollows, where the wild grapes hung in clustering bunches from the trailing vines; on the undulating uplands, where the black-haw, with its silvery branches bore its toothsome berries; in the dark, still vales, along the brookside, where the tall trees, ere the leaves had fallen, shut out the light of moon and stars. To these places, by the glare of pine torches, or by the light of the moon, the hunters made their way. The dogs ranged widely and well for short-legged fellows, and soon, far away, a yelp from old Bose; then sharp and clear from the others. Instantly all is excitement and confusion. "Hush, every one of you!" says old Amos. "Is you all done gone clean stark mad? I want's to hear dem dogs." A short, yelping run—for the opossum stays on the ground but a little while when pursued by dogs—and all is silent, expectation is on tip-toe, and every ear is strained to catch the next note from the dogs. There it is, a short, deep baying, from old Bose. "Treed," they all shout, and away they go, pell mell, through bush and briar, regardless of scratched faces and torn clothing. Clustered around the tree they look for the game—he usually takes a small tree or sapling. Old Bose is sitting on his haunches, looking with dim eyes far up into the branches; he has swept the leaves from behind him by the motion of his tail. The other dogs are standing on their hind legs, or capering wildly around, occasionally gnawing a bush in their eagerness to get at the enemy. "Dar he," says a young darkey, and there, between him and the

waning moon—on a high branch—sits the doomed marsupial, grinning a horribly ghastly smile, which he will wear even after he is baked; he is clutching the branch with his hand-like paws, and, as Jake says, "Wid his tail wrapped 'round de lim'." "Clime for him, Jacob," says the old man, and Jake, divesting himself of a combination of shreds and patches, which he dignifies by the name of a jacket, ascends into the branches. Instantly all are on the lookout. The dogs, with glaring eyeballs and stiffened sterns, await the fall. The torches are trimmed, and throw out a ruddy light. The boy in the tree commences a vigorous shaking, but he has a hard customer to dislodge—holding on as he does with feet and tail. Presently his fore paws are shaken from the branch; still he holds on with his hind ones and his tail; waving to and fro, head down, he holds on, like grim death to a sick nigger; his feet are shaken loose, and still he clings with his tail. The dogs are wild with excitement, and the darkeys capering around, yelling like demons. "Shake him loose, Jake." He gives the branch a sudden jerk, and the varmint, with outstretched legs, comes flying down. Old Bose catches him on the fly, and as Tige makes a grab for him, he closes his jaws on the dog like a steel trap, and holds on like a snapping turtle.

"Don't let 'em chaw him up," says old Amos, and the 'possum is snatched from the mangling curs. He is seemingly dead, but still smiles and smiles—be he villain or not; but if you should lay him down and go off a few yards, he would be up and off in a twinkling. His tail is now thrust into a cleft stick, and one of the darkeys laying it across his shoulders he is borne in triumph at the rear of the procession.

Such was 'possum hunting in the long ago. Mr. Fifteenth Amendment thinks it *infra dig* to indulge in such pastimes now. He has to attend "church an' de perlitical meetin's, and call on de cullud ladies." So the opossum is given up to "poor white folks," and a few low-down country niggers.

I don't know how Mrs. Glass, or Miss Leslie, or Soyer, or Brilliat Savarin would cook a 'possum, but old Aunt Dinah, or Chloe, or Phillis, used to "bake 'em wid 'taters," and I can assure you they were good. GUYON.

SHOOTING AROUND ST. PAUL.

"WHAT a pity," said my visiting friend Kilburn to me, "that you have so far to go for your shooting now; a perfect hunter's paradise this must have been in days gone by, when only Indians pursued the game." "You are quite correct in your remarks," said I, game is becoming scarcer every year in the immediate vicinity of St. Paul; but in spite of all that, what would you say to a little shoot less than a mile from here, at some very fine game, too. I can give you a shot, I think, in less than an hour's time; how would that suit you?" "Nothing would please me better, Z., but I am really afraid you cannot make good your promise," said he, looking out from the windows upon our busy streets. "Leave it all to me," I remarked, "it is now four o'clock, and before five o'clock you shall be gratified in your wish and I make my promise good."

Taking him into my hunting den, for the confusion reigning in my sporting room precludes my calling it by any other title, I bade him array himself in one of my hunting suits and hip boots, while I followed his example. He looked incredulous still, but obeyed with such good-natured alacrity that in five minutes' time we were off, and in another minute were crossing the bridge that spans the "Father of Waters" at this point, and the West St. Paul flats lay before us scarcely a rifle shot distant. While the rattle of teams over the "Nicholson" still rung in our ears I called K's, attention to a distant puff of smoke darting out of a clump of wild rice on the flat; in a moment after the report came clear and distinct, sending a pleasant thrill to our hearts. My companion's face brightened, and he was about to speak to me when my ears caught the sound of wings. From the direction of Pickerel Lake came a low flying flock of mallards, barely clearing the top of the bridge overhead. On the impulse of the moment I sang out sharply, "Mark!" Up went K's gun. "Don't shoot," I yelled, "you will be hauled up for shooting in the city limits." "Sure enough," said he, looking rather cheap, and taking down his gun, "we are hardly out of your principal street. What a shame that I could not let them have it," he added, his face flushed with excitement.

Bidding him be patient and follow me, we struck into a cow path at the foot of the bridge, and leaving the village of West St. Paul, our sixth ward, on our left we reached a little red cottage from which a hay road led toward the lake. On getting over the bars a boat, mounted midway on two wheels, blocked our path.

"If we only had that," said my friend, pointing at the boat, "we would be fixed." "You shall have it," I interrupted; "it is mine," and taking out my whistle I blew a loud blast. Out of the bottom of the boat from among a pile of decoys, gun and paddles, arose an apparition in the form of Ed., our printer, whom I had sent ahead to save time and put the boat in readiness. After doing so he laid down and took a nap. "Behold!" said I to K., "the inventor, Eddie S. To him belongs the credit of the construction, and to myself and friends the use of this novel craft, which runs on land or water with equal facility."

Placing our guns and ammunition in the boat to properly balance her, we laid hold and trotted to the water's edge; while Ed unshipped and hid the wheels in the wild

rice, K. and I. launched the boat together. Embarking we paddled out into the open lake, and being familiar with the different channels through the wild rice, were shortly in position in the narrows, the spot chosen for our evening's shoot. Overboard went the decoys. Ed and I busied ourselves placing them in good position, K. being told to keep his eyes open and mark east, undertook his part with commendable zeal and patience. Though intent upon my work I managed to keep an eye on K., and when I felt him give an excited start I knew what was coming. Bang, bang! went his gun—splash, splash! into the water went a pair of black ducks (*Fuligula ruftorgues*) throwing the water into my eyes, and fairly blinding me. Through my tears I roared at K., "pull out your watch!" He did so, and it lacked eight minutes of five. From the lower lake there came a scattering volley, and presently it was repeated in our front. I had just time to sing out "Mark!" when the ducks went whizzing by like lightning; a pair fell to K. and myself, while Ed sat in the stern of the boat looking after the flock.

"Why didn't you shoot?" I queried. "Shoot!" said the astonished and discomfited boy, scratching his head, "they did not wait long enough." The deepening shadows brought the ducks on us. Fast and furious from every point of the compass they whizzed by, every now and then leaving one or more of their numbers behind them, victims to our shots, until the water about us was dotted with our game, and we hastened to retrieve before it became too dark. "Count them," Ed, said K, "as you throw them into the boat." He assorted them as he did so, and the result was as follows: Eleven blacks, five teal, three widgeon, one red head and a spoon-bill, fat and plump all of them, and in the best condition.

"What wouldn't I give," K. remarked again and again, "to take this bag home with me where we seldom or never see a duck, and rabbits and grouse claim our attention. If you ever come our way I'll give you a taste of that kind of sport, and if lucky, throw you in the way of a shot at a deer."

On reaching home, after a hasty tea my friend Ben. W. Kilburn left on the evening train for his home in the White Mountains, where his name is a household word, and his pictures of the rugged hills as much esteemed as he is himself for his many noble manly qualities. May the reader have the pleasure sometime of meeting him.

DUCK SHOOTING ON MOREDOCK LAKE.

FOR some fifteen years or so, it has been the wont of your scribe, with four or six choice spirits, all hunters true, and adepts in the use of gun, oar or paddle, when November steps around, to let business and its cares wag awhile on their own hook, and skip away to some lake, and enjoy the exhilarating and tonic sport of duck shooting. Hearing that Moredock Lake was brimful of water, and its surface covered with many kinds of wild fowl, and being but twenty-five miles below St. Louis, we concluded to take our outing on its classic banks. Accordingly friend R., self and henchman, acting as vanguard, J. W., N. B., and Col. E., were to join us three days later. Shipped on board the good packet Emma Elliot at four o'clock, and at seven were safely landed at Harrisonville, where kind friends took charge of us for the night, the next morning forwarding us to our destination—the head of the lake. Arrived at our camping place, our first care was to launch the boats, then pitch tents. In the meantime our cook had started a rousing fire, dressed and cooked a pintail duck, killed by R. from the waggon as we drove along the edge of the lake, the same shot giving us also a lively mule race of some two hundred yards. Our inner-selves and minor details of camp being set to rights, and there being some two hours of daylight left, we took to our boats, and pulled to a bunch of young willow trees that had grown up in mid-lake, forming a splendid natural blind, from which we opened a brisk "*feu de joie*," as we were shooting for meat; everything in the shape of duck that came, in and out of range, was duly saluted. Night coming on we cried halt, joined boats, took a smile, gathered our birds, then pulled for camp at a racing stroke. I should mention that our boats are rigged with the Lyman patent rowing gear, giving perfect satisfaction in all respects. Three days later our friends joined us, getting all the shooting they could desire, with any amount of fun, frolic, and good health thrown in. The result of our ten day's hunt was three hundred birds thrown across the pole.

Moredock precinct, Monroe county, Illinois, in which Moredock Lake lies, has an interesting early history. In 1780, Shadrach Bond, with a few Americans, settled in this locality, and gave it the name of American bottom, which it has ever retained. Several forts also were built in this locality, the most noted being Fort Charters, the headquarters of the commandant of Upper Louisiana, at that time the center of business and life in the valley of the Mississippi. The aborigines of the country were the Kaskaskia's, who maintained their foothold long after sunlight had been let into the forest by the clearings of the early settlers. From their tombs and relics found in them, we get some idea of their progress in civilization; the arts and their epoch—the polished stone age. The relics unearthed are, hard limestone hoes, tomahawks, axes of diorite or green stone, arrowheads of flint, cornelian spearheads, flint knives, and shell money, or probably medals worn as ornaments, or distinctive marks of individuals. The pottery found are; wide-mouthed jars, small round pots narrow-mouthed, burnt black on the

under side, the color dark gray, sometimes black, seldom red. Their dead were buried in rude boxes, with bottom, sides and top, of rough slabs of limestone, and but for this fact these souvenirs of an extinct people, probably never would have come under the eye of our modern archaeologists, and a link in human civilization.

To return to our birds. Moredock Lake was so named in honor of Col. John Moredock, a man of great personal merits, a good hunter, crack shot, warm and true friend. The variety of ducks bagged by our party are the following: Scaup duck (*Fuligula marila*), hunter's name blue-bill; abundant. Gadwall (*Anas strepera*), gray duck. Widgeon (*A. americana*), bald pate; Zinzin-of-Louisiana. Pintail (*A. acuta*). Green winged teal (*A. carolinensis*). Shoveller duck (*A. chrypeatea*). Shovel bill duck, micoina, canvasback (*F. valisneria*), largely on the increase in this section since three years. Red head (*F. ferina*). Golden eye (*F. clangula*). Black jack, mallard, (*A. boschas*). Coot (*Fulica atra*), "poule d'eau." Marsh hen.

With compliments of the season, and good wishes for the continued success and prosperity of FOREST AND STREAM. Toujours, PERDRIX.

St. Louis, Dec. 28th.

"TOMMY JONESES."

A SKETCH OF THE NEW JERSEY COAST.

ON a certain Sunday in November I find myself alone in the "setting-room" of a two story frame house situated on the crest of the bleak and desolate strip of sand known as Long Beach, which, stretching northeast and southwest for twenty miles, saith unto the mighty ocean "thus far and no farther."

From the balcony I have been watching the ships go sailing by "freighted," in the words of the Western rhapsodist, "with all, how many hopes, and fears, and longings, and shingles, and petroleum, and tobacco!" Tiring of their protean monotony I have turned my gaze westward to the bay, Egg Harbor Bay, where sit a "power 'o brant" noisily feeding with a manifest sense of security which is very aggravating. The cunning rascals seem to be perfectly aware that it is Sunday, and that therefore they are safe from molestation. Flesh and blood are weak, so I have removed the temptation from my sight by descending to the sitting-room.

As I said, I am alone; not from choice but from necessity. Not a man among my chums could I find who was able to "get away," so I shouldered my number nine, and here I am at "Tommy Joneses" for a week's sport among the wildfowl. Should the reader care to follow me, let him leave the N. J. S. R. R., at West Creek, and find Job Parker, who will furnish him sneak-box and stools, take him over to the beach and "gun" for him for \$2.75 a day, and earn it, too. Job is a good man, a good honker, and a good shot.

But where was I? Oh, yes, in the sitting-room. Having nothing to do (churches are scarce on the beach), I turn my attention to my surroundings, and find no little food for observation if not for reflection. The "setting room" divides the "bar-room, (so called I know not why, for no liquor is sold), from the kitchen. It also does duty as a dining-room. The floor is covered by a rag carpet, which in windy weather undulates with every gust that finds its way up through the chinks and rat-holes. Cheap paper of a gaudy and vexatious pattern adorns the walls seamed in regular parallel cracks by the shrinkage of the wide boards which form them, and in putting it on there is displayed a lofty disregard of the exigencies of the figure which redeems it from utter lack of interest.

Hung here and there, and nowhere straight, are pictures whereof the choice was dictated, let us hope, rather by means than by taste. One of these is a glaring lithograph of our Saviour, with the subscript "Sacred Heart of Jesus," in English, French and Spanish. A companion picture is supposed to represent the Blessed Virgin, also in three languages, and another, over the title of "The Southern Beauty," is calculated to give the credulous observer very erroneous impressions of the Southern type. Opposite this hangs a work of art entitled "The Watchers," appropriately, be it observed, from the fact that the little boy in blue and crimson is fast asleep on the doorstep, and the overfed poodle, whose head is twice the size of the boy's, is gazing at nothing out of the corner of his eye with much intensity. The usual family photographs and ambrotypes are placed conspicuously in the best light, and present the several members, together with the uncles, aunts and mothers-in-law, in a number of ingeniously awkward attitudes and uncomfortable positions which, as a rule, show off their hands and feet to the greatest advantage.

In the centre of the mantelpiece stands the big eight-day clock, nearly touching the low whitewashed ceiling which is merely the floor of the room above. On either end is a gorgeous bouquet of impossible flowers cunningly fashioned of feathers and wool, the like whereof hath never existed, and ranged along are several gilded China motto cups and useless regulation vases.

The furniture consists of half a dozen painfully new (and hard) wooden chairs and a couple of tables whereon are a few books, not recent and much bethumbed. This library, if not extensive, is select and varied, embracing the "Holy Bible," "Peterson's Magazine," "Pilgrim's Progress," "Herrick's Almanac," and a hymn book. These are the solid volumes, but for light literature we may turn to the "Converted Jewess: A Memoir of Maria —," or "An Account of the Experience of Hester Ann Rogers and Her Funeral Sermon by the Rev. Dr. Cooke."

Fish Culture.

BLACK BASS OF THE POTOMAC.

THEIR HAUNTS AND HABITS.

WASHINGTON, D. C., Dec. 30th, 1876.

EDITOR FOREST AND STREAM:—

The interesting communications of Seth Green and others, recently published in FOREST AND STREAM, in regard to the Black Bass of New York waters, prompt me to say something of the species of that game and rayenous fish, now so abundant in the Potomac from tide water to the sources of the river, and in season they afford rare sport for the angler. They are beyond doubt high game, and it is to be hoped that our fish culturists will soon pay more attention to the propagation of this fish, which can be accomplished without much difficulty, as they are able to take care of themselves early in life, and hold their own against the encroachments of all other fresh water fish.

The bass were first introduced in the Potomac about twenty years ago, by General Randolph, then constructing engineer of the Baltimore and Ohio Railroad, who brought two hundred from some western waters in the tank of a locomotive, and turned them loose in the Potomac at Cumberland. Similar honors have been claimed for several other persons, and while others may have aided in the work of stocking the river, there is no doubt that the largest number was put in by General Randolph. Since then they have increased and multiplied so rapidly that not only the Potomac above tide water, but the Shenandoah, Monocacy, and other tributaries of the river are filled with them. These fish rarely attain a weight of more than four and one-half pounds, and it is but seldom that one of this size is taken, though they are frequently captured weighing three and three and a half pounds, and from this down to three-quarters of a pound; indeed I have had a bass not more than five inches long attempt to take a minnow half as large as himself, and thus become hooked; but the true angler of course always returns such small ones to the water, that they may afford better sport in after years. In this locality live minnow is the most desirable bait, though the bass are inclined to be as fastidious at times as to their feeding. Frogs and crawfish also make good bait, but the difficulty in procuring them renders their use rather meager. Upon one occasion when fishing, at one of the most desirable places on the river, with attractive line bait, I met with no success, although everything seemed to be favorable. Becoming discouraged I put a dead minnow upon a hook, and threw out near the line with the bait, and in this way took four or five fine bass with dead minnows, while they would not notice what I believed to be the more attractive bait within a few feet of it. They have their feeding hours early in the morning and late in the afternoon, being the best time to catch them, though I have frequently taken fine ones in the middle of the day when the weather was not too warm.

Probably the upper Potomac is one of the most beautiful views in the country. The scenery is unsurpassed, and no class of people enjoy the beauties of nature more than patient anglers. Freed from the dust and strife of the city, they fully appreciate the charming scenes surrounding them, and the health promoting pleasures which drive away care and make us cheerful. The bass of the Potomac frequent different currents and pools, according to the season. In spring they are caught at the foot of the Great Falls and Little Falls in large numbers. Later in the season they are found in the numerous rapids and shutes along the river, and the best sport is afforded in taking them from these waters. As warm weather approaches they seek the deep holes and eddies, where they remain until the return of cooler weather, when they may be again found in the rapids and shallow water. In the winter they again seek the deep holes.

As above mentioned, live minnow is the principle bait used, roach, a small fish of the shiner species, smelt, young shad and sun fish being plentiful. Roach, however, are the hardest, and more easily kept alive in the minnow bucket, and are therefore the most desirable bait of the several varieties named, besides they remain alive much longer on the hook. Smelt and young shad make attractive bait, but they are very tender and soon die when put in minnow buckets. The bass will often rise to a fly in turbulent water, but they are taken so much more rapidly with live bait that fly fishing is not indulged in to any great extent. They are also frequently taken by trolling, and several times I have found magnificent fishing pools by trolling over them. On one occasion, while thus trolling behind the boat, a friend with me had a finestrake, and captured a handsome fish. We stopped, took soundings, found a hole about sixteen feet deep, and fishing it for half an hour had taken half a dozen magnificent bass out of it. This hole invariably yields something for our basket, and sometimes as many as ten or twelve have been taken from it in an hour or two.

The Potomac bass are very tenacious of life, and their muscular power frequently enables them to escape while being taken off the hook, unless the angler is careful. When hooked they fight bravely, sometimes breaking water three or four times before being landed. I have known a bass to run under a boat after being hooked by an inexperienced angler, but to one accustomed to their ways such a thing is not liable to occur. I always kill the fish immediately upon taking it off the hook, by inserting my knife blade back of the head, and severing the verte-

brae at the base of the brain, thus preventing any possibility of escape, besides it is a well known fact that the fish is made more palatable by being killed than if left to die for want of its natural element.

We have no law in this District in regard to taking bass, neither have the States of Maryland or Virginia yet given attention to the subject, but it is to be hoped that suitable laws for their protection will soon be passed. The spawning season for bass commences about the middle of April and continues until June. The authorities should prohibit their capture before the 1st of June anyhow, but the open season might continue from that time until the first of December.

Now that I have given a brief history of the bass in the Potomac, their haunts and habits, I have only to say that anglers will always find rare sport in this river, and I am sure visitors from abroad will be heartily welcomed by their brother anglers of Washington, as a more hospitable or generous set of men are not to be found in this land. There are hundreds of places on the Potomac within two or three hours drive of Washington, where the rarest sport is afforded. The Little Falls, Dam No. 7, and the basin above it, Stubblefield Falls, the Great Falls, and many other places between Washington and the latter point, are celebrated for good fishing.

In a future letter I will have something to say about the Great Falls Fishing Club, an organization of gentlemen who own a comfortable Club-house near the Great Falls, fitted up with all the conveniences, and being ardent lovers of the sport, they capture many bass during the season.

In my last letter I mentioned the fact that an importation of carp had been ordered from Europe to stock the ponds of Maryland and neighboring States. The steamship Leipzig arrived at Baltimore a few days ago, with Mr. Rudolph Hessel, an eminent fish culturist on board. He had forty-four live carp out of two hundred with which he started from Germany, one hundred and fifty-six having died on the voyage. These fish came from ponds bordering on the Danube in Hungary, and include several varieties of the carp family. On shipboard they were kept in large tanks, and were frequently supplied with fresh water, but the vessel encountered very rough weather, having been at sea twenty-three days, and it is thought this proved fatal to so many of the fish. The forty-four survivors were taken to the ponds at Druid Hill Park, near Baltimore, for propagating purposes, and it is thought they will breed next spring.

OCCASIONAL.

STOCKING SOUTH JERSEY WATERS WITH SALMON.—The waters of southern New Jersey have been stocked with 40,000 California salmon under the auspices of the West Jersey Game Protection Society. The work has been performed by Capt. Milton P. Peirce, South Jersey Fish Culturist who writes to one of the local paper as follows:—

"The salmon eggs were obtained from the U. S. Government by the West Jersey Game Protective Society which assumes the expenses from the time the eggs leave the Government encampment, on the upper Sacramento river, until the young fish are old enough to be placed in their new home. The stocking of the streams of South Jersey with this 'King fish of the world' has been entrusted to the subscriber, who is almost constantly engaged in distributing them, preference being given to neighborhoods that are willing to relieve the Society of the few dollars of expenses attending the same. The distribution will be very general throughout South Jersey, as the plan pursued is radically different from that in vogue elsewhere. The plan generally pursued after the great expense of taking and hatching the eggs is to select some pleasant day, and take the entire lot of young fry (sometimes two or three hundred thousand) to one or two large streams, and turn them all in at once. The almost inevitable result is that such a cloud (or school) of young fish is sure to attract the immediate attention of their enemies (the larger fish), and a very large proportion of them are destroyed. The plan pursued by us is strictly in accordance with the instruction of Prof. Baird, the U. S. Fish Commissioner, viz.: to go to the small tributaries of the large streams, where the water is of but few inches in depth, and put a few hundred fish in a place. This of course entails a heavy expense as compared with the plan of 'dumping' the entire lot at one time and place. Another feature which we have adopted, under Prof. Baird's instruction, and which I have omitted above, is that of placing the young fry in the water after dark. The advantages of our plan are various. When young salmon are placed in a stream they will go no higher if suitable spawning places can be found. When placed in the head waters of a stream they will come there again and again if there is enough water to float them. When placed in after dark they have ample opportunities to hide. If a glaring light prevails they are frantic, and will rush to destruction,

MILTON P. PEIRCE,

Aquadale Ponds, Wenonah, N. J.

THE WISCONSIN STATE HATCHING HOUSE.

MILWAUKEE, Dec. 22d, 1876.

EDITOR FOREST AND STREAM:—

Your paper occupying a prominent position in our establishment here, and noticing your zeal and the interest you have in fish culture, I take the liberty of encroaching upon your time, and the columns of your truly valuable paper, by giving a description of the Fish Hatching Establishment of the State of Wisconsin. Last year (1876) the State appropriated the sum of \$10,000 for the purpose of restocking the waters of the State, and five commissioners were appointed to carry out the project. Messrs. Welch, Hoy, Palmer and Dousman and Gov. Ludington are the Commissioners. A few acres of land, with buildings, etc., were purchased at Madison, Wis. At that point nothing but brook trout are raised. Here in Milwaukee, through the kindness of the Board of Councilmen and Water Commissioners, the large basement of the Pumping Works has been given to the Fish Commissioners to further their work and project. The hatching room is about 40x80, well lighted by the means of large windows—five in number—placed upon a level with the ground; it is also heated by steam, supplied by the boilers, which supply the huge engines that pump water for the city. The water is brought into the hatchery by the means of a pipe four inches in

It is perhaps superfluous to say that the inevitable sewing machine and agonizing accordeon are not wanting, and these, with a "base-burner," and a looking-glass, which, resting upon a gilt capital from the cabin of some wrecked ship, hangs at a threatening angle over one of the tables, complete the interior.

The north door is fastened up securely with nails, and tightly caulked with oakum, rags and paper. But the south door is not, so let us open it and step out upon the porch.

From the cobwebbed rafters wildfowl hang in bunches or in pairs, and beneath the benches which run along the house lie wooden decoy-ducks of more or less antiquity of pattern and various stages of mutilation and neglect. In the corner stands a rusty eel-spear which has evidently seen much service, and a neighboring hook shares its scanty accommodation between a dilapidated gill-net and a rubber coat. On the fence hang sundry articles of clothing, towels, pails and mops, and here and there a pair of wet boots are stuck to dry upon the pailings. Fifty yards or so from the house stands the rickety barn half hidden in the low, scrubby brush surrounding it, and, hard by, a couple of haystacks lend their mingled sustenance and shelter to the few lean kine which seek them. But O, for the pen of a Walt Whitman to describe the chaos which reigns in the space between the house and barn! There are those, I am aware, to whom Whitman's candy is less distasteful than Whitman's poetry, just as the young lady thought who said that she didn't think much of Wagner's music, but his drawing-room cars were "lovely."

On every hand the sandy ground is littered with the accumulations of many shipwrecks, miscellaneous trash and lumber, and antediluvian implements of husbandry which have outlived their usefulness. Ah, what a field for Whitman's genius! How vigorously would he handle the prolific subject, and what poetic glamour would he not throw over it! With my mind's eye I can read the unwritten lines of burning verse wherein he'd clothe in immortality these naked things.

Something like this, perhaps. Listen:—

The earth speaks!
To me, appreciative, the inanimate objects lift up their silent voices:
Once the solid forest claimed them,
Also the bowels of the earth.
Later they emerged from factory, forge and carpenter's shop.
They announce themselves.
Each announces itself.
Mast, spar, rudder, spade, axe,
Shovel, hatchway, yards, plank, crowbar, rake, pitchfork, hoe,
Anchor, cable, barrel-staves, wagon, cart, wheelbarrow, fence-rail,
Stanchion, bulwark, bench, buoy, tub,
Grindstones, timbers, keel, chain plate, shutter, wedge, sash, stove-pipe,
Main-truck, knighthead, hoopskirt,
Tomato can, bowsprit, cleat, block, shingle, lee-scupper, bilges, reef,
port-holes,
Starboard watch, forecassie, binnacle, hawser,
Bolt-rope, marlinspike, and what not.

Now I contend that anybody who fails to see in the above the soul of true poetry ought to be made to see it. To that end I would condemn him to a course of Dowden and Rosseti. Should he still be unconvinced (assuming his survival), I would refer him to Mr. Peter Bayne in No. 1648 of Littell's "Living Age" for January last, and remain, pending his conviction, his very humble servant,

K.

GOOSE-BONE WEATHER PREDICTIONS.—The goose-bone is more closely watched in Kentucky than in any other part of the country. It has been handed down among the early traditions of the State, and may be called the Kentucky weather prophet. It is to be found in nearly every Kentucky country home, and in many parts of the State the farmers consult it, and prepare for handling their crops in accordance with its readings. The prophecy of the goose-bone does not extend beyond the year in which the goose was hatched, and the prediction is for the three winter months only. Take the breast bone of a last spring's goose and divide it into three equal parts, and the different divisions will represent December, January and February. The breast bone of a goose is translucent, and if clear when held up to the light, the weather will be mild and pleasant; but if covered with cloud-like blots, it will be gloomy and cold; the heavier the blots, the colder will be the weather.

A study of this year's goose-bone indicates that the weather for December will be cloudy and gloomy, probably with much rain and snow, not very cold, but, withal, a very disagreeable month. About the last of December we shall have some cold weather, which will continue to grow colder as January advances. The month of January will be a cold one throughout, with some very severe weather during the last part of the month. On the prophecy of the goose bone, it may be predicted that about the last of January we will have the coldest weather experienced for a number of years. February will be more pleasant and spring-like, betokening an early return of the flowers. During the last of the month, however, there will be few cold days, but no severe weather.

Such is the prophecy of the goose-bone, and as we have the word of a good old farmer up in Woodford county, that it has not failed for fifty years, we may as well prepare to meet it, and need not be surprised if we have good skating on the Ohio river during the latter part of January.

—Louisville Commercial.

—The Wisconsin State Hatching House is located at Milwaukee, and not at Madison, as was stated in a recent issue of this journal.

—We have received the Annual Report of the Fish Commissioners of Virginia and Maine, and will print an abstract soon.

—The Montpelier Watchman says: "The Fish Commissioners have been obliged to decline the proportion of land-locked salmon belonging to the State, distributed by the United States, because no provision has been made by the State for hatching the same. This is a reproach on the last Legislature, which neglected to so provide."

diameter, and empties into a large trough or reservoir thirty feet long by four feet deep, set five feet up from the floor; this reservoir is placed in the rear of the room. The hatching troughs run at right angles with it. The troughs for the raising of lake trout are twenty-four in number, and are sixteen feet long by twelve and one-half inches deep. The water is let into them by means of a two-inch pipe, set at an inclination of 45°. There are also twenty Holton boxes in full operation each containing about 350,000 eggs of the white fish (*Coregonus albus*), about 7,000,000 in all. The number of trout amounts to between two and three million, and all at the present writing in splendid condition, nearly ninety-five per cent. of the eggs showing the fish formation. The lake trout spawn was procured of the City of Milwaukee from the fish as they were taken from the gill-nets. The white fish spawn was taken at Detroit, Mich., Sanguinaw, Mich., Penseauke, Wisconsin, and Escanaba, Mich. The hatchery is under the management of Mr. H. W. Welscher, of Rochester, N. Y., formerly with that prince of good fellows, Seth Green. Under Mr. Welscher's management the establishment is on the high road to success, and we Milwaukeeans pride ourselves upon having one of the best, if not the best, fish hatching establishments in the United States. Mr. H. F. Dousman, of Waltham, Wis., a prominent citizen of this State, and largely interested in the raising of brook trout, is Secretary of the Board of Fish Commissioners. Only yesterday the Board, with the Chief Engineer of the City, Board of Aldermen and other prominent citizens of this city visited the house and expressed themselves as highly pleased with the good work that was going on. All feel proud of the step Wisconsin has taken, a step which places her in the front rank with her sister States in the noble science of fish culture.

COREGONUS.

FRESH WATER SALMON.

EDITOR FOREST AND STREAM:—

Your Canada correspondent is much mistaken when he says that salmon will not live away from the sea more than two years. If he will come here I will show him plenty of salmon (*Salmo salar*) three and four years old from California, Bucksport, and Canada eggs, that have never tasted salt water. Our experience is that salmon are more easily raised than trout, will grow much larger, do not require very clear water, and will live in almost any mill pond, and give great sport with a fly.

JAS. B. THOMPSON.

New Hope, Dec. 30th, 1876.

Natural History.

THE BASKING SHARK IN NEWFOUNDLAND WATERS.

THE readers of FOREST AND STREAM are aware that some of the most remarkable curiosities of natural history have of late come to light in Newfoundland. On this island was the home of the Great Auk, which I described in a former communication, and here alone are to be found the remains of this extinct marine bird. The gigantic cephalopod, commonly called Devil Fish, with arms 24 feet in length, first put in an appearance here, and I was the first to obtain a perfect specimen of this huge monster, previously supposed to be fabulous. One of our salmon seems to have nurtured the largest tape-worm yet found in this species, if indeed it be not the only one. I have now to add to the list of our natural curiosities another not less remarkable, namely, a specimen of the Basking Shark, which I had the good fortune to obtain rather recently.

In the month of August last I was informed that an extraordinary sea monster had come ashore at a small village called Topsail, on the southern shore of Conception Bay, and about twelve miles from St. John's. I lost no time in hurrying to the spot, hoping the stranger might turn out to be another Devil Fish. To my intense regret I found that before my arrival the fishermen had cut it into fragments for the purpose of extracting the oil, and thrown parts of it into the sea, which, however, I induced them to fish up for me. Had they only known what a prize they had got, and preserved it whole, they would have realized a very handsome sum by the sale, for this proved to be a splendid specimen of the Basking Shark, of which there are only three specimens in all the museums of the world, and about whose anatomy and habits very little is known. How delighted Professors Verrill and Baird would have been to add this to their collections! The length of the monster was thirty feet. It had got entangled in a salmon net at a short distance from the shore. Two boys paddling about in a boat actually passed over the fish as it lay struggling in the net, unable to use its locomotive organs. A number of fishermen, on hearing the news, soon managed to pass a rope round the tail and towed it ashore, where they at once proceeded to kill it and cut it up. I did the best I could under the circumstances. I bargained for the skull, only half of which, unfortunately, remained, the caudal, dorsal and pectoral fins, and one of the vertebrae.

Though evidently one of the shark tribe, it presented some most puzzling appearances. In its mouth I found long strips of what seemed to be fringes of whalebone along the gill openings; and not being then aware that anything resembling it was found in the mouth of any fish except the whale, I was unable to determine to what species it belonged. I cut out several feet of these whalebone-like fringes, which constituted along each gill a kind of grating, bearing a close resemblance to the teeth of a comb. Their color was olive brown; the laminae I found very elastic, but on bending one or two of them I found they snapped off like steel when bent beyond a certain point. This showed they were not whalebone. But another puzzle presented itself. I found in the mouth long strips of small palate teeth, which were very hard, conical, all curved slightly at the point, in one direction and rather over a quarter of an inch in length. They were arranged very closely together, each strip containing six rows. It was evident that with such teeth and the pectinated structures already referred to, this shark must be a harmless fellow, living probably on small fish or animalculæ filtered out of the

water by his comb-like appendages. When taken it was probably pursuing the shoals of caplin in the bay—a small fish about seven inches in length which, at that time, were in great abundance. The teeth would be quite sufficient to catch and crush these and similar small fry. Whether the fringes are used for keeping the gills clear of floating substances, as the fish feeds near the bottom, filtering the water before it enters the gills, or whether, like the baleen-plates of the whale, they serve to extract from the sea the minute creatures on which it lives, I leave naturalists to determine. Might not these fringes suggest that this shark is a link in the gradation of animals between the whale tribe and the cartilaginous fishes? The skin was whitish and without scales. The lobes of the caudal fin are unequal in size, as is the case in all sharks. I had to content myself with a portion of the skull, the fins, vertebrae, teeth and pectinated appendages referred to. These are now in my possession.

In the standard works on natural history I found but meagre accounts of the Basking Shark, about which, indeed, little is known among naturalists; and I could find no reference whatever in works to which I have access to the fringes or teeth. Lately, however, my attention was drawn to two articles on the Basking Shark, which appeared in *Nature* for August 10th and August 31st, 1876, written by Mr. Ed. Percival Wright and Mr. George J. Allman. These writers have furnished a complete account of this fish, so far as existing knowledge goes, and cleared away my difficulties. From this source I learn that quite recently the British Museum and the Royal Dublin Society have each added a specimen of the Basking Shark to their zoological collections, and that twelve months ago the only specimen in all the museums of Europe was to be found in Paris; so that at present only three preserved specimens of this sea monster are in existence.

In the Museum of Trondheim, Norway, and in those of Christiania, Kiel and Copenhagen, there have been long preserved pieces of the very fringes I have been describing, and they have proved a puzzle to every one who examined them, some eminent authorities believing that they were planted on the outside of the fish's skin, like the long spines of certain rays. The eminent naturalist, Prof. Steenstrup, of Copenhagen, in whose charge one of these fringes was, hit on the right conclusion, guided by an account of the appendages written by Bishop Gunnerus in 1766, and made up his mind that they really belonged to the Basking Shark. He further argues that "they must act as strainers; that the shark takes in whole volumes of minute food, catches it on these fringes and then swallows it. He declares it to be a great mistake to call this fish a carnivore—that is, if he eats flesh at all, it is small flesh, not big flesh." Mr. Wright believes that "these big, lubberly beasts, which in their mouth have scarcely more than the name of teeth, feed on all sorts of minute oceanic creatures, frequently taking in with them floating algæ." Here it is that my specimen seemed to me of special importance, as its teeth do not at all answer this description of Mr. Wright's, being numerous, strong and sharp, more than a quarter of an inch in length, curved like the teeth of the white shark, and quite capable of crushing the smaller fish. I should incline to the opinion that such teeth indicate that the Basking Shark lives mainly or entirely on small fish, such as caplin and lance. At the time when my specimen was taken the whole bay was full of shoals of caplin, rushing in on the shore to spawn; and it seems most probable that it was in the eagerness of its pursuit of these that it approached so near the shore, and got entangled in the net. Such teeth of course quite unfit it for the life of carnage led by the white and blue sharks—those terrors of the tropical seas—so that we may infer it is a peaceable, harmless animal. It remains, however, to be determined what is the special function of the fringes. Steenstrup, as we have seen, considers that they serve to collect its food from the water. Mr. Allman is of opinion that these branchial appendages are strainers by which the water, before coming in contact with the branchial, is freed from extraneous bodies which would otherwise interfere with the function of respiration. "Its teeth," he says, "are little more than tubercles." The teeth of my specimen, however, are far from despicable; so that possibly my discovery may add a new fact to science. "Its food," he adds, "must accordingly be found among the less resisting inhabitants of the ocean; and as the Basking Shark will therefore be driven to feed near the bottom, and among sea weeds, the existence of the branchial appendages admits of an easy explanation. We must thus at once perceive the admirable adaptation of this interesting arrangement to the habits of an animal which would otherwise be subjected to the constant annoyance of having its branchial clogged with the floating fronds of sea weed, a circumstance which the anatomical structure alone would otherwise render more liable to occur in this than in the other sharks, as the openings to the branchial in the *Selachus maximus* are of enormous size, and the branchiostegous membranes particularly loose." I think Mr. Allman's view is strengthened by the character of the teeth in my specimen.

It is very remarkable that so little should be known of the Basking Shark. Dumeril, an eminent French naturalist, stated truly only twelve months ago, that the specimen in the museum of Paris was "the sole representative in the museums of Central Europe of this enormous species of the northern seas." Since then, as we have seen, two other specimens have been obtained. There is no specimen, I am told, in any American museum, a circumstance which deepens my regret at the destruction of the one I have been describing. One hundred and ten years ago Bishop Gunnerus, of Norway, described after a fashion

this great fish, and referred to the strange fringes; but owing to the rarity of opportunities afforded to naturalists of examining the Basking Shark, its anatomy and mode of life are but partially known. Yet these huge sharks are often seen, sometimes in shoals, off the west coast of Ireland gambolling playfully, or basking in the bright morning suns of June. "Of large size," says Mr. Wright, "and shark though it be, it would appear, like many other big animals, to be of a gentle and placid disposition, to be fond of sunning itself on bright days, and to never interfere with mankind, unless when they interfere with it; and yet with all these facts in its favor the animal being, so to speak, common, having local names, being of a size not easily overlooked, and not being like its cousin, the blue shark, a man-eating devil, this *Selachus maximus* was very little heard of and less known until the other day." I dare say one reason of this has been the difficulty of capturing the Basking Shark. Of course it will not take bait, like the white shark, and when harpooned it dives with lightning-like rapidity to such depths that the rope from the boat becomes exhausted, and crew and boat are pulled to the bottom. Hence, though the oil from the liver of one of these sharks is worth £40 sterling, such are the difficulties and dangers of capturing them—greater than those of whale fishing—that men engaged in the sperm whale fishing dread to harpoon them.

Mr. Allman relates that thirty years ago a Basking Shark got entangled in the trammels of some fishermen, and was towed into the strand at Coolmain, on the southern coast of the County Cork. There, however, it met the same fate as overtook my specimen, having been immediately cut in pieces by the country people, with the expectation of obtaining oil from it. It is, however, an interesting fact this huge shark is sometimes seen in Newfoundland waters, and being a good-natured, lubberly sort of fellow, we may hope that another specimen may be persuaded to come ashore in the interests of science. I am not without hope that the portions I have secured may, when examined by a competent anatomist, throw some more light on the structure and habits of this great rover of the deep.

M. HARVEY.

St. Johns, Newfoundland, Dec. 21st, 1876.

ADDRESS OF A. R. WALLACE BEFORE THE BRITISH ASSOCIATION

RISE AND PROGRESS OF MODERN VIEWS AS TO THE ANTIQUITY AND ORIGIN OF MAN.

Concluded.

THERE is one other striking example of a higher being succeeded by a lower degree of knowledge, which is in danger of being forgotten because it has been made the foundation of theories which seem wild and fantastic, and are probably in great part erroneous. I allude to the Great Pyramid of Egypt, whose form, dimensions, structure and uses have recently been the subject of elaborate works by Professor Piazzi Smyth. Now, the admitted facts about this pyramid are so interesting and so apposite to the subject we are considering, that I beg to recall them to your attention. Most of you are aware that this pyramid has been carefully explored and measured by successive Egyptologists, and that the dimensions have lately become capable of more accurate determination owing to the discovery of some of the original casing-stones and the clearing away of the earth from the corners of the foundation, showing the sockets in which the corner-stones fitted. Professor Smyth devoted many months of work with the best instruments in order to fix the dimensions and angles of all accessible parts of the structure; and he has carefully determined these by a comparison of his own and all previous measures, the best of which agree pretty closely with each other. The results arrived at are:—

1. That the pyramid is truly square, the sides being equal and the angles right angles.
2. That the four sockets on which the first four stones of the corners rested are truly on the same level.
3. That the direction of the sides are accurately to the four cardinal points.
4. That the vertical height of the pyramid bears the same proportion to its circumference at the base, as the radius of a circle does to its circumference.

Now all these measures, angles, and levels, are accurate, not as an ordinary surveyor or builder could make them, but to such a degree as requires the very best modern instruments and all the refinements of geodetical science to discover any error at all. In addition to this, we have the wonderful perfection of the workmanship in the interior of the pyramid, the passages and chambers being lined with huge blocks of stones fitted with the utmost accuracy, while every part of the building exhibits the highest structural science. In all these respects this largest pyramid surpasses every other in Egypt. Yet it is universally admitted to be the oldest, and also the oldest historical building in the world.

Now these admitted facts about the Great Pyramid are surely remarkable, and worthy of the deepest consideration. They are facts, which in the pregnant words of the late Sir John Herschel, "according to received theories ought not to happen," and which, he tells us should therefore be kept ever present to our minds since "they belong to the class of facts which serve as the clue to new discoveries." According to modern theories, the higher civilization is ever a growth and an outcome from a preceding lower state; and it is inferred that this progress is visible to us throughout all history and in all the material

records of human intellect. But here we have a building which marks the very dawn of history, which is the oldest authentic monument of man's genius and skill, and which, instead of being far inferior is very much superior to all which followed it. Great men are the products of their age and country, and the designer and constructors of this wonderful monument could never have arisen among an unintellectual and half barbarous people. So perfect a work implies many preceding less perfect works which have disappeared. It marks the culminating point of an ancient civilization, of the early stages of which we have no record whatever.

The three cases to which I have, now adverted (and there are many others) seem to require for their satisfactory interpretation a somewhat different view of human progress from that which is now generally accepted. Taken in connection with the great intellectual power of the ancient Greeks—which Mr. Galton believes to have been far above that of the average of any modern nation—and the elevation at once intellectual and moral, displayed in the writings of Confucius, Zoroaster, and the Vedas, they point to the conclusion, that while in material progress there has been a tolerably steady advance, man's intellectual and moral development reached almost its highest level in a very remote past. The lower, the more animal, but often the more energetic types have, however, always been far the more numerous; hence such established societies as have here and there arisen under the guidance of higher minds, have always been liable to be swept away by the incursions of barbarians. Thus in almost every part of the globe there may have been a long succession of partial civilizations, each in turn succeeded by a period of barbarism; and this view seems supported by the occurrence of degraded types of skulls along with such "as might have belonged to a philosopher" at a time when the mammoth and the reindeer inhabited southern France.

Nor need we fear that there is not time enough for the rise and decay of so many successive civilizations as this view would imply; for the opinion is now gaining ground among geologists that paleolithic man was really preglacial, and that the great gap—marked alike by a change of physical conditions, and of animal life—which in Europe always separates him from his neolithic successor, was caused by the coming on and passing away of the great ice age.

If the views now advanced are correct, many, perhaps most, of our existing savages, are the successors of higher races; and their arts, often showing a wonderful similarity in distant continents, may have been derived from a common source among more civilized peoples.

I must now conclude this very imperfect sketch of a few of the offshoots from the great tree of Biological study. It will perhaps, be thought by some that my remarks have tended to the depreciation of our science, by hinting at imperfections in our knowledge and errors in our theories, where more enthusiastic students see nothing but established truths. But I trust that I may have conveyed to many of my hearers a different impression. I have endeavored to show that even in what are usually considered the more trivial and superficial characters presented by natural objects, a whole field of new inquiry is opened up to us by the study of distribution and local conditions. And as regards man, I have endeavored to fix your attention upon a class of facts which indicate that the course of his development has been far less direct and simple than has hitherto been supposed; and that instead of resembling a single tide with its advancing and receding ripples, it must rather be compared to the progress from neap to spring tides, both the rise and the depression being comparatively greater as the waters of civilization slowly advance toward the highest level they can reach.

And if we are led to believe that our present knowledge of nature is somewhat less complete than we have been accustomed to consider it, this is only what we might expect; for however great may have been the intellectual triumphs of the nineteenth century, we can hardly think so highly of its achievements as to imagine that, in somewhat less than twenty years, we have passed from complete ignorance to almost perfect knowledge on two such vast subjects as the origin of species and the antiquity of man.

HABITS OF MINK.

The account of "The Mink as a forager," by M. A. H., Jr., in your last number, reminds me of a story told by a friend, which happened a few years ago. "We were spending our vacation in the woods of Maine, fishing, and traveling about for a good time in general. One day we came across an old dam made to flood a piece of lowland. As this looked like a good place to fish we stopped, seated ourselves upon the edge of the dam, and cast in our line. The fish were quite plenty, and as fast as we caught one we threw it behind us upon the scaffolding. After a dozen or so had been caught, I thought I would light my pipe, pick up the fish and put them in the shade, and I started to do so. I accomplished the first object, but upon looking for the fish I could not find a single one. I thought that my chum must have removed them, and was playing a joke upon me, but on mentioning it to him he was as much surprised as I was. They could not have fallen through the cracks, nor leaped over the side without our knowing it. Where were they? That was the question. He returned to fish, and I seated myself upon the bank to digest the subject. Presently he caught another fish and threw it upon the boards. Immediately I saw a mink run out from a hole near by, snatch the fish and carry it off. This explained the mysterious disappearance of the others.

Remembering that we should be minus our dinner, and

as the little fellow had already obtained the lion's share, we took care to place the rest of the fish in a safer place."

Cambridge, Mass.

W. M. D.

[We have had lake trout weighing twelve pounds apiece, carried off by minks, and dragged to their holes in the bank, when their size prevented them being drawn in.—Ed.]

MENOPOMA AND MENOBRANCHUS.

NEW HAVEN, January 1st.

EDITOR FOREST AND STREAM.—

Under the Natural History department of the last number of FOREST AND STREAM, was given a cut of "Menobranchus," with a subjoined description of "Menopoma." This would confuse readers not acquainted with the two animals.

R. T. MORRIS.

Correct. The cuts were interchanged by mistake, or carelessness. To remedy the error, and to prevent confusion, we give an illustration of each, with a description of the Menobranchus or Banded Proteus. A description of the Hellbender was printed in our issue of December 28th.

THE HELL BENDER.

The Banded Proteus (*Menobranchus Lateralis*) now to be seen in the Aquarium up town, is one of the most curious and interesting of aquatic animals. As the visitor to the Aquarium will be able to observe its peculiarities of form and structure, no extended description of them is needed. It will be well, however, to direct attention to the peculiar form of the gills, there being three on each side, ramified and fringed, and of a red color, on account of the blood which circulates through them. Dr. Beall invented an ingenious arrangement by which this phenomenon of circulation could be witnessed. The blood discs are of so extraordinary a size that they can be distinguished by an ordinary pocket magnifier while passing through the vessels.

The Banded Proteus is found in Lake Champlain and at the outlet of Lake George. It is also to be found in certain of our Northern inland lakes, where its presence is a bane to the fishermen, since it has a peculiar fondness for the spawns of the white fish. Its movements in the water are usually slow, but, from the size of its tail, it is

THE BANDED PROTEUS.

evident that when occasion demands it can move with great speed. They are said occasionally to come upon the land. Its color is brownish with blackish spots, and its length varies from one to two feet.

Wood, writing of the *Proteus anguinus*, states that at the duchy of Carmiola is a most wonderful cavern, called the grotto of the Maddalina, extending many hundred feet below the surface of the earth, and consequently buried in the profoundest darkness. In this cavern exists a little lake, roofed with stalactites surrounded with masses of rock and floored with a bed of soft mud, upon which the Proteus may be seen crawling uneasily, as if endeavoring to avoid the unwelcome light by which its presence is known. These creatures are not always to be found in the lake, though after heavy rains they are tolerably abundant.

The same writer adds that the discovery of this animal is extremely valuable, not only as an aid to the science of comparative anatomy, but as affording another instance of the strange and wondrous forms of animal life which still survive in hidden and unvisited nooks of the earth.

DOES THE OSPREY EVER TAKE DEAD FISH.—Our correspondent, Roamer, writes us from Portland, saying:—

"In FOREST AND STREAM of December 7th, S. C. C. tells of an Osprey picking up a dead fish. Did not the observer mistake a young eagle for an Osprey? I have never known an Osprey to take a dead fish from the water, even when accidentally dropped from its own talons, and

if this incident occurred as related by S. C. C., is it not an unprecedented one? It would, however, be no unusual occurrence for an eagle to pick up a dead fish, and the bird in question may have been an eagle in the immature plumage that much resembles that of the Osprey or Fish-hawk."

The generally received opinion is, of course, that the Fish-hawk will never stoop to pick up a dead fish even when, as Roamer says, "accidentally dropped from its own talons." We do not think, however, that such an observer as we know S. C. C. to be, would be likely to mistake a young eagle for a Fish-hawk.

SORES ON FISH.

PLYMOUTH, Mass., Dec. 28th, 1876.

EDITOR FOREST AND STREAM:—

Nearly one-half the pickerel caught through the ice in Billington Sea, this town, have sores on them, some being completely covered. Can you give a reason for it? Did you ever hear of it before? This pond is the only one affected. There used to be a smallpox hospital on one of the islands, and some people believe the fish caught it that way. Quantities of fish are taken every year there, but more or less are sick, or at least look so. OBSERVER.

It is impossible to say what the sores may be, as they are not here to look at. Better send them to some competent physician or microscopist. Never heard of fish having smallpox. Mr. Fred Mather tells us that there is a black fish (tautog) in the New York Aquarium that came from a fish car in Fulton Market, which has ulcers on its sides as large as hickory nuts. Such things are not rare in either salt or fresh water, but never heard of a lake where all, as we understand you to say, were affected in this manner. Ulcers and fungus are different. The latter results from an injury. We wish our scientists would look into this matter.

Woodland, Farm and Garden.

FLORIDA LANDS FOR SETTLEMENT.

IN the winter of 1873 the FOREST AND STREAM undertook a thorough and critical survey of the State of Florida, the editor believing from his personal knowledge of the resources of the State and its beneficent climate, that it would eventually, if not immediately, become the chosen resort of agriculturists, pleasure seekers and invalids. Though the very intelligent investigations of Mr. F. A. Ober, first, and of Dr. Kenworthy ("Al Fresco") afterwards, as well as other gentlemen of probity and perspicacity, we were enabled to compile a book of several hundred pages which has been of great service to those whom it was specially intended. Like all other works giving information of like character, its perusal only stimulated a desire to know more; for the simple knowledge of the existence of a source from which information could be drawn, was sufficient in itself to attract the curious to the fountain head. For several years we have answered a multitude of questions from people desiring to visit Florida for health, sport, or settlement, and replying, *ex cathedra*, we doubt if many persons have been misled or misinformed. We are now glad to be measurably relieved from responsibility by an authority much more competent, whose avowed business and duty it is to give all information required. We refer to the "Florida New Yorker," a journal published at 21 Park Row, whose especial mission is to develop the State of Florida, and bring it and the east into juxtaposition and close communion and communication. Foremost among the questions asked of us are those which are categorically answered below—the "cost to go," and the "cost to settle." This cost, the *Florida New Yorker* says, ranges from \$36 75 by several all-rail routes, to \$25, meals included, on the cheapest and most direct steamship routes, all, or nearly all of which, are advertised in the columns of FOREST AND STREAM. Any routes which brings you through New York city will prove as quick and cheap as any other. From Chicago, for instance, money and time will be saved by coming to New York. The paper referred to continues, as quoted:—

"What will it cost to settle? That depends, entirely, upon the means you have in hand to settle with. If you are a poor man, landing in Florida with only a hundred, or a few hundred dollars, you should build a log house. You can live in a tent and be healthy. The poles or logs for building grow on any land you may select. With the aid of a good negro man laborer, (who can be hired for \$15 to \$20 per month), you can cut the logs, skin them, notch and put up the body of a single room house in one week, ready for the roof. The boards can be rived in two days from pine or cypress timber at your door. These can be weighted down with logs laid on top of the rows as they are put on, or nailed on, which is better, and, in the end, cheaper. Flooring can be had at a cost of \$10 per thousand for lumber, generally near you. Sticks for a mud chimney can be got out in one day by two laborers. Another day ought to be sufficient for completing, by daubing with clay to be had a foot or two under the surface.

"This is the rudest and cheapest house. With lumber at \$10, near by, it is easy to estimate what will be the cost of a framed residence with two, four or more rooms. Carpenters are in demand, wages ranging from \$1.50 to \$4 per day. In most localities, lime of good quality can be had by burning the lime rock on the ground.

"How shall I make a living the first year if I have but little money and settle in the woods?" You will have a hard rub of it the first year. If you can get through that year, supposing that you have kept steadily at work, you are all right. Don't attempt too much. Go slow in clearing up land. Better rent land already cleared, if possible. You can thus commence, in February, planting the seeds of peas, beans, tomatoes, watermelons, &c., &c. Successful with these crops, you will get returns from them as early

as May or June. Your sweet potato crop, planted in August, on the lands that have already produced a crop of vegetables, ought to yield you from 100 to 400 bushels per acre. A great many new settlers can be named who have averaged \$100 per acre on watermelons, cucumbers, &c., and 200 bushels of sweet potatoes on the same land, the same season. The young orange trees planted on the same land will not be injured by such crops. It is, really, necessary cultivation for the young grove. In a few years—from six to eight—this grove will be valuable in proportion to the care and skill bestowed upon it.

"If you must settle in the woods and clear up the land, starting in January or February, with the aid of one good hired man, you ought to have five acres cleared, fenced and broken up with the plow, in time to plant one acre in watermelons and one in cucumbers, tomatoes, &c., by the first of March. Then you have until August to cultivate the other three acres in corn. When the fodder is stripped from the corn, sweet potato vines can be planted in ridges thrown up in the middles of the corn rows. The vines planted cost nothing. One bushel of sweet potatoes, bedded in January, the slips drawn in April and every rain until July or August, and planted in rich soil, will make an abundance to plant your entire five acres in August. The two acres in watermelons, cucumbers, &c., well manured and cultivated, ought to bring you \$200 in June and July. The five acres planted in sweet potatoes ought to yield, at the lowest, 500 bushels. It is seldom that potatoes sell for less than fifty cents per bushel, in Florida.

"Now, then, if you have been able to hire your plowing done, you have saved the value of a horse. It is worth what a poor horse will cost to keep him one year. Supposing this course has been pursued and you are able to keep your hired man and plant your five acres in orange trees, two years old, in November, you are then in a position to ask (and very likely to get), from \$500 to \$1,000 for what ought not to have cost you over \$250. The crop raised is that much extra, and should be a support for the next year. With fish of all kinds and game abundant, near you, moss to make the best mattresses hanging on the trees around you, all the material for fencing and building at your door, there is no other climate where nature comes so near providing a good living for the cost of reaching out your hands to gather it. The experience which you have had in battling through the first year, will enable you to live more comfortably on less labor, each succeeding year.

"In the suggestions here given, a thousand industries that will earn any working man a support, are not mentioned. The certain and quick competency from the steady increase of a small stock of cattle, sheep or hogs, the fine openings in hundreds of growing towns for profitable ventures in merchandising, the crop to be reasonably expected, the second and third years from planting bananas, grapes, figs, sugar cane, &c., are all left out, and the hardest case is presented for the first year, to a working man of very limited means. If such a man can live through the first year, he is independent for the others."

The "Florida Land and Immigration Company," of which Col. J. B. Oliver, editor of the paper just quoted from, is general agent, is doing good service in locating settlers and supplying some of the best selected lands at very low rates. There is a great deal of unoccupied land, and the theory is, that the occupancy of a portion at lowest rates, must enhance the value of the remainder to an extent that will seem a fair average price for the whole.

We have been much interested and amused at the ingenuity of a scheme to induce purchasers, of Florida lands, which originated with Mrs. Mattie A. Bridge, a lady who has very high endorsements, and who may be addressed at the office of the *Florida New Yorker*. This scheme is inoculated with the stimulus of chances. Sixty-one tickets are issued to cover a section of good land on the Transit Railroad, any one of which will entitle the holder to an acre, and may secure twenty-five acres, ten acres, five acres, four acres, or two acres. The cost of a ticket is \$10. A section consists of 160 acres. A circular distributed by this lady says:—

"The land is of the best and most productive quality in Florida, much of it being situated upon the margin of the finest lakes in the State, and side by side with orange groves worth \$1,000 per acre, that cost six years ago less the \$5.00."

FRUIT CULTURE.

IT is stated that in some parts of the continent of Europe fruit may be bought at one cent per pound, and if fruit culture were attended to in our country in the same manner, the grateful apple, the melting pear, and the luscious cherry would be within the reach of even the poor man's purse. But so long as the attention of our farmers and landholders is not directed to this in the right way, so long will fruit be scarce and high-priced. In Switzerland, where the land is divided into small holdings, each occupier being the owner, as a matter of course he is always endeavoring to make the most of his plot. All his land, whether pasture or tillage, is planted with tall standard fruit trees, so as to admit of the oxen and plow passing beneath them. Strawberries, currants, raspberries, and other small fruits are not forgotten, but attended to with great care, and even the hedge rows are utilized; and many a bushel of fruit or walnuts is gathered from what would otherwise be waste ground. There the peasants acquire a love for arboriculture while yet at school. A plot of ground planted with an assortment of fruit trees being generally at the disposal of the schoolmaster and his pupils, he will give them lessons on budding and grafting, explain to them the relative merits of the different varieties, and thus impart knowledge into their young minds which generally bears fruit in after life. If some such system were adopted in the schools of our agricultural districts, it would diffuse practical knowledge among the rising generation, the importance and results of which cannot be overestimated. Fruit trees, walnut, hickory, or chestnut look better than stunted elms or alanthus, give as grateful a shade to the weary pedestrian, and put more

money in the owner's pocket, and if this were carried out, in time our unsightly fences and hedge rows would be laden with fruits in their season, and our country landscape be a garden indeed.

THE NEW YORK HORTICULTURAL SOCIETY.—The annual meeting of the New York Horticultural Society was held in its rooms, West Thirty-third street near Broadway, the President, Mr. John Henderson, in the chair. After the preliminary business was transacted, the report of the Treasurer for 1876 was read, showing a balance on hand of \$495. Though rejuvenated only twelve months ago, the roll of membership shows nearly 300 names, which the society confidently hopes to more than double during the current year. It was decided that in future at the regular monthly meetings, special exhibitions of rare plants, flowers and fruits be held, a schedule of prizes for which was read by the Secretary. These meetings are free, and to them the public are cordially invited. And now that the society has got thoroughly organized, at each meeting a paper on some subject connected with horticulture will be read and discussion thereon invited. Last year's exhibition at Gilmore's Garden having proved a decided success, two large exhibitions will be held this season in some suitable hall in May and September, for which schedules of premiums amounting to over \$2,500 are already issued, and can be had by any one interested on application to the Secretary. In addition to this a splendid exhibition of roses and strawberries will be held in their rooms on the 26th of June. The election of officers for the ensuing year resulted in the choice of the following gentlemen: President, John Henderson; Vice Presidents, Peter Henderson, James M. Paterson, R. B. Parsons, and S. B. Parsons; Recording Secretary, Wm. J. Davidson; Corresponding Secretary, James Y. Murkland; Treasurer, Isaac H. Young.

ORANGES AND LEMONS INDIGENOUS TO FLORIDA.—According to a map dedicated by Michael Lok, citizen of London, to Sir Philip Sidney in 1524, republished in a volume of the Hakluyt Society's works, Florida extended from the Hudson river south to Cape Florida. It has been stated by some writers that the orange was not native to Florida, but that it was introduced by the Spaniards, but in 1563, in Hakluyt Society's Publications, gives a list Jean Ribaults, in his description of a voyage to Terra Florida of the natural productions of that region, among which oranges and lemons are enumerated.

CHRYSANTHEMUMS.—ED. FOREST AND STREAM.—Please tell me what varieties of Chrysanthemums you consider best for early fall flowering. My varieties have almost all run into a dirty pink color, and I would like to get a few distinct colors that I can depend upon, preference being given to the Pompon varieties.

We name over a dozen of those varieties we consider really good sorts in their respective colors. There were some very fine newer sorts exhibited at the November meeting of the N. Y. Horticultural Society, but they have not been sufficiently tested out of doors yet: *Aurora*, orange; *Criole*, cinnamon; *Bob*, dark chestnut; *Boule Blanche*, white; *Canrobert* and *Stella*, yellow; *Mad Dumage*, pink; *Iffigenia*, rose; *Prince Albert*, fringed white; *Rui des Lilliputs*, purple; *Surprise*, white with rosy tips, and *Marabout*, light blush.

FARMING IN FLORIDA.

PICALANTA, Dec. 18th, 1876.

EDITOR FOREST AND STREAM:—

While Florida has never been noted for the richness of its soil in general, yet between Jacksonville and Palatka, east of St. John's river, plenty of good farming land may be obtained on easy terms from \$7 to \$75 per acre, according to location. The Orange is undoubtedly a good paying crop; trees selling from \$25 to \$45 per 100, and if planted judiciously, proper treatment being shown them, at the end of the fourth year you will realize that your investment has been a paying one. Meanwhile the cost of living can be defrayed by the cultivation of Fruits, Vegetables, etc., the Strawberry being pre-eminent, selling readily at 35c. per quart, being a rapid and abundant grower, requiring but little attention. The returns from this crop alone have netted me more in cash this season than, I venture to say, most of your tradespeople have netted during the entire year, and without half the care or anxiety. The salubrity of the climate is universally acknowledged by thousands of invalids who have come here to escape the rugged winters of the North. I would not, as a rule, advise tradesmen to come here, but of farmers there is a scarcity. With \$1,000 a good practical man, one that is not afraid of hard work and plenty of it, can make more money in five years than most of your farmers North in seven. Chances for failure of crops are very few, if any. A farm properly managed yielding an abundant harvest, and ready markets for the product. Our forests and streams abounding in game and fish, make it at once the farmers' arcadia and the sportsman's paradise.

Very truly,

ALEX. WINCHESTER.

COLD WEATHER IN SOUTH CAROLINA.

PORT ROYAL, Jan. 3d.

EDITOR FOREST AND STREAM:—

After mature deliberation I have concluded that Greenland's icy mountains—having started to invade (West) India's coral strand—have become stranded off the Carolinas, and sincerely hope that they may soon be set free and move on to their destination. On no other hypothesis can I account for the present long continued frigidities which as yet shows no signs of abatement. I am looking for the Arctic Owls every day.

Seriously, three or four common winters have been boiled down into the one month of December, '76, and if the weather only keeps on so we shall have skating before long. I shall look with interest for your reports from Florida. The cold and rough weather has kept me at home, and I can only report that rabbits, opossums and partridges are plenty. I keep a few steel traps set for the

former, with good success. I venture to predict that parties coming South now will be greeted by a warm and open spring. In spite of the cold weather my Orange trees remain unscathed, but of the fruit left upon the trees a large portion has suffered. As a rule, it is not safe to allow our Oranges to remain unpicked after the middle of December. To get them at their best they should be gathered the last of November, carefully packed away in chaff, dry moss or cotton, and eaten in the months of February and March. I have kept them in this way as late as the month of May.

RUSTICUS.

—The annual dinner of the New York Horticultural Society took place on Tuesday evening, at Mouquin's restaurant, 141 Fulton street. The table was magnificently adorned with choice and rare flowers. Next week we shall speak of it at length from an æsthetic standpoint.

DAMAGE TO FRUIT IN FLORIDA BY FROST.—The *Florida New Yorker* says:—

"It has been a matter of near a month's anxious inquiry to learn through the Florida papers, as well as diligent private correspondence, the exact amount of injury sustained by this unprecedented spell of weather. Beyond the killing of very young trees in certain sections of the State and partial injury to fruit and the shedding of the foliage, no very serious loss has been sustained. To be able to make this report will be worth thousands to Florida. It may be fifty years before such an extraordinary weather report shall be registered again."

—A. R. Whitney, Franklin Grove, Lee County, Ill., the most extensive orchardist in the West, has marketed 2,000 bushels of winter apples the present season, and gathered over 20,000 bushels of cider apples from his own orchards. He also purchased from 10,000 to 15,000 bushels of apples from his neighbors. He has already made 2,700 barrels of cider, and his presses are still running. From his apple pomace he has washed out 45 bushels of apple seed, and will save pomace enough to feed all of his stock for the entire winter.—*Turf, Field and Farm*.

—P. A. Stine, a viniculturist of Kern County, Cal., has adopted the following simple and successful plan of curing raisins in the sun: The bunches are plucked, dipped into hot lye, and placed upon board platforms in the sun. There they remain from ten days to two weeks, being turned meanwhile two or three times, when they are taken down and packed ready for shipment to market. The dipping in hot lye is for the purpose of killing the ova of insects already deposited and preventing further deposit during the drying process, which it effectually does, and also for the purpose of rendering the skin tender instead of leathery, as some varieties are apt to be. There is thus no danger of the raisins being devoured by worms after they are packed.—*Stockton Independent*.

A FLOWER A YARD IN DIAMETER.—On some of the East India Islands, where so many queer things grow, is found a flower that measures a full yard across; yet it has only a cup-like centre, and five broad, thick, fleshy petals. Seen from a distance, through the dark-green leaves of the vines among which it grows, the rich wine-tint of the flower, flecked with spots of a lighter shade, is said to impart a warmth and brilliancy of color to the whole surrounding scene; but, the nearer the observer comes—all eagerness to see more closely so wonderful a flower—the less does he like it. Not that the color is less beautiful; but who cares for beauty in human beings, when its possessor is malicious, disdainful, or untruthful; and who cares for beauty in a flower, when the odor is disagreeable? So, notwithstanding its proudly brilliant color and its great size, the *Rafflesia Arnoldia* will never be admired, for we are told that its "odor is intolerable, polluting the atmosphere for many feet around."—*Saint Nicholas*.

—We still hold that chestnut trees may be, and have been, transplanted with as great success as the apple, pear, plum, peach, and cherry. Give them the same preparatory manipulations in the nursery, and there will be an abundance of lateral and fibrous roots either upon the young or old trees. Chestnut trees sent out from the nurseries may be injured during transit, and when planted out barely live, remaining sickly and feeble until finally they die, just as apple, pear, and other fruit trees have done in thousands of instances; but this is no good reason for placing the chestnut among trees difficult to transplant and make live. We happen to live in a region where chestnut trees abound, and we have also had considerable experience in transplanting seedlings from the nurseries and trees from the woods, consequently our conclusion in regard to the facility with which the chestnut may be removed is not founded upon theory, but upon practical experience.—*Moore's Rural*.

THE CHESTNUT.—If farmers, a dozen or more years ago, had planted a dozen or two of chestnut trees, they would not take hundreds of dollars for them now. They would have furnished them from a peck to a bushel of chestnuts per tree this past fall. They would be an ornament to the homestead, that only years of growth could reproduce. A man in a year can build a fine house and outbuildings, but God builds trees, and takes years and scores of years to do it. Man cannot build them. He can plant them when small, and they will yearly grow in strength and beauty. One of the most beautiful sights in nature is a beautiful, symmetrical chestnut tree, loaded with its creamy-white blossoms. We have seen acres and acres of them, and stood and admired them by the hour. Every farmer could have these scattered about his homestead, and his children and grandchildren would take the greatest delight in gathering the nuts from them.

Chestnut trees are a little treacherous in transplanting, but we transplant them by the hundred, yearly, and always with success. The trees can be grown from the nuts by farmers. Procure nut that have been permitted to ripen pretty well on the tree. They may then be put away for a few weeks, and then mixed with dry sand and put in a box and nailed up to exclude mice, and buried out doors till spring, when they may be planted. Most nurseries have the trees, and the quickest way to get them is to procure them from the nursery, three or four feet high. Chestnut makes excellent timber for rails, splitting easily and straight, and being very durable. It is also used in making furniture, the inside work of passenger cars, steamboats, &c. It prefers a rather dry soil, and on knolls and ridges anywhere in the west and south will do well. We urge readers to plant trees, nut-bearing trees as well as fruit trees not only to adorn, but to increase the comforts of home.—*Rural Home*.

THE CORNELL CHALLENGE.—Mr. J. N. Ostrom, Captain of the Cornell crew, writes a letter to the *Herald* announcing officially that the Cornell Navy is in receipt of formal refusals in answer to the challenges sent to the University Boat Club of Oxford and Cambridge. Oxford's reasons for declining is: "It would be impossible to get a really representative crew together during our long vacation." Cambridge gives several reasons, the first of which is the same as that stated by Oxford; second, "By accepting yours we lay ourselves open to innumerable challenges, which we should be quite unable to meet;" third, "It has hitherto been our invariable practice to row against no other university than Oxford." The letter closes as follows: "If it should not be inconvenient to you to enter for the annual Henley Regatta we can insure for you there not only competition with the best English eights, fours and pairs, but a hearty welcome." Inasmuch as Oxford and Cambridge enter crews in this regatta there is still an opportunity for Cornell to row the English universities. Such an undertaking, however, is out of the question, inasmuch as the Henley Regatta takes place in June, about commencement week. For this reason the crew could not expect to arrive in England more than a day or two before the race, and, under such conditions, defeat would be inevitable. Capt. Ostrom goes on to say: "It seems highly probable from this that no American university will ever succeed in making a race with Oxford or Cambridge without sending a graduate crew to the Henley Regatta. In this way the oarsmen could go over early enough to secure the practice which would be absolutely necessary in order to make their chances of success equal."

DAUNTLESS BOAT CLUB.—At the regular monthly meeting of the Dauntless Boat Club, held Wednesday evening, Dec. 5th, 1876, at Grand Union Hotel, the following officers were elected for the ensuing year:—

O. H. Collin, President; M. Freeborn, 1st Vice President; O. J. Conklin, 2d.; W. R. Morse, Secretary; J. H. Redfield, Treasurer; B. M. Loutrel, Captain; W. J. Demarest, Lieutenant; O. H. Collin, H. W. Walter, and F. Gillean, Trustees.

This club will give an amateur minstrel entertainment and reception on Friday evening, January 12th, 1877, at Lexington Avenue Opera House. They will be assisted by Messrs. Smith, Chas. and Geo. Bramhall, Hobbie and Meigs, of the Argonauts; Messrs. Newton and Johnson, of the New York Athletics; Mr. Gunther, of the Nassau, and others, and it will be a very enjoyable affair.

A BOAT CLUB'S WEALTH.—The trustees of the Seawanhaka Boat Club have filed with the County Clerk a report of the club property as follows: Eight-oared barge, \$350; four-oared shell, \$200; ditto, \$100; two gigs, \$250; chairs, tables, lamps, etc., \$100; two-story frame boat house, at mouth of Jack's creek, Long Island City, \$4,000; total, \$5,000.

—It is believed that Columbia, Cornell, Princeton, and other colleges in the Middle States will form a Rowing Association in opposition to that formed by the colleges of the New England States. An attempt will be made to include the Naval Academy and West Point cadets in the association.

—Ed. Hulton, who won the single scull race at the Centennial regatta, has published a challenge dated Toronto, Jan. 4th, to William Scharff, of Pittsburg, offering to row him on Toronto Bay for from \$500 to \$2,000 a side, allowing him a fair amount for his expenses, the race to take place early in June.

OCEAN FIREWORKS.—The Victoria, from Glasgow, was riding out a heavy westerly gale about half-way across the Atlantic on the 18th inst., when, at six in the evening, the atmosphere improvised a rich display of phosphoric fireworks. Balls of glowing red fire the size of a man's fist danced upon the yards and stays, and as they fell exploded in mid air with a snapping report. They chiefly alighted upon the ends of yards, at intervals of a foot, though likewise favoring the centers, and at times the vessel had the aspect of being decorated for a first-class festival. One of the balls burst close to the nose of Mr. Theodore Knox, the chief officer, and for a moment blinded him. The noise was like that of a pistol discharge. No debris struck the deck, and no smell was created. The balls were atmospheric and impalpable. They are generally forerunners of a gale.

Rational Pastimes.

THE FATAL GLOVE FIGHT.—It will be remembered that at a recent glove contest in Boston, one of the contestants was so bruised or stunned that he died shortly afterwards. At the autopsy it was stated that his death was the result of organic disease of the heart, but this is what a correspondent writes us regarding the matter:—

EDITOR FOREST AND STREAM:—I want to place before you the facts in the recent so-called "glove contest" at Revere Hall, Boston, wherein one of the contestants was, shortly after the failure to come to time, quite dead, in spite of medical attendance. I was the only M. D. present at his case, being called just as soon as the spectators mistrusted that all was not right with the man. I found him exhausted, and with marks of external head injuries, especially on the left side. His heart, though irregular and overtaxed, gave no sign of existing disease. Now, though the inquest managed to discover organic disease of the heart, the M. D. making the autopsy did not so define what he found in detail. I would suggest that always some regular physician be present in future, if such exhibitions be allowed, to prevent the "fighting down" of any man beyond a technical standard not involving health.

SKATING.

Fancy dress carnivals on the skating lakes are now in order, the ice being very favorable for the purpose, as it is nearly a foot thick and will bear an immense crowd. One of these parties was named to take place at the Capitoline Lake on January 10th—the day we go to press—which promises to be a very attractive entertainment. The first time these carnival masquerades were ever given at a skating rink in this country was in February, 1862, when the Union Pond, Brooklyn, was the scene of a festive gathering of the kind which attracted about ten thousand people. On the Capitoline Lake the water is not over a foot deep, and the ice is now ten inches thick and will bear ten thousand people if necessary.

—The attendance at McMillan's fashionable Windsor Skating Rink on Madison avenue was numerous the past week. There is some talk of devoting one night this month to a carnival—a sort of exclusive subscription affair.

—The ball has been up at the Skating lake at Prospect Park for several days of the New Year, but the rain on Saturday interfered with the sport.

BASE BALL.

The Athletic Club of Philadelphia is being organized as an anti-League club under auspices which promise to enable the club to take its old prominent position in the championship arena. Hicks Hayhurst is to be club manager, and honest Al Reach the field captain. Under such management no suspected men will be allowed to enter its team. The nine as spoken of will include Bennett, the fine catcher of the Neshaunks, of Newcastle, Devlin as pitcher, Fesler at first base, Reach at second, and Meyer at third, with Fulmer at short field, Outhbert at left, Senderfer—the Count—at centre field, and Coons at right field and as change catcher. If Bennett can support Devlin's pacing delivery this team will play a very strong game. The Athletics will charge but twenty-five cents admission to their games this season. Al Wright, who has done the club such faithful service so many years, is to be the Secretary.

ANNUAL CURLING BONSPIEL BETWEEN NORTH AND SOUTH FOR THE DALRYMPLE MEDAL.—For the seventh time this match, which ranks among the most important events of the curling season, has been brought to a happy termination. The champions of the North and South of Scotland met on Wednesday last on the Central Park pond to contest for the Dalrymple trophy. There were many obstacles in the way of the match, arising chiefly from the unprepared state of the pond, but the zealous curlers had succeeded in removing them all before the arrival of the eventual day. After the game began the spectacle on the ice became one which can only be witnessed once a year. There were in all eleven rinks composed of eighty-eight players, and what with their strange gestures, curious shouts and jokes, they presented a scene well worthy of a visit. The peculiar cries or orders of the skips sounded strangely to American ears, but the universal good humor was something which all could appreciate. The game lasted for about four hours, and when Mr. John L. Hamilton, the Umpire and President of the Grand National Curling Club, announced the result, victory was found to be on the side of the North. The following is the score:—

NORTH.		SOUTH.

Majority for North, 27.
The result is made all the more interesting by a glance at the history of the match. Seven games have, as intimated above, been played for the medal. Of these the South won six, so that this is the first occasion upon which the North has carried off the trophy. Besides this, the North also won the two subsidiary prizes, the flag and Kirkpatrick medal, awarded respectively to the skip making the highest score, and the skip beating his opponent by the greatest number of points. Although the South had previously, with monotonous regularity, taken the leading prize, it had never succeeded in walking away with all the honors. The result was regarded by both victors and vanquished as

entirely satisfactory, and the banquet which followed the match was characterized by all manner of jollity and mirth.

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

FOX CHASE.—A correspondent recently asked us where he could procure a copy of Everhart's poem "The Fox Chase." The book is published by Messrs. Porter & Coates of Philadelphia.

E. W., Old Westbury, L. I.—Do you think W. & C. Scott & Son's \$100 breech-loading guns good for ordinary land and water shooting? Ans. Certainly; as good as any guns made for the same money.

J. H. S., Brooklyn, L. I.—Will you please inform me when the season closes for rabbit shooting in this State? Ans. No general State law. Rabbits cannot be killed on Long Island after January 1st.

SUBSCRIBER, Boston.—Your dog has diabetes. Give him the following: Gallic acid 1½ drs., powdered opium 10 grs., powdered gum Arabic 1 dr.; mix and make into 24 pills, giving three each day.

F. and L., Brooklyn.—When the end of a setter dog's tail is merely cut off without pulling out any cord or muscle will it stand out straight, or will it do otherwise? Ans. A setter's tail should not be cut, if at all, until he is nearly grown. Then if properly done it will stand straight without regard to pulling out cord or muscle. But many dogs who carry their tails crooked or bent straighten them in the field.

A. B. H., Peasedale, R. I.—My setter has piles. Can he be cured? He is a great pet and I should hate to lose him. Ans. Procure the following ointment, and apply morning and night: Compound gall ointment 1 oz. Give the most simple food, say oatmeal or rice and milk, with a little boiled liver occasionally, as it acts as a laxative.

G. R. W., St. James, Missouri.—Can you advise any treatment that will prevent dogs' feet from getting tender while hunting rough ground? Ans. Soaking them in alum water or brine will harden them, but regular exercise will keep the feet in proper condition.

TOR SNAP, Cazenovia.—What is the fare to Jacksonville, Florida by water, sailing vessel and steamship? Ans. By sailing vessel, \$15, by Fernandina line, \$20; by steamer via Charleston or Savannah, \$27.50; excursion ticket \$50.

R. G. C., Jackson, Nebraska.—Will you please answer in FOREST AND STREAM, how severe frost have they had at Tampa, Fla., this winter and has it damaged orange trees to any considerable extent? It is said here that they had the heaviest frost for forty years, and oranges are killed to the ground. Ans. A few flakes of snow fell in Tampa and the thermometer fell to 24° Fah. Very little damage was done there. See editorial elsewhere.

W. P. P., Greensburg.—In the number of FOREST AND STREAM for August 17th, 1876, is an article headed "Colleges and Their Training," which speaks of a book on the subject by H. W., Fothergill, Eng. Can you inform me how to procure the book? Ans. Write to editor London Field, 346 Strand, London, Eng. We have never seen the book here.

R. M. S., Nelles* Corners.—Where can I get the best double-barrel breech-loading shot gun for say \$50? Ans. It would be unjust to the many eminent manufacturers who advertise in our columns for us to discriminate between their guns. You must examine and judge for yourself.

C. C. P., Baltimore.—I have a bull terrier that is sore and mangy at the end of his tail. You will oblige me by letting me know what to do for it in your next paper? Ans. After washing your dog thoroughly with carbolic soap, make an ointment as follows: Take 2ozs Basilicon ointment, 1oz. flour of sulphur, and spirits of turpentine enough to make an ointment of the proper consistency to be well rubbed into the parts affected.

X. Y. Z., Boston.—I have a setter, and he has a double or split nose. I would like to know if it is a separate breed, or if you ever heard of setters having a split nose. Ans. We consider the split nose a decided objection in either setter or pointer, but particularly in the latter as indicating impurity of breed. It probably originated with the old Spanish breed of pointer, and now crops out occasionally where there is mixed blood. If it were merely a freak of nature, as some contend, it could not be transmitted or reproduced as it undoubtedly is where dogs possessing it are bred from.

E. W. F., Wethersfield, Conn.—1. Can you inform me if Saltus' Dash prizes were first or second? 2. Has Bonnet Carrie ever been exhibited; and do you consider her an extra fine animal? 3. How many years back does Plunkett's pedigree extend? Ans. 1. First. 2. No; she is a remarkably handsome and well bred bitch. 3. Plunkett was by Beauty, he by Tim, he by Rover, he by Ranger, he by Rattle, further on the sire's side the K. C. S. B. says not. Plunkett's dam was Grouse, by Hutchinson's Bob. Bob was born in 1859, and his pedigree is given for three generations; how many years it extends we do not know.

GILL, New Castle, N. Y.—1. Can I breed quails from a trio I have? 2. Where can I buy live quail? 3. I generally bag two-thirds of my birds; am I a good shot? 4. Define a pot-hunter, and to what class does he generally belong in society, morals, etc.? Ans. 1. Probably not in confinement; turn them out in the spring and they will breed. 2. Live quails are frequently advertised in our columns. Messrs. Whitney & Morris, No. 228 Washington street, this city, generally have them. 3. Yes, better than the average. 4. A pot-hunter is one who hunts for profit and not for sport, but as long as such obey the laws and do not shoot out of season we cannot see how their morals or social position can be affected by their calling.

E. J. R., Westfield, Conn.—The distemper has left my Pat with a very sore eye; the flesh is raw all around it. I had a dog run over several weeks ago, and I think that the bone on the top of his head is cracked, and about every other day a bunch forms about as large as a hen's egg, and discharges bloody matter. What would you advise me to do for them? Ans. We should recommend a dressing of carbolic salve around the eye; it is cooling and healing. For the wound on top of the head first apply a flaxseed poultice, and afterwards, if the wound appears painful, wash with a weak solution of sugar of lead and powdered opium, applied warm.

JUNIPER, Searsdale.—We have given a large number of recipes for waterproofing boots. A new one, given in the London *Gazette*, is as follows: Take 1 pint of drying oil, 2oz. yellow wax, 2oz. spirits of turpentine and 1oz. Burgundy pitch—the hard materials melted over a slow fire, and the others added and well mixed. Rub this mixture on the boots at a distance from the fire, repeatedly, until the leather is saturated. Common black pitch was found equal to the Burgundy, and rather better. It is probable that other variations might be made without detriment, provided a proper consistency is maintained in the mixture of the oils, wax and pitch. The boots do better to dry three or four weeks after being treated with the composition, than to use them while it is fresh. Will some of the readers of the FOREST AND STREAM give this composition a trial and report the result?

F. R., Allentown, Pa.—1. Do you think the country lying between the Platte river, in Nebraska and Arkansas river, Kansas, in the Western part, will be populated very much in about three years? 2. Do you think the large quantities of game which abounds there at present will last yet for many years? 3. Please name all the large game, small game, feathered game and fishes which abound there. 4. Which is the best agricultural country, that lying north of the Smoky Hill Fork or south? 5. When would you advise me to go out there? Ans. 1. Probably not. 2. The buffaloes are almost all gone now, and the antelope are being rapidly exterminated, especially in the northern part of the section to which you refer, deer and small game will, of course, last longer. 3. We have not space in this column for such a list as you request. 4. Not much difference in the immediate vicinity of the Smoky; 5. What do you want to go for? To settle or to hunt? If the former in spring; otherwise late summer or early autumn is the time.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOLENT IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

* * * Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, JANUARY 11, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

Trade supplied by American News Company.

CHARLES HALLOCK.

Editor and Business Manager.

OUR LADIES' DEPARTMENT.

IN starting this journal our avowed mission, as printed in its prospectus, was "to inculcate in men and women a healthy interest in out-door recreation and study." While we have had many lady readers from the beginning, and many lady contributors, some of whom are qualified to take positions in the front rank of sportsmen; and while we have catered, to some extent, to the wants and requirements of women who seek health and bloom in the open air, we have never set aside any special department for their service. This we now propose to do. We have secured the aid of a popular and competent lady journalist, whose salutatory to her sex will be found under its proper caption, and we earnestly beg our ladies to lend us their countenance and assistance. Our "Women's Department" at the Centennial showed what they can do in technology. But it did not show what a benign and wholesome influence they can exercise upon their husbands by becoming partners in their pastimes and exercises as well as in their bed and board. The FOREST AND STREAM is read much in the Home Circle. Now, with the additional attractions which we give it, let it become more and more a delight and household word. By ingratiating the women we secure the alliance of the men. Women have a noble part to perform in this life, and upon their noble conduct, character and influence the nobility of man depends. So thinketh

THE EDITOR.

AROUND THE WORLD.—We have received the preliminary announcement of a proposed Scientific Expedition around the world, which has for its objects the study of Architecture, Archaeology, Geology, and the Fauna and Flora of new and little known localities. A full scientific corps will accompany the expedition, and the steamer will be fitted with every appliance for safety, comfort and instruction. Should the projectors succeed in organizing their expedition, we shall notice it at greater length. Information can be obtained by addressing Jos. O. Woodruff, Indianapolis, Ind.; Prof. W. L. B. Jenny, Chicago, or Prof. J. B. Steele, University of Michigan, Ann Arbor.

SIMPLE METHOD OF COMPUTING INTEREST.—Multiply the principal by the number of days and divide the product—for 5 per cent, by 7,200—for 6, by 6,000—for 7, by 5,143—for 8, by 4,500—for 9, by 4,000—for 10, by 3,600.

AGRICULTURE—THE IDEAL AND REAL.

"I LOOK upon the pleasure which we take in a garden as one of the most innocent delights in human life. A garden was the habitation of our first parents before the fall. It is naturally apt to fill the mind with calmness and tranquility; and to lay all its turbulent passions at rest. It gives us a great insight into the contrivance and wisdom of Providence, and suggests innumerable subjects for meditation."—ADDISON.

There was a time, in the good old days of our country, when people saw health, happiness and respect in an agricultural life; but now that it is reduced to one of the most scientific pursuits it has to go begging for men of brains, while the other professions and callings, most or them much less worthy of attention, are crowded to overflowing. The spectacle of a stalwart farmer plowing, and a delegation of men calling him to abandon his work and rule the people is a beautiful picture of the past. Cicero mentions several of those cases, not then uncommon; our own historians tell us of others. Is it because our farmers to-day are not in sympathy with their work? or is it because amid the excitement of cities, the wonderful inventions, people being shot rapidly from city to city with little chance to see what sort of a being a farmer is—is it because amid all these we lose sight of agriculture that it does not occupy its true position?

It is a well known fact that if a farmer's son manifests talents a little above the ordinary run of farmers; if he can manage the stock more successfully; if he has longings for intellectual culture, he is regarded as too good for the farm; the town and a profession must possess him, while his brother, an unambitious, lazy country lout, would rather pursue the dull routine that he has gone through than take the trouble to try something new. Horace Greeley said on the subject:—

"Is agriculture a repulsive pursuit? What has been called farming has repelled many of the youth of our day, I perceive, and I glory in the fact. An American boy who has received a fair common school education, and has an active, inquiring mind, does not willingly consent merely to drive oxen and hold plow forever. He will do these with alacrity if they come in his way; he will not accept them as the be-all and end-all of his career. He will not sit down in a rude, slovenly, naked home, devoid of flowers, and trees, and books, and periodicals, and intelligent, inspiring, refining conversation, and there plod through a life of drudgery as hopeless and cheerless as any mule's. He has needs, and hopes, and aspirations which this life does not and ought not to satisfy. This might have served his progenitor in the ninth century; but this is the nineteenth, and the Young American knows it."

And hence it is, that, while the best minds of the country come to the city to reinforce us, they leave the farms to the management of men who see nothing of the sacredness of their work, whose chief idea of a farm is so much food and drink. The tendency of the times is to reject manual labor, and those business men who live nearest the cars are regarded as the most fortunate.

Speed, at present, is everything. Now if a man could, by turning a little wheel, plow acres upon acres in a day; if crops grew and matured in a week; if one could watch the growth of vegetation in a day; if all work could be done by steam, there is no doubt that thousands would flock to the side of agriculture. We might see horse-jockeys standing, stop-watch in hand, and betting on the growth of a cabbage. But alas! these things are not so. There is, perhaps, the least excitement in an agricultural life of any manner of living; in fact it is "behind the times."

One of the most powerful objections to agriculture is urged in the fact that it does not pay; that ideal farming and air castles are one thing, the reality another. Greeley again says:

"Most men are born poor, but no man who has average capacities and tolerable luck need remain so. And the farmer's life, though proffering no sudden leaps, no ready short-cuts to opulence, is the surest of all ways from poverty and want to comfort and independence. Other men must climb; the temperate, frugal, diligent, provident farmer may grow into competence and every external accessory to happiness."

Young rattle-brains once said he would like to be a farmer well enough, if he could live in the city. Horace said (not Greeley):—

"Is there any place where envious care less disturbs our slumbers? Is the grass inferior in smell and beauty to the cold pavements? Is the water, which strives to burst the lead in the streets, purer than that which trembles in murmurs down its sloping channel? Why do people nurse vines along the columns of the city? and why is that house commended which has a prospect of distant fields?"

Another fellow of the class mentioned above in triumph discovered that Horace Greeley bought a hog for five dollars and sold it for three, and he gave it forth to the world as proof positive that farming "didn't pay." Of course it was accepted by the world at large; but the investigator finds that she brought him in no less than seventeen dollars through numerous offspring.

Many men look with less disgust on a man stained with political treachery or corrupt morals than they do on a man stained with the pure soil and honest elements. If a young man has been highly educated, and proposes to be a farmer, the relations and friends immediately exclaim with great clamor, "What! throw away all that education, and be a coarse, rude farmer? Destruction hath overtaken us!"

They, of course, differ with Cicero when he says: "I am excessively delighted with the pleasures of husbandmen, which are not checked by any old age, and appear in my mind to make the nearest approach to the life of a wise man." It is not necessary, then, that a man should be rude, uncultivated and of no intellect, when he has

chances for study and improvement that few men enjoy; the long winter—just the time he may devote to culture—while with granaries full, health, happiness, independent, he may compare with satisfaction his own lot with that of striving humanity in general. Lord Francis Bacon said, "Indeed it is the surest of human pleasures; it is the greatest refreshment to the spirits of man. Man shall ever see that, when ages grow to civility and elegance, men come to build stately sooner than to garden finely, as if gardening were the greater perfection."

But until the popular idea changes, until men look on work as a blessing and not as a curse, when the farmers themselves take advantage of their opportunities—not until these things begin shall agriculture take its true position. A young man must not, however, rush suddenly into farming with the idea that previous education is unnecessary, and that it does not take brains, for if he does he must look well to his bank account. It is just this fact that enables smart men to succeed. Happily, under the influence of our agricultural schools and a growing favor for agriculture, we may hope that before long "the good time coming" will cast into insignificance "the good old times," and men will not be afraid to be healthy and happy. Perhaps then we may see many such peaceful scenes as men love to gaze on. Edward Everett describes one of them:—

"The well filled wagon brings home the ripened treasures of the year. The bow of promise fulfilled spans the foreground of the picture, and the gracious covenant is redeemed, that while the earth remaineth, summer and winter, heat and cold, and day and night, and seed time and harvest, shall not fail."

ANGLING IN ENGLAND AND AMERICA.

Mr. Francis Francis, in the preface to his "Book on ANGLING," tells us that "when first infected with the fever of angling, my ambition was to catch every species of fresh water fish, from the minnow up to the salmon, which inhabits our British waters."

This would be easy enough to do, in a small territory like England, containing not over twenty species of fish which can be coaxed to take bait; but how would the American angler succeed in such an enterprise? He would have to travel from Florida to Alaska, and from New York to San Francisco, a region containing several millions of square miles of territory, and according to the latest writers more than one hundred species of fish which can be taken with the hook—a moderate estimate, since there are fifty species of salmonidæ in the United States already described. A long life industriously devoted to this pursuit would hardly suffice. The present writer has been an angler for over fifty years, and has fished in sixteen States and Territories, but thirty species of fish are all that he has captured in our fresh waters. Now, if Mr. Francis is able to write a volume of four hundred and twenty-nine pages on the fresh water fishes of Britain, what libraries would he compose if he had our Ichthyofauna to describe? There is an immense field for American writers upon this subject, although some excellent books has been written within the last ten or fifteen years. Fifty years ago the only work to be found by the young angler was that of Isaac Walton, which indeed is the book of books—guide, counsellor and friend—and can never be out of fashion, any more than Shakespeare himself. Then comes Sir Humphrey Davy's Salmonidæ, and the inimitable sketches of Professor Wilson in Blackwood's Magazine; and later we have the works of Dr. Smith, Herbert, Morris, Roosevelt, Genio Scott, Brown, Gibbs, Hallock and Prime, besides many charming papers in the sporting journals.

Mr. Francis, ten years ago, wrote as follows about Salmon Fishing in Norway, which some late writer describes as superior to that in Canadian waters:—

"But a while ago Norway was a pleasant spot for fishermen. The few fishermen to be met with there were (they are not now) fond of telling of their sport, but they were gentlemen and sportsmen of the old school. The natives were civil, easily satisfied, and fishing was easy to come at. But this is all altered within a very few years. The British snob soon followed, and forthwith he took his abominable annual holiday and toured the country, and set off in shoals in pursuit of the object of his worship and adoration, the nob of his own land. Throwing his spare cash about like the idiot he is—transporting his nasty little vices and manners along with him, aping all that is bad in his model, and unable to understand or imitate the good, he has played the same pranks there that he has all over the world, and so the natives become grasping, and salmon fishing is, save at high prices and long leases, not to be had."

If British writers criticise people of other countries rather sharply, it must be confessed that they do not spare their own countrymen. S. O. C.

NORFOLK HARBOR FROZEN OVER.—A Norfolk (Va.) correspondent, who sends us some frigid meteorological data from that locality, says the harbor was skimmed over with ice on the 3d of January, and remarks sardonically, "if it keeps on this way much longer we shall have a 'solid South.'"

A SHIPWRECKED NATURALIST.—Our enterprising friend "Fred Beverly," who sailed last month for Martinique on a collecting tour, has had bad luck at the outset, the vessel in which he sailed having run upon the outer reef at Bermuda, in a heavy blow. Ober waded eight miles to land. The vessel is in St. Georges for repairs, where are also twenty other vessels in like predicament.

—Madame Nilsson sings at Vienna in January, Madame Patti in March and April, and Madame Lucca in May.

GAME PROTECTION.

NEW YORK SOCIETY FOR THE PROTECTION OF GAME.—*Resignation of Royal Phelps as President.*—The regular monthly meeting of this Association was held last Monday night at the residence of Mr. Charles E. Whitehead, No. 64 West Thirty-fifth street. The chair was occupied by Royal Phelps, President, who read a large number of letters from all parts of this and adjacent States approving of the active measures taken by the Association for the Preservation of Game, and requesting information for the guidance of newly-formed clubs. The report of the Treasurer for the past year showed a balance on hand after all disbursements of \$48.37 in cash, and \$4,000 in United States bonds deposited with Mr. Phelps in trust for the Association.

The most important business transacted was the election of officers. Royal Phelps, Esq., who has filled the office of President for twelve years with much honor and usefulness, and who has become not only beloved by the members who have followed him as leader, but so intimately identified with the Association that his name and its have become, as it were, synonymous and correlative, announced before the election that he felt constrained to decline being President any longer. He was now approaching the allotted threescore and ten, and his advancing years warned him that he should curtail his engagements. He preferred to resign from office now, while he was yet strong, so that he might still devote his spare time to the interests of the Association. The members endeavored to persuade Mr. Phelps to reconsider his determination, but he firmly declined a re-election. The following officers were then elected for the ensuing year: Clinton Gilbert, President; Robert B. Roosevelt, Vice-President; Secretary and Treasurer, Thomas N. Cuthbert; Counsel, Charles E. Whitehead; Executive Committee, H. A. Fahenstock, Henry Carey, and Stephen A. Main.

The Committee on Amendments to the By-laws was directed to co-operate with the Committee on the State Association with the view of pressing the amendment drawn up by the Association at the present session of the Legislature.

Charles Hallock moved a vote of thanks to the retiring President and the board of officers, which was so amended by Mr. Whitehead as to place the resolution (so far as Mr. Phelps was concerned) in the hands of a committee to engross suitable resolutions expressing a proper recognition of his services; and Messrs. Hallock and Whitehead and Col. Wagstaff were so appointed by the chair. A vote of thanks to the board of officers was then passed. Three new members were elected.

After adjournment, the members partook of a sumptuous dinner of antelope meat, wild turkey, and other game around the board of their generous host.

UNCLEAN FOOD.—If nothing else will induce pot hunters to stop killing game out of season, possibly the following fact, when known, will prevent people from buying and eating them, and thus spoil their little game: The ground has been covered with a heavy coat of ice and snow for two weeks, entirely cutting the birds off from their ground food. Under such circumstances they feed almost entirely upon the leaf of the laurel. This leaf is rank poison to man, and persons eating the birds are liable to suffer from its effects. True sportsmen, instead of shooting birds during such weather, are inclined to feed and care for them.

—The "London (Canada) District Fish, Game and Insectivorous Bird Protective Society," to which we have courteously been elected an honorary member, is doing its utmost to have the fish and game laws strictly enforced. During the past year, fines have been imposed upon various parties. Its Secretary is B. C. Marshall, Esq.

A SWINDLING SCHEME.—The "Mineral City Land Company," whose advertisement appeared in our columns three weeks ago, is a swindling concern, and their whole scheme is intended to defraud. We have the affidavit of Mr. G. A. Dickerman, County Clerk of Guyon county, Texas, in which the lands advertised are said to be located, to this effect, besides several like assurances from our friends in that section. We trust we have done no wrong to any of our readers.

By the exercise of a careful scrutiny of all matter proffered for publication in this journal, we have hitherto avoided being imposed upon. In this case, however, we confess to have been humbugged. We at first declined to receive the advertisement, but accepted it at last when we found that journals older, and, we supposed, more sagacious than our own, had printed it. The "Mineral City Land Company" wins, and we and others lose. That is the "head and tails" of it.

FOND OF H-H-H-HUNTING.—Last week we received from Hallowell, Me., a club of subscribers whose names all begin with an H. The coincidence was explained by an accompanying statement that the party were all fond of H-h-h-hunting.

THE WINTER IN BERMUDA.—A letter from Prof. G. Brown Goode, of the Smithsonian Institution, who is spending the winter in Bermuda, says.—

"It is very pleasant here, though we have felt the same cold weather here which you have had at the north. We have not seen the thermometer below 54 degrees, however. Fishing is not very good at present, but I have already added twelve new species to the fauna."

Thirteen steamers now ply between Jacksonville and Sanford, on the St. Johns river.

FLORIDA NOTES.—It is said that much the larger number of visitors to Florida, this year, are people looking for a permanent home there. Nearly all our Florida exchanges complain of the scarcity of cottages to rent, owing to the increasing demands of newcomers.

So much freight has accumulated at Fernandina for New York, that the last steamer was unable to receive it all, and left quite an amount on the wharfs awaiting shipment.

The *Detroit Free Press* says that Mrs. A. T. Stewart has taken the whole floor of a hotel in Jacksonville, Florida, and proposes to pass most of the winter there.

Those visiting the Indian river this season will find Capt. Wm. H. Sharpe's Hotel, at Sand Point, a very pleasant place to stop.

Hon. G. C. Brantley recently bought the Brock House, at Enterprise, and Messrs. Bodine & McCarthy, late of the Green Cove Springs Hotel, have contracted to run it this season. The house is now open for the reception of guests. It is one of the most charming places in Florida.

Sportsmen say there were never so many ducks on the upper St. Johns as at present.

Mr. Wm. B. Astor, of this city, is having a royal time among his many friends in Jacksonville, Florida. Some pleasing entertainments have been given on his splendid yacht *Atlanta*, anchored in front of the gay and festive winter resort, Jacksonville. Mr. Astor is investing quite a slice of his large fortune in that State.

The *Norwich Courier* says: "Florida seems to be the Utopia of Connecticut people. Three Norwich families have gone there to settle within a week, and we hear of others in different parts of the State."

—The average mid-day temperature at New Smyrna, Florida, for the month of December, according to the record of our correspondent, Maj. George A. Allen, was 60°. Highest, 79°; lowest, 44°. Lowest at 7 o'clock a. m. (Dec. 2d) 29°; at 9 p. m. 34°.

—"Whitney's Florida Pathfinder," for the season of 1876-'77, is now ready for distribution. Parties desiring an instructive and valuable Florida Guide, will do well to send 25 cents to the office, 66 John street, for it.

Our Women's Department.

SALUTATORY.

THE title we have chosen for the new department of our paper will define with all necessary explicitness the subjects to the discussion of which it will be mainly devoted. We have always been fortunate in being able to number many ladies among our friends and allies. The means by which we attained to so desirable a result may, we believe, be explained in a few words. While endeavoring fully to illustrate the hunter's camp, and all that pertains to it, we have never forgotten his home and home interests. In bestowing a certain share of our attention upon these matters we have inevitably touched upon much which comes under the ken of ladies. There has always been a great deal in our columns which we would fain think must have had some attractions for them—the priestesses of that temple at whose altars we would be regular and recognized attendants. Natural history has, or ought to have, the same interest for the fair as for the sterner sex. The Kennel has supplied as many favorites, and a far greater number of pets, to ladies than it ever did to men. We might go further and assert that ladies are amongst the most deeply interested readers of the tales of deeds by flood and field which appear in our weekly hunter's feast.

In proposing, therefore, to open our columns to themes and discussions which will both secure for us a more hearty welcome into the home circle, and confirm the friendships we have formed among our fair readers, we make no departures from the aims we have consistently followed. We simply extend them. While appealing directly to ladies we hope to be regarded with all the greater interest by gentlemen. A gentleman's paper should also be a ladies' paper. Whenever it touches upon interests which come under the halo arching the portal of home, or more broadly those affecting society, it asks a welcome to both.

There are, however, many topics of peculiar interest to ladies, and falling within the most restricted boundaries of our special province. Take for example the many games and out-door sports in which ladies indulge, and the many others in which it would be well for them to engage. Of the former we need only mention boating, archery, swimming, cricket, croquet and billiards, although the list might be considerably extended. We seldom meet ladies near the pools where the trout and salmon lurk; yet who ought to follow the "gentle art" more enthusiastically than they? Whose hand could more more deftly trail the subtle fly than woman's? We stop here in the meantime, upon the threshold of a wide subject. It covers all the disputed questions of female education, and woman's physical as well as mental development. Even were we to restrict ourselves to the former we should still have an abundance of themes for our weekly chats in the parlor or by the fire. Society has done much to ruin the "human form divine," as exemplified in woman, which might be remedied or prevented by the inculcation of a little common sense upon the subjects of exercise and pastimes, or by a course of training by the brook, or with the sculls for each "season" in Vanity Fair.

"Something there is more useful than expense,
And something previous e'en to taste—'tis sense."

The lines are Pope's, and it would be well for those who undertake to bring up the young of either sex to keep

them in mind. One other explanation we would make in regard to our treatment of the educational qualities affecting ladies. It has been the too prevalent custom to create in what we may call the average mind a feeling of nausea in reference to all such discussions. We mean to guard against such a danger by refraining from physiological and otherwise mysterious researches, in order to prove that certain exercises are beneficial. If the common sense to which we have referred does not satisfy any man or woman that horseback riding or swimming is a healthy exercise for his or her daughter, there must be a lack of that perception which is required to appreciate physiological arguments. To advance them would, therefore, be a useless expenditure of ammunition.

If we turn from these subjects to those of a more general home interest, we are again brought into a wide and fruitful field. It is so wide, in fact, that in every direction we see no bound but the horizon. We do not mean by that that home represents the meeting of earth and heaven. Unfortunately such a statement might, in some cases, be contested. We refer to the simple, prosaic fact that the array of matters affecting home is practically limitless. We shall not be limited by those things pertaining to the table, nor by those others which belong to the beautifying of the home. But as we have said, we see no limit on any side. We cannot be expected to be more explicit.

Another matter to which we shall feel it our bounden duty to give occasional notice will be the proper sphere of woman in the world. Her endeavors in many of the arts, sciences and professions have compelled a certain recognition. We find the names of Bonheur and Thompson among artists, of Eliot, Sands, Strickland, Browning and of a thousand others among authors; we find woman in the church, at the bar, in the medical profession, on the operatic and dramatic stage, in journalism, on the lecture platform, in many of the industries, both artistic and mechanical. We find them in nearly every walk into which they can force their way. They are to be regarded among the workers and reformers of the world—and let that closing statement be our best reason for providing something for their special entertainment and instruction.

AFTER DINNER.

(Master and Mistress Log—At the Table—Time, Evening of Wedding Day Anniversary.)

MISTRESS—I can hardly realize that another year of our married life has passed away, and that upon this of all days in the year you and I should be sitting here alone and not one of the children with us.

MASTER—It does seem a little hard, but all will be right in a few days. The boys will all be home for Tom's birthday, and we must get up a special St. Nicholas for the occasion to make up for his absence on Christmas Day.

MISTRESS—Still, it is dull without them—the second anniversary of our marriage we have spent and them all absent. But what do you propose giving on Tom's birthday?

MASTER—I have a good many things in my eye, but the question of their distribution rather puzzles me.

MISTRESS—Tell me what they are and I may help you. I have seen some presents too.

MASTER—They are very nearly all books. First comes Scribner's wonderfully fine illustrated edition of Dr. Holland's "Mistress of the Manse." The illustrations are by Mary A. Hallock, Thomas Moran, Alfred Fredericks, Edwin A. Abbey, Helena DeKay, and others. To say that they are exquisite conveys no idea of their beauty or of the wonderful harmony between the artists and the poet. In other respects the style of the book is of the best kind.

MISTRESS—You say nothing of the poem, nothing of the soul within so fine a body.

MASTER—No, and for this reason that to none could "The Mistress of the Manse" be more appropriately given than to the mistress of our Table, Hearth and Parlor. I did not wish to destroy the interest of the tale for you.

MISTRESS—Tell me a little, a very little.

MASTER—Well, I may try, though it is no easy matter to tell you a part of a story. It is a tale of love, home, patriotism, war and death, and is, moreover, told with a pathos and strength that mark poetic genius of a very high order. There is a refinement about everything written by Dr. Holland which makes us feel that we are in the society of a scholar of clear and lofty mind and a warm heart.

MISTRESS—Tell me about some other book?

MASTER—There is Harper's edition of Coleridge's "Rime of the Ancient Mariner," illustrated by Dore. It is one of the most superb volumes of the season, and is in my opinion, also, one of the most suitable gift books. I will not say much of the wonderful Rime, because it is in the first place familiar to all the world, and in the second, very little can be said of it with safety.

MISTRESS—And what of the artist's work? Is it equal to his *Wandering Jew*?

MASTER—In my opinion it is superior to anything Dore has hitherto given us. In Coleridge's company he is seen at his very best. To the realm of the supernatural to which one almost shrinks from following the poet, Dore leads us with the strong hand of a guide, familiar with all its horrors and terrible shapes and versed in the ways of its fantastic occupants. Dore shows power, and in that word my opinion of the work may be summed up.

MISTRESS—I bought, a few days ago, another book of Harper's "Practical Cooking and Dinner Giving," by Mrs. F. Henderson.

MASTER—Was to-day's dinner cooked according to its receipt?

MISTRESS—No, and don't be sarcastic in speaking of that dinner. It was cooked with a heavy heart, and that is worse than a bad fire.

MASTER—I didn't mean to hurt you, especially on such a day as this. The dinner was good enough for two old married folks. But tell me something about the book.

MISTRESS—Its author is a very sensible woman, and the book is first rate. She aims less at originality than excellence. Some of the receipts are contributed by her friends, Mrs. E. L. Youman's, Mrs. Gratz Brown and others, and even the Rev. Henry Ward Beecher has been prevailed upon to tell what he knows about the baking of

reed-birds. The remarks about serving and arranging dinners are invariably practical.

MASTER—Can you give a sample of its value which I can appreciate?

MISTRESS—Oh, yes. Mrs. Henderson devotes part of her space to beverages.

MASTER—That's a "hot 'un" for me, but let me hear what she says about a milk punch.

MISTRESS (reads)—Milk punch (Mrs. Filley). Ingredients: Four quarts of Jamaica rum, three quarts of water, five pints of boiling milk, three pounds of loaf-sugar, twenty-four lemons, two nutmegs. Cut thin slices, or only the yellow part of the rinds of the twenty-four lemons. Let these thin parings and the two grated nutmegs infuse for twenty-four hours in one quart of the rum. It should be put in a warm place. At —

MASTER INTERRUPTS (LAUGHING)—Four quarts of rum! Three pounds of sugar! Not to speak of a couple of dozen of lemons, water, milk and nutmegs! Surely that's a pretty stiff drink. I couldn't swallow it, and should like to see it done, but next time I order a milk punch I must ask the bar tender if he gives it a la Henderson. I always thought it an innocent sort of a beverage. Nine-and-a-half quarts of liquid, to carry weight besides, and to order it the day before you drink it!

MISTRESS—If you had waited until I had finished reading, you would have found that the punch need never be taken all at once. The book states that it will keep for ever.

MASTER—That's no recommendation. No man wishes to keep his drink that length of time.

MISTRESS—You may laugh, but the book is the best I ever had.

MASTER—Well, I am satisfied. But to be serious, there is another book also published by Harper & Bros., and though not exactly a new one, yet deserving of our notice at this time. I mean "The Poets of the Nineteenth Century," selected and edited by the Rev. Robert Aris Willmott, with additions arranged by Evert A. Duyckinck, and illustrated with one hundred and forty one engravings. It is an admirable specimen of typography and taste, and the illustrations are marvels of beauty. It covers the ground well, and there are very few cases in which I would differ from the choice made by the editors. And now what of the other things you have read?

MISTRESS—I visited Knox's the other day, and was lost in admiration of his stock of hats, furs, canes and gloves. At his Fifth avenue store he has a Centennial pavilion, a perfect gem among structures of the kind. For both use and ornament he shows an endless variety of goods, and one's only difficulty is to make a choice. Speaking of hats, don't you think you had better get a soft felt fur for evening wear at your club? A silk hat might get—well, it might be accidentally exchanged, or lose some of its "fair proportions."

MASTER—You are back to the "beverage" question I see, but I disdain to follow you. Try again.

MISTRESS—H'm, his furs are lovely.

MASTER—And his canes?

MISTRESS—Would do to keep sarcastic gentlemen in order.

MASTER—I see you mean to carry me by storm, so you shall have the furs.

MISTRESS—And now that you are so good, I'll give you something from Gorham's. I have not yet chosen it, for I had there the same difficulty in making up my mind that I felt at Knox's. The silver ware is so very beautiful, and the designs so original, that I came away perfectly bewildered or dazzled. I had no idea that silver could be made into articles of so many different kinds—like only in all being exquisite.

MASTER—I have seen nothing more artistic than Tiffany's Limoges enamel. The illustrations from "Jerusalem Delivered" are, I think, the finest I ever met with. It might be a little too much for your purse—\$1,500—it certainly is for mine, but I advise you to see it. Or, perhaps, you might fancy a mirror set in onyxes, which make literally a glorious frame. Or have you a penchant for bronzes? If so, go to Tiffany's, and forget those of Russia or Japan. As for jewelry and trinkets, there are in that line gifts to suit lovers, friends, and even husband's and wives. But let us leave the table for the parlor and talk over old times.

LESSONS IN POLITENESS.—According to the author of *La Politesse Française*, a work recently published in Paris, a gentleman, when he gives his hand to a friend, must press his friend's hand but not shake it. If he is to shake hands with a peasant, he must present his hand ungloved, or the peasant will consider himself insulted. If he is about to shake hands with a lady, he must keep his gloves on. When he offers to conduct a lady to the piano he must, in taking her hand, half close his own. In dancing with a lady he must "not permit himself" to squeeze her hand; and he must, if he wishes to show himself a true gentleman—or at least "unveritable gentleman"—spend 18,000 francs, or \$3,500 a year on his gloves. A gentleman who spent this much a year on his gloves of various kinds and colors, would probably, if only for the sake of consistency, treat himself every day to at least one new hat. All, however, that we are told on the subject is that a gentleman's hat should always be "bright and brilliant." A gentleman never altogether separates himself from his hat, though it is not etiquette to wear it in a room. In the street, on meeting an equal of his own sex, he takes it off for a moment. On meeting a lady, or superior of his own sex, he remains uncovered until he is told to put his hat on. Do not eat in the street, do not smoke a pipe in the street, do not smoke a cigar in the street, if you are walking with a lady—not even if you happen to be this lady's husband. It seems odd to tell a gentleman who is supposed to spend \$3,500 a year on his gloves not to smoke a pipe in the street, but we have reproduced this caution as we find it. When you bow, bow properly, but not so deeply that your vertebral column will make a right angle with your legs. If an officer in uniform salutes you, do not make yourself ridiculous by returning his salute in military fashion. A lawyer will not only think you silly, but will be greatly irritated if, visiting him on a matter of business, you ask him how he is, inquire after the health of his wife, express a hope that the children are all well, and so on. This sort of talk should be reserved for friends whose time is not valuable, or who have no right to charge for it.

THE RETICULE.

—A lady has this year won the Joseph Hume Scholarship in Jurisprudence, awarded by the London University,

and it is stated that this lady has already taken the first place in all the classes that women are permitted to attend, and is now making her way in such active business as the law is allowed to persons who are not called to the bar.

—Ladies in Australia play cricket matches for the benefit of local charities.

—Mme. Essipoff will remain in America until spring. Her husband, Leschectizki, the composer, is the Steinway agent at St. Petersburg.

—A Philadelphia paper propounds the following radical query:—

"Why should not the boys be taught to cook as well as girls? A husband who understands how to bake, broil, stew and boil, is a real treasure in a household, however accomplished his better half may be in the same direction."

There is, in fact, no limit to the extent to which male education might be carried in the direction referred to. It would appear to be all the more necessary that study of the above science should be pursued by "boys" and "husbands," since the complaints are loud of the incompetency of "mothers" and "wives."

—The *Home Journal* objects to the wearing of diamonds when traveling, and bases its objection upon the ground of the vulgarity of such a proceeding. There are thousands of people who may be met any day, who appear to be glad of the excuse furnished by a *dictum* so authoritative for leaving their diamonds at home. We take it for granted that they all read the *Home Journal*.

—"That humor is a thing of late and slow growth may perhaps be seen in the want of it in women. Just as they cherish a number of ideas and institutions that tend to become obsolete among men, so they are tardy and backward in their appreciation of humor."

Thus wisely says a Saturday Reviewer. The fun of it is, that the writer, from the serious manner in which he brings his indictment is apparently so insensible to the charms of a joke, that it has escaped his notice that he has just perpetrated one of the hughest kind.

SUPERIORITY OF AMERICAN GAME AND FISH.—A partridge, fat and tender, is as good as a mushroom. Truffles do not improve woodcock. The birds can afford to go it on their own hook without any assistance whatever. So with such fish as the pompano, the mountain trout, the jack salmon and the shad. They are able to stand alone. In Europe they don't stand at all. Their best fish is the crawfish and the snail, for the lobster is indigenous everywhere, and is not to be counted in the list. They know nothing of the soft shell crab, of the terrapin, or of the oyster as a cookable viand. Their turbot will not compare with our halibut, nor their sole with our shad. The English white-bait is simply a minnow, and only a trifle better than a smelt. In soups, which is a thing of condiments, they do excel us. As a general rule their service is neater than ours. But you can give, on a few hour's notice, a better dinner at the St. Nicholas in Cincinnati or at Rufer's in Louisville, wines included, than you can give in Paris at the Cafe Anglais or in London at the Burlington.—*H. Waterson of Louisville Journal*.

Rifle.

NATIONAL RIFLE ASSOCIATION.—Mr. George S. Schermerhorn, Jr., Secretary of the N. R. A., has presented his report for the past year, one prolific of events to the rifleman as having seen the greatest of International Rifle contests. Mr. Schermerhorn repeats the proceedings of the Association regarding elections of officers, change of office, death of honorary members, etc., etc., and continues thus:

The roll of annual members continues about as last reported, but there has been a marked and gratifying addition to our affiliated club list, owing mainly to the amended regulations as to affiliation, passed February 1, 1876, and in this connection the Secretary has to report that the first of the "conventions of riflemen," as provided for in these amended regulations, was held at Creedmoor on the 26th of May last, during the spring meeting. The following clubs and associations were represented by delegates: Amateur Rifle Club, Scottish-American Club, Seventh Regiment Club, New York City; Jamaica Rod and Rifle Association, Long Island; Twenty-third Regiment Club, Brooklyn; Hudson River Rifle Association, Poughkeepsie; Yonkers Rifle Association, Yonkers; Parthian Rifle Club, Hudson, and Connecticut Rifle Club, Stamford, Conn. The contract with the State of New York, giving to the members of the National Guard of this State, in uniform, the free use of fifteen targets upon the range at Creedmoor, on Monday, Thursday, and Friday of each week, from June 1 to December 1, for the sum of \$4,000, was reserved for the year 1876. There have been fifty-seven matches shot at Creedmoor, during the year, under the auspices of the Association, as follows: Spring meeting, 6; fall meeting, 17; special matches for badges and trophies, 34. In addition to these, and inserted in the programmes of the Association for the spring and fall meetings respectively, were the Leech Cup match and the Irish-American return match of 1876, shot under the auspices of the Amateur Rifle Club.

Thanks are returned to various gentlemen and firms who have presented medals, etc., and the report concludes with a reference to the reports of the sub committees.

Col. George W. Wingate, Chairman of the Range Committee, has prepared and presented a very elaborate report on the target question, the conclusion of which is that canvas targets are not suitable for Creedmoor. We make the following abstracts. The report we presume will be printed in full in the Association report for 1876:

At the opening of the season, the feeling among the members and officers of the Association in favor of canvas targets was very strong, and the Committee was charged with the task of introducing them at Creedmoor, and have used their best endeavors to give them a fair and thorough

test. Having procured drawings of the plans held in most estimation in England and Canada, they erected three different targets, namely: One upon the plan used in Canada, consisting of a frame sliding up and down upon two rods, with a counter balance; another, constructed with a dummy, moving like a window sash, designed by Mr. E. H. Sanford upon the model used at Wimbledon, and the third turning sideways upon a pivot, something like a pendulum, and exposing a signal when depressed, devised by Major H. S. Jewell, Inspector of Rifle Practice, Fifth Brigade. Mr. Sanford's target had a wooden frame, the others were all of iron, knife edged. A triangular disc was used to hook into the bullet hole until the second shot, when the aperture was pasted over with paper. These targets were covered with canvas, over which paper targets were pasted when a new surface was required.

The Committee regret to say that the result of the experiment was unsatisfactory. The Jewell target from the first worked comparatively easy, while the system of marking was generally admired. Both the iron frames, if not used frequently, were difficult to operate. The Canada target was stiff at first, but subsequently worked easier. The dummy target worked the hardest, and, when the firing was rapid, required two men. In the latter part of the season the "dummy" was given up, and a regular target substituted, making it double, the shot being signalled by showing a disc over the place struck; the lowering of the target raising the other, which could be shot at while the first shot hole was being pasted over. The expense of operating the canvas targets has been found to be fully as great as iron ones, including even the glass. During the practice of the National Guard, six quarts of paste a day have been found necessary at each target, and the disbursements for paper, canvas, etc., amount, in the course of a month, to a considerable sum. The Committee have not been able to calculate this exactly, but have been informed by the President of the Jamaica Rod and Rifle Association that a canvas target, erected on the double system last mentioned, upon their range, though made as cheap and light as possible, cost \$53, and that the expense of operating and keeping it in repair, from January to November, was \$23.50, the number using it being but fifteen.

The results at Creedmoor have convinced your Committee that the life of an iron target, when used as constantly as they are there, cannot exceed three years. This is owing greatly to the short-range practice of the troops, whose continuous practice at 100 and 150 yards has been found very destructive. Scarcely any of the targets originally imported by the Association are now in good order. To cast an iron target which will stand the tests to which it is subjected is quite difficult. They must have a chilled face, and be of a certain density of iron. If too soft, they curl up at the edges; if too hard, they crack and break. Messrs. Cornell, the contractors for the State, were obliged to make three attempts before they were able to ascertain the quality of the metal required and turn out slabs which would stand. Those they now manufacture have been thoroughly tested and stand well. They cost \$25 a slab.

That portion of the report referring to matches, etc., we shall publish next week.

THE NATIONAL GUARD.—Adjutant General Townsend's Report for the past year has been published. He begins by remarking upon the increased strength and efficiency of the National Guard, which has greatly improved notwithstanding the abolishment of the exemption from taxation and the disbandment of several regiments last year; but to keep the organization up to such a standard, he recommends the continuance of the yearly appropriation of \$275,000. The improvement, he thinks, is due in great part to the interest excited by the introduction of rifle practice. The success at Creedmoor has resulted in the establishment of eight additional ranges throughout the State—one each at Buffalo, Rochester, East Syracuse, Albany, Poughkeepsie, Yonkers, Mt. Vernon, and Oswego—and the proficiency of the guard in marksmanship is very notable. The improvement is due mainly, however, to the increased liberality on the part of the Legislature.

The force at present consists of eight divisions and 17 brigades, divided into one regiment and 11 separate troops of cavalry, one battalion and 11 separate batteries of artillery, 25 regiments, 12 battalions and 18 separate companies of infantry. The total number is 21,724. The commander-in-chief and staff, and the division and brigade commanders and staffs number 342.

CONLIN'S GALLERY.—The first of the series of matches for this year at Conlin's shooting gallery, 930 Broadway, will commence Wednesday, January 10th. It will be a tournament open to all comers, and to consist of two classes of marksmen, viz.: the "Experts" and the "Amateurs," each class having a number of valuable prizes offered for competition. All gentlemen wishing to enter as "experts," and those who have made a score of 46 in a possible 50, or better, in the gallery, are classed as experts, and are "barred" from shooting as Amateurs. All the prizes are not only valuable but appropriate. The tournament will continue till all the tickets are sold.

HELLWIG'S GALLERY.—Heliwig has moved his popular shooting gallery from 271 and 273 Eighth avenue, to a more central and convenient place, 695 Sixth avenue. It is being built under J. S. Conlin's patent, who is at present superintending the building of the gallery. The gallery will be one of the best in the city, and its past patrons will find more accommodations and attractions. The "opening" night will be on Saturday evening, January 13th, and some of the best rifle shots in the country will be present.

MILEY'S GALLERY.—This well known resort of Brooklyn rifle men, located at No. 381 Fulton street, re-opened on the 3d inst. Many improvements have been made and during the season valuable prizes will be offered for competition.

CANADA.—*Nelles Corners, Ont., Jan. 4th.*—A rifle club has been organized at Fisherville, Ont., three miles from Nelles Corners. The following gentlemen are the officers: J. Walker, J. Norman, H. Gee, J. Lemmer and A. C. Smith, Directors; Geo. Mable, Captain; J. W. Holmes, Secretary and Treasurer; N. Reicheldt, Executive officer; F. Otterman, Scorer; R. M. Smith, Supply Agent and Correspondent; Geo. Held, N. P. Finch, P. Nablo, and John Otterman, acting members, with the captain, secretary and treasurer, scorer and supply agent.

R. M. S.

THE NEW WIMBLEDON TARGETS.—Subjoined are diagrams of the targets which are to be used—the one at 200 yards, and the other at 500 and 600 yards—at the English N. R. A. meeting of 1877. The black lines and circles show the new target and its divisions, and the squares in the bull's-eye and to the right of the reader, the respective diameters of the circles and the side of the containing square, in inches. The dotted lines and figures to the left

show the divisions and dimensions of the Wimbledon targets of 1874. No alteration is to be made in the long range target, except that the ring outside the bull's-eye will be called the "Inner," and the square in which it is contained the "Magpie."

We are indebted for the above to the *Volunteer Service Gazette*.

Game Bag and Gun.

GAME IN SEASON IN JANUARY.

Hares, brown and gray. Wild duck, geese, brant, &c.
FOR FLORIDA.
Deer, Wild Turkey, Woodcock, Quail, Snipe, and Wild Fowl.

—A letter from Mr. L. L. Hepburn and other interesting matter is unavoidably left over until next week.

—We have many subscribers who are acquainted with Mr. Call and the Lake Pleasant Hunting grounds of the Adirondacks. Well, Silas and his brother have just had the satisfaction of killing a panther in the vicinity which measured eight feet in length. Silas says the hunt was the most exciting he ever had.

—A Tiffin, Ohio, correspondent says he caught an opossum last week that weighed twelve pounds. How is that for large? He says it is the first one seen about there since 1865. Two ruffed grouse were also killed near town by a Tiffin sportsman last week. They are seldom seen there.

—Several of our subscribers having inquired for the Fox Gun, we take occasion to say that a specimen may be seen at the Emporium of Holberton & Beemer, 102 Nassau street.

—We noticed a fortnight since a fine gun imported by Mr. H. C. Squires from the manufactory of Mr. W. W. Greener. We are pleased to learn that this elegant piece of workmanship has passed into the hands of such an ardent sportsman as Col. Bodine, the "Old Reliable" of the first American team. Although at the "head of the class" as a rifleman, Col. Bodine is also a first-rate field shot, and his "Greener" will waken the echoes of the Catskills in the death knell of many a partridge.

—A pigeon match between J. Greenley and W. Humphries on one side, and R. Mason and H. Mason on the other, was shot at Newark, N. J., last week; ten birds each, 21 yards rise, 80 yards boundary, trap and handle for each other; stake, five brace partridge. The result was as follows:—

Name.	Total.	Name.	Total.
J. Greenley.....	9	R. Mason.....	8
W. Humphreys.....	8	H. Mason.....	7

Mr. Wm. Merritt acted as judge.

—Thanksgiving Day eighteen young men of Janesville, Wis., formed two hunting nines, headed by Will P. Bowen and Rob M. Palmer, and started in quest of rabbits, the party beaten to set up a supper for the entire party. The entire number slaughtered was 191, and the difference in favor of the Bowen nine 21.

MASSACHUSETTS—*Boston, Jan. 6th.*—Our season is now closed. A friend and I were out on December 26th and got a few birds, although we had to travel in two feet of snow on a level. The first bird I shot was a grouse which dropped at the shot, but we could find nothing of it. An hour later my friend returning to the spot saw a hole with no track near it, kicked in the snow, when out went my wounded bird which he shot. Never had a grouse do this before. Plenty of white owls, and a friend of mine had 60 on hand at one time this fall to stuff. Butcher birds very plenty this winter. Ice 16 inches, snow 2½ to 3 feet on level.
S. K., JR.

[It is a common habit of the ruffed grouse and quail to take refuge in the snow.—ED.]

CONNECTICUT—*Litchfield, Jan. 8th.*—We can sum up the results as to game in this section. Of woodcock there were none of any account, nor have been since 1872, when we killed 117—19 being the most in one day. Most of them were killed over Mr. Colt's old "Phil." Ruffed grouse and quail have been in fair numbers for this section, and I have seen a good many of the latter the past week feeding on the top of the snow, which, though over two

feet deep, has not drifted badly, and allows the weeds to appear in places. The two best day's sport were October 27th. Two of us killed 9 grouse and 2 woodcock October 31st. Three of us killed 12 grouse and 6 quail, all over one dog.
T. H.

INDIANA—*Lafayette, Jan. 6th.*—This season I have killed 200 quail, 17 rabbits, and 14 ruffed grouse, which are rather scarce here. The quail have been very plenty, and will be next fall unless the hard winter kills them. One bag of game my self and brother killed the day before State election was 29 quail, 4 ducks, 1 woodcock, 1 snipe, 3 ruffed grouse, and 1 rabbit. Rained all the forenoon.
T. W. AND W.

VIRGINIA—*Norfolk, Jan. 2d.*—Weather very cold since Christmas. Not many ducks in market this week. Quite a number of fine bucks have been killed within eight miles of town the past three weeks. Plenty of hares killed near town this week. Quail lying close in the woods.
S.

TENNESSEE—*Nashville, Jan. 2d.*—Persons who have returned from a hunting excursion to Big Bottom, Humphrey's County, report wild turkeys, ducks, geese and rabbits plentiful, but very shy. Game is becoming scarce in Davidson County.
R. J. M.

CANADA—*Megantic and Eastern Townships, Jan. 2d.*—Several deer have been killed this season in the "Flat Rock" woods between Ormstown and Franklin, some forty miles southwest from Montreal. As the deer are now being protected there during the close season they are increasing every year. In the Megantic District deer are very plenty up the Salmon river and in the "Basin," and a few moose signs are reported to have been seen around the "bog" above Scotston. The glories of the Megantic country are fast departing, as the district is being rapidly filled with settlers, who frighten away the moose and destroy the deer during the deep snows in the months of March and April. The pot-hunters who visit its waters in the month of September and kill the trout on their spawning grounds are also helping on the work of extermination. The catch of furs has been very light throughout the townships, but with our revised game laws, properly enforced, the catch will be greatly increased in a few years.
STANSTEAD.

CANADA—*Nelles Corners, Ontario, Jan. 1st.*—Three young friends or mine went out rabbit shooting a few days ago, 21st inst., and met with poor success, only getting 3 rabbits, in the forenoon. Not satisfied with this they tried it again after dinner, and had better luck, bagging 14 rabbits, 5 pheasants, and 10 quail, and were home at six o'clock.
R. M. S.

LOADING SHELLS.

NEW YORK, January 2d, 1876.

EDITOR FOREST AND STREAM:—There has been of late considerable correspondence in your columns on the loading of shells, the gist of which is, that they should be filled up with wads, so that after firing, the shell will fill out the chamber to its full length. Do you deem this necessary where (as in the Remington gun) there is no actual shoulder, but the chamber is gradually convexed down to the bore of the gun, and on which would you put the extra wads, the powder or shot?

Do you not think, that for the sake of economy, and saving of weight, this would be the way to load, i. e., first a paste board wad, then a felt wad over powder, and over the shot enough saw dust to fill the shell, covered with a pasteboard wad? Would you put a pasteboard or felt wad over shot? Are the pink wads likely to injure or wear the barrels? Yours, truly,
A. B. B.

[When, as our correspondent describes, there is no shoulder, or apparent shoulder, it is a matter of but little consequence whether the shell is of full length or not; in that case we should cut and turn them. The mode of loading described would answer very well, and either saw dust or bone dust used. In fact, this is done now in rifle shooting where a small charge is required, the saw dust being placed directly on the powder to fill up the space between that and the ball. We have never heard that the pink edge wads were anything but beneficial to a gun barrel. A pasteboard and felt wad over the powder, and two pasteboard wads over shot should fill up any shell, unless a remarkably small charge was being used, so that it could be turned to meet the top wad.—ED.]

—Thomas W. Sparks, of 121 Walnut street, Philadelphia, who represents and wears the green laurels of a long-established house, still maintains the enviable reputation of the "Philadelphia Drop and Moulded Shot." He has received from the United States Centennial Commission a very flattering testimonial, in the shape of an award, for "uniformity and general good finish of the pellets." This was the first Shot Tower in America, and was established sixty years ago.

The Kennel.

HORACE SMITH, ESQ.—On the first day of January last we lost the services of Horace Smith, Esq., who has long assisted us in our Kennel Department. Although contributing comparatively few editorial articles to its columns, those that he wrote were characterized by sound sense and substantial practical information. The Squire's chief value laid in his familiarity with canine pathology, the rearing and management of dogs, and his practical knowledge of guns, especially the old-time muzzle-loaders, which a long life and experience had made familiar tools. He was a sort of ancient Vade Mecum and Compendium. We believe that our friend proposes to engage in the Sportsmen's Outfit business, and in this line we can unreservedly recommend him to all our friends, and wish him every success.

We wish to remark here that we find, notwithstanding the injunction which has always stood at the head of our editorial page, to address all communications whatever to FOREST AND STREAM PUBLISHING COMPANY, that many of

our readers have been in the habit of directing to Mr. Smith, personally, correspondence intended for the paper, and we now reiterate and emphasize the request that in order to have such matters duly attended to in future, all letters, whether on kennel or other subjects connected with the paper, be addressed to the Forest and Stream Publishing Co. We would also mention that while our personnel services and advice are as freely as ever at the disposal of our readers, and while even more attention will be given to prescribing for all diseases of dogs, we can not dispense medicines, although we will advise where they can be purchased or order them sent if requested.

THE BALTIMORE BENCH SHOW.

It is with pleasure that we record the fact, that the Bench Show of Dogs, held at Baltimore, last week, under the auspices of the Maryland Poultry and Fanciers' Association, was an unqualified success. Indeed, we doubt if we err in stating that no Bench Show has ever been held in this country where the arrangements have been so perfect, and the details so accurately carried out. We say this without prejudice to the St. Louis Show, for, although the same system was in force there, it was on a very much smaller scale. This was a Bench Show in which what we have always claimed should be the primary object of such gatherings, viz.: the instruction of the masses, was followed to the letter, and the stain remaining from the Philadelphia fiasco somewhat, if not entirely, wiped out. If those gentlemen who declared that they would not send their dogs to Bench Shows until they could be assured of fair treatment had been at Baltimore, they would have found no cause for complaint. Here, in the first place, was a catalogue, with a carefully prepared index, in which the name of every dog entered was printed, with his age, color, and abstract of his pedigree. To be sure there were typographical errors, but this was unavoidable where owners were not present to read the proof. The stalls were numbered in regular rotation, according to the classes as printed in the catalogue, and every dog was in his proper place. Numbers to correspond with the entries for the special prizes were also affixed to each stall, so that there was no confusion and no mistakes. The judging was carried out to perfection. Punctually on Tuesday morning (the first day) the dogs commencing with class 1 were led before Mr. Davidson, in the judges room. If that gentleman kept books with a scale of points for each dog, no one was aware of it, and there was no tedious waiting while figures were footed up. The awards in each class were announced at once, and the winning ribbons of blue, red and white, affixed to the stalls almost before the first dogs in the succeeding class had been led out. On this occasion Mr. Chas. Lincoln, the Superintendent, had an opportunity to show his metal, and we unhesitatingly pronounce him to be the best man for the position that could be found. His system and activity were both remarkable, and unhampered with red tape, and aided by an exceptionally good memory, he carried the entire detail of the show to a most successful and satisfactory conclusion.

The exhibition was held in the hall, or rather succession of halls, forming the second story of the Maryland Institute, an admirable place for the purpose. The attendance throughout was large, and the pleasure of the visitors greatly enhanced by the fact of the winning dogs being already designated. The ladies were out in force, and as the beauty of Baltimoreans is proverbial, we fear that more than one correspondent neglected his official duties in their presence. In fact, we could mention one popular gentleman, the editor of a prominent western sporting journal, who, from this cause, up to the hour of our own departure, had almost entirely neglected that thorough and comprehensive examination of each individual dog which it is his custom to make, and which is expected by his constituents. The officers of the Association were most constant in their labors, and courteous in their attentions, and we take this opportunity to thank, most sincerely, Mr. S. H. Slifer, President, Mr. Geo. O. Brown, Secretary, and Messrs. J. Addison Smith, and others of the officers and Executive Committee for their kindness.

WHO WON.

Taking the catalogue in regular order, we find that the premium for imported English setter dogs was quite at the mercy of Rock, who seems to hold honors and years remarkably well, and who will now probably retire from the bench to make room for some of his promising progeny. Mr. Westcott was second with his Pedigree, a dog from Mr. Laverack's kennel, that has improved wonderfully since we saw him first. Snipe received an H. C., but the fourth and last entry in this class was improperly placed there. Mr. Westcott was also successful in the bitch class with Magnet, a little blue Belton, imported at the same time with Pedigree, too little, if friend "Homo" will pardon us, and scarcely the specimen, in appearance at least, that we should have expected Mr. Laverack to send to this country. Brenda, with which Capt. Foster, was second, is a lovely bitch, only thirteen months old, by Pride of the Border out of Kirby, and the same exhibitor completely clanned the puppy classes with a litter six months old by Rock out of Kirby. This lot all had Rock's splendid head, and also his color, and the gyp, Minna, will be heard from again. As might be expected, the native English setter class was a large one, and must have been a difficult one to judge, as there were many more good dogs to the proportion of bad ones than is usually seen. General opinion coincided with that of the judge in the award of first honors to Tell, a grand dog, and workman all over, but we were rather disappointed to see the red ribbon go to Snooks, a dog handsome enough to look at (too handsome, in fact, and apparently more fitted for the parlor than the kennel), but who seemed, to our eye at least, to lack something that "meant business." We had

marked the first three dogs in the class as likely to furnish a winner among them, particularly Mack, a lemon and white, and Dick, a black and white, both very handsome dogs, and, as we afterwards learned, from a stock which has been bred pure in Maryland for many years. That we were not very far out, is shown in the fact that in the bitch class, Bess, an own sister to Mack, whom we had also marked as a winner, was placed first. It was pleasant to see one of old Busters stock placed, although it was only an H. C., second honors being taken by Kate, a lemon and white entered by the St. Louis Kennel Club, but really the property of Mr. T. S. Demuth, of Fort Dodge, Iowa. Among the dogs in this class were three entered by Mr. Jno. E. Reyburn, of Philadelphia, which, although perhaps not quite up to bench show standard, we doubt not, in the field, possess all requisite qualities. Among the puppies, Guy, an orange and white dog by Morford's Don, was first for his sex, but although a handsome dog he was not quite up to the Morford standard, having light nose and eyes. The Irish were, numerically, not well represented. Of course the St. Louis Kennel Club could not well be beaten with Elcho and Loo II. In fact, in the dog class, they had but one competitor, Buck, exhibited by Mr. Miley, of Lancaster, Pa. A protest was entered against this dog, both here and in the special, for the best Irish dog with two of his get, on the grounds, first: that his name is not Buck, but York, and again that there was a doubt as to the parentage of the puppies exhibited with him. There were no imported dog puppies entered, and in the bitch class, Mr. Dorrance, of Wilkesbarre, had a walk over with Shiela, a remarkably well grown and fine appearing gyp by Plunkett out of Stella, but possessing the white spot with which Plunkett appears to stamp most of his get, and which we confess we do not like. Gordons, particularly the dogs, were a remarkably fine class. Mr. Marbles' Grouse repeated his Springfield performance, and secured first honors, a decision in which we heartily concur. Grouse's quality is remarkable, and his tan we believe is not equalled in the richness of its red by that of any dog in the country. Mr. Whitman's Grand Duke was second, but we should rather have seen the position occupied by Mr. Jenkin's grand old dog Hero, now twelve years old, and sired by "Idstone's" celebrated Old Kent. Both, however, displayed the same fault—too much lumber. In bitches Mr. Tileston was first, with Lou, a position we had marked for Mr. Jenkins Alice, a lovely bitch, and of perfect breeding, an opinion, as regards positions, which we maintained until after the judging, when Mr. Davidson explained to us the points of difference. Lou, although short in the head and of less perfect tan, won by her coat, feather, legs and general build. We were glad to see our friend, Dr. S. Fleet Spier, of Brooklyn, exhibiting a fine lot of puppies by his Gypsum, all dogs; and Mr. Munn's stock was represented by two gyps shown by Mr. J. Addison Smith, they being by old Duke of Gordon out of Dream.

The pointers, taken throughout, were probably much better in quality than are usually exhibited. The recent importation of the Westminster Kennel Club, Don, now known as Sensation, headed the list in the heavy class beyond a question, and was the observed of all observers. He has a head such as is rarely seen on a pointer in this country, the real English type, square nose, with what Idstone calls a well defined "stop" between his eyes. If any fault is to be found with him it is behind his loins, but even here his slight lack of muscle, or "swell," may be owing to his recent sea voyage. His tail may be a trifle coarse, but, although there are undoubtedly more perfect types in England, and possibly in this country, we question if anything better has ever been imported. Mr. Schuchard's Ned, a black and white dog by Capt. Grafton's Jim out of Whisky, was deservedly second, and Mr. Coffin's Ponto, a liver colored, workman-like dog, was highly commended. In the large bitch classes the Columbus Kennel Club were first, with a fine liver and white ticked bitch, and Mr. Tilghman second, with a venerable matron of twelve summers of the same color, who, judging from some of her progeny present breeds good ones. The Westminster Kennel Club showed a brace, Daisy and Flirt, the former of whom was entered erroneously in this class, being under fifty pounds. They are both litter sisters to Jim, second prize winner, being out of Whisky, and had the markings so fashionable in England forty years ago, white, with liver heads. In the small class Mr. Steel's Flake had no peer among the dogs, and looked as fine as silk. It is difficult to pick a flaw in Flake, his extreme fineness, if it is one, being the nearest approach. Mr. Turner's Tell, a splendid liver colored dog, would have been first in almost any other company, and many thought him closer than he actually was. In the small bitch class the Columbus Kennel Club exhibited a black bitch, Fan, whose breeding is unknown, but whose quality is undeniable, and we would fain bow to Mr. Davidson's judgment. Not so, however, as regards second place. Lilly, although a beautiful little bitch, and a Field Trial winner, we think should have changed places with Whisky, litter sister to Flake, who received an H. C. In the puppies Mr. Orgill showed a brace by Flake out of Lilly, that were simply superb, one, Rose, being perhaps the finest specimen of a pointer puppy ever shown in this country. Old Phil's stock was represented by the Westminster Kennel Clubs, Dinah, by the Champion Pete out of Phillis; also by old Phil, a very handsome black bitch, but just over distemper, and scarcely in show condition.

In the succeeding classes, comprising fox hounds, harriers, etc., there were scarcely the number of entries we should have expected to see in a Maryland show. Dr. Twaddell showed those wonderful and perfect dachshunds of his, and we can state most positively that they are not cast iron. The Chesapeake Bay Duck dogs, as might be expected, were out in strong force, and as will be seen in another column, a scale of points has been adopted for judging them in future; in the present instance we must be pardoned if we do not criticise them. There appeared to be at least three distinct types represented, each of which possessed claims for all the qualities required. Mr. Whitman, who came all the way from Chicago, unfortunately had no competition among the Irish water spaniels, nor was he successful in the class for retrieving spaniels, other than pure Irish, in which Mr. Latrobe was first with his Scamp, but it must have been for some other reason than their top knot that the judge (as was stated) discarded Mr. Whitman's dogs, as the top knot is mentioned by all authorities as a distinguishing mark of this dog. There were but three fox terriers exhibited, and we cannot criticise the awards of the judges of a class, the points of which

we admit we are totally ignorant; doubtless their judgment was correct, and we heard no murmurs.

Our space will not permit us to go into details as regards the non-sporting classes. Capt. Taylor, in spite of that little joke about the prick ears, was well qualified to judge them, and the awards will be found below. The specials so closely followed the awards in the general classes that no remark is necessary:—

THE AWARDS.

Sporting Dogs.

CLASS 1.—IMPORTED ENGLISH SETTER DOGS.—1. Rock, St. Louis Kennel Club, St. Louis; 2. Pedigree, C. S. Westcott, West Philadelphia; Snipe, H. C., R. E. McClenahan, Port Deposit, Md.—BITCHES.—Magnet, C. S. Westcott, West Philadelphia; 2. Brenda, Captain J. W. Foster, Leesburg, Va.; Belle, H. C., John C. Higgins, Delaware City, Del.

CLASS 1.—IMPORTED ENGLISH SETTER DOG PUPPIES.—1. Sam Tilden, Capt. J. W. Foster, Leesburg, Va.; 2. Wade Hampton, do.; Capt. Foster, H. C., George H. Nixon, Leesburg, Va.—BITCHES.—1. Minna, Capt. J. W. Foster, Leesburg, Va.; 2. Pixey, E. L. Kinney, Washington, D. C.

CLASS 2.—NATIVE ENGLISH SETTER DOGS.—1. Tell, J. H. Stromberg, Baltimore; 2. Snooks, Dr. E. R. Baer, Baltimore; Gen. R. E. Lee, W. B. Tilghman, Baltimore.—BITCHES.—1. Bess, Nisbet Turnbull, Baltimore; 2. Kate, T. S. Demuth, Fort Dodge, La.; Heart, H. C., Anthony M. Johnson, Ellicott City, Md.

CLASS 2. NATIVE ENGLISH SETTER DOG PUPPIES.—1. Guy, Alex. McComas, Baltimore; Brush, W. R. Abell, Baltimore.—BITCHES.—1. Pixey, E. L. Kinney, Washington; 2. Fleet, R. E. McClenahan, Port Deposit, Md.

CLASS 3. IMPORTED IRISH SETTER DOGS.—1. Elcho, St. Louis Kennel Club, St. Louis; 2. Buck, Chris Z. Miley, Lancaster, Pa.—BITCHES.—1. Loo II, St. Louis Kennel Club, St. Louis; 2. Kathleen, Dr. Wm. Jarvis, Claremont, N. H.; Fire Fly, H. C., M. VonCulin, Delaware City, Del.

CLASS 3.—IMPORTED IRISH SETTER BITCH PUPPIES.—1. Shiela, B. F. Dorrance, Wilkesbarre, Pa.

CLASS 4. NATIVE IRISH SETTER DOGS.—1. Socks, S. N. Hyde, Boothby Hill; 2. Bob, E. G. Vanhorn, Baltimore; Top, H. C., Chas. H. Reeves, Baltimore.

CLASS 4.—NATIVE IRISH SETTER DOG PUPPIES.—1. Shantie, Edmund P. Welsh, York, Pa.—BITCHES.—1. Hebe, J. Addison Smith, Balt.

CLASS 5.—GORDON SETTER DOGS.—1. Grouse, Jerome Marble, Worcester, Mass.; 2. Grand Duke, J. H. Whitman, Chicago; Mack, H. C., A. McComas, Baltimore.—BITCHES.—1. Lou, William M. Tileston, Forest and Stream, New York; 2. Alice, B. W. Jenkins, Baltimore; Maggie, H. C., L. R. Cassard, Baltimore.

CLASS 5.—GORDON SETTER DOG PUPPIES.—1. Romeo, S. Fleet Spier, M. D., Brooklyn.—BITCHES.—Dream, J. Addison Smith, Baltimore.

CLASS 6.—POINTER DOGS (OVER 50 LBS.)—1. Sensation, Westminster Kennel Club, New York; 2. Ned, Frederick Schuchardt, New York; Ponto, H. C., Charles E. Coffin, Muirkirk, Md.

CLASS 6.—POINTER BITCHES (OVER 50 LBS.)—1. Belle, Columbus Kennel Club, Columbus, Ohio; 2. May, Chas. H. Tilghman, Easton, Talbot county, Md.

CLASS 7.—POINTER DOGS (UNDER 50 LBS.)—1. Flake, Edmund Orgill, Memphis; 2. Tell, J. J. Turner, Jr., Baltimore; Captain, H. C., Arthur P. Baer, Baltimore.

CLASS 7.—POINTER BITCHES (UNDER 50 LBS.)—1. Fan, Columbus Kennel Club, Columbus, Ohio; 2. Lilly, St. Louis Kennel Club, St. Louis; Whiskey, H. C., Westminster Kennel Club, New York.

CLASS 8.—POINTER PUPPIES (DOGS OR BITCHES UNDER 12 MONTHS.)—1. Rose, Edmund Orgill, Memphis; 2. Rush, do.; Jim, H. C.; Fred. Schuchardt N. Y.

CLASS 9.—FOX HOUNDS (IN COUPLES, DOGS OR BITCHES.)—1. Logan, Hunter, George W. Scarff, Magnolia, Md.; 2. Rover, Chorus, H. S. Zell, Baltimore.

CLASS 10.—HARRIERS (IN COUPLES, DOGS OR BITCHES.)—1. Belle, Rose, Wm. Ahrens, Baltimore.

CLASS 12.—DACHSHUNDS (DOGS OR BITCHES.)—1. Unser Fritz, Dr. L. H. Twaddell, West Philadelphia; 2. Gretchen, and Schnapps, H. C., Dr. L. H. Twaddell, West Philadelphia.

CLASS 13.—CHESAPEAKE BAY DUCK DOGS OR BITCHES.—1. Turk, John Stewart, Baltimore; 2. Bob, J. J. Turner, Jr., Baltimore; Prince, H. C., Frank J. Ahern, Baltimore.

CLASS 14.—IRISH WATER SPANIELS (DOGS).—1. King of the River, J. H. Whitman, Chicago; 2. Sinbad, do.—BITCHES.—Bridget, J. H. Whitman, Chicago.

CLASS 15.—COCKER SPANIELS (DOGS OR BITCHES).—1. Queen, J. J. Turner, Jr., Baltimore; 2. King do.

CLASS 16.—RETRIEVING SPANIELS (Other than pure Irish Dogs or Bitches).—1. Scamp, R. Stewart Latrobe, Baltimore; 2. Dash, Thomas A. Symington, Baltimore.

CLASS 17.—FOX TERRIERS (DOGS OR BITCHES).—1. Tricksey, Charles Walton, New York; 2. Fitch, Robert Hume, Richmond, Va.; H. C., Dom Pedro, Wm. M. Tileston, FOREST AND STREAM, New York.

DIVISION NO. 2.—NON-SPORTING DOGS.

CLASS 18.—MASTIFFS (DOGS OR BITCHES).—1. Tiger, J. Howard McHenry, Pikesville, Baltimore County, Md.

CLASS 19.—ST. BERNARDS (DOGS OR BITCHES).—1. Nero, Isaac Jacobs, Baltimore; 2. Rover, J. H. Brown, Baltimore.

CLASS 20.—NEWFOUNDLANDS (DOGS OR BITCHES).—1. Neptune, Thomas Philbin, Baltimore; 2. Caesar, D. W. Taylor, Perrymanville, Md.; Rover, H. C., John J. Strine, Baltimore.

CLASS 21.—SIBERIAN OR ULM DOGS (DOGS OR BITCHES).—1. St. Elmo, Samuel T. Clark, Baltimore; 2. Nero, Willie E. Morton, Prince Frederick, Md.

CLASS 22.—DALMATIAN OR COACH DOGS (DOGS OR BITCHES).—1. Frank, Charles J. Moore, Baltimore; 2. Major, do.

CLASS 23.—SHEPHERD DOGS (DOGS).—1. Lock, Chas. E. Foster, Baltimore; 2. Shepherd, J. W. Downey, M. D., New Market, Frederick county, Md.—BITCHES.—1. Polly, J. W. Downey, M. D., New Market, Frederick county, Md.; 2. Quick, Charles E. Easter, Baltimore.

CLASS 24.—BULL DOGS.—Jack, H. Scarff, Upper Falls, Baltimore county, Md.

CLASS 25.—BULL TERRIERS (DOGS OR BITCHES).—1. Dick, C. Carroll Poultney, Mt. Vernon Place, Baltimore; 2. Joe, Charles Carroll, Baltimore; Jeff Davis, A. E. Smyrk, Baltimore.

CLASS 26.—BLACK AND TAN TERRIERS (DOGS OR BITCHES).

es. Exceeding 11 pounds weight.)—1. Milesian, M. Duffy, Baltimore; 2. Lilly, A. K. Shriver, Baltimore.

CLASS 27.—BLACK AND TAN TERRIERS (DOGS OR BITCHES Not exceeding 11 pounds weight.)—1. Molly, J. D. Olcott, Milwaukee, Wis.

CLASS 28.—SKYE TERRIERS (DOGS OR BITCHES).—1. Donald, Wm. Sanderson, Philadelphia; 2. Toby, James Fletcher, Jr., St. Denis, Baltimore county, Md.

CLASS 29.—SCOTCH TERRIERS (DOGS OR BITCHES).—1. Trifle, J. Randolph Modcal, Baltimore; 2. Stella, A. K. Weeks, Baltimore.

CLASS 30.—DANDIE DINMONT TERRIERS (DOGS OR BITCHES).—1. King, John Gill, Baltimore; 2. Sandy, C. E. Zitzer, Baltimore.

CLASS 31.—TOY TERRIERS (DOGS OR BITCHES, not exceeding five pounds weight.)—Fanny, A. Sellers, Baltimore county, Md.; 2. Lillie, Geo. F. Ullrich, Baltimore.

CLASS 32.—POMERANIAN OR SPITZ DOGS (DOGS OR BITCHES).—1. Prince, Geo. Wheatley Ravenswood, Baltimore Co., Md.; 2. Nancy, J. Addison Smith, Baltimore.

SPECIAL PRIZES.

No. 1.—Grand prize of \$100 cash, divided equally for the best setter and pointer dog or bitch, won by setter dog Rock of St. Louis Kennel Club, and Sensation, pointer dog of Westminster Kennel Club.

No. 2.—Dr. J. D. Logan's \$25 for the best setter dog or bitch exhibited, either imported or native, to be determined by its breeding, form and apparent qualities denoting excellence, won by Loo II, St. Louis Kennel Club.

No. 3.—Charles F. Bancroft's fine painting, value \$40, for English setter bitch, either native or imported, won by Magnet, C. S. Westcott.

No. 4.—Dr. W. H. Keener's \$25, for the best English setter dog for stud purposes, either native or imported, to be shown with not less than two of his get, won by Rock, St. Louis Kennel Club.

No. 5.—J. Addison Smith's double barreled breech-loader, for the best native English setter dog, won by Tell, J. H. Stromberg Baltimore.

No. 6.—F. O. deLuze's case of Spratt's Dog Biscuits, for the best native setter bitch, won by Bess, Nisbet Turnbull, Baltimore.

No. 7.—Clark & Snider's Silver Cup, for the best Irish setter dog, for stud purposes, either native or imported, to be shown with not less than two of his get, won by Top, Chas. A. Reeves, Baltimore.

No. 8.—W. H. Holabird's Shooting Coat, for the best Irish setter dog, native or imported, entered by a resident of Maryland, won by Top, Chas. A. Reeves, Baltimore.

No. 10.—Messrs. Smith & Whiting's case of Assorted Powder of their manufacture, for the best Gordon setter dog, for stud purposes, either native or imported, to be shown with not less than two of his get, won by Hero, B. W. Jenkins, Baltimore.

No. 11.—F. O. deLuze's case of Spratt's Dog Biscuits, for the best native Gordon setter bitch, won by Maggie, L. R. Cassard, Baltimore.

No. 12.—Merchant Shot Tower Co.'s eight bags of Bird Shot, for the best native Gordon setter pup, won by Mack, Alex. McComas, Baltimore.

No. 13.—United States Lounge Co.'s Camp Lounge, for the best Gordon setter puppy, dog or bitch, under 12 months old, won by Dream, J. Addison Smith, Baltimore.

No. 14.—Messrs. Trimble & Kleibacker's English Leather Gum Case, with Cartridge Tray, and a Silver Plate, to the best pointer dog, for stud purposes, to be shown with not less than two of his get, won by Flake, Edmond Orgill, Memphis, Tenn.

No. 15.—Edward Melchoir's Smith & Weston pistol, for best stud pointer dog, under 50 pounds weight, to be shown with not less than two of his get, won by Flake, Edmond Orgill, Memphis, Tenn.

No. 16.—Mr. Schumaker's Parlor Rifle for the best pointer dog under 50 pounds weight, won by Flake, Edmond Orgill, Memphis, Tenn.

No. 17.—J. J. Turner, Jr.'s \$25 for the best pointer puppy, dog or bitch, under six months old, won by Black Prince, Columbus Kennel Club, Columbus, Ohio.

No. 18.—Alex. McComas's silver-mounted Swiss Shooting Rifle, for the best couple of fox hounds, dogs or bitches, won by Logan and Hunter, Geo. W. Scarff, Magnolia, Md.

No. 19.—Messrs. Wagner's case of the best Chesapeake Bay duck dog or bitch, won by Rob, J. J. Turner, Jr., Baltimore.

No. 21.—Merchant Shot Tower Co.'s eight bags of Duck Shot for the best Chesapeake Bay duck dog or bitch, won by Rob, J. J. Turner, Jr., Baltimore.

No. 23.—May & Fairal's case of Green Seal Champagne for the best retrieving spaniel, other than pure Irish, won by Scamp, R. Stewart Latrobe, Baltimore.

No. 24.—W. A. Lilly's handsome Dog Kennel, for the best pointer or setter dog or bitch, to be entered by a resident of Baltimore, won by Tell, J. H. Stromberg, Baltimore.

No. 26.—Messrs. D. J. Foley, Bro. & Co.'s two quarter kegs best Hazzard Duck Powder No. 4, for Chesapeake Bay dog or bitch, also 12 one-pound cans of Hazzard's Electric Powder for best Gordon setter dog or bitch, won by Grand Duke, J. H. Whitman, Chicago.

No. 26.—Special. A.—\$25, won by Bess, J. J. Turner, Jr., Baltimore.

No. 29.—George W. Webb's Silver Cup for best pointer dog, under 50 pounds weight, for stud purposes, to be shown with not less than two of his get, won by Flake, Edmond Orgill, Memphis, Tenn.

No. 30.—Alexander Wolley's case of Stuffed American Game Birds, for the best Irish setter bitch, native or imported, won by Loo II, St. Louis Kennel Club, St. Louis.

No. 31.—R. Q. Taylor's Seal Skin Cap, for the best Irish water spaniel, dog or bitch, won by King of the River, J. H. Whitman, Chicago.

No. 32.—John P. Moore & Son's Colt's Pistol for the best native English setter puppy, under 12 months, won by Blossom, Thomas A. Symington, Baltimore.

No. 33.—Chris. Shaw's Silver Plated Ice Water Pitcher for the best Irish water spaniel dog or bitch, won by King of the River, J. H. Whitman, Chicago.

No. 35.—Messrs. A. L. Webb & Son's case of Assorted Powder for the best pair of Pointers, won by Daisy and Flirt, Westminster Kennel Club, New York.

No. 36.—The Silver Hunting Horn for the best Dachs-hunds dog or bitch, won by Under Fritz, Dr. L. H. Twaddell, West Philadelphia.

No. 37.—Joseph C. Grubb & Co.'s Gyro Bussy Pigeon Trap, for the best native setter puppy under 12 months, won by Blossom, Thomas A. Symington, Baltimore.

No. 38—Stuart's Restaurant prize of \$20 for the best winter bitch to be shown with not less than two of her pups, won by Fan, Columbus Kennel Club, Columbus, Ohio.
No. 40.—The Mayor of Baltimore's \$10 for the best Chesapeake Bay duck dog or bitch, won by Rob, J. J. Turner, Jr., Baltimore.

THE CHESAPEAKE BAY DOG.—Not the least interesting occurrence in connection with the Baltimore Bench Show, was the meeting held at the Carrollton House to settle the status of, and make a scale of points for the Chesapeake Bay Dog—the dog *par excellence* for ducking in those waters, where great courage and endurance is required; not simply a retriever, but a dog who will face the heaviest ice or surf; a dog that will scramble over, or, if needs be, dive under the heaviest ice. As it appears probable that Baltimore will give us each year one of our best Bench shows, it was very important that this question should be settled, and some definite understanding arrived at as to what should be the standing for quality in this noble dog. Looking at it from a general stand point, it seems to us somewhat unfortunate that one type should not have been named, by which both breeder and exhibitor could be governed; but as the dog will probably be more fully represented at Baltimore than elsewhere, it may not matter much. In fact, the Committee appointed at the first meeting had no easy task. At least two families were represented in whose possession the dog, which they claimed as the correct type, had been for some generations, and it is somewhat to be wondered at, that with a dog of the value of this one, and the constant use for him, something more definite with regard to his origin is not known. That his ancestors came from the Irish coast appears to be generally conceded, yet, with the exception of color, we can find no trace of any similar Irish breed of dogs, omitting of course those specimens which, being crossed at a later day, possess some marked characteristic of the water spaniel.

A meeting having been organized at the suggestion of the Maryland Poultry and Fanciers' Association, with Dr. Rowe, editor of the *Chicago Field* in the chair, a committee, consisting of Messrs. John Stewart, O. D. Foulks, and J. J. Turner, Jr., was appointed, which, on the following evening, reported as follows:

To the Maryland Poultry and Fanciers' Association: The Committee appointed by your Association to grade Chesapeake Bay Dogs, respectfully report as follows: That they have divided the so-called Chesapeake Bay Dogs into three classes, as follows: First, the Otter dog, class O; second, the curly haired dog, class C; third, the straight haired dog, class S. The color of class O is a tawny sedge, with very short hair. The color of class C is a red brown. The color of class S is a red brown. The bitches must show the color, and approximate to the general points of the class to which they belong. In the three classes a white spot on the breast is not unusual. Two year old dogs at each class not to weigh less than eighty pounds, and bitches of same age sixty-five pounds. Measurements as follows: From fore toe to top of back, 25 inches; from tip of nose to base of head, 10 inches; girth of body back of fore leg, 33 inches; breast, 9 inches; around fore feet, 6 inches; around fore arm below shoulder, 7 inches; between eyes, 2½ inches; length of ears, 5 inches; from base of head to root of tail, 35 inches; tail, 16 inches in length; around muzzle, below eyes, 10 inches.

—Mr. Theron G. Strong of this city, claims the name of Rab for his setter dog out of Huyler's Nell by Bliven's Jack. The name has become classic, being first given by Dr. John Brown in his charming story, "Rab and His Friends."

—Mr. Max Wenzell claims the name of Doe for his Irish setter bitch puppy, by Buck out of Floss, purchased of H. Smith.

—On December 19th Mr. Fred H. Hoe's cocker Nellie whelped eight puppies, 6 gyys and two dogs, by his dog Watch.

MR. STEEL RETRACTS.

PIERMONT-ON-HUDSON, Jan. 4th, 1877.

EDITOR FOREST AND STREAM:—In your issue of the 21st ult. Mr. Luther Adams takes me to task, and in the issue of the 28th Mr. Sterling does the same, only more so. I will answer both together and thereby save your valuable space for something more interesting than any controversy about dog shows. Mr. Adams says I seem jealous that the St. Louis Kennel Club should have taken so many prizes at Field Trials and Bench Shows. I can assure Mr. Adams that if they have the best dogs I hope they will continue to win. I am aware that the St. Louis Kennel Club own some of the finest dogs in this country, and Mr. Adams' Rock would be hard to beat even in England.

Mr. Sterling says the St. Louis Bench Show was held under the auspices of the St. Louis Fair Association. The advertisement says that the St. Louis Bench Show would be held at the same time as the great Agricultural and Mechanical Fair, and on the grounds of the St. Louis Fair Association, and I had been informed that the St. Louis Kennel Club managed the Bench Show; but on looking over the *FOREST AND STREAM* I see in the issue of September 21st a notice that the St. Louis Bench Show would be held under the auspices of the St. Louis Fair Association, which notice had escaped my eye, hence my mistake. Intended no disparagement to exhibitors or judges; what I thought was that it was not the thing for an association to manage a show and enter their dogs for competition instead of for exhibition only. I hope if the *FOREST AND STREAM* succeed in interesting the sportsmen of New York in a Bench Show that Mr. Adams, Mr. Sterling and

the gentlemen Mr. Adams names will be judges, for I believe no better men could be found to give a fair decision, and hoping the present year may not pass without New York seeing a Bench Show that will rival those of the Crystal Palace in London, I remain, WM. F. STEEL.

[We are glad to publish Mr. Steel's letter, and we say for the benefit of those who do not know him as well as we do, that he is the last man to willingly do or say anything to hurt the feelings of another, and we are satisfied that his remarks regarding the St. Louis Bench Show were written entirely through misapprehension.—Ed.]

✉ All letters for this department (and any other) should be addressed to FOREST AND STREAM PUBLISHING COMPANY. See standing notice at head of editorial page.

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

SOUTHERN WATERS

Pompano, *Trachynotus carolinus*. Grouper, *Epinephelus nigritus*.
Drum—two species. Family *Sciaenidae*. Trout (black bass) *Centropomus atavus*.
Kingfish, *Menticirrhus nebulosus*. Striped bass or Rockfish, *Roccus lineatus*.
Sea Bass, *Sciaenops ocellatus*.
Sheepshead, *Aichasargus probato-* Tailorfish, *Pomatomus saltatrix*.
cephalus. Black Bass, *Micropterus salmoides*.
Snapper, *Lutjanus caxxus*. M. nigricans.

FISH IN MARKET.—Most varieties of fish have been scarce during the past week, local catches of cod and haddock being the exceptions. We quote: Striped bass 20 to 25 cents per pound; smelts, 15 to 20 cents; bluefish, 12½ cents; salmon (frozen), 35 cents; mackerel, 25 cents each; shad (southern), 50 cents each; Spanish mackerel, 25 cents per pound; white perch, 15 cents; green turtle, 20 cents; terrapin, \$14 per dozen; frostfish, 8 cents per pound; halibut, 20 cents; haddock, 8 cents; codfish, 10 cents; blackfish, 15 cents; flounders, 12½ cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 25 cents; scollops, \$1.75 per gallon; whitefish, 20 cents per pound; pickerel, 18 cents; salmon trout, 20 cents; ciscoes, 10 cents; sunfish, 10 cents; yellow perch, 10 cents; hard shell crabs, \$4 per 100; soft shell crabs, \$1 per dozen; red snapper, 15 cents per pound.

—John Dunton, writing from Boston, in 1686, describes the fish of that vicinity, among them "basse, salmon, sheepshead, and oysters in great plenty." None of these are found there now, although striped bass were sometimes taken from the bridges fifty years ago.

"GRINDLE" FISHING IN MISSISSIPPI.

JACKSON, Miss., Dec. 30th, 1876.

EDITOR FOREST AND STREAM:—

I had long been anxious to hook our fisherman's abomination a—"John A. Grindle." In July last I was successful. We, Chess and I, started one morning long before sunrise, armed with our fishing tackle, consisting of a dried cane pole fourteen feet long (mine is eleven-sixteenths of an inch thick at the butt), hooks and line, with large goose or swan quill for a float, and a bucketful of minnows caught the day before, and anchored in the river which we have to cross to reach our destination—Lawrence Lake—the dreariest, hardest to find, most god-forsaken place I ever saw; an excellent duck roost at times, and as such much frequented in season. Woe to the poor devil coming away at night who becomes bewildered. It is a mere chance if he finds his way out; usually has to camp out all night. I had no such fears. Chess knows every pond, lake and stick of timber in the woods. "Here is where I killed a turkey; here is where we had five fair cracks at turkeys without getting any. Do you see that little patch of cane? Well, there a rattlesnake gave me fair warning the other day, and I took it," he said, with a significant look and nod; with such reminiscences he beguiled the way.

Reaching the lake proper, after wading for a hundred yards in a beaver run, in mud and water up to our knees, we found a water moccasin at the edge with half of a goggle-eyed perch, as large as my hand, protruding from his mouth. Getting a good sized stick, my friend put the moccasin beyond further temptation, and put the fish back in the water, where we found him at our return dead.

To come back to "John A.," as the fish is usually called here. In going to the upper part of the lake, having had but poor luck, we had to go around a log, over the end of which the limbs of a tree were hanging. To keep clear of them, I pulled the bait close to the boat and lowered my rod. By so doing I trolled the bait, when, suddenly, "hold on, Chess, I am hung!" was my exclamation, my impression being that I was hung to a sunken log, but the quivering on my rod told a different tale. I had hooked my first "Grindle." He and I had it. I was obliged to stand up in the boat to give myself any chance with him. The first rush he made he went under the boat, scraping the line ominously. I held on, and the line held. His next rush was for some bushes, from where I turned him, and the boat shot into clear water; then it was "pull Dick, pull devil!" Three times he ran to get under the boat, and every time I kept him sufficiently near the surface, so that Mr. Grindle went full tilt against the boat with a noise you could hear all over the lake. Twice my friend had his hand in his gills to lift him into the boat, having no gaff, and each time the fish broke away in a new rush. The last time my friend tried to lift him into the boat by the line, but the hook snapped. Mr. Grindle was free, and I was mad! "Never mind! you had your fun with him," was my friend's consolation.

The fish was as long as a man's arm. We thought he weighed from ten to twelve pounds. The only thing they are fit for is fun, and you can have that, for they are the gamest fish we have, being utterly worthless for anything else. I would like to know his name, besides the local one he bears all through this State. Our mutual friend "Guyon" can not give him his place in ichthyology, so I come to you. The Grindle grows to a large size. "Guyon" says a negro caught one weighing twenty-four pounds. Mr. "John A." resembles our black bass more than any other fish, but has a wolfish and snaky appearance, dorsal

and ventral fin, making, with its eel-like tail, a circuit around the posterior part of its body. Yours, truly,
GEO. C. EYRICH.

The fish you mention is, we think, from your description, *Amia calva*, Linn, known in the northwest as the "dog-fish" or "lawyer," the latter name probably from its rapacious habits and tenacious grasp. Perhaps, in Mississippi, there may have been an obnoxious lawyer, called John A. Grindle. "He belongs to the order *Ganoidei*, and is the only living representative of the *Amiadae*. They have cycloid scales, non-lobate paired fins, and heterocercal tail." See Huxley, *Anatomy of Vertebrated Animals*, p. 145. We have met with this fish in many western waters, as well as in those of Florida, but wherever he is found he is a villain, destructive and useless, and the sooner he vanishes from the world, like the rest of his family, the better.

DOINGS OF THE FISHING FLEET.—Ten fishing arrivals have been reported the past week, two from Newfoundland, four from Grand Menan and Nova Scotia, and four from La Have Banks. The receipts of codfish were 40,000 lbs., and of halibut 16,000 lbs., all from La Have Banks. The shore fleet have done poorly, owing to rough weather, and some of them were exposed to great danger in the thick snow storm on Friday afternoon and night. The latest sales of fresh halibut were at 12½ and 8½ cents per pound for white and gray; of codfish and haddock, \$1.80 to \$2 per hundred pounds; of frozen herring, \$1.15 to \$1.40 per hundred. There is no change of importance to note in other departments of the fish market.—*Cape Ann Advertiser*, Jan. 5th.

—The culture of the fig is practicable in Massachusetts, according to the Horticultural Society, and the protection of the trees in winter is an easy matter. Nothing more is necessary than to dig up the trees in autumn and plant them in a cellar, the repetition of this process soon forming a mass of fibrous roots, rendering their removal a matter of entire safety, at the same time that it induces fruitfulness.

New Publications.

MAGAZINES.

The *American Naturalist* for January, in entering on its eleventh volume, indulges in a little self-congratulation which we think by no means out of place. The ten volumes which have already been published contain a very large amount of valuable information on American Natural History, and the list of contributors in the past contains all the most noted names in North American science. The *Naturalist* has done more than any other periodical to popularize science, and to educate the masses to an appreciation of the practical importance of scientific investigation and study.

The number before us is in no way inferior to its predecessors. It contains a number of valuable articles, the more important of which are "Is Protective Mimicry Due to Natural Selection?" "Giant Birds of New Zealand," "The Migrations of the Distinctive Locusts of the West," and "The Philosopher's Stone." Besides these there are several shorter articles, all of much interest. The General Notes are unusually full and interesting. A valuable feature recently added to the magazine is the Report of Proceedings of Scientific Societies. The *Naturalist* has become a necessity to every worker in science.

"The *FLORIDA NEW-YORKER*, a journal recently established in New York, and having for its object the advocacy of Florida as a field of immigration, and the advantageous employment of capital, is ably conducted by Col. J. B. Oliver, a gentleman of extended personal acquaintance with Florida, its resources and capacity. Every issue of this valuable paper is replete with pertinent original contributions from the pens of well-qualified citizens of the State, and the editorials are invariably well written and to the point." Published at No 34 Park Row, New York. Single copies, 10 cents; one year, \$2.—*Adv.*

Sportsmen's Goods.

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of Waterproof Shooting Suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp at Philadelphia Centennial Exhibition. It has grown gray in service, but is good for use yet. This suit is known as the 'Boston Shooting Suit,' in contradistinction no doubt, from the garments which are manufactured out west and at Washington, each of which has a local demand of its own. It is said that the western prairie fowl can distinguish any sportsman who visits their domain by his clothes. They can tell him 'by the cut of his jib,' and the old educated birds (which no one cares to eat, by the way,) know exactly what distances to keep from the rail-shooters, the brant men, and the chicken-killers respectively, to be safe. They have 'got them all down line.' This need not be so before the waterproof shooting suits were invented. Bostonians, Hoosiers and Buckeyes all stood the same chance then. But now it is—with a sarill pipe to leeward by the old-weather cock—'here comes a Simmons; cheese it!' or, 'Ere's a 'Enning—lie low!' or, 'Look out for Holbird! Scatter! you beggars, scatter!'—FOREST AND STREAM.]

DECOYS.

RED HEAD.
WHISTLER.
MALLARD.
BLACK DUCK.

COOT.

SOLD everywhere in the U. S. by all first-class dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT,"
made by
G. W. Simmons & Son.

This new design of WATERPROOF SHOOTING SUIT, made from extra quality duck, has attained such popularity as to be called for from all parts of the country, and even from England.

"Shipping clothing to England strikes us very much like sending 'Coals to Newcastle,' but the merits of the 'BOSTON SHOOTING SUITS' have been heard of in the Old Country, and that land of sports men has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—Boston Paper.

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is water-proofed by a new patent process. The seams and pocket corners are securely fastened, and nothing neglected to render the suit perfect in every respect.

THE PRICE HAS BEEN FIXED AT \$13, TO INCLUDE HAT OR DOUBLE VISORED CAP, DETACHABLE HAVELOCK, COAT, VEST, AND PANTALOONS.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the 'Golden Rule' (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and, in addition skillfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

PERSONS ORDERING FROM A DISTANCE NEED SEND ONLY THE FOLLOWING TO BE SURE OF A PERFECT FIT: BREAST MEASURE, WAIST MEASURE, INSIDE SEAM COAT SLEEVE, INSIDE SEAM PANTALOONS; MENTION HEIGHT AND WEIGHT.

The Galaxy

For 1877!

It is the best purely Literary Magazine in America.

ALL THE LEADING NEWSPAPERS ADMIT THIS!

"It quite eclipses the more conservative periodicals of the day."—The Journal, Boston.

"It crowds more downright good literature between its covers than any other American Magazine."—Times, Chicago.

"There is not a dull page between its covers."—Times, New York.

"A model periodical, a credit to American Periodical Literature."—Press, Philadelphia.

"It is certainly the best of the American Magazines."—Express, Buffalo.

"About as near perfection as anything can be."—Register, New Haven.

"Well sustains its reputation for vigorous and racy writing."—Tribune, N. Y.

"It is more in accordance with the spirit and feeling of the American public than any other Magazine."—Graphic, New York.

DURING 1877

It will have serial stories by Mrs. ANNIE EDWARDS and JUSTIN MCCARTHY.

SHORTER STORIES BY HENRY JAMES, JR., REBECCA HARDING DAVIS, Mrs. JOHN SHERWOOD, LUCY H. HOOPER, ROSE TERRY, GEO. CARY EGESTON, EDGAR FAWCETT, NORA PERRY, and many others.

Many of our Leading Statesmen and distinguished Army Officers will write for it.

RICHARD GRANT WHITE will have a new series of Papers suggested by his recent trip to Europe.

Essays by J. S. C. ABBOTT, ELLIOTT, YOUNG, BURGESS, KATE HILLARD, KIMBALL, ALBERT RHODES, DR. GUERNSEY, Prof. BOYSEN, and many others.

Poetry by BAYARD TAYLOR, Saxe, WINTER, PARSONS, JOAQUIN MILLER, and many others.

The Scientific Miscellany and Nebulae are worth the whole price of the Magazine.

Who would not give \$4.00 for such a Magazine for a Year.

We Pre-Pay the Postage.

It can be had with either Harper's Weekly or Bazar for \$7.50. With Littell's Living Age, for \$10.50.

BULLETIN OF THE NUTTALL ORNITHOLOGICAL CLUB.

A QUARTERLY JOURNAL OF ORNITHOLOGY

This journal (now entering upon its second volume) is at present the only serial publication in America devoted to GENERAL ORNITHOLOGY. While it is intended to serve primarily as a medium of communication between working ornithologists, it also contains matter of a sufficiently valuable character to interest all who take any interest in the general subject of which it treats. Although devoted mainly to North American Ornithology, it will be so far general in its character as to give notices of all the more important works or memories relating to Exotic Ornithology. The list of contributors to its pages already embraces nearly all of the leading ornithologists of the country. Among them are Dr. Elliott Coues, Mr. Robert Ridgway, Mr. George N. Lawrence, Dr. T. M. Brewer, Dr. T. Hale Streets, Mr. H. W. Henshaw, Mr. William Brewster, Capt. Charles Bendire, U. S. A., Dr. J. C. Merrill, Dr. J. G. Cooper, Mr. E. W. Nelson, and numerous others more or less well known to ornithological readers. Its editorial supervision is in charge of Mr. J. A. Allen, assisted by Prof. S. E. Baird, and Dr. Elliott Coues. Although published by the Nuttall Ornithological Club of Cambridge, Mass., it is not in any narrow sense the organ of any section or locality. It being conducted as a MAGAZINE OF ORNITHOLOGY, its department of reviews gives prompt notices of all papers relating to North American Ornithology, as well as of all important ornithological works or memoirs wherever appearing; while its department of "General Notes" is rich in notices of rare or little known species of North American birds, and gives the latest and fullest intelligence attainable respecting the progress of ornithology in our own country. It is hence a journal no one interested in ornithology can well afford to be without.

Terms: \$1.00 a year (including postage), strictly in advance; single numbers, 30 cents. Back numbers can be supplied. Circulars, giving a list of contents of Volume 1, sent on application. Address Mr. H. B. RILEY, Newton, Mass. Dec 21

Miscellaneous.

Acme Club Skate.

Only reliable Self-fastening Skate invented. Can be instantly and firmly attached to any boot. Requires no heel-plates, straps, or key. Price per pair, \$5. Finely nickel plated, \$7. Sent by mail on receipt of price, with 30 cents extra for postage. Send stamp for catalogue of skate novelties and sporting goods.

Highest Honors

AT THE

CENTENNIAL WORLD'S FAIR, 1876!

THE

SHONINGER ORGANS

PRONOUNCED UNANIMOUSLY AS THE

Best Instruments.

Their comparative excellence is recognized by the Judges in their Report, from which the following is an extract:—

"The B. SHONINGER ORGAN CO.'S exhibit as the best Instruments at a price rendering them possible to a large class of purchasers, having a combination of Reeds and Bells, producing novel and pleasing effects, containing many desirable improvements, will stand longer in dry or damp climate, less liable to get out of order, all the boards being made three-ply, put together so it is impossible for them to either shrink, swell or split." THE ONLY ORGANS AWARDED THIS RANK.

This Medal and Award was granted after the most severe competition of the best makers, before one of the most competent juries ever assembled.

New styles and prices just issued, which are in accordance with our rule, the BEST ORGAN for the least money.

We are prepared to appoint a few new Agents. Illustrated Catalogues mailed, postpaid, upon application to

OCTOBER REVERIES.

For Forest and Stream.

Ye peaceful hills!
Ye clinging pastures, in whose stony nakedness
The dreaming kine, 'mid haunt of fox and whirring grouse,
Feel rest of man's controlling hand,
And roam the Kings of Nature,—envying not
Their fellows in the greener glades below!
Ye fragrant, weird, unfathomable woods,
Through whose deep labyrinths I trod
A youthful huntsman, eager for the chase!
There, seated on some fallen giant of thy race,
Whose grizzled garment—rent with storm and death,
Revealed the piteous wounds by tempest given,
I paused, with such tense strain of ear and eye
As filled mysterious sounds with added mystery;
The pattering nut, the swinging leaf
Which winnowing slowly in its downward flight
Kissed loving partings to its browney mates;
The springing branch, the groaning of some distant tree
Which moved by winds undreamed of at its base,
Too roughly bore the knotted arms together;
All seemed to people so the aisles with sound,
That when from out the dreamy fictions I had wrought,
Some hapless partridge,—crested like a chief—
Stalked unsuspecting on my view,—I scarcely woke
Until the fateful gun—by instinct aimed
Startled with keen report
The nimrod of my soul to life again!
Thenceforth Apollo ruled,
And life's full pulses beat with unison
To distant bay of hounds. The sterner,
Half-barbaric mood, so lately wedded to its sylvan spouse
In cosmic meditation, swept
The beauteous cobwebs to forgetfulness.
And yet not all forgot;
Still oft my thoughts in pleasant revery
Do conjure back the days by fell and wood;
And once again, o'er hill and bog and stream
I catch thy russet glow and golden tint,
O Nature fair! and view thee at thy loveliest, clothed
In the rich garb of thy October days!

New York, Jan, 9th, 1877.

WEDWORTH WADSWORTH.

Deer Hunting in Michigan.

PART I.

For Forest and Stream.

IF the sketch which follows, depicting a general outline of incidents which entered into the experience of a "Greenhorn," on his first deer hunt in the wilds of Michigan, shall have the effect of driving the work-en-cumbered denizens of the city into some reasonable consideration for his own well being, by taking for himself such recreation as will yield him the greatest possible benefit, the object of it will have been accomplished. After a fellow has spent say thirty years of his life with his nose at the grindstone, it is not astonishing that it comes to strike him at last as being somewhat monotonous, and then when he comes to look at the results and sees little but cavernous eyes, sunken cheeks, attenuated frame, and a general slaughter of the vital energies, it is well that he began to think, "What is to be the end of all this anyhow? Does it pay? and, if not, what is the remedy?" When a man has reached this crisis, and asks himself seriously these questions, there is hope for him, and happy will it prove if he can profit by my experience, so he may enjoy himself to the full limit of his capacity; and his capacity will require no stinted draught, particularly if he has been a constant reader of FOREST AND STREAM, for while yet in the toils his tastes and inclinations will have been so shaping and developing as to prepare him to receive the maximum amount of enjoyment and satisfaction the moment he breaks the monotony and enters upon the rejuvenating process. In my case I went into early training. It commenced with the first issue of FOREST AND STREAM, and it still continues. Thursday nights my watch is slow, and from the moment I take my seat before my wide open grate, with slippers and cigars until bed time, I let the world wag. I am drinking in new life, shaking hands with Thad. Norris, holding high carnival with Major Sarasota, and courting old Al. Fresco as I would my own "Gum Drop." Wife says we must make that "party call" to-night. "Not much," say I; "here's mettle more attractive!" Well, I read my FOREST AND STREAM through; then turn again to your new title page on the outside of cover, study that grand old head, which is the Daniel Webster of all mooses, then to the camp, the rods, the guns. Oh! I wish I were there; but then—not any of this for me. Oh! no, the delicious reality is too far beyond my reach. It is all very nice to know that there is such a fountain of perpetual youth, and that the mysteries of the

Forest and the Stream can be enjoyed by some, so that we can read about them and get the crumbs as it were from the rich man's table, or to borrow a smile, we can look at the blackened frames next morning after the fireworks are over, and so enjoy the fireworks second-hand like.

Now, it so happens, that in one of these reveries, the post carrier brings a letter posted "Wild Cat," Michigan. Of course that's from Elisha ('Lish for short), lumberman, merchant, notary, constable, sportsman and brother-in-law. Let's see what he has to say; some patent business probably, as usual. What! do I read aright? Why, the boy says: "Dear Greenhorn, if you want some sport, come here at once; lots of deer, plenty of bear, clouds of turkey, wild cats *quantum sufficit*, and as for partridges, quail, jack rabbits, and all such small insects, they overrun the country, begging for a front seat in a pot-pie. Come quick. Bring "Bird" (that's my wife) and stay eighteen months. Gentle reader: (Original but not copyrighted) were you ever struck by lightning? If so, you can probably imagine the thrill that shivered my timbers the moment the full force of this thing struck me. Here was the grand opportunity of a life time; but how *can* I? Oh! the tantalizing cuss! he knows it's impossible. Of course it is. But the vision haunts me; like Banquo's ghost, it will not down. I imagine I see the handwriting on the wall—he "who hesitates is lost." Well, I hesitate! I am lost! I resolve. I *will* go. There! it is done. I will telegraph so that I can't back out, and a message goes instantaneous. Are there any skeptics in your large family that don't believe in the virtue of a good resolution? Let them try it and see. My resolution is scarce an hour old, and here is a new man already. Why, the new life bursts out all over; the tension of a long strain is off; the whole frame springs upright; the true manhood steps forth and asserts the privilege of a hitherto imprisoned birthright, which else might have gone, like Esau of old, for a mere mess of pottage. So it is fixed. I go. Now to business.

Let's see; I must have a Winchester and a—well, never mind. I will tell you just what I *did* take, and then let you know in the end how the items respectively served my purpose, as follows, viz: A Winchester rifle, a heavy blue flannel shirt, a tightly knit cardigan jacket, a pair of rubber boots, a few pairs of extra heavy woolen socks, a Holabird shooting coat, an old soft felt hat, and a sheath knife, all together (except of course the rifle) filling not more than half an ordinary sized hand bag. I did not take a shot gun, as my ambition was for the "heavy weights"—no sparrows and wrens and sich; for my bag, this time. All these things provided, therefore, the most beautiful morning of the whole year (two month's since) saw me on the rear platform of a Pullman parlor, passing quietly out of the Erie depot, bound for sundown. The next morning found me at Port Huron, with a trip of thirty miles up the shore of Lake Huron yet before me, and no practicable way of making it but by boat. A boat of the regular line would not pass up until evening, but I must do better if possible, for I thought of that "Lordly Buck" that was waiting, and afraid lest Bergh might make a case against me if I taxed his patience too long; but it was no use. After hailing all sorts of craft, and trying to drive a bargain with numerous tug captains I gave it up, and it was ten o'clock at night before I set foot on the dock at Lexington, where was a pair of stalwart arms wide open to embrace, and they being clad in the shaggiest of Ulsters, it was no great stretch of the imagination in the hug that followed, to believe that I had found my own Grizzly, and that he had got the best of me. Five miles more inland in the pitchy darkness behind "Old John" (of whom more anon), brought us to our destination, and by midnight I was fast in the arms of Morpheus under a hospitable shelter, with warm hearts and true around me, and the "Lordly Buck" scarce five hundred yards away in "the bush," waiting to bid me good morning.

I was awakened betimes by the sound of voices under my window, and looking out, I saw in the faint grey of the early dawn the preparation on foot for the sport of the day; the boys were waiting for us with the hounds (splendid fellows), and a good backwoods team with hay, straw, robes, and other creature comforts filling the box, and into which, after a glorious breakfast of venison, fresh eggs, wafer-like buckwheat cakes, and the most fragrant and delicious of coffee, we all bundled. Then, amid a jolly outburst of orchestral music from some half-dozen fog horns we started, just as the streaks of grey in the east began to broaden and reflect a silver sheen on the frosty landscape. Now, while we are driving along gaily, but

not rapidly (for the corderoy road forbids that), I will introduce my companions:

First, there is "Lish," our brother-in-law, a thorough sportsman, "with all that that implies," a born gentleman in all his walks and conversation, the worthy head of the community, and the authority of an extended local district in all matters pertaining to the horse, the dog, or the gun—a mechanical genius of the first water—and a most genial and intelligent companion. Next comes Buxton, young in years, but old in wood craft; can scent a deer about as well as a hound; can thread the mazes of the forest without breaking a twig, or losing his locality for an instant; a most willing and unselfish worker for the enjoyment of others. Then comes Berthaur, an educated and intelligent gentleman, whom taste and inclination, and perhaps fortune, has led to a frontier life, an ardent lover of all manly sports, and a valued teacher and mentor to the youth of the community. Last, but not least, is Joe Butterball, in charge of the team. What Joe don't know about getting a team through a "slashing" isn't worth knowing; but when it comes to guns—well, if Joe has one in his hands give him a wide berth. He "don't know nothing about the dog-goned things—don't like 'em." So we had prepared for Joe an old muzzle loader loaded with blank cartridge, to be used as we should instruct. I was armed with a Winchester, Buxton with a Spencer carbine, Berthaur with a fine Webley breech loader, loading buck-shot. 'Lish had both a Winchester and a Daly gun. Well, here we are. We have come a mile due west of the hamlet, and here is apparently a cross road; at least they call it such but it is really little else than a path cut for the surveyor's through the forest for the laying out of the section line roads. Here we drop Buxton and the hounds. They go a mile or two further on foot, when they enter the forest to the north of the road, gradually making their way back towards us, and driving the deer before them. We turn into the forest to the north, and after going in a short distance the horses are hitched, and Joe left in charge. We give him the blunderbuss loaded and prepared for his use, and tell him to pull the trigger if he hears the hounds coming too near his station, so as to frighten the deer over towards us. We cock the gun for him, and leave him fully prepared for the emergency. We then take up our several positions about five hundred yards apart, on a line due north from each other. Joe first, Berthaur second, myself third, and 'Lish last. As a Greenhorn, I am told to keep my eye on a certain black stump when I hear the hounds coming, for if the deer comes through on the runway I am watching, he will surely pass within ten feet of that stump. I am told, also, that if the deer gets by me unhurt, not to let the dogs follow, but to stop and tie them fast. I am provided with stout muslin cords for that purpose, for the deer would probably lead them to the lake, seven or eight miles distant, and we might see no more of them for days, our hunt for the next day be spoiled. So, with these hints, I wait in the grand solitude of the virgin forest, with ears intent for the voice of the hounds. I cannot tell how long I waited. I only know that in a supreme moment of contemplation, when the soul seemed filled with the greatness, the grandeur, the glory of the illimitable wilderness, I was suddenly aroused to a realizing sense of the situation by a distant cry of the hounds, distant and low at first, gradually coming nearer and more distinct; now evidently running to the north, now to the south. Oh! the music of that full chorus, which now began to break loudly on the still air, was inspiring. All else was still as death, and every particular hair was standing on end with expectation. One loud, deep, and wonderfully clear voice, was evidently nearer than the rest, but running too far north for my runway. Presently, crack goes a shot, evidently from 'Lish's Winchester; then another, and another in quick succession. All is still again. The deep, loud-voiced hound, is heard no more; but the others are in full cry, nearly in front of me, but yet at some distance. I cannot resist the inclination to climb that high stump at my right, to see if I can see the result of those three sharp cracks. I am up there in an instant, but can see nothing: I suddenly hear a twig snap almost at my side, and looking down quickly, there is a beautiful fawn bounding lightly by, scarcely seeming to touch the ground, so graceful, so beautiful. I am spell-bound, and haven't the heart to stop him. No! Go on, my jewel, and take your life with you. The hounds are still crying loud and near. I am now back in an instant to my old position, with my eye on the black stump, though my game has probably passed. I must stop

the hounds. A'ah! there is a commotion in the brush over by that stump now. No fawn this time. A crash in the thicket, and out rushes like the wind an old grey-haired monarch, plunging like lightning right by my wondering and bewildered vision, and myself powerless to raise an arm to stop him. In an instant, however, Richard is himself again, and I send a wild shot after him. He is away now two hundred yards, going straight from me. I raise my rifle again with comparative deliberation this time. Ah! old fellow, where are you now? His heels fly up, and turning a complete somersault he lies still. The shot had struck him behind the ear and entered his brain, and in falling his momentum had carried him completely over.

I viewed my prize with a pride that I will not attempt to express. He was a grand fellow, and his head and antlers will remain an heirloom, I hope, for many generations to come. I now start to get Joe to help me in the details of bleeding and dressing him. Hark! there goes Joe's gun! Can there be another coming? I stop to listen, but hear nothing but a faint, distant jargon, in Joe's peculiar vernacular, and hasten to see what has happened to him. I found him leaning against a stump, with his hands pressed over his abdominal region, throwing out curses by the bushel on all guns, and that gun in particular, which was lying in the mud at his feet. He was able finally to explain that, after he had heard our shots, he thought all necessity for shooting his gun had passed, and he didn't like to see it standing there cocked, for the "durned thing might go off of itself, you know," and so resolved to put the hammer down. In performing the operation he held the breech against his stomach, the hammers slipped from his fingers and exploded both barrels, the recoil sending him flat on his back, and as he expressed it, "knocking his breakfast clean up into his hat."

Lish and Bertham had now come up with the hounds, and we passed congratulations and enjoyed a hearty laugh at Joe's expense. Lish had killed a buck and a doe, which satisfactorily accounted for his three shots. Bertham had not been in luck, and all agreed that the Greenhorn had acquitted himself with credit, but rather joked the sentiment which gave the fawn his liberty. We now waited for Buxton to come in before we tackled the substantial that we had brought for the inner man. He was not long after the hounds, however, and while regaling ourselves at the festive board, Buxton related how the large buck that I killed was started up by the hounds, only a few rods from where he was standing, and he could have captured him easily, but he thought of that "chap from York who had come a thousand miles to shoot deer, and he wouldn't steal any of his chances *no how*." Who says there is isn't honor and fellow feeling in the backwoods? Indeed, that is just the place to look for it and its name, when you find it—is Buxton. Well, there must be an end to all things, and the end had now come to our first day's hunt. We all turned to and had our venison stored in the wagon box in short order, which obliged all but that "favored chap from York" to walk home. That night a mysterious party, with glistening knives and lanterns, were busy until midnight cutting up and dividing the spoils, and planning for the next day's hunt, which promised lively sport, inasmuch as bear and wild cat were included in the programme. I find I have forgotten to speak of "Old John," as I promised. He is a grand character in his way, but the length of this paper precludes the singing of his virtues, and of his wonderful intelligence at this time, but will come in with a subsequent account of the three day's sport that followed, and which was participated in by

GREENHORN.

WHAT WE HAVE IN KENTUCKY.

"WE" uns "claim that Kentucky affords as great, if not greater and more diversified attractions to refined sportsmen, than any State south and west.

As a woman occupies greatest conspicuity in the earliest authentic records we recognize her claims, and give her merits precedence in our enumeration by declaring that the superior beauty of Georgian and Circassian women was conceded before Kentucky figures in history; in fact, before the State was created. Now, the unanimous concessions, so far as reports have been received, are that the Kentucky women approach nearest the angelic type. The world knows that the finest and fastest racers on the turf are of Kentucky origin.

Our kennels of fox hounds have no superiors in speed and staying qualities; our pointers and setters are as staunch as the best, and in B. Mills & Son, of Lexington, we boast manufacturers of as fine guns as any market offers to sportsmen, no matter whether rifle or shot, muzzle or breech-loaders; and Meek & Milam, of Frankfort, are the inventors and makers of the best reel known to American anglers.

We envy the fisherman who has never handled a "Meek reel," but has the treat in store, for it will prove the richest of his piscatorial enjoyments.

When we viewed in Government Building the Centennial display of fishing tackle we felt that it was sadly deficient when we failed to discover a Meek reel in the collection; and imagine, if you can, our pity for one of your New York gentlemen of the rod who confesses to us that he had never heard of our Frankfort reel. We are inclined to hold Genio C. Scott and John J. Brown responsible for his ignorance. Our recollection is, that their

partiality is expressed for the New York balance reel. Affix a similar balance to the handle of a Meek reel, start it, and you have solved what is pronounced the puzzling chimera of perpetual motion.

But the most enchanting mountain scenery; and streams swarming with bass, salmon and pike invite the angler, while the abundance of deer, turkeys and partridges in those regions render them the hunters' heaven. Bears, panthers and wild cats are not unfrequently encountered, and one of our clubs brought us one of the trophies of its last hunt, a fine specimen of the black bear. The thrilling descriptions of its capture caused an involuntary shudder to us younger hunters, most of whom never saw bruin except behind a screen of iron rods; but the true version of that monster's death, which slowly but unerringly followed the club proclaimed it ignominiously slaughtered after it had been *entrapped* by a native, who received a liberal pecuniary compensation for his favor.

It is almost superfluous to add that the choicest article known to chemical scientists of that elixir, which every prudent and provident angler esteems an indispensable to his "armamentarium"—"snake medicine"—is distilled in our blue grass counties.

The Kentucky and Cumberland rivers, arising in the mountains near the Virginia border, course hundreds of miles through the State before they are lost in the Ohio; our Green and the famous Salt of central origin, are no insignificant streams before their tribute is paid to the same. Those principal streams, with their numerous large tributaries, render Kentucky one of the finest fields in the Union for fresh water angling, though at present the perfection of sport is sought in the upper Kentucky and Cumberland and their mountain tributaries in consequence of the indiscriminate bushwhacking warfare which has been waged upon the inhabitants of our central and western streams. The almost universal approval and observance of a general fish law enacted by our last Legislature, inspire hope that the rapid increase of the game varieties native to our waters will soon supercede the necessity of drawing upon mountain rivers for delight. Moreover, our State hatchery is in successful operation, and several thousands of California salmon fry have been planted in various streams. Should they thrive and "take to" our waters, we shall be especially favored.

After the completion of the Cincinnati Southern Railroad all the largest streams of Kentucky will be of convenient access by rail. Already, since the building of that road was commenced, a hunter's paradise has been erected at Cumberland Falls, about which is the wildest and grandest scenery of the State. Trains on C. S. R. R. will be run within ten miles of that wonder. The fall is about seventy feet, at an ordinary stage of water, and the pool below is not only immense but affords an inexhaustible supply of finny game. The hunter will need no transportation from the falls to hunting grounds, for a deer can be started at any time within half a mile. We shall leave the attractions of that watering place and Rock Castle springs, near by, to be described through your advertising columns, as will soon be done, we have been assured.

In the blue grass counties quail shooting is the hunter's only genuine sport, except fox-chasing. Woodcock and snipe are so rarely flushed that one in a hunter's bag is the exception. Hares are plentiful, but they and squirrels are pursued chiefly by old musket and single-barrel shot gun sportsmen, who are principally of African extract.

Many parties from every blue grass county go to the mountains on fishing excursions in spring and summer, deer hunting in the fall, and we call for reports of the richest incidents of each through the columns of FOREST AND STREAM.

With a hearty wish for an increase of that prosperity which its late enlargement and new outer dress proclaims, as well as for the renewal of our old friend's subscription, and the contribution of a few of the "good ones" which we know, he can narrate charmingly, we refrain.

SPORT IN FLORIDA.

PUTNAM, Ct., Nov. 24th, 1876.

EDITOR FOREST AND STREAM:—

I have sometimes thought I would write you of some of the interesting times I have had while shooting and fishing and traveling throughout Florida. I was twenty-two days in the saddle on an excursion from Silver Springs, in Marion county, down through Hernando, Hillsboro and Manatee counties, returning through Polk and Sumner counties to my winter home at Orange Dale. One of the most laughable and withal most disagreeable adventures was with a fifteen-foot alligator on the border of the Everglades. We were stopping at Punta Rassa, at the southern part of Charlotte Harbor, last winter, and having made some pleasing acquaintances among the hunters and pleasure-seekers then there, I was invited to take a trip in a sail boat down to Esetro river, about twelve miles south, as some flamingoes and scarlet ibis had been seen there recently, and it is excellent hunting grounds for most all kinds of game. I was ready at an early hour, and taking a flat or push boat with us, with a spanking fair breeze, we soon arrived at the mouth of this beautiful river, rivalling in picturesque beauty the famed Oclawaha. Sailing up as far as deemed prudent we came to a good tie-up for our boat, and launching our flat were soon paddling our way up to the drift or passage to the famed Lilly pond, where we expected the rare birds; our way was up a kind of ditch like a path through high saw grass on each side;

we saw thousands of water-fowl and many large alligators. Passing a small opening we saw a huge alligator lying on the grass at the end of this opening. He was so large we determined to try to get him for his teeth, and Adams and Bailey were to try their rifles on him. He was only about forty feet from us. Backing our boat a little, they both fired. As the boat was unsteady they did not kill him dead as is usually the case when hit in the eye; but the creature plunged into the water and came directly for the larger channel, where we were in less than a minute. He was passing under our boat; the water being shoal he swung the boat half round, tipping out Adams, Bailey and myself. I happened to fall where the water was shoal, but Bailey and Adams went over backwards into the very middle of the ditch or stream. Such floundering for a few moments I never saw before. Adding to the general scare were two large moccasin snakes, which seemed to appear then and there among the crowd. However, the boat did not completely overturn and we soon got in; but Bailey's rifle and my Parker shot gun were lost, and it was ten minutes before we reclaimed them from the mud. Too wet and muddy to continue we returned to the boat, and perhaps it was lucky that we met with the mishap, for we found a canoe there with two rough looking men just boarding her. They, as soon as spying us, as hastily left, paddling down stream as fast as possible. It took us full two hours to wash the mud from our clothes, and Adams and myself concluded to stay in our boat, while the rest of the party again started for the little Lilly Lake. The warm sun soon dried our clothes, and we slowly proceeded a little way up the river, and seeing a flock of wild turkeys were enabled to kill three of them. O such fine, splendid birds! By and by we saw a very large alligator, who, with saucy imprudence, swam directly for our boat, and in his ugly, wicked eye seemed to challenge us. He lay on the water within fifteen feet of us, when I sent a bullet crashing through his brain and turned him up. We passed a rope around his neck and then put a few bullets through his brain to make sure; and with hatchet and knife finally separated his head from his body. It was as much as we two could do to get the head into our boat. We shot some parakeets, and four white and two variegated cranes and one otter. Before our party found us they had considerable sport, and quite a pile of ducks and cranes and one deer. We soon got under sail, and before sundown arrived back at Punta Rassa. The next day we planned a trip across the peninsula to Indian river, and arranged for horses so as to start the next Monday, expecting to be gone at least two weeks. This we successfully accomplished, and if you would like the journal for your readers I would give it to you in my next, although I shall not tell of my experience of getting off the horse some half a dozen times, and alighting in as many different ways. Mostly, however, getting off over his tail and sitting down double quick. Nor will I tell you of my scare when I met a panther, although I had often said I would give ten dollars for a shot at one. He was only about thirty feet from me, and on a big limb of a live oak; and yet I did not shoot. No siree! I didn't want any cat—we had a cat at home. G. F. W.

NOTES FROM MISSISSIPPI.

HUDSON, Miss., Dec. 25th, 1876.

EDITOR FOREST AND STREAM:—

Leaving the "Keystone" State about the middle of November we journeyed by rail and boat to Northern Mississippi to spend the winter with our amiable friend and acquaintance, J. M. Lindley, who resides on his pleasantly located little farm on the first range of bluffs east of the Mississippi fifteen miles. As we came on the Pennsylvania railroad we rode in the smoking car carrying our Winchester rifle and shot-gun by our side; but when we reached Pittsburg and changed to the "Pan Handle" route, the conductor ordered the guns put in the baggage car. The baggage master being busy changing the baggage only, inquired if we were going through to Cincinnati, and laid them down to one side on some baggage until he could have time to put them away more securely. When we reached Columbus we went out to look after things, as they change both conductors and baggage masters there, and the retiring baggage master came to us and said that he came near getting killed with that rifle, to which we replied that he must have handled it very carelessly, as there was no load in the barrel when we handed it to him. Then he acknowledged to having picked it up by the lever, which cocked it, and when he put the lever back it put the cartridge in the barrel, and the first thing he knew he had put a ball through the top of the car. We venture hereafter that that baggage master will handle a Winchester with a little more care and discretion. After arriving in Mississippi we took a few days' hunting through the bottom; only saw one deer which, was too far off to get a shot at, but succeeded in killing some fine wild turkeys, which are very plenty hereabouts this winter. Deer are not as plenty as they usually are. Black bear are very thick in some parts of the bottom. One man over on Beaver dam has caught four this winter in his log trap; the largest weighed 380 pounds. Joe Keiser, a trapper near here, from Hannibal, Mo., bought him two of Newhouses No. 5 traps, with which he has caught two small bears, weighing respectively 130 and 165 pounds. Bears usually go into winter quarters here early in January, and do not come out again until the last of March. The winter has been unusually cold for this locality, and it is generally thought that the bears have already housed.

We have been around through much of the South, and

think northeast Mississippi, contiguous to the Mississippi river, is the hunter's paradise for large game—bears, deer, panther, wild turkey, geese, swan and duck, with some few partridges, out on the hills, and abundance of squirrels everywhere. There are many hunters, and some who are excellent shots with a rifle. Parties can generally get accommodated with board, the best the country affords, at from \$8 to \$10 per month, and although the accommodations are not such as are to be had in a more thickly settled country, yet we have always found that in our trapping and hunting expeditions down here the past few winters have always given us a keen relish for the corn bread and fried bacon, with an occasional cup of good sweet milk, and always a cup of good hot coffee. SHETHAR-BOZNAI.

THE HAYDEN SURVEY.

SUMMARY OF THE FIELD WORK OF THE ZOOLOGICAL, AND
GEOGRAPHICAL SURVEY OF THE TERRITORIES UNDER THE
DIRECTION OF PROF. F. B. HAYDEN, FOR THE SEASON OF
1876.

FOR reasons beyond the control of the geologist in charge, the various parties composing the United States Geological and Geographical Survey of the Territories in charge of Prof. Hayden, did not commence their field-work until August. Owing to the evidences of hostility among the northern tribes of Indians, it was deemed most prudent to confine the labors of the survey to the completion of the Atlas of Colorado. Therefore the work of the season of 1876 was a continuation of the labors of the three preceding years, westward, finishing the entire mountainous portion of Colorado, with a belt of fifteen miles in width of northern New Mexico, and a belt twenty five miles in breadth of eastern Utah. Six sheets of the Physical Atlas are now nearly ready to be issued from the press. Each sheet embraces an area of over 11,500 square miles, or a total of 70,000 square miles. The maps are constructed on a scale of four miles to one inch, with contours of two hundred feet, which will form the basis on which will be represented the geology, mineral, grass and timber lands, and those portions that may be redeemed by irrigation. The areas of exploration the past season are located in the interior of the continent, far remote from settlements, and among the hostile bands of Ute Indians that attacked two of the parties the previous year.

The point of departure the past season was Cheyenne, Wyoming Territory. Two of the parties, with all their outfit, were transported by railroad to Rawlins Springs, and proceeded thence southward. The other two were sent by railroad from Cheyenne southward, one party to Trinidad and the other to Canyon City.

The primary triangulation party was placed in charge of A. D. Wilson, and took the field from Trinidad, the southern terminus of the Denver and Rio Grande railroad, August 18th, making the first station on Fisher's Peak. From this point the party marched by the valley of the Purgatoire, crossed the Sangre de Cristo range by way of Costilla Pass, followed the west base of the range northward as far as Fort Garland, making a station on Culebra Peak.

About six miles north of Fort Garland is located one of the highest and most rugged mountain peaks in the west called Blanca Peak, the principal summit of the Sierra Blanca group. On the morning of August 28th, the party, with a pack-mule to transport the large theodolite, followed up a long spur which juts out to the south. They found no difficulty in riding to timber line, which is here about 12,000 feet above sea level. At this point they were compelled to leave the animals, and, distributing the instruments among the different members of the party, proceeded on foot up the loose, rocky slope to the first outstanding point, from which a view could be obtained of the main peak of the range. Although this first point is only six hundred feet lower than the main summit, yet the most arduous portion of the task was to come. The main summit is about two miles north of the first point, in a straight line, and connected with it by a very sharp-toothed, zigzag ridge, over which it is most difficult to travel, on account of the very loose rocks and the constant fear of being precipitated down on either side several hundred feet into the amphitheatres below. After some two hours of this difficult climbing, they came to the base of the main point, which, though very steep, was soon ascended, and at eleven o'clock a. m., they found themselves on the very summit. From this point one of the most magnificent views in all Colorado was spread out before them. The greater portion of Colorado and New Mexico was embraced in this field of vision. This point is the highest in the Sierra Blanca group, and, so far as is known at the present time, is the highest in Colorado. The elevation of this point was determined by Mr. Wilson in the following manner: First, by a mean of eight barometric readings, taken synchronously with those at Fort Garland, which gave a difference between the two points of 6,466 feet; secondly, by fore and back angles of elevation and depression, which gave a difference of 6,468 feet. The elevation at the fort was determined by a series of barometric readings, which, when compared with the Signal Service barometer at Colorado Springs, gave it an elevation of 7,997 feet, making the Blanca peak 14,464 feet above sea level. This peak may be regarded, therefore, as the highest, or at least next to the highest, yet known in the United States. A comparison with some of the first-class peaks in Colorado will show the elevative height:

	<i>Fcet.</i>
Uncompahgre Peak, above sea level.....	14,285
Blanca Peak,	14,464
Mt. Harvard,	14,884
Gray's Peak,	14,341
Mt. Lincoln,	14,296
Mt. Wilson,	14,280
Long's Peak,	14,271
Pike's Peak,	14,140

The foregoing table will afford some conception of the difficulty encountered in determining the highest peak where there are so many that are nearly of the same elevation.

tion. About fifty peaks are found within the limits of Colorado that exceed 14,000 feet above the sea level.

From this point the party proceeded westward across the San Luis valley, and up the Rio Grande to its source, making two primary stations on the way, one near the summit district and the other on the Rio Grande pyramid. From the head of the Rio Grande the party crossed the continental divide, striking the Animas park, and thence proceeded by trail to Parrot City.

After making a station on La Plata Peak, the party marched northwest across the broken mesa country west of the Dolores, making three stations on the route to complete a small piece of topography that had been omitted the previous year, on account of the hostility of the Ute Indians. After making a primary station on the highest point of the Abajo mountains, the party turned eastward to Lone Cone, where another station was made. Thence crossing the Gunnison and Grand rivers, they proceeded to the great volcanic plateau at the head of White river. The final station was made between the White and Yampah rivers, in the northwestern corner of Colorado. During this brief season Mr. Wilson completed about 1,000 square miles of topography, and made eleven geodetic stations, thus connecting together by a system of primary triangles the whole of southern and western Colorado.

In company with the triangulation party, Mr. Holmes made a hurried trip through Colorado, touching, also, portions of New Mexico and Utah. He was unable to pay much attention to detailed work, but had an excellent opportunity of taking a general view of the two great plain-belts that lie the one along the coast, the other along the west base of the Rocky Mountains. For nearly 2,000 miles' travel he had constantly in view the cretaceous and tertiary formations, among which are involved some of the most interesting geological questions. He observed among other things, the great persistency of the various groups of rocks throughout the east, west, and north, and especially in the west; that from northern New Mexico to southwest Wyoming, the various members of the cretaceous lie in almost unbroken belts.

Between the east and the west there is only one great incongruity. Along the east base of the mountains the upper cretaceous rocks, including Nos. 4 and 5, are almost wanting, consisting at most of a few hundred feet of shales and laminated sandstones. Along the west base this group becomes a prominent and important topographical, as well as geological feature. In the southwest, where it forms the "Messa Verde" and the cap of the Dolores plateau, it comprises upwards of 2,000 feet of coal-bearing strata, chiefly sandstone, while in the north it reaches a thickness of 3,500 feet, and forms the gigantic "hog-back" of the Grand River valley.

While in the southwest he visited the Sierra Abajo, a small group of mountains which lie in eastern Utah, and found, as he had previously surmised, that the structure was identical with that of the four other isolated groups that lie in the same region. A mass of trachyte has been forced up through fissures, in the sedimentary rocks, and now rests chiefly upon the sandstones and shades of the lower cretaceous. There is a considerable amount of arching of the sedimentary rocks, caused probably by the intrusion of wedge-like sheets of trachyte, while the broken edges of the beds are frequently but abruptly lifted up, as if by the upward or lateral pressure of the rising mass. He was able to make many additional observations on the geology of the San Juan region, and secured much valuable material for the coloring of the final map.

He states that the northern limit of ancient cliff-builders in Colorado and eastern Utah is hardly above latitude 37 deg. 45 min.

The Grand river division was directed by Henry Gan-
aet, topographer, with Dr. A. C. Peale as geologist. James
Stevenson, executive officer of the survey, accompanied
this division, for the purpose of assisting in the manage-
ment of the Indians, who last year prevented the completion
of the work in their locality by their hostility.

The work assigned this division consisted in part of a small area, containing about 1,000 square miles, lying south of the Sierra la Sal. The greater portion of the work of this division lay north of the Grand river, limited on the north by the parallel of 29 deg. 30 min., and included between the meridian of 108 deg. and 109 deg. 30 min.

This division took the field at Canyon City, Colorado, about the middle of August. The party traveled nearly west up the Arkansas river, over Marshall's Pass and down the Tomichi and Gunnison rivers to the Uncompahgra (Ute) Indian agency. Here they secured the services of several Indians as escorts in the somewhat dangerous country which they were first to survey. This area, lying south of Sierra la Sal, was worked without difficulty. It is a broken plateau country, and presents many extremely curious pieces of topography. Eleven days were occupied in this work.

The Grand river, from the mouth of the Gunnison river to that of the Dolores, *i. e.* for nearly a hundred miles, flows along the southern edge of a broad valley, much of the way being in a low canyon, 100 to 200 feet deep. The course of the river is first northwest for 25 miles; then, turning abruptly, it flows southwest, and then south, for about 75 miles. This valley has an average width of 12 miles. It is limited on the north and west by the "Roan or Book Cliffs" and their foot-hills, which follow the general course of the river. These cliffs rise from the valley in a succession of steps to a height of about 4,000 feet above it, or 8,000 to 8,500 feet above the sea.

From its crest this plateau (for the Book Cliffs are but the southern escarpment of a plateau) slope to the N. N. E. at an angle of not more than five degrees. It extends from the Wahsatch mountains, on the west, to the foot-hills of the Park range, on the east, and presents everywhere the same characteristics. The Green river crosses it, flowing in a direction exactly the reverse of the dip. It borders the Grand on the north for 100 miles, the crest forming the divide between the Grand and the White. On the south side of the crest are broken cliffs; on the north side, the branches of the White canyon immediately. This leaves the divide in many places very narrow, in some cases not more than 30 to 40 feet wide, with a vertical descent on the south towards the Grand river, and an extremely steep earth-slope (35 degrees in many cases) at the heads of the streams flowing north to the White river. This crest, though not over 8,500 feet in height, is the highest land for a long distance in every direction.

After leaving the Uncompahgre agency, the party followed Gunnison's Salt Lake road to the Grand and down that river to the mouth of the Dolores, in latitude 38 deg. 50 min., longitude 109 deg. 17 min. At this point they

turned northward, and went up to the crest of the Bock plateau. They followed the crest to the eastward for upwards of a hundred miles, or to longitude 108 deg. 15 min.; then descended to the Grand and followed it up to longitude 107 deg. 35 min., and thence via the White River (Ute) Indian agency, to Rawlins, where they arrived on October 23d.

The whole area worked is about 3,500 square miles, in surveying which about 60 stations were made.

The geological work of this division, by Dr. Peale, connects directly with that done by him in 1874 and 1875. Sedimentary formations prevail on both districts visited during the past season.

The country first examined lies between the San Miguel and Dolores rivers, extending northward and northwestward from Lone Cone mountain. The general character of this region is that of a plateau cut by deep gorges or canyon, some of which, especially towards the north, extends from the sandstones of the Dakota group to the top of the Red Beds. The depth of the canyon, however, is no indication of its importance as a stream-bed, for, excepting the main streams, they are dry the greater portion of the year. There are no great disturbances of the strata. What folds do occur being broad and comparatively gentle.

The San Miguel river, on reaching the San Juan Mountains, flows toward the northwest, and with its tributaries cuts through the sandstone of the Dakota group, exposing the variegated beds lying beneath, that have generally been referred to the jurassic. About 25 or 30 miles north of Lone Cone, the river turns abruptly to the west, and flows west and southwest for about 15 miles, when it again turns and flows generally northwest until it joins the Dolores. Between the San Miguel and Lone Cone the sandstone of the Dakota group, or No. 1 cretaceous, are nearly horizontal, forming a plateau which, on approaching the mountains, has a capping of cretaceous shales.

Beyond the bend the San Miguel flows in a monoclinical valley, in which the canyon walls are of the same description as in the upper part of its course. As the mouth is approached the Red Beds appear. Between this portion of the course of the San Miguel and the almost parallel course of the Dolores, which is in a similar monoclinical rift, there are two anticlinal and two synclinal valleys parallel to each other. They are all occupied by branches of the Dolores, lower cretaceous, jurassic, and triassic strata outcrop, and present some interesting geological details, which will be fully considered in the report on the district. The Dolores river comes from a high plateau in a zigzag course, flowing sometimes with the strike, and sometimes with the dip of the strata. Its general course on the western line is about northwest, from which it turns to the northward and westward, finally changing to northwest again, to its junction with the Grand. It is in canyon the greater part of its course.

In the region of country north of Grand river, the geological formations extend uninterruptedly from the Red Beds exposed on Grand river to the white tertiary cliffs forming the summit of the "Roan Mountains" or Book Cliffs. The Grand is generally in a canyon in the Red Beds; on the north side the No. 1 cretaceous sandstone forms a hog-back, sloping towards the cliffs. Between the crest of this hog-back and the cliffs there is a broad valley formed by the erosion of the soft cretaceous shales which extend to the base of the cliffs, and in some places form their lower portion. The cliffs are composed mainly of cretaceous beds, rising one above another in steps until an elevation of about 8,000 feet is reached. The summit is the edge of a plateau sloping to N. N. E. This plateau is cut by the drainage flowing into the White river from the south. These streams rarely cut through the tertiary series.

Coal of poor quality is found in the sandstones of the Dakota group, and also in the sandstones above the middle cretaceous beds. Wherever noticed it was in their seams, and of little economic importance.

The White river division was directed by G. B. Chittenden, as topographer, accompanied by F. M. Endlich as geologist.

The district assigned to this party as their field for exploration during the season of 1876, commenced on the eastward at longitude 107 deg. 30 min., joining on to the work previously done, and extended westward 30 miles into Utah Territory. Its southern boundary was N. latitude 39 deg. 38 min., while the White river formed the northern limit. In order to complete to the greatest possible advantage in the short time that could be allowed, it was determined to make the White river agency headquarters, and in two trips from there complete the work. About 3,800 square miles comprised the area surveyed.

In working up the topography of this district the party spent 48 days of absolute field work made 41 topographical stations and 16 auxilliary ones; and traveled within the district about 1,000 miles. The party ascertained the course of all the main trails, the location and quality of almost all the water, which is scanty throughout, and can map with considerable accuracy the topographical forms and all the water courses. The area is almost entirely devoid of topographical "points," and the topographer is obliged to depend to a considerable degree on those for the north and south for the triangulation. The country has heretofore been almost entirely unexplored, and was described by the nearest settlers as a broken canyon country, extremely dry. It was marked on the maps as a high, undulating plateau, with fresh water lakes and timber. The party saw no lakes of more than 400 yards in diameter, and only two or three of those. The country is nearly all inhabitable, both winter and summer, and considerable portions of it valuable; and though three quarters of it is within the Ute Indian reservation, the advantage of a more accurate knowledge of its character can readily be seen.

While working in the low, broken country of Southwestern Colorado, last year, Mr. Chittenden made use of a light, portable plane-table, and found it of great value. It appeared at that time that its value was greatest in that class of country, and that in a low, rolling district, with few prominent points, or in a high mountain country, it would probably be of little or no use. Altitudes were determined by the mercurial barometer, with a base at the White River Indian agency, and checked by a continuous system of vertical angles. The altitude of the agency has been determined by a series of barometric observations extending over two years and a half, and referred to railroad levels, and can probably be depended on to within a few feet. The altitude of the agency being about 6,500 feet, and the altitudes in the district ranging from 5,000 to 8,000 feet, makes its location the best possible in height for a barometric survey of the region.

It is the intention of the survey during the coming year to publish some tabulated results of the barometric work in Colorado, showing the system and its accuracy and reliability. This may be of use in future work, since the topography of the whole west must greatly depend on barometric determinations of altitude, and Colorado has furnished almost every possible phase of western topography. The longest dimension of the work lying east and west, and the White and Grand rivers running in approximately parallel courses, the district stretched from the White river up over the divide between the Grand and White, and embraced the heads of the lateral drainage of the former river.

The general topography is a gentle rise from the White river towards the south, and a sudden breaking off when the divide is reached, into rugged and often impassable cliffs, known on the maps as the Roan or Rock mountains. The gentle plateau slope of the White river side is out by almost numberless and often deep canyons, and in many cases the surface of the country has been eroded away, leaving broken and most picturesque forms, the lower benches generally covered with cedars and pines, and the upper rich in grass.

There are four main streams draining into the White river within the limits of our work—a distance of something over 100 miles. The easternmost is a large running stream; the second, though tolerably good water may be found in pools in its bed, carries in the summer no running water for the greater part of its course; the third has for most of its length a trickling stream of the bitterest of alkali water, while the fourth and westernmost one is perfectly dry for some twenty-five miles from its mouth, and then forks, one branch containing pure, sweet water in pools the other a running stream of bitter alkali. All of these streams have more or less good water at their heads. They traveled nearly the whole length of all these water-courses, but found good trails only in two middle ones. Trails, which traverse the whole district in every possible direction, keep mostly on the summits of the ridges and plateaus, and by taking care not to cross the canyons, the country is very easily traveled through.

The country is almost entirely destitute of timber, and has but little good water. It is, however, abundantly supplied with grass, and, especially in the winter season, must be well stocked with game. It seems well adapted to its present use as an Indian reservation, and is likely to remain for years to come more valuable for them than it could be for a settlement.

In the far western portion, and outside the limits of the reservation, one large vein of asphaltum and several small veins were found, and also running springs of the same material, all of which, if once reached by railroads, will prove of great commercial value. These deposits have been spoken of before, but their location has not been accurately determined. The principal vein seen by this party is at present about one hundred miles from railroad communication, but less than half that distance from white settlement, and is likely in the present rapid growth of that country to be within a few years made available.

According to the report of F. M. Endlich, the geology of this district is very simple, though interesting. Inasmuch as but one divide of importance occurred within the district, the work was somewhat simplified. This was formed by the Book cliffs, between the drainages of the Grand on the south and the White on the north. Both these rivers flow a little south of west, into Green river, which they join in Utah. From the junction of the Grand and Green downward, the river is called the Great Colorado. Orographically, the region surveyed is comparatively simple. The book cliffs are the summit of a plateau about 8,000 feet above sea level, continuing unbroken over to the Green river. Toward the south these cliffs fall off very steeply, forming deep canyons that contain tributaries of the Grand river. On the north side, with the dip of the strata, the slope is more gentle, although, in consequence of erosion, numerous precipitous cliffs are found. Descending in that direction, the character of the country changes. Instead of an unbroken slope, we find that the plateau has been cut parallel by the White river drainage, and the long, characteristic mesas of that region testify to the action of erosion. Approaching the river, constantly descending with the slight dip of the strata, the bluffs become lower and lower. Though the creek-valleys are wide, and at certain seasons no doubt well watered, the vegetation is that of an arid country. Dwarf pines, pines, and sagebrush abound, to the almost entire exclusion of other trees or grass. Traveling down White river, this character is again found to change. A new series of bluffs, occasioned by heavy, superincumbent strata, gives rise to the formation of deep canyons. For forty-five miles the party followed the canyon of the White, that, no doubt, is analogous to that of the Green, and probably closely resembles that of the Colorado in its detail features.

[To be continued.]

Fish Culture.

ABSTRACT OF THE ANNUAL REPORT OF THE FISH COMMISSIONERS OF THE STATE OF VIRGINIA FOR THE YEAR 1876.

IN November, 1875, the Commissioners received, through the United States Commissioner of Fish and Fisheries, 320,000 California salmon, paying only the express charges. Half of these were taken to the hatching house at Lexington, and half to that at Blacksburg, and entrusted to Mr. Fred. Mather, an accomplished expert, aided by Mr. W. F. Page, an élève of the Blacksburg Institute, whose energy, zeal and intelligence inspire confidence in his future success. The eggs at Lexington hatched well, and yielded 120,000 fish, which were distributed as follows:—

Tye river, Nelson county.....	17,000
Pedlar river, Amherst county.....	10,000
Jackson river, Alleghany county.....	15,000
Mountain lake, Giles county.....	3,000
Tributaries to the James in Botetourt and Rockbridge.....	75,000

The distribution of these salmon was confined to the headwaters of the James and Roanoke rivers, the expectation being that not only on account of their having fewer enemies there, but that with the known instincts of anadromous fishes they will be more likely to return to the captures of mountain torrents. Until the success of the

experiment is ascertained the Commissioners will hatch no more on their own account, but will turn their State's quota over to the Maryland Commissioners to be placed in the tributaries of the Potomac. The limited means at the disposal of the Commissioners will be devoted to the propagation of brook trout, to which their mountain streams are so well adapted. A conclusion in which we heartily concur as a course likely to give the greatest satisfaction to the people, and one that will result in more immediate and tangible profit.

Upwards of 4,000 eggs of the land-locked salmon were secured from Maine, which, after being hatched at Lexington, were distributed in the Tye, New and Roanoke rivers, Mountain lake in Giles county, and in several streams in Rockbridge and Botetourt counties.

About 400 red-eye perch were taken from a pond in Smyth county—of which hundred were put into New river and 150 into James river at Lynchburgh, and the same number into Tye river at the railroad crossing. The Commissioners were indebted to the kindness of Mr. Buchanan, who permitted his pond to be seized for these fish.

Black bass (*Grystes salmonides*) were put into James river at various points five years ago, and have become quite numerous. All the streams, except four or five in Eastern Virginia were stocked with these fish last fall, but there being no law to protect their work the Commissioners will wait until one is passed before continuing. The pond bass, or Southern chub, (*Grystes nigricans*) was brought to the State from South Carolina about the beginning of the century. It now abounds in all the mill-ponds in Eastern Virginia in which it has been placed, and is found in large quantities in the quiet coves of the James, Rappahannock and other tidal waters. Unlike other fish, it does not appear to go up stream, even to spawn. In ponds it goes to the shallow water near shore for that purpose; and it has never been known higher up a river than it has been placed. Its tendency seems to be downward. Even in spring it has been known to descend a long, narrow race, and go over the mill-wheel, in quest of wider and deeper waters.

They will in future be placed when young in ponds made for the purpose in May when they can be easily captured, and transported when cool weather comes to where they are to be permanently placed. As the shad and herring are more particularly the fish of the people the matter of propagating them early received the attention of the Commissioners. Mr. W. D. Marks was employed to take charge of the hatching operations at Tobago bay on the Rappahannock, where there were four large shore-seines and a shad spawning ground. The season, however, was even more unfavorable than that of the previous year; and notwithstanding all efforts and precautions the designs of the Commissioners were in a great degree frustrated and their hopes dissipated from an utter impossibility of obtaining ripe fish, and they succeeded in hatching and turning into the river only about 800,000 young shad. Mr. Marks ascribed the cause of failure to the great quantity of fixed contrivances for the capture of fish lower down the river, and expressed the conviction that if the law does not intervene, they will be forced in a few years to look to other States and streams for the means of replenishing the rivers. James River was examined, and Berkley fixed upon as a hatching station in charge of Mr. Henry B. Nichols, who succeeded in spite of all obstacles in hatching and turning into the river about 400,000 young shad.

With respect to herring, the best mode for propagating them is said to be by moving them bodily above tidewater, out of the reach of seines, nets and traps. To that end, steps have been taken to move next spring, 5,000 above Boshers dam, where they may spawn and hatch without molestation. The herring does not spawn, as the shad, in the flowing tide or stream. It deposits its eggs on brush, logs, rocks, etc., where they stick. They are all impregnated, and are exposed to fewer casualties than those of the shad. A herring spawns from 100,000 to 150,000 eggs each. Taking the lowest figure, and admitting that only half of the 5,000 are females, there will be 250,000,000 of eggs; which operation, repeated for a series of years, would make James river the finest herring stream on the continent.

With regard to the propagation of brook trout (*Salmo fontinalis*) the Commissioners say:—

"It is desirable, both on the score of cheapness and for supplying means for full instruction in the art of pisciculture, to raise our own spawners. We have, therefore, had ponds constructed both in Lexington and Blacksburg for them, and we hope by the next season to have an abundance of eggs to occupy both of those hatching establishments during the succeeding winter. For the present we have been compelled to buy, and have obtained 150,000 eggs from Troutdale, New Jersey. Of these 100,000 will be hatched at Lexington, and 50,000 at Blacksburg."

Seth Green's statement regarding the mode of stripping is reprinted from FOREST AND STREAM, and the Commissioners think that their streams once stocked sportsmen would flock to their banks, where "fly oil" is unknown and mosquito bars are but a tradition.

Through the kindness of Mr. A. Y. Lee a considerable number of goldfish have been sent to the hatching-house at Lexington, and in another year will be distributed in various streams. They are not considered a good food fish, but being very prolific, they supply food for those that are.

The two hatching-houses at Blacksburg and Lexington bid fair to realize the results expected of them. The one at Blacksburg, in connection with the State institution, is in charge of Professor Ellzey, who makes fish culture a part

of his course, and teaches his pupils the practical processes of the art. This, in a few years, will diffuse a knowledge and taste for this new industry throughout the State. The one at Lexington, in connection with the military institute, is in charge of Professor McDonald, and is in active operation. The theory and practice of fish culture is taught there as well, and ponds have been constructed for trout spawners, which will probably yield eggs enough to employ the full capacity of both hatching-houses next year. The question of oyster propagation (a very important one) engages the attention of the Commissioners; also the terrapin question. The hybridizing salt and fresh water fishes, and acclimating salt water fishes to fresh water, opens a wide and useful field; and all these topics will be given full attention.

The bill making an appropriation for opening a fishway at the Great Falls of the Potomac failed to become a law at the last session of Congress. The bill was favorably received in the Senate, but was not, for reasons unknown, considered by the committee of the House. There is a fair chance for its passage this winter. It is not an artificial ladder, but the mere reopening of an old channel, which will empty its waters into the river at its deepest part below, and thus invite and insure the ascent of the fish. There is little doubt of its success.

The Commissioners have proposed an act for the consideration of the Legislature which, if passed, will greatly facilitate their operations. With respect to the amount appropriated, the Commissioners are of opinion that while the Commission may continue to do much good with the present appropriation, double the amount would yield quadruple results. They feel the inadequacy of the appropriation at the present time. They could this season hatch a million of brook trout eggs at the same cost of attendance that is involved in the hatching of less than 200,000.

We are indebted to Commissioner W. B. Robertson for an early copy of the Report.

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

SOUTHERN WATERS

Pompano, <i>Trachynotus carolinus</i> .	Grouper, <i>Epinephelus nigritus</i> .
Drum—two species. Family <i>Sciaenidae</i> .	Trout (black bass) <i>Centropomus viridis</i> .
Kingfish, <i>Mentidarius nebulosus</i> .	Striped bass or Rockfish, <i>Roccus lineatus</i> .
Sea Bass, <i>Sciaenops ocellatus</i> .	Twilfish, <i>Pomatomus saltatrix</i> .
Sheepshead, <i>Archosargus probatocephalus</i> .	Black Bass, <i>Micropterus salmoides</i> .
Snapper, <i>Lutjanus carax</i> .	<i>M. nigricans</i> .

FISH IN MARKET.—Our quotations vary but little from those of last week. Southern shad are coming in in fair quantities, and are sold at reasonable prices: We quote: Striped bass 20 to 25 cents per pound; smelts, 20 cents; bluefish, 12½ cents; salmon (frozen), 30 cents; mackerel, 25 cents each; shad (southern), 40 cents each; Spanish mackerel, 25 cents per pound; white perch, 15 cents; weakfish, 15 cents; green turtle, 22 cents; terrapin, \$15 per dozen; frostfish, 8 cents per pound; halibut, 20 cents; haddock, 8 cents; codfish, 10 cents; blackfish, 15 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 20 cents; scollops, \$2 per gallon; whitefish, 20 cents per pound; pickerel, 18 cents; salmon trout, 20 cents; ciscoes, 10 cents; sunfish, 10 cents; yellow perch, 10 cents; hard shell crabs, \$4 per 100; soft shell crabs, \$1 per dozen; red snapper, 15 cents per pound.

A MODEL FLY BOOK.—Messrs. Holberton & Beemer, of 102 Nassau street, have presented us with a Fly Book of their own manufacture, handsomely bound in Russia leather, with the Brainerd clip, holding one full gross of flies. The advantage of the Brainerd clip is that the flies can be carried without bending the gut-lengths or snells on which they are tied, thereby obviating the necessity of soaking in water to straighten them for use. This method also tends to preserve the flies, as well as to keep moths out. There can be little doubt that fly books arranged with this desirable improvement will soon supersede the old style of book. The leaves of Holberton's book are made of fine parchment. There are several pockets in which flies, silk, and odds and ends can be placed, and some places for scissors, pliers, and the like. The price, we believe, is \$8.00. With cheaper covers, the cost would be less.

—In our editorial last week on Angling in England and America, the name Morris was printed for Norris (Thad Norris, Esq.) an unfortunate mistake. We don't wish to see a single laurel abstracted from the crown of the veteran angler.

S. K., Jr., of Boston, says that smelt fishing during the past week has been very fine, chiefly on the Neponset river, just outside of the city. It is fine sport on a warm day. They are taken through the ice the same as pickerel, but in much larger numbers, some lines getting 15 to 20 dozen a tide.

WALTER M. BRACKETT'S LECTURE ON SALMON.—The hall of the Massachusetts Anglers' Association at Boston, was filled Wednesday evening, Jan. 10th, by an appreciative audience, attracted there by the announcement that Mr. Walter M. Brackett, the well known artist and sportsman, would deliver a lecture upon the "Salmon." Among those present were a large number of ladies. Mr. Brackett had, for the purpose of illustrating his lecture, specimens of rods, lines and spears, and exhibited several fine paintings of the salmon, which were greatly admired. He commenced his address by saying that from time immemorial the salmon had been considered the "King of Fishes." His habits, his beauty, color and perfection, all bespeak

him an aristocrat. He delights only in the purest water, and lives only on the daintiest food. He associates with none but his equals, and is by far the most gamy and high spirited of his kind. In former years all of our New England rivers were abundantly supplied with this valuable fish, but with the march of certain kind of civilization, which has been blind to the importance of fish as an article of food, the salmon has entirely disappeared from most of our waters. The salmon continued to frequent the rivers of Massachusetts until the building of the Holyoke and Lawrence dams, which sounded their death knells. The rivers of Maine suffered the same fate, the Penobscot being the only river that has not suffered in like manner. With the exception of the latter river, all the rivers of New England have been effectually cleared of all migratory fish. Since the Legislature of Maine made efforts to regulate the inland fisheries of that State, the supply has been doubled, and within the past three years the catch has increased some 15,000.

Mr. Brackett gave an interesting sketch of the history of the salmon. As it requires a dam only 12 feet high to arrest his progress to the spawning beds, the utmost leap being 10 feet, the building of fishways over and around the dams became necessary in order to restock the exhausted rivers. This has been done to a great extent by private parties and by State authority. The lecturer proceeded to give a description of the natural and artificial process of spawning. Speaking of the fecundity of the salmon, he said that a salmon casts 1,000 eggs for every pound of her weight. The enemies of the young salmon were the sea-trout, the sheldrake and kingfish, which can each stomach twenty small fish per day. He advised the sportsman who went fishing for salmon to take a breech-loading rifle with him and make war upon the enemies of the salmon. But the greatest of those enemies was man, who resorts to every possible artifice to capture the salmon; and of all deadly weapons invented the Indian spear was the most destructive, a specimen of which Mr. Brackett exhibited. The localities frequented by the salmon, his instincts and habits were fully described. Rods, gaffs and flies, such as the true sportsman uses, were described and specimens exhibited. The best rod to be had is made of split bamboo, always provided it is made by Mr. Leonard, of Bangor. He did not say this to advertise the wares of Mr. Leonard, for they advertise themselves by their own merits. Bradford & Anthony were cited as the best source from which to obtain lines, flies, and gaffs, and in conclusion Mr. Brackett told his hearers that if they would know how much real enjoyment could be got out of life to go a fishing. If they could not go a salmon fishing, they should catch trout or anything that would take them away from their daily and monthly routine. Live in the woods a few weeks every year and they would not only be more healthy, but happier. At the close of the lecture, which was instructive and at times eloquent, a vote of thanks was tendered Mr. Brackett for his efforts to please, and subsequently the members repaired with their ladies, to the library room, where a substantial banquet was spread.

FLORIDA—Homosassa, January 8th.—We have a very nice party of visitors, but not quite full yet. We are taking seven kinds of fish on the "fly." Cavalier weighing five and a half pounds on seven ounce rods makes a nice play. Mr. Greene Smith took it, and it took one half hour to land it. Sea trout take the fly as fast as it is cast, and I saw two gents take about a dozen trout in front of the house in a very short time. The channel bass went for the "fly" so fast that Mr. Smith took in his fly, afraid of hooking them, they were so large, as he did not want to break his tackle. They are having real good sport. Ducks are in pretty well. Deer sign are plentiful. I have a fine pair of hounds, and we are going to take a good hunt in a few days.

ALFRED P. JONES.

Natural History.

BIRD PETS.

EDITOR FOREST AND STREAM:—

Your good editorial of the 2d ult. on aviaries brings before my mind memories long passed, pleasant reminiscences of former bird pets, and from my refreshed remembrance I shall try to recall a few incidents connected with my experience in this line. If I can succeed in placing these little episodes of long ago in the light of interesting facts it is all I desire. Since boyhood I have been devotedly attached to the woods, and even now am never quite happy away from them. Of course fondness for the forest and love of its indwellers are terms synonymous, and birds have always been my hobby. I have, too, learned some useful and practical lessons from this book of nature, the pages of which I have been so long carelessly perusing. My bird-houses, for I owned two, contained most of the birds mentioned in your article, but in addition I had some larger birds in a wire room separate from the others; five crows, a barred owl, a red-tailed hawk, and (I hesitate, for methinks I detect your smile), a turkey buzzard. This was my "happy family," for this term is applied, I believe, to those miscellaneous collections of animals where discord is most rampant—and very prolific was it of amusement. I agree with you that the smaller birds are interesting and instructive, but for affording unadulterated amusement I know of no bird to compare with the American crow. The owl, buzzard and hawk did little to make themselves interesting. At times the hawk, when live food, either chickens or wounded birds were placed in the cage, would exhibit his ferocity by pouncing down upon the unfortunates. He would seize one of them, and ruffling his every feather till he seemed twice his former size, would rend the warm and quivering flesh, making dangerous passes at any who approached within reach of his talons, keeping up at the same time a shrill whistling noise. This cruel sport was, however, of rare occurrence. I finally turned him loose, having first labeled him by fastening a metal tag around the tarsus of one leg. Within two days the bird was brought back dead, having been killed at some distance from my place by some one who took him for a wild bird. But to return to *Corvus americanus*. Durance vile has apparently no effect on him, and he bears it *sine cura*. He, however, makes it warm for his companions in captivity, and I have often wondered whether they at times did not long for death, to whom life was made such a burden. It seemed to me that my crows must have been born in sin, they displayed so many characteristics in their everyday life to bear out this sup-

position. Thieving, deception, and frequently murder with malice prepense, together with many minor vices, were of constant occurrence. And yet they were taken from the nest while still in down and brought up in most exemplary manner by their self-appointed parent. The crow is of an exceedingly affectionate disposition, and becomes as devotedly attached to his master as a dog. He shows his affection in most unequivocal ways. Sometimes perching himself on the arm he will rub his head against your face, making at the same time a low guttural noise signifying in his unmelodious crow voice his trust and confidence in you. I have stroked the head of one of my black pets for five minutes while *Corvus* held himself in an unmoved statuesque attitude, all the time keeping up the guttural melody, and finally dropping his wings and quivering his tail and body he glides away with a joyful caw, only to return shortly to the same perch. They are exceedingly provident of future wants, and there seems to be no limit to their gastronomic abilities. If a well-filled dish of palatable food is placed in the cage, after having satisfied their hunger, they cram full their capacious mouths, and in a sedate manner start on an inspection tour. As soon as some convenient hole or crevice discovers itself to them they there deposit their *bonne bouche* and cover it carefully with sand, bits of paper, and so forth, then returning to the dish they repeat the operation till in a few moments the plate is as clean as the traditional dish of Jack Sprat. After having placed a morsel in such a hiding place they eye it circumspectly from its various approaches, and if any part is still exposed they cover it more carefully or becoming provoked drag it forth, and seek another place. In an hour or so they are seen to go systematically to each corner and draw out the food and devour it with evident relish. Query: Do the crows act in a similar way in the wild state? Sometimes the tidbit having been swallowed long before by one of the others who watched its concealment, the rightful owner signifies his rage by lusty cawings. They are inquisitive to a degree, and also show their thieving propensities by seizing any bright or shining article, such as a silver dollar or a knife, which they will conceal with remarkable skill.

One of my most mischievous birds had a trick of seizing the buzzard by the tail with his bill as the latter sat on his perch, and closing his wings would swing back and forth, the buzzard meanwhile keeping up a peculiar hissing noise and making frantic but futile attempts to reach the tormentor with his strong beak, while Jim Crow thoroughly enjoyed the agony of his victim. The owl, too, was an objective point of attack for the crows, and of course they had him at great disadvantage while daylight lasted, but I suspect that retaliation took place at night when the boot was on the other leg, for we frequently heard the most melancholy noises down below, and if he accomplished nothing else he must have proved a frightful incubus to them during their sleeping hours, for he troubled ourselves not a little by his weird song.

RAMON.

BREEDING OF THE WILD GOOSE IN CONFINEMENT.

PERCE, Dec. 4th, 1876.

EDITOR FOREST AND STREAM:—

In your number of 26th October, under the head of Game Bag and Gun, an extract appears from the *Toronto Globe*, giving an account of the game of Newfoundland, in which the writer states, speaking of the wild goose: "It is a remarkably fine bird, easily domesticated, but does not breed when tamed." This is an error, which the following facts will substantiate:—

At Gaspé Basin no less than four respectable inhabitants have wild geese that breed—Messrs. Annett, Coffin, Bechervaise and Patterson.

These birds go off in the spring, make their nests on some of the islands in the main river, and return home at the end of October with their progeny, numbering from seven to eight. The young birds are rather wild at first, but following the old ones are driven into the barn.

Mrs. Benjamin Coffin states she has a pair which have bred regularly nineteen or twenty years, and Mrs. Hugh O'Hara had some that followed the wild ones in the spring and brought home a brood in the fall.

A neighbor of mine had a wild gander mated with tame geese. But an important fact connected with these birds is, that the goose does not lay before the third year.

PHILIP VIBERT.

[Our correspondent has our thanks for the very interesting information conveyed in the above note. We should think that some of our sportsmen might take advantage of the facts here stated to secure live decoys for goose shooting.—ED.]

THE MAMMALS OF WYOMING.

WASHINGTON, D. C.

EDITOR FOREST AND STREAM:—

The list of mammals found near Fort Sanders, Wyoming, as published in *FOREST AND STREAM* of Dec. 21st, 1876, requires many additions and the following corrections:—

For "Gray rabbit *Lepus sylvaticus*," read Sage rabbit, *Lepus sylvaticus* var. *nut. all.*

For "Say's striped squirrel, *Spermophilus lateralis*," read *Tamias lateralis*. Colonel Brackett has excellent authority for the generic name, but it has lately been determined that the animal is a *Tamias* not a *Spermophilus*.

For "Chipmunk *Tamias striatus*," read Four-striped Chipmunk, *Tamias quadrivittatus*.

For "Black-tailed Deer, *Cervus columbianus*," read Mule Deer of S. ay, called Black-tail in Wyoming, *Cervus macrotis*. *C. columbianus*, is not found so far east.

For "White-tailed Deer, *Cervus leucurus*," read, Western variety of Virginia Deer, *C. virginianus* var. *macrurus*. Otherwise the list is correct as far as it goes.

ELLIOTT COVES.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDENS JAN. 10TH.—Two screech Owls (*Scops asio*), one presented by Melvin Lawton, Philadelphia, and one by S. N. Still, Malvern, Pa.; one red shouldered hawk (*Buteo lineatus*), presented by T. C. Ivins, Tullytown, Pa.; one Newfoundland dog (*Canis familiaris*), presented by T. Mason Mitchell Roxborough, Philadelphia; one red-tailed hawk (*Buteo borealis*), one lynx (*Lynx canadensis*), one snowy owl (*Nyctea nivea*), and one golden eagle (*Aquila chrysaetos*), purchased; one red kangaroo (*Macropus rufus*), born in the Garden; one Virginia deer (*Cervus virginianus*), presented by Louis J. Ladner, Jr., Philadelphia; one ocelot (*Felis pardalis*), presented by John D. Bliss, Philadelphia; nine *Salamandra bilineata*, six *Salamandra erythronota*, and eight *Triton niger*, presented by T. C. Shepherd, Philadelphia.

ARTHUR E. BROWN, Gen'l. Supt.

ARRIVALS AT THE CENTRAL PARK MENAGERIE JAN. 14TH.—One golden eagle (*Aquila canadensis*), presented by Mr. G. H. Jones, Catskill, N. Y.; one wild cat (*Lynx rufus*), presented by Mr. Henry Seaman, New York city, from Catskill; one snowy owl (*Nyctea nivea*), presented by Mr. Wm. J. Scharif, Canajoharie; one gray squirrel (*Sciurus carolinensis*), presented by Master Thos. J. O'Donohue, New York city; one colored peccary (*Dicotyles tajacu*), presented by Mr. Peter Benson, Corpus Christie, from Texas; one white-throated sapajon (*Cepus hypoleucus*), presented by Master H. M. Cornell, New York city; one duck hawk (*Falco anatum*), presented by Master J. A. Holmes, Brooklyn; two panthers (*Felis concolor*), bred in the Menagerie.

W. A. CONKLIN, Director.

Woodland, Farm and Garden.

COUNTRY HOMES AND HORTICULTURAL SOCIETIES.

THERE can surely be no doubt of the humanizing influence of flowers, and the elevating moral which we all may read written on the florid page of Nature; owing to many causes, among which an eager struggle for existence, and for wealth, may be counted the chief; our people give but little attention to beautifying their homes, and a well-kept tidy garden is the exception, not the rule. Let a taste for plants and flowers be created, be it ever so week at first, it will grow with our growth, and even the few pots of flowers in the window become teachers in the great lesson of life. Here also is the great advantage of homes in the country for the working classes. If a man have but a few yards of ground round his place, and be not too ambitious in the selection of plants, the cost is practically nothing but the labor, and that itself soon becomes a positive pleasure, removing him from many demoralizing influences. It is a pleasure that leaves no bitterness, but on the contrary is based on an appreciation of what is simple, natural and beautiful. It diverts the mind and raises the thoughts to the contemplation of forms whose perfection needs no eulogy, and whose beauty is its own excuse. This leads naturally to the influence exerted by Horticultural Societies in this direction. They not only give an impetus to the growth of the best varieties of plants, flowers, fruits or vegetables, but bringing them directly before the people interested in their development, influence their tastes, and lead unconsciously to a higher standard of refinement. For many years, much to the disgrace and loss of our city, there has practically been no Horticultural Society. The first society of the kind was organized in 1818 by a few kindred spirits, and gathering strength its beneficial effects were soon discernable in the spirit of emulation shown by the members and the general aspect of improvement in all horticultural productions. In the year 1821 the society had acquired such a reputation that it was thought prudent to apply to the State Legislature for a charter, which was readily obtained, and which is still in force. This society still continuing to flourish, exhibitions were held, a library selected, the meetings were well attended, until about 1855, a lack of interest was manifested in the society, the meetings and exhibitions were neglected and the society languished, until making one last spasmodic effort in September, 1857, to hold an exhibition, the committee in charge lost so much money on it that they were disheartened and the meetings were discontinued. In the mean time we have seen the Societies in Boston and Philadelphia grow strong and prosper; their horticultural halls and libraries an honor to the respective cities, and their meetings and exhibitions a success.

A little over a year ago about fifty gentlemen, mostly connected with horticulture, met to take measures to form a society, and, after organizing, a constitution and by-laws were adopted, and officers for the ensuing year elected. Fearing to clash with the old society, they took the name of the New York Horticultural Association, and taking rooms in Cooper Institute, their monthly meetings soon became a success, and the roll of membership increasing they felt strong enough to give a public exhibition in June at Gilmore's Garden. This building being so well adapted for such an exhibition, and the members and others responding so nobly to the call made on them it proved a decided success, and gave encouragement to the growing feeling that the old society should be resuscitated, and the association amalgamated with it. Dr. Knight, and several of the officers and members of the society were communicated with, and legal advice being obtained, a meeting of the society was called by advertisement and at an adjourned meeting thereof a reorganization was effected, and the association merged into the Society. The exhibition in June having proved so successful it was decided to hold a similar one in September. Still greater interest was manifested in this by all, and the society being so encouraged, have issued Schedules of Premiums amounting to over \$2,500 for two large exhibitions, to be held May and September, in addition to which liberal premiums are offered to be competed for at the monthly meetings, papers on horticultural subjects will also be read, and discussion thereon invited, hoping thus to bring the society more directly before the public and to make these meetings interesting and pleasing. The roll of membership consists of about 300 names, and the Treasurer's report for last season shows a balance of \$495 in the treasury.

The annual dinner of the society was held at Mouquin's, 141 Fulton street, on Tuesday the 9th. The table was laden with Flora's rarest treasures communicated by the different florists in honorable emulation. Many of the specimens were very choice and of a character rarely seen on such occasions. After the table had been cleared Toasts were in order, and success to the N. Y. H. Soc. drank with all the honors, Mr. Elliott responded in his usual

happy manner. Mr. Peter Henderson spoke on "The progress of Horticulture in this country and Europe;" Mr. John Cadness on "The history of Botanical Science;" Mr. Walter Reed on "The Gardeners of the past;" Mr. Wm. Bennett on "The Gardens of the past;" Mr. Foulis on "Plants and their peculiarities;" and Mr. J. Laird Wilson spoke very happily in answer to the Toast of "The Press." The evening was enlivened with songs, and altogether it was a most enjoyable reunion.

PLANT CATALOGUES.—We have just received Peter Henderson & Co.'s combined seed and plant catalogue for this year, happily entitled "Everything for the Gardener." It includes some very interesting and desirable novelties in plants, including the new zebra striped grass *Eulalia*, and the *White Hydrangea*, both introduced from Japan by Mr. Thos. Hogg. Mr. Henderson also gives an extract on *planting lawns and flower beds* from his new work "Gardening for Pleasure," introducing several plants which will be of great service to many. The catalogue is carefully compiled, and is valuable as a book of reference.

—B. K. Bliss & Sons also send their abridged seed catalogue and illustrated Gardener's Almanac, offering in addition to their usual full assortment some good novelties in flower seeds, and some three new varieties of Potatoes which we doubt not will prove to be all they claim, and add to their high reputation for carefulness in recommending only good things.

THE CHINESE PRIMROSE.—Among all the numerous varieties of winter-blossoming plants there are few which give more constant satisfaction than the Chinese Primroses, for they bloom often from eight to ten months in the year, and are rarely troubled by insects. Since they were first introduced from China in 1820, their flowers have been decidedly improved. Originally they were of a dull lilac hue, not attractive either in color, shape or size, but the skill of the florist has combined to produce a rarely beautiful flower in every shade of color, from purest white to the richest crimson tint; variegated, striped and spotted varieties are also offered for our selections, while others have petals with well defined margins of colors with large white eyes like the Phlox, and still others are seen with edges deeply tinted with royal purple, or deepest crimson hues, and the remainder of the petals are of the purest white.

Not contented with all these charming varieties, the florists have succeeded in producing double primroses, which are exceedingly beautiful, and now no stand of plants is considered complete which does not contain one or more of these lovely plants.

The White Queen has a double pure white flower, very large, while its petals are deeply serrated or fringed.

The Queen of England has very large, double flowers, which at first are of snowy whiteness, and then assume a lilac tint.

The Double Red Primrose is also a very attractive flower, but not as lovely as the white varieties in my eyes.

The primrose is a perennial, growing easily from seed, or from off-shoots from the roots. A moderately warmed room is better for its health than hot-house heat, and it requires good air—needs to have the room well ventilated daily.

Its soil should be of a rich but sandy loam; it will not grow well in a heavy, soggy compost, but it should be well lightened with gritty sand.

In watering, be sure to have the water quite warm to the hand, and do not let any of it remain in the saucer over fifteen minutes. A cup of boiling water given in the saucer every morning stimulates its growth; but give only enough to be sucked up directly by the roots.

After the buds show themselves, a weekly watering with weak manure-water, made either with horse, cow, hen manure or guano, will give a brighter hue to the flowers, and increase their size.

These plants do not require as much sunlight as either roses or geraniums—yet they must have the direct rays of the sun some time during the day. We have found a southwest window very suitable to their needs. Primroses can be purchased for a small sum. Twenty-five cents will buy a fine plant. **DAISY EYEBRIGHT.**

—One of the important outgrowths of this club is the Alden factory here, one of the largest in Michigan. It has this fall done more for the farmers of this vicinity than any other like institution in the county, or perhaps the State. The immense crops of apples could find no market at any price except at this factory. There has been bought by this company upward of 25,000 bushels of apples. The price paid had been from 15 cents to 30 cents per bushel. It has employed since the last week in August 50 girls and from six to ten men, paying out on an average fully \$100 per day to the farmers for apples and to their daughters for their labor. This large amount of money has been distributed within a small territory near the factory. The company has shipped 20,000 pounds of the preserved apples to fill the orders of the United States Government, and have surely to ship by the 1st of January 120,000 more. The cores and peelings of this large amount of apples have been yielding a great quantity of cider, which is made into pure cider vinegar, and they estimate about 500 casks as this fall's product. This institution is a farmer's institution, owned and managed by practical farmers, and is called "The Farmers' Fruit Preserving Company."—*Lena-roe Junction Farmers' Club Report.*

—For hanging baskets or for similar purposes *FRAGARIA INDICA* may be recommended. It is not often seen, but might be advantageously used for variety sake. Its long thread-like runners are elegant, the flowers are yellow, surrounded by a broad-leaved calyx, and succeeded by a globose bright transparent coral-red berry, which, if not eatable, is at least very ornamental.—*Gardeners' Chronicle, London.*

FAREWELL TO THE POTATO BUG.—The Colorado potato beetle, or potato bug, as we generally call it, has at last found its match in the shape of a mite parasite. Prof. Riley, at a meeting of the St. Louis Academy of Science, exhibited a potato bug which was so completely covered with a mite parasite that the point of a needle could not be placed on any part of the beetle's body without touching one of the parasites. He estimated the number of

mites at eight hundred. The bug had been attacked by these enemies and killed. The potato bug seems to have a number of natural enemies, such as the toad, the crow, the rose-breasted grosbeak and domestic fowls. There are no less than twenty-three insect enemies that attack and kill it. The bug has also been migrating eastward across the continent for several years, until it has now reached the Atlantic ocean. We hope it may find a watery grave, and let the waves sing its requiem.—*Rocky Mountain News.*

—At St. Augustine, Florida, ice formed almost nightly during the week ending Jan. 6th.

Our Women's Department.

SEA-SICKNESS.

A GREAT many cures have been discovered for sea-sickness, of varying degrees of absurdity. We give the palm to a writer in the *English Mechanic*. He states that many years ago he had occasion to frequently cross the Irish Channel, and was invariably sick on there being the least motion of the water. Once, however, when it was very rough, and the wind blowing a hurricane he hit upon an expedient which proved an effectual preventive, that is, he made his respiration coincide punctually with the heave and fall of the vessel. Occasionally he fell asleep, and as his breathing did not then keep time to the vessel's motion, the sickness came back, and required one or two harmonious breaths to dispel it. We would not be guilty of discourteously doubting the writer's word, but we trust that since publishing his cure he has tried its effectiveness on a voyage across the Atlantic. A man might, no doubt, resort to less harmless amusement for eight or nine days than the regulation of his lung action. We can imagine him standing on deck watching the vessel's movement. As she rises up some one of the mountain waves of which sailors tell, our friend is slowly and deliberately inflating himself. The internal cavity is filled with the salt sea air as a balloon with gas, but still the vessel rises up the long slope. He contains himself with difficulty and the oppressive sensation approaches agony as the vessel quivers on the summit. His fine sense of harmony, however, demands and compels a reciprocal quiver from his bursting frame. But O the relief as the good ship glides swiftly downward into the trough, and he once more feels free to let out the pent-up breath. We can picture him at meals gulping down his food with earnest anxiety that the regularity of his breathing be not interfered with by anything as gross as victuals. It is air that he wishes to take regularly, or victuals would be useless. We can even picture him in a choppy sea with a long "ground swell," endeavoring by a series of sniffs and puffs to suit the fidgety action of the ship. And at night—but we leave him to get out of the dilemma as he can. If he sleeps he is sick, if he does not sleep he is sick, and before reaching his destination would be mad—assuming his sanity when starting. The choice is neither great nor attractive. It strikes us that the better plan would be to let the sickness come and run its course, and then eat, drink, sleep and breathe to suit ourselves, but at the same time the experience of a traveler who has crossed the Irish channel is entitled to some respect.

The *Journal du Havre* gives what is said to be a real remedy. The formula varies with the state of the water, the constitution of the individual, and the more or less liability to suffer from that distressing malady. The following is the recipe for very rough weather: Chloral, three grammes; distilled water, fifty grammes; currant syrup, sixty grammes; French essence of mint, two drops. Half the mixture to be taken on embarking. The latter clause makes us suspicious. Let us suppose that the weather has not revealed itself—and we never heard that it did six or seven days beforehand—that we are not very sure about our constitutions, that we are about to make our first voyage and know nothing about our liability to "that distressing malady," what then about the formula for the mixture on embarking?

Upon the whole there seems to us more common-sense in the Irishman's action, who, when about to emigrate to this country, took his wife out with him every day in a row-boat, "to practice the sea-sickness." So to our lady friends who would like to join yachting parties, but are afraid of the malady, we would give the simple advice, "practice it."

THE DUEL.—When two men make up their minds to seek at the sword's point or pistol mouth a "satisfaction" which they cannot otherwise obtain, it is quite right that we should hold them up to public view as law breakers, and invite the law to assert its offended majesty. It would, however, be a very narrow view which would take cognizance of the merely legal aspects of the affair. The principals may no doubt be interested in the result, both of the meeting and the subsequent criminal proceedings, but there is no necessity for concentrating one's vision upon them as though they were the only parties affected by the quarrel. In such an age as our's summoning an enemy to the field is one of the most selfish luxuries in which a man can indulge. He summons at the same time many spirits from the vasty deep of society which had better have been allowed to lie in becoming rest.

When all the thousand tongues of scandal have been set a-wagging; when the cause of quarrel has been unearthed; when the peace of families has been broken, and relations of the most sacred kind have become subjects of bar-room discussion, a man's personal satisfaction is dwarfed by the

multitudinous wrongs to innocent individuals his search after it involves. The man who commits an assault is, for the time being, a "lower" animal. He belongs no longer to reasonable humanity. The physical pain he inflicts does not cure the pain within himself which led him to such folly, and revenge of that kind is puerile. He is challenged, and two men lower themselves to the level of rams butting each other for something which instinct scarcely recognizes. They meet and butt and—nothing more. Admitting that in the olden time duelling had a salutary effect in teaching men self-restraint, society now furnishes the means of obtaining all the satisfaction a duellist could desire. We leave the law entirely out of the case. We also lay aside all the arguments of the kind which tend to show that the duel is a blunder, since it is very poor recompense to the aggrieved to be shot by the aggressor. What we wish to point out is that society has in its own hands the righting of all wrongs not recognized by the law, or to the righting of which the law is not summoned. The "cuts" of society are sharper than those of the sword, and the shaft of its contemptuous sarcasm are worse than the sting of the bullet.

But let us suppose that a lady is the cause of quarrel. He who would resent by blows a wrong to her, doubles it. He is, indeed, rather gratifying his own feeling of, it may be, just resentment, than applying any balm to her wounds or erecting any defense between her and wrong. What has she done that the state of her feelings should be discussed, and her name be in the mouths of all men? What have the families done to merit such treatment, that their private affairs should form the burden of a chorus which every goose in the land is cackling with more or less discordancy? We would remind assaulters and challengers that there are other feelings to be considered than their own. No one has a right, by inviting the public gaze to household privacy, to break through the sanctity which ought to surround Home.

DISCRIMINATING CHARITY.—A story with an excellent moral reaches us from Providence. It is to the effect that a Newport lady was one day very much outraged and shocked by the profanity of a tatterdemalion, and that opening her window she bribed him by the gift of a quarter to desist and depart! The result was, in view of the depravity of human nature, perfectly natural. The boy left in satisfaction and silence. On the following morning a horde of boys and men were under the lady's window blaspheming in chorus, and occasionally demanding a price for quietude and absence. The lady had unwittingly set a premium on profanity. The practice of offering premiums is carried to an alarming extent. An employer offers a servant a starvation salary, and chuckles over the reduction of his expenses. The time comes when the till is robbed, or the clerk is an absconder with several thousand dollars. The employer had virtually set a premium on dishonesty. A beggar is met on the street. His romance is pitiful, and his appearance gives it the stamp of reality. Assistance is given, and under the name of charity a premium is set upon laziness. It is a hard matter, but a fact, that one of the best traits of man's character—that which enables him to feel the beauty of charity—should have been the means of inflicting endless wrong upon society. It has been ingeniously said that to indulge it tends to preserve a man's tenderness. In other words, it is better, for the sake of one's own feelings, to relieve a case of apparent distress, than to turn away on the ground of the impossibility of distinguishing the bogus from the real. This is the merest selfishness under the flimsiest of disguises. The feelings of the giver do not enter in any way into the question. All that ought to be considered is the necessity of the receiver. Every case in which charity is bestowed upon the undeserving, carries with it the prolongation of a curse—that of constitutional indolence—which ought to be removed.

THE RETICULE.

—Every woman who lately offered herself as candidate for election to the London School Board has been triumphantly returned.

—Miss Kinglake, niece of the Crimean historian, has just made an aristocratic marriage. The bridegroom is the son of Earl Fitzwilliam.

—Poetry is the flour of literature—prose is the corn, potatoes and meat; satire is the aquafortis; wit is the spice and pepper; love letters are the honey and sugar; and letters containing remittances are the apple dumplings.

LITERARY, DRAMATIC, ARTISTIC AND MUSICAL.

—A long and important poem by Mr. Swinburne, entitled "The Sailing of the Swallow," will appear in the March number of the *Gentlemen's Magazine*. It is in heroic measure, and is intended to form a portion of Mr. Swinburne's "Tristan and Yseult."

—Bruce had recourse to the sword, Tell to a bow and arrow, and Washington appealed to the God of battles, but when a woman strikes for liberty, she uses anything she can lay her hands on.

—A bashful young man, while out driving with the dearest girl in the world, the other day, had to get out and buckle the crupper, and hesitatingly explained that the "animal's bustle had come loose."

—Madame Patti's recent benefit at Moscow is stated to have been a great success. Signor Campana's "Esmeralda" being the opera chosen. There were sixty calls for the *beneficiaire* during the performance, and more than 300 bouquets were showered upon her, besides which she was presented with a beautiful pair of diamond and sapphire earrings.

—The *Frankfort Gazette* announces that a general congress of German women, which is to last some days, has recently been opened in that town. There are not less than eight reports to be discussed; the principal subjects

being—prejudices, reform in the education of women, the literature of youth, woman in the family, the obstacles which present themselves to the extension of the sphere of employment for females, their influence in social life, etc.

—Lady Cathcart, who died in 1798, had four husbands, of whom Lord Cathcart was the third; the fourth was a Captain Maguire, an Irish officer, who, not much pleased with the poesy on her wedding ring—

If I survive,
I'll have five,

took her to Ireland, and kept her there, in solitary durance, for twenty years, when he died, and her Ladyship returned to dance at the Welwyn Assembly.

—The widow of Dr. Gray, of the British Museum, died on the 9th inst., at the advanced age of ninety years. Mrs. Gray compiled a monograph on molluscous animals, and she etched some thousands of plates with her own hand, and so rendered an inestimable service to students of conchology. Her set of algae, which is extensive, is presented, according to her wish, to the museum of the University of Cambridge.

—The *Popular Science Monthly* gives good advice in regard to the prevention of colds. The mistake is often made of taking great care to put on extra wraps and coats when preparing for out-door exercise. This is not at all necessary in robust persons. Sufficient heat to prevent all risk of chill is generated in the body by exercise. The care should be taken to retain sufficient clothing after exercise, and when at rest, to prevent the heat passing out of the body. Indeed, persons very often catch chills from throwing off extra clothing after exercise, or from sitting about in garments the material of which is not adapted to prevent the radiation of heat from the body.

—A story is going the rounds of newspapers to the effect that Worth, the famous man-milliner and dress-maker, is in trouble with a Parisian duchess. It appears that he designed for her a magnificent and unique toilet. Soon afterward she discovered an exact duplicate of her costume in her milliner's shop. She sent word to M. Worth that she did not want the dress; and he replied that it had been ordered, and must be accepted and paid for. The duchess was furious, and thus revenged herself. She wrote to M. Worth, "I shall take and pay for the dress, but not wear it. I send you this by my cook; you will be so good as to alter the costume so that it will fit her." And "they say" that the cook makes her appearance in the elegant costume on her days "out," and that Worth feels disgraced.

—Miss Clara Louise Kellogg is gravely reported to nourish her sweet voice upon a soup made by her admiring mother from beef, potatoes, a little rice, and many onions. The singer observed to a correspondent of *The Milwaukee Sentinel* that she had never seen so many young girls who think themselves born prima donnas as in Chicago. "Sneak they ever so little they are confident of shining upon the world as an operatic star; but," she added, "I think it more the fault of the music teachers, who, as it pays them, encourage the idea, and while they cannot create a voice in their scholars, until them for anything else." Mrs. Kellogg said to the correspondent that her daughter sang several airs when nine months old, and played the piano at three years; that oatmeal made her bilious; that she injured her heel wearing high-heeled boots; that Patti was the only living singer that "the chicken" would take off her hat to; that she was pestered with suitors, who would throw themselves at her feet, write her frantic letters, go crazy and make fools of themselves generally.

—Mrs. Florence Rice Knox, of New York, made her debut in Malta under the stage name of Ricca, and *The Malta Times and United Service Gazette* gives the following chronicle of her success; the opera was "Il Trovatore." "Madame Ricca as *Azucena*, who had never before appeared on any stage, enchanted the audience. Her fine clear notes, high, middle and low, but particularly the latter, are such as have been rarely uttered in our theatre. Since the time of Signora Borghi we do not remember having listened to a voice that will bear to be confronted with that of Madame Ricca. Her first song was rapturously applauded; her duet with *Manrico*, which follows, was splendidly sung and acted; in the third act, when arrested and brought before the Count her exclamatory notes were highly sympathetic, and her defiant tones still more admirably effective. In the prison scene her dulcet strains were really enchanting, and produced in the audience a sensation the expression of which it is impossible to describe. *Brava, Brava*, was heard from every quarter, and Madame Ricca may justly congratulate herself on having achieved a triumph greater even than that which report had induced the public to expect."

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

S. H. B., Titusville, Pa.—Are the Parkers Brothers foreigners or Americans? Ans. Plymouth Rock, we believe, to the backbone.

KANKAKEE.—Inquirer, of Urbana, Illinois, wishes the author of "Camping on the Kankakee," in *FOREST AND STREAM* of Jan. 4th, to state explicitly how far down the river he went.

R. P. L., Savannah, Ga.—Can you give me the name of some maker or designer of badges suitable for a rifle club prize? I wish to have one made. Ans. J. W. Hayes & Co., 922 Broad street, Newark, N. J.

P. L., Philadelphia.—Will you please give me the close seasons for Pennsylvania, for the following fish: black bass, striped bass or rock fish, white and yellow perch, and roach. Please answer in your next paper? Ans. Black bass, March 1st to July 1st. No close seasons for the other fish named.

D. S., New York.—Please let me know, if you can, which is the best time on record for one mile in a shell? Ans. We can find no authenticated and official time for one mile. The nearest to it is $1\frac{1}{4}$ miles by James Riley, 9 min. 24 sec. at Troy, Aug. 31st, 1875.

BRISKER ANDOVER.—Just now the best antelope hunting district is west of Dodge city, on the Atchison, Topeka and Santa Fe Railroad, and east of Pueblo and Trinidad, Colorado. On the Kansas Pacific Railroad the finest herds of antelope are found west of Kit Carson and east of Denver.

Do ducks ever stay as far North as Massachusetts in winter? Ans. Yes; some of the more local species winter on the Massachusetts coast and to the northward. Such are: *Bucephala islandica*, *Harelda glacialis*, *Histrionicus torquatus*, rarely found so far south, *Somateria mollissima* and others. The black duck *Anas obscura* winters on the Connecticut coast.

B. P., Pittston, Pa.—I have a young setter (15 months old) which I am now treating according to the rules laid down in Dink's, but if that

falls to help him I should like to have another remedy at hand? Ans. Treat your dog as prescription to T. D. McA. above, only making the first dose of calomel 20 grs. instead of 15.

C. D. MUNROE, Lawrence, Mass.—Last June I was presented with a tame crow with one of his wings cropped, which causes him to fly in a circle, and as he is very tame and a very comical fellow, I am anxious to know if his wing will grow out again? Last fall he shed the feathers of his head and back but neither his wings nor tail. Ans. The feathers of his wing will grow out again.

H. C. M., Worcester, Mass.—Will you please state the size of bullseye 4, 3, and 2, ring on target used by the rifle teams from Zettler's and Conlin's gallery in their late contest for championship, also position, calibre rifle and distance shot? Ans. Bullseye $1\frac{1}{2}$ inches; center, $\frac{1}{2}$ of an inch; inner, 1-16 inch; outer the same. Position, off-hand; rifle, .22 calibre; distance, 110 feet.

J. A. H., Nashua, N. H.—Will you be so kind as to give me in your next paper the present address of R. W. Cameron, who was Centennial Commissioner from New South Wales, or that of some person, in whose care I can write him? Ans. Mr. R. W. Cameron's address is No. 23 South William street, this city.

F. W. F., Westboro, Mass.—I am in want of a beagle hound and would like to know where I can get one and the price? I should like a male pup. Will you inform me where I could get one? Ans. We question if there are any pure beagles in this country, but if any of our readers have any for sale, and will advertise them, they will find no difficulty in finding purchasers.

H. A. S., Newark.—Can you tell me in what part of Florida I will find the climate the best and what kind of game I can shoot in the months of March and April, as I have to go south on account of my health? Ans. Go to the house of Alfred Jones at Homosassa on the Gulf of Mexico. The fishing there is superb but you will not find much game at the season you speak of.

OCDONIA, Philadelphia.—I notice in your issue of last week an article from Dom Pedro, Pottsville, Pa., of a party of hunters killing 26 deer in four days, in the Schuylkill region at the present time, I think your correspondent has been misinformed as to locality, for I think it would puzzle a *vet* to find half of this number in Schuylkill county. I would be pleased to learn in what particular section of the country this party of hunters bugged their game?

M. C. G., Chicago.—Are "Spratt's Patent Meat Flbrine Dog Cakes" reliable? Can a dog live on these alone? Will he not require any other food? I have a valuable dog and am desirous of knowing if they are safe and healthy, before using them? Ans. They are perfectly reliable and healthy food for a dog. The only difficulty in their use is that sometimes dogs, particularly if they have been fed much meat will refuse to eat them. They soon acquire the taste, however, and get to like them.

W. DEM., New York.—What is the proper distance to shoot at a target with a .22-calibre Smith & Wesson revolver; also the size of bullseye? Ans. We should suggest commencing at 50 feet with one of Conlin's Creedmoor targets, increasing the distance. The disadvantage of shooting at close distances is that with the ammunition made for them the pistols nearly always over shoot. Bullseye two inches. A man should be able, with some practice to hit an eight-inch target every time at 40 yards.

T. M. H., Waterbury, Conn.—Will you please let me know what is the matter with my setter dog, and what I can do to relieve him? His tail has been down for about three months, forming a half circle between his legs? Ans. We should want further symptoms before we could tell what ailed your dog. Probably, however, he has worms, in which case give him 60 grains Arca nut in three doses of 20 grains each, two hours apart, followed in four hours by one oz. castor oil. You can get the nut prepared in proper doses from Holberton & Beemer, No. 102 Nassau street.

H. D. D., San Francisco.—Will you kindly mail to me the best work (English or American) on oyster culture, and I will remit amount when known. If you have no such work for sale, please advise as to the best publication, price, and of whom to procure it? Ans. We know of no work on oyster culture published in this country. By writing to Messrs. Thorn, Queens Printers, Dublin, you can get the "Report on Oyster Fisheries," published in 1870; price six shillings sterling, or by writing to Mr. Frank Buckland, of *Luna and Water*, you might get a copy of the more recent Parliamentary Report.

N. S., Morristown, N. J.—I want to know something about Homosassa as a place for an invalid, particularly as regards table comforts, as I can eat only in the most delicate manner. Would I do better at Enterprise or Smyrna? Ans. We know of no place that approaches Homosassa for its table comforts. The route is by rail from Fernandina or Jacksonville to Cedar Keys, and thence by small steamer or sail boat, 30 miles or so. One can go via the St. Johns river and the Ocklawaha, to Silver Spring, and thence stage to Ocala. The rest of the journey (20 miles) to Homosassa is very rough.

H. H., Flushing, L. I.—1. Will you kindly inform me how the game of "Krikak" is played? It was patented on the 9th December, 1873, by J. T. Cammeyer, who is the sole manufacturer, in New York. Should you be unable to answer this question you would oblige me by stating where Mr. Cammeyer's manufactory is? 2. To oblige a lady will you please tell me how to remove kerosene oil stains from brown silk? Ans. 1. The game we are not familiar with, but Messrs. E. J. Horsman & Co., No. 72 John street, are sole agents for it. 2. We believe that nothing will remove the stains from brown silk; ether will take out the grease but the color will go too.

J. F. M., Haw Branch, N. C.—Do you know of any work or Ornithology better than Audubon's for a sportsman? if so, what is the cheapest, a copy in boards or in cloth, with plates painted, and what would be its size? How many sizes have been published? What would Audubon's cost, that is, the cheapest with colored plates? Ans. We know of nothing with colored plates on American Ornithology better than Audubon's. The large edition is not now to be had, the small (octavo) cost \$100. We must apologize to our correspondent for having overlooked this question for several weeks. The note was mislaid.

F. D. W., Williamstown, Mass.—1. Can a safe and reliable breech-loading shot gun be bought for \$50? If so which is the best maker? 2. In the State of Massachusetts, Connecticut, New York, and New Jersey, are taxidermists allowed to kill all kinds of game and small birds at any season of the year provided they want them to set up as specimens? Ans. 1. Yes, the Fox gun, made by the American Arms Co. of Boston, the Remington gun and the Parker, are all reliable guns. 2. The law gives them that privilege as regards insectivorous and other small birds, but not, in some States at least, as regards game birds.

OZAR, Providence.—I have a setter pup between five and six months old. For quite a while he has thrown up his food, but the last week he has been a little better, but he has commenced again and he now howls when eating. His nose is cold and wet, but his breath is offensive. Please tell me what is the matter with him, and also what will cure him? Ans. Your dog's trouble arises either from worms or indigestion. In either case it will benefit him to give 40 grains arca nut in two doses of 20 grains each two hours apart, the last dose to be followed in four hours by half an ounce of castor oil. Feed little or no meat and see that he is properly exercised.

W. D. K., Yarmouth, N. S.—1. What is the best way to reach the Nepigon river, from Quebec? What month is the trout fishing the best there, and what is the cost a day for guides, boat, &c.? 2. I want to get a rifle for moose hunting. What make is most suitable, and which is the best, single or double barrel? Also the cost? Moose hunting is principally done here in the fall before the snow comes. Ans. Go to Toronto; thence by Northern Railroad to Collingwood and steamer to Red Rock Landing, north of Nepigon river. July is the best month and cost of guide and canoe \$2 per day. We should feel inclined to recommend the Winchester rifle.

N. C. B., Portland, Maine.—I have been told that several of the back numbers of your paper contains articles on exploration and adventure in Newfoundland. Can you tell me how many of those articles were published, and what would be the price of the papers containing them? Ans. We printed a series of articles, containing very full information of the flora, fauna, and geology of Newfoundland, included between the dates of Dec. 31st, 1874, and Feb. 25th, 1875, some ten or more in all. Besides these we have printed two dozen or more articles on Natural History of the Island, its Game Animals and Fish, which if collected would make a compendium that cannot be found in libraries. We will hunt them up for you at 10 cents per copy.

T. D. McA., Middletown, O.—I have a fine setter pup (about eight months old) with the following symptoms: Nose, warm and dry, thick matter discharge from the eyes, cough after violent exercise, stands stretched with nose out and draws in as if making an effort to clear his nostrils, has a twitching or jerking of the body which, when sitting, appears to be a downward motion of the shoulders, is restless and whines in his sleep? Ans. Your dog has distemper. If the symptoms are still acute open bowels well with 15 grains of calomel placed on the back part of tongue in a dry powder. Give quinine sulph. gr. v, three times a day; keep bowels opened with calomel giving small doses after the first, and should they be too loose give ti opii $\frac{1}{4}$ dr. with starch water as an injection.

H. C. P., Fitchburg, Mass.—I inclose you sketch of legging to be worn with moccasins or shoes, and would like your opinion in regard to the prospect of sales, provided I insert an advertisement in your paper? I have worn a pair for the last two years and find I could not do without them. They have straps to pull on like boots, and buckle around the foot so tightly that they are nearly water tight. In the morning when the dew is on the grass or bushes, they are indispensable, being protection to the pants. Ans. We should think they would answer capitally providing they can be removed as readily as the ordinary legging which buttons on the side; the advantage of a legging being that it can be removed without necessitating a change of shoe. As for their sale through the medium of an advertisement in our paper, we can speak confidently as we have the unvarying testimony of all our advertisers on that point.

G. B. W., New York.—Where can I find the best shooting ground in Delaware for water fowl? also the most accessible point from this city and the way to get there? If you know of any more convenient place to New York city you would oblige me very much by informing me through your columns? Not counting L. I. Ans. There is a system of railroads, starting from Wilmington, Del., which reaches every good ducking ground of the States of Delaware and Maryland, and the Capes of Virginia. Clincoteague Bay, in Accomac county, Va., Sinepuxent, in Worcester county, Maryland, and Indian River Bay and Bombay Hook, in Delaware, are best places. When there is no ice in the Delaware, the river from Bombay Hook, up, is an excellent ducking ground. You can get hotel accommodation. The waters of the Chesapeake are equally accessible by branches from the main railroad, and abound in ducks. Havre de Grace, on the Susquehanna, is a favorite resort.

H. W. A., Jr., Boston.—1. Is there any other name given for "chicken" which I see given repeatedly in your columns? 2. Is there any way of preparing skins that when a few days old will not stiffen and break with handling? 3. Do ducks ever stay as far north as Massachusetts throughout the entire winter? 4. When do "chicadees," or a bird so called, lay their eggs, and where? Ans. 1. "chicken" or "prairie chicken" is the vulgar name of the pinnated grouse. 2. If you use arsenical soap instead of dry arsenic your skins will not stiffen; presuming of course that you refer to bird skins. 3. Yes—some varieties. 4. "Chicadees" or Titmice, belong to the family *paridae*; they are a hardy bird, building sometimes nests shaped like a bottle or purse, or sometimes making their nests in a knot hole. They raise two broods during the summer, and are more numerous, particularly the crested ones, in the South and West.

R. L. T., Dallas, Texas. We are having quite a controversy here in regard to quail and partridge. Some claim they are one and the same kind of game, and others that they are different. And all agree to leave it to your valuable paper to decide. Ans. We presume the question refers to the birds of this country alone, and on this assumption answer that the names quail and partridge are both applied to *Oryzopsis virginianus* in different sections of the United States. The bird is called quail in New England and the West, while in Pennsylvania, Virginia and to the South and Southwest it is called partridge. In New York and New England the ruffed grouse (*Bonasa umbellus*), is called partridge. The quail and partridge of Europe are very different from our bird, and from each other. For a very interesting and expansive article on the grouse and quail of North America see this journal, Vol. I. No. 19, p. 259.

R. E. P., Ferrisburgh, Vt.—1. Years ago, not long after Porter's death, I think, there were two *Spirits of the Times*, each claiming to be the original Jacobs. A contributor to one of them, signing himself as remem-ber, "Nesmuic," was a remarkably agreeable writer. Can you tell me who he was, or what has become of him? 2. Are there any beagles in this country answering to the description given of that bred by Frank Forester, who calls them "pocket editions of the old southern hound," long eared and of melodious voice—and Mayhew, in "Dogs and their Management," page 349, says: "The beagle is the bloodhound, only of small size." A breed of hounds like Forester's and Mayhew's beagles is greatly desired. Do they exist? Ans. 1. We do not know who "Nesmuic" was; perhaps some of our correspondents can supply the information. 2. We question whether there are any pure bred beagles in this country. The dog which we have seen and which is commonly called a beagle is usually an undersized fox-hound, whereas the beagle proper should not be more than 12 or 14 inches high at the shoulder.

A. B., Lancaster, Pa.—1. Have you ever published a list of dogs that were awarded prizes at the Pittsburgh Bench Show, or do you know what dog took first premium in the Irish setter class? 2. What is the cause of my dog coughing when excited, or for instance when I let him out of the kennel, or after running will occasionally take a fit of coughing; he also shakes his head and scratches his ears. I cannot see anything the matter with them? 3. I have a setter pup nine months old that carries a bad tail to look well; he carries it too much curled up over his back, could anything be done to make him carry it straight? Would you advise docking his tail, being $16\frac{1}{2}$ inches in length? Ans. 1. We have never received a prize list of the Pittsburgh show. 2. Your dog has cancer of the ear. Wash the ear thoroughly, and twice a day pour in some of the following solution: Goulard's extract $\frac{1}{2}$ oz., wine of opium, $\frac{1}{2}$ oz., sulph. zinc, 30 grs., water, 7-oz., mix. 3. If your puppy still carries his tail badly when one year old, draw it down to the middle of the hock and cut off all below. But if he carries his tail straight in the field we would not touch it; a slight crook is rather fashionable now; most of the "blue bloods" have it.

C. M., West Exeter, England.—1. Would you kindly tell me in your next what kind of sport would be met with in the country between Montana and the Pacific Coast? Lord Dunraven speaks of it as a country in which he read there was a great deal of game and that the Indians were friendly, but he knows nothing of it from experience. What part of the West do you consider best for elk, blacktail deer, and b. ar? I have had eight years in the West, big game shooting, but have never been in the country I have mentioned. I am coming out next June and hope to be on the plains by July. 2. Would you kindly tell me whether I could rely on getting a really fine setter in America for, say, \$100, for use on the prairies? There is so much trouble in bringing out dogs. Ans. 1. We have never hunted in the country west of Montana, but resident correspondents speak highly of it. In Montana among the eastern foothills of the main divide are to be found elk, black and white-tailed deer, buffalo, bear, moose, mountain sheep and antelope in large numbers. Fort Benton is a good place to start from, traveling north along the base of the mountains. 2. A fair dog could be bought for that money, and being accustomed to any game would probably be of much more immediate service than the best you could bring with you.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOLENT IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

*Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, JANUARY 18, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published objection being made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

Trade supplied by American News Company.

CHARLES HALLOCK,

Editor and Business Manager.

SAVE THE QUAIL.

IT seems this season as though the elements had conspired for the extermination of the quail living north of the 40th parallel. At a time, too, when we have been congratulating ourselves on the abundance of the birds, and were looking forward to the season of 1877 as in prospect to be the best for many a year from a sportsman's point of view. We had experienced a delightful fall, and the weather had, up to the 1st of December, been well nigh faultless; but well has the ice king, waking from his long lethargy, improved his opportunities since then. That he has outstepped his own rightful prerogatives during the first month of his active work, our chilling experience affords ample proof. But especially bad has this season been for the quail. At the outset we had a light fall of snow, then we experienced one of those winter rain storms during which the water freezes as it touches the ground. There was soon a coating of ice over the country that completely bound in every edible thing. Even the branches of trees and shrubs were coated with the ice mantle to their every twig. The quail were unable at one time for a fortnight to reach even the buds, upon which they have to subsist when all else fails.

This state of things was followed by more snow, then rain, and more snow again. Seeds, grain and stubbles in general are thus doubly ice-bound. Besides all this, during most of the time the thermometer has averaged but 15 degrees above zero. A good index to the suffering the quail have experienced is the difference in weight between birds shot during the latter days of November and those killed the last of December. Should this continue we shall look long and far for sport next October.

The question now arises: Can we not alleviate their sufferings and save some of their lives? The baiting of game has long been practiced for purposes of capture, and with just as small trouble and expense the quail may be fed and saved through this severe weather. On the afternoon of the 30th ult. we flushed a bevy of twenty individuals. Having secured one bird and finding it unfit to eat on account of its emaciated condition, we desisted from following the bevy. If these birds are saved through the winter there will be, say eight pairs breeding next spring. Quail will on an average raise twenty pairs in a season to the pair, there being two nests of eggs of about fifteen each. The eight pair will give in this way 160 birds, or about

eight bevies in the following fall. This rate of increase is not placed at too high a figure.

Weather like this will account for the alternating scarcity and plenty of birds in different years. But it seems to us that a great many quail could be preserved through the winter if those interested would make an effort in this direction. A spot should be cleared at the border of some swamp which the quail are likely to frequent for food or shelter. On this clearing, buckwheat, corn oats, or the screenings of wheat and rye should be scattered, together with hay and hayseed; leading from this in various directions grain should be sparsely scattered to some distance, forming paths, which the birds coming upon, will follow up. During the weather that is now upon us quail are forced to travel over a great deal of ground to find a living. As soon as the baiting place is discovered they will remain near by until long after the supply of food is exhausted, and if it is occasionally replenished they will settle in the immediate locality, and probably breed near by in the spring; one would be surprised to know how little the birds can eat and yet live. We must exercise foresight and take a little trouble in this matter, and those of us who love the golden days of October, and their accompanying delights with dog and gun, should try now to help the quail survive the rigors of these bitter winter months.

RACQUET.

THE Racquet Court Club of this city, of whose proceedings several reports have appeared in our columns, occupies the spacious building on the upper corner of Twenty-sixth street and Sixth avenue. This club was organized in June last—the opening day having been the twentieth of that month—“with a view to encourage a taste for Racquets and other athletic exercises.” The aim of the founders, as stated in the above clause quoted from the constitution, has been fully carried out by the governing committee. Not only has the necessary provision been made for the practice of the special game from which the club takes its name, but for engaging in nearly every other form of indoor athletic and gymnastic sport. There are two racquet courts each sixty-three feet long by thirty-one and a half feet wide, and having end walls thirty-five feet in height. These are painted of a dull red color. Adjoining them is a hall fitted with all the usual appurtenances of a gymnasium, and having a bowling alley for those fond of that game. On the upper story, and running round both courts, a race track has been prepared, which is admirably adapted either for pedestrian exercise, or for training for walking or running matches. Fencing and boxing are also taught in connection with the court, which is in all points one of the best, if not the very best, gymnasium in the city.

In regard to the constitution of the club its provisions are such as to keep it select without being unnecessarily exclusive. The officers of the club are Mr. W. R. Travers, President; Mr. Rutherford Stuyvesant, Vice President, and Mr. M. Morgan, Secretary and Treasurer, all of whom are chosen from and by a board of twenty-five governors. There are also a Racquet Court Committee, a Gymnasium Committee, and a House Committee, the members of which are elected in a manner similar to that employed in making a choice of officers. As originally provided the membership is restricted to five hundred, but we believe that in order to meet the great number of applications that limit is to be extended. The fact is deserving of notice as an indication of the popularity of the game, and as an evidence of the many attractions of the club. The candidates for membership, who must be at least eighteen years of age, are disposed of by ballot at the monthly meetings of the Board of Governors. A very good provision applies to visitors and strangers, who may be admitted to the club house or portions thereof, on such terms and for such periods as the Board of Governors may determine. Of the rights and duties of members there is only one of which special mention need now be made. It is as follows:—

“Every member of the club shall pay an entrance fee of fifty dollars, and the sum of fifty dollars as an annual subscription, payable in advance, on the first day of November in each year. No entrance fee shall, however, be required of members who shall have advanced towards the building fund to the extent of not less than \$250 each.”

Besides the games usually played in a gymnasium the club has a handsomely fitted billiard room, and so far as we are aware there is only one constitutional limitation to the kind of amusement permitted. All games of cards and games of hazard are prohibited. There is also a reading room well supplied with the best periodicals.

It is no part of our present purpose to moralize over the benefit such an institution is to a community like that of New York. One significant fact is that on New Year's Day its members, instead of driving through the streets, after the ridiculous and in every way reprehensible custom of “making calls,” were hard at play in the courts with racquet and ball. Mr. E. L. Montagne, whose prowess is universally acknowledged, and has been previously noticed by us, was, after some very exciting play, the victor of the day.

Although the game of racquet has been played in this city and vicinity for a number of years, its principles are not generally understood. It appears to have been introduced from England, but how long it has been in vogue in that country may be doubted. Strutt, who wrote in 1801, makes no mention of the game, although he refers to the “racket” or bat with which it and tennis are played. Similar references are made by other writers, and even by old Father Chaucer, which do not, however, substantiate the

antiquity of the sport. The derivation of the word will, from the fact of the same name being given to the implement used in tennis, throw little light upon the subject. There is an Italian word *racchetta* for *retichetta*, a derivation from the Latin *rete*, a net; and there is also a Dutch word *racken*, to stretch. The French word *racquette* has the same meaning as our racquet or racket, and as it was from that country that England borrowed the word, and the game of tennis, the name is clearly of French extraction. It is likely from the netted bat used in the game that the French word came, through the Italian, from the Latin, in the manner above pointed out.

As to the game, it is one of the many forms of ball play to which from time immemorial Englishmen resorted for amusement. The learned aver that the first ball was made by a woman named Anagalla, and that women only in the days of Homer played at ball. Saint Outhbert is said to have played “atte balle with the children that his fellows were,” and it was used, although we do not know in what kind of pastime, in London about six hundred years ago. A very interesting passage is quoted by Strutt from St. Froix, a French author, who, in speaking of hand ball, says: “This exercise consisted in receiving the ball and driving it back again with the palm of the hand. In former times they played with the naked hand, then with a glove, which in some instances was lined; afterwards they bound cords and tendons round their hands to make the ball rebound more forcibly, and hence the racket derived its origin.” This appears a very probable view of the course of the ancient ball play. The French played “palm play,” or, as it might be called, hand tennis, at a very early period. The latter game was known in England under the name of “fives,” and was practiced at least as early as the time of the good Queen Bess. There were endless modifications—balloon-ball, stool-ball, goff, or goff hurling—and when the racket was introduced tennis was added to the list. It is not unlikely that the game of “racket” or “racquet” was subsequent to those above mentioned. A not improbable suggestion is that it was an adaptation of the old game of “fives” designed to bring into play the racket or bat used in tennis.

Coming next to a description of the game we may premise that to make it intelligible is almost impossible. Like many others, it must be seen to be understood, and must be played to be appreciated. The court we have already described, and besides it a ball and a bat are required for each player. The ball is white—hence the necessity of having the court painted of a dark color—and must not weigh more than one ounce. The bat or racket has a long, straight handle terminating in an oval form, across which catgut or silk wire is stretched in such a way that a network is formed. Although the method of play is the same at the Racquet Court of this city as at present in England, we believe it differs considerably from that in vogue some years ago. Then the ground was marked off into four spaces by lines running parallel with the end wall. One side took the two inner compartments, the other the two outer, the former playing “inhand” the latter “outhand.” In the event of there being only two players each took two divisions. The player beginning the game was required, as now, to strike the ball so that it would be driven against the wall above a certain line. If, in rebounding, it fell into any of the other divisions the player allotted to that division was required to return it on the first rebound, and so on until the ball was missed. If, on the ball being returned, it either went under the required line or over the wall, the player was out.

The courts on Twenty-sixth street are divided into two parts by a line known as the “short line” running parallel with the end wall. The outer of these divisions is equally divided by a line drawn at right angles to the short line. At each end of the short line and on its outer side, a small space is marked off for the scorer. The front wall shows two lines. The lower is about thirty inches above the ground, and is called the “tell-tale.” Any ball striking below it, whether in serving or returning, is a hand out. Above it at a considerable height is the “serving line.” The two divisions of the ground made by the line above referred to at right angles to the short line, are called the right and left courts. Let us suppose that the players are ready to begin. The scorer may be in either court. We will assume that he is in the right. Standing with at least one foot in the ring he throws up the ball and strikes it with his racket so that it is driven against the front wall above the serving line, and rebounding falls within the left court. If he fails in this it is a fault. Serving two faults, missing the ball when he first throws it up, or failing to strike the front wall first, is a hand out. Should the ball be served or played into the galleries, or hit a beam rod, or wood, or netting above the limited lines of the court, it counts against the striker, even if it return to the floor. The ball having been served in the manner described the occupant of the court into which it falls must strike it either before or on the first bound, and again drive it against the front wall. It is considered dead on and after its second hop. The racquet must be used with only one hand.

There are several rules to which it would be useless here to refer. The game, as we have said, can only be understood by those who have seen it played; but the grand object of the players may be broadly said to be to keep the ball up as long as possible by striking it on its rebound from the front wall. That this is not an easy matter may be readily admitted, and very simply tested. It is much more easy for a green player, even on serving, to miss the ball than to hit it, and

easier still, even should he succeed in hitting it, to do so in such a manner that it will either strike the front wall below the serving line, or fall into the wrong court. Not only agility but judgment is needed to play the game well. It is, when skillfully played, one of the most graceful of games, and as an exercise has no superior.

GAME PROTECTION.

"INTERNATIONAL ASSOCIATION FOR THE PROTECTION OF GAME"

Most of our readers are aware that the functions of this Association are merely advisory, and confined to the devising and preparation of sweeping game laws for Canada and the United States, based upon the last revised nomenclature, as accepted and adopted by the Academies of Science and Naturalists generally. This Association was organized two years ago. Committees were appointed to take up the work allotted to them, and they have been steadily in motion ever since. Large bodies proverbially move slowly, especially when the work they have to perform is intricate and arduous. The duties of the Committees on Law, Nomenclature and Distribution of Species, were entrusted to the best informed men that could be selected. The Committee on Nomenclature, for instance, was constituted as follows:

Dr. Elliott Coues, U. S. A., Smithsonian Institution, Chairman; Alex. Agassiz, Museum of Comparative Anatomy, Cambridge, Mass.; Dr. J. L. LeCoute, Academy of Sciences, Philadelphia; Prof. Theo. Gill, Smithsonian, Washington; Prof. E. D. Cope, Phila., Academy of Sciences; Rev. A. B. Lamberton, Rochester, N. Y.; Prof. G. Brown Goode, Wesleyan University, Middletown, Conn.

The work of this Committee was so dependent upon the auxiliary labors of the Committee on Distribution, that progress has necessarily been slow. As Secretary of the International Association, the editor of this paper has been often and not unreasonably applied to for information as to what had been done, and was being done; and some have supposed that the institution and its mission had quietly dropped into oblivion, as the day fades.

To satisfy and encourage all persons interested, and their name is legion—for they include every club and every individual interested in the protection of game birds, animals, and fish—we have asked a member of the Committee on Nomenclature for a statement and received the following reply:

HAMILTON, Bermuda, Dec. 27th, 1876.

DEAR SIR:—

I regret exceedingly that the work of the committee on the nomenclature of game animals has been so much delayed. You must blame the Centennial, however, and not the committee. The Washington members of the committee, held, as you will remember, two or three meetings, and canvassed the various plans suggested for its report. The plan which we finally adopted, was somewhat as follows: 1. The name or names. To take up consecutively in their order of scientific classification, those North American animals recognized by sportsmen as "game." Under each species would be given (I) The English name or names, recommended for popular adoption, special reference being had to avoiding the use of the same name for two different species—in doubtful cases the preference being given—to the most common and best known species, by giving to them the most characteristic and widely used name. (II) The accepted scientific name of the species. (III) A synonymic list of the popular and scientific names—under which the species is described—by the leading American writers on gunning and fishing, such as Frank Forester, Lewis, King, Brown, Norris, Scott, Hallcock, Prime &c. (IV) A list of the common or sportsmen's name—arranged geographically, i. e., so arranged as to show at a glance the name by which any given species is known, in any given section of the country. (V) To define the limits of the geographical range of the species.

In the division of works Dr. Coues undertook the birds, while Prof. Gill and I became responsible for the fishes and mammals. The preliminary work on the fishes I have already completed, though much revision is still necessary.

Do you still think of visiting Bermuda this winter? Yours truly,
G. BROWN GOODE.

To GEAS. HALLOCK, Esq., Sec'y. Int. Asso. for Protection of Game and Fish.

The information this letter contains is important and sufficiently encouraging. In time the work will be completed, and when done, it will be well done. Otherwise it had better never been undertaken. It is important that this information should be disseminated, and every reader of this article should make it his business to see that his town or county paper prints Prof. Goode's letter. We enjoin upon him to do so. The public will not only thus be advised of what is being done, but the apathetic and discouraged will be stimulated to continued effort. This incentive is especially needed at this time. Few very positive benefits seem to have yet resulted from two years of agitation and legislation. Game is still shot and sold out of season; fingerlings are netted; and even the eggs of quail and grouse are gathered—served at table as *pettites morceaux*. Let us feel that it is not yet too late to mend, and that some significance is left in the cry for Reform.

NEW YORK.—We are indebted to our correspondent "Major," at Middletown, New York, for copies of some recent game laws passed by the Board of Supervisors of Orange county. One of these is as follows:—

"SECTION 1. No person shall sell or expose for sale any quail, woodcock or partridge in Orange county, or receive any money, valuable thing or consideration, directly or indirectly, at any place or from any person or persons, for any quail, woodcock or partridge taken, shot or killed after the passage of this act in Orange county. And no person or persons, express company or corporation, shall carry, take or send any such game or birds, or allow any such game or birds to be carried, taken or sent out of Orange county. And no person shall receive any money or other valuable thing or in any way make any profit for hunting, taking, catching or killing any quail, woodcock or partridge in Orange county.

"SEC. 2. No person shall take, shoot or kill woodcock between the 1st day of February and the 1st day of September in any year after the passage of this act.

"SEC. 3. Any person or persons, express company or corporation, who shall violate any of the provisions of this act, shall be liable to a fine of twenty-five dollars or be imprisoned in the county jail for a term not exceeding twenty-five days for each and every offense, or may be punished by both such fine and imprisonment."

While we fully appreciate and endorse the efforts of the Supervisors of Orange county, or their advisers, in their efforts to preserve game, it is still our duty to inform them that their action is unconstitutional, and that their enactment will not hold water. It is a well determined fact, and one that has been fully tested, that no Board of Supervisors of any county in this State has the right or power to abrogate any condition of the existing State laws. If they will take the trouble to examine the State game laws they will find that Section 32 gives them the power to make any regulations protecting *other* birds, fish or game than those mentioned in the act, and nothing more. Any person who is annoyed or penalized through the enactment has a good cause of action against his prosecutors. However, we trust that before woodcock season shall again come around that the question of extending the close season will have been settled satisfactorily at Albany. With regard to not permitting any person who may go to Orange county to shoot to carry their game out of the county; the gentlemen are going a little too far in the cause of game protection. It is hard enough in some States for visiting sportsmen not to be allowed to send their game, for which they have paid the natives pretty roundly, to their friends or carry it home, but to have to eat it all within the limit of one county is rather too indigestible. The further enactments of the Orange county Supervisors in relation to fishing with weirs, nets and traps are excellent, and we trust they will be rigidly enforced.

MASSACHUSETTS.—A correspondent, whose letter is too long for publication, writes us from Boston in a tone of bitter complaint against the manner in which the game laws of his State are, or rather are not observed. Snaring, particularly, he thinks should be restricted or prevented by a very heavy fine, and he relates that while shooting at Sangus, where he found the game very scarce, a gentleman remarked to him that he had a friend who had already shot fifty-four partridges inside of three weeks, and had disposed of them to a dealer in Boston. He goes on to say:—

"I went out gunning on the 13th of November, on the Boston and Providence road, in the vicinity of Mansfield, and remained there for four days, and during my travel through the woods I destroyed seventeen snares, and no later than Thanksgiving day, a friend of mine and I went out for a day's sport, and before we got as far as Winchester I destroyed nine snares. We also came across a man who was ferreting rabbits. He had two spotted hounds and a small terrier with him, and I afterwards learned he was from Charlestown. No wonder game is scarce, when we have such men as these, who go around snaring game birds and ferreting rabbits. Now, if we should succeed in the next legislature and have some heavy fines imposed on these pot hunters and non-sportsmen, I think it would have a tendency to stop all of that kind of business. I was very sorry indeed that I could not attend the meeting the sportsmen held at the Bay State House, Worcester, December 7th, but I had business that called me away the day previous."

MAINE.—Our correspondent "Roamer" writes us from Portland that the grand jury has just returned indictments against two persons for trout fishing out of season. He says: "I believe that these are the first convictions for such an offense in this State."

PENNSYLVANIA.—W. H. Crowell writes from McKean county, Pennsylvania:—

"Our deer season has closed at last. It has been perfect slaughter in this section, and every pot hunter from far and near has taken a hand. A great many of the old sportsmen have kept away from the woods for fear of being shot. Last year the law closed the season on the 1st of December; this year on the 1st of January. The poor deer have suffered terribly."

WISCONSIN.—A Janesville correspondent writes that they are beginning to be benefitted in that section by the law passed some time ago prohibiting the use of sneak boats and batteries on Lake Koshkonong. Last fall the shooting was better than it has been for years.

NEBRASKA.—A correspondent writes us from Osceola, Polk county, Nebraska, in relation to the burning of the prairie grass, as follows:—

"I wish through your paper to call the attention of the sportsmen to a very important fact, in regard to the preservation of our game. And that is in the prevention of the late burning of the grass in the spring. I am considerable of a sportsman, and my observations have led me to believe that the late burning of the grass in the spring in our western country, is very detrimental to the increase of our prairie game. This late burning is generally done for breaking and to obtain late pasture; but by its means vast numbers of the eggs and young of the prairie chicken are destroyed yearly, and also quail and plover, causing annually a far greater destruction of game than is now done by sporting. It does not only destroy the eggs and young but drives away the old birds, and thereby causes a continual decrease in the quantity. Now, in my estimation, nothing but a stringent law to prohibit all burning of the grass after the period when these birds begin to nest (which is about the 1st of April), will prevent this wholesale destruction. This is a matter of great importance to those wishing an increase in the quantity of our game, which seems to have been overlooked heretofore. I hope that the sportsmen in our western country, and especially in Nebraska, will use all their influence to get our next legislature to pass a law to remedy this great evil. This will not only protect our game, but will protect all of our insectivorous birds."

—The present season in Florida is better than 1874-1875, but not as good as last.

THE HUNTERS CAMP AT FAIRMOUNT PARK.—The Hunters Camp, which was built in Landsdowne Ravine, and which was quite a prominent feature in the grounds at the late Centennial Exhibition, was presented by us at the close to the Fairmount Park, to be kept as an additional attraction to those already beautiful grounds. The following letter of acknowledgment has just been received by us:—

OFFICE OF THE
COMMISSIONERS OF FAIRMOUNT PARK,
251 SOUTH FOURTH STREET,
PHILADELPHIA, Jan. 9th, 1877.

At a meeting of the Commissioners of Fairmount Park, held December 9th, 1876, the following resolution was adopted, viz., Resolved, that the gift of the "Hunters Cabin," in Fairmount Park, be accepted, and that the thanks of the Board be and are hereby returned to the donors. Attest:

R. W. ROBBINS, Secretary.
To Publishers of FOREST AND STREAM, 17 Chatham street, New York.

OUR WASHINGTON LETTER.

FROM OUR OWN CORRESPONDENT.

WASHINGTON, D. C., January 6th.

A NATIONAL ZOOLOGICAL GARDEN—THE PUBLIC PARKS OF WASHINGTON—GERMAN AND ENGLISH SPARROWS, ETC., ETC.

The noticeable improvements in the public squares of Washington within the past five years have greatly added to their attractiveness, and probably there is no city in the Union to-day which can boast of a larger number of public parks than the capital of the nation. Immediately south of Pennsylvania avenue, the principal thoroughfare, there is an unbroken park containing about 300 acres, extending from the Capitol to the President's house, a distance of more than a mile, which has been beautified to a great extent, and is still being improved. Of course this park will not compare to your Central Park in extent, but there are about ninety public reservations throughout the city, varying in size from half an acre to eighty acres, and I doubt very much that any other city has such a large number. The largest square is that surrounding the Executive Mansion, which contains 80 acres; Smithsonian grounds, 52 acres; Capitol grounds, 48 acres; Monumental grounds, 44 acres; and grounds around the Agricultural Department, 33 acres; other smaller squares which serve to make the continuous park between the Capitol and President's House contain from two to seventeen acres each. Besides the above we have La Fayette, Franklin, Lincoln, Farragut, McPherson, and other squares located in different sections of the city, many of them filled with magnificent trees and kept in first-class order.

I mention these facts for the purpose of showing that we might have here a collection of birds and animals equal to that of any other city; indeed there is abundant room for a National Zoological Garden, wherein might be collected at a comparatively small cost, within a few years, specimens of American and foreign animals. Many of these animals could be secured through the Smithsonian Institute, the army and navy, and other officers of the Government while in the discharge of their regular duties, and the cost would be trifling. Such a collection would not only add greatly to the attractions of the national capital, now fast becoming the favorite winter resort for the whole country, but would be of immeasurable value to the student of natural history.

Gen. Babcock, the officer in charge of public grounds, has repeatedly urged upon Congress the advantage of making a small appropriation of \$20,000 or \$25,000 to establish a National Zoological Garden, but thus far his efforts have been unsuccessful. He has frequently had offered to him for the public grounds specimens of various animals, but has had to decline them for the want of means to properly house and care for them. A small appropriation for the erection of necessary sheds, cages, etc., for animals which could be collected would be of great advantage. Franklin Square has two commodious cages in it, one of which was erected two years ago for a large American eagle presented to the Commissioner of Public Buildings and Grounds by the President, to whom it was sent from Wisconsin. Subsequently three fine specimens of the same bird were presented by Sergeant-at-Arms French, of the Senate, and placed in the same cage. About a year ago one of the birds died, but the others are doing well, and add to the attractions of that square. The other cage contains several large owls, which attract quite as much if not more attention than the eagles. In 1872 a doe was purchased and placed in La Fayette Square; the following year Mr. S. H. Kennedy of New York, presented a handsome buck, and Mr. James H. Clements, of Virginia, a doe. The latter was placed in La Fayette Square, but the buck had to be kept in the Government stable, on account of having no suitable inclosure for him in the public grounds. Last year a pair of prairie dogs were presented to Gen. Babcock and placed in La Fayette Square, a proper wire inclosure having been constructed for them. Bad luck seems to have attended the deer, as they all died within a year or two; but another doe was presented by a gentleman of this city, and is now in possession of Gen. Babcock. That officer has no doubt of his ability to establish and maintain at the seat of government an attractive Zoological Garden at a trifling cost, if authorized to do so by Congress.

Several attempts have been made by citizens to establish a garden of this character as a private enterprise, but so far they have been unsuccessful. An act was passed by Congress in 1870 to incorporate the Washington Zoological So-

ciety, and among the incorporators were Henry D. Cooke, George W. Riggs, Horace Capron, James C. McGuire and other prominent citizens of Washington. They were authorized to establish and maintain such a garden, import birds and animals from foreign countries free of duty, etc., but for some reason the society never organized. At the last session of Congress another bill was introduced to establish a Zoological Society in the district, naming other gentlemen as corporators, but the failure of the society first incorporated to organize probably disgusted Congress with the whole matter, and the bill was reported adversely.

There is nothing to mention this week in sporting matters, the continued cold weather, followed on New Year's Day by the most severe snow storm we have had for ten years, I fear has had the effect of driving the partridges further south, and as a consequence they will not be as abundant next season as they were during the season just closed. It has been my experience, and sportsmen who have resided long in this locality will bear me out in the statement, that a severe winter is always followed by a scarcity of birds the ensuing fall. The ground having been covered with snow and ice, and everything frozen hard for several weeks, the birds have been unable to secure necessary food, except such as they could get in thickets and sheltered places, and many of these have migrated to a more southern latitude. Last winter the weather was very mild, the effect of which was that the birds remained hereabouts, and the broods raised during the spring and summer gave us the greatest abundance last fall.

The German and English sparrows, which were first introduced in this city about five years ago, have increased in numbers so rapidly that not only the public squares but the streets and avenues also are now filled with them. About one hundred pairs were liberated in the public parks at first, and they have produced thousands since. These birds, it is said, subsist almost exclusively upon the larvae of all kinds of insects, and as they are not migratory they prevent the maturity of such larvae and thus prevent great damage to the plants and trees. Every year it has been found necessary to put up a large number of new boxes for them, and they have been occupied almost immediately. At first the birds were very much disturbed by the boys, but this was soon stopped, and they grew very tame. Suitable boxes for water were placed in all the public squares for them, and in winter when the ground is covered with snow they are supplied with food. A noticeable feature in the habits of these sparrows was that in no case where boxes with several compartments had been placed in the trees would they be occupied by more than one pair, so all boxes now made for them are for the accommodation of one pair only.

Sporting Notes From Abroad.

FROM OUR OWN CORRESPONDENT.

LONDON, Jan. 1st, 1877.

NEW YEAR'S in the World's Metropolis! How different the surroundings and the general aspect from what prevails with you. I can fancy the gay scenes on the Avenue, the general jolly and holiday appearance of the streets, enlivened with the merry jingling of the sleigh bells, the calling from house to house, and the good cheer everywhere offered. Here it is a holiday, to be sure, but "calling" as we understand it, is confined to the houses of the American Minister and some few American residents. The theatres are crowded at night, for the new pantomimes are all pronounced successes, and for a month to come young England indulges in acrobatic performances, transforming himself into Clown or Harlequin, and perhaps grandpa or uncle Tom into Pantaloon, with his prettiest cousin for Columbine. Stormy, wretched weather marked the close of the year, with slush, and wind, and rain, and sleet, while at the north we hear of snow storms and weather-bound trains. But little they care for the weather in the country homes of Merrie England, the only part of their life I envy them, where Christmas is scarcely over yet and the yule log still burns and crackles in the wide chimney.

Although racing is almost over—for during the coming month there is a lull, even in cross country meetings—the closing of the entries for many events occurs this week, and upon the announcement of the weights all will be excitement and speculation again. Grouse shooting is also finished, the one hundred and three lawful days allowed by act of Parliament having closed early in December. How astonished you New Yorkers would be should your leading daily newspaper, corresponding (if you have one) to the *Times* here, devote three or four of its columns to the discussion of grouse shooting. Yet that is what the great "Thunderer" did last week, and very good reading it was, too. No such year, with the exception of '72, has been known for a long time, so that you have not had a monopoly of the abundance of game on your side. "Driving" has been the principal mode adopted on the large moors in grouse shooting. It is objectionable as tending to make only dilittante sportsmen, and affording no encouragement to the breeding of dogs. Still, as I remarked in a former letter, large bags are the order of the day, and such as made by the Duke of Hamilton and friends, who, on the island of Arran, killed 999 brace of grouse (why could they not have thrown in another?) in a day or two, cannot be made in the old-fashioned way over dogs. But then as it is a recognized thing for the birds to go to a poulterer's shop,

it does not matter much; there is no waste, such as is most shamefully practiced in your country, where I have known men go to the prairies in August and throw away their "chickens" by the hundred because they could neither keep or transport them. And the same might be said of your summer woodcock shooting. What an infamous outrage it is to kill these noble birds in July and throw them away! But there is some excuse for the average grouse shooter in selling his game. He probably has to pay a rental of £250 per annum for his shooting, and at the price he receives for his birds, say half a crown each, he must kill at least 3,000 to pay expenses. But as very few kill on rented ground anything like this number, it becomes rather an extravagant amusement. Here's a pill for your anti-game protectionists. The shootings and fishings in Scotland alone rent for the sum of £300,000 annually. It is considered that, taking in the northern counties of England, the total rental for grouse shooting alone amounts to a quarter of a million sterling, which would require two million of birds at half a crown each to pay. But as it is estimated that not more than 300,000 birds find their way to the markets it can easily be estimated how much British sportsmen pay landlords for the privilege of grouse shooting.

Weston has failed in his latest attempt to walk 505 miles in six days, the amount accomplished being only 460 miles. The failure, however, was somewhat mitigated by his really wonderful performance on the first day when he walked 115 miles, and 105 without a stop. People are becoming tired of the great cornet player and costumer, and if he does not soon make a *bona fide* square match with some one, he will have to either "skip" or walk to empty benches. His remarks from the judges' stand at the close of his last exhibition, when he spoke of his rival, O'Leary, as "the Italian from Tipperary," disgusted every one. O'Leary has also been unfortunate, having lost his match with Howes on his first appearance in London. The defeat, however, was admitted to have been caused by an attack of the diarrhoea, and his square style of walking is generally admitted.

Higgins, the sculler, has replied to Hanlon's challenge to row at Toronto, but declines for the reason that he intends to remain at home to defend the championship of England against all comers. Boyd, the Tyne man, is willing, however, to meet Hanlon on his own terms, and will go to Canada to row him; or he offers to row Scharff of Pittsburg in Canada waters. He says nothing about rowing in the United States, and in fact since the Philadelphia regatta English oarsmen, whether amateur or professional, are rather shy of American matches or challenges. I do not know whether the true reason has been given for Oxford and Cambridge's declination of Cornell's challenge, but I am assured on good authority that it was mainly owing to the fact or their having been informed that the Cornell crew would be composed of men who would not come within the English interpretation of the word amateur.

The Kennel Club have fixed on Wednesday and Thursday, 2d and 3d of May, for the Field Trial Derby Meeting to be held at Horseheath, near Linton, Cambridge. The club have decided adversely upon a petition to disqualify Mr. E. J. Poer, of Limerick, whose name has been conspicuously before the public in connection with troubles arising out of the late Cork Bench Show. American beef is holding its own in English markets, and the recent arrival of some fat cattle from Chicago has opened John Bull's eyes to the fact that our western plains will produce beef. Emigration is likely to follow, and that of a better class than usual.

VAQUERO.

Rifle.

THE NEW WIMBLEDON TARGET.—We printed last week from the *Volunteer Service Gazette*, cuts of the new Wimbledon targets. One of them was wrong and we now give a correct cut of the 500 yards target.

The following table explains fully the dimensions:—

Name of Division.	Target at 200 Yards.	Target at 500 and 600 Yards.	Target at 800, 900, and 1,000 Yards.	Disc to Signal Hits.	Value of Marks.
Ballseye.....	1 ft. diameter.	2 ft. diameter.	3 ft. diameter.	White.	5
Inner.....	1 ft. "	3 ft. "	4 ft. "	Red.	4
Magpie.....	2 ft. "	4 ft. "	6 ft. square.	Black & White.	3
Outer.....	{ Remainder of target 4 ft. square.	{ Remainder of target 6 ft. square.	{ Remainder of target 12 ft. by 6 ft.	Black.	2

When ties are shot off at a "Carton target," the value of a Carton will be 6 marks.

The following is a copy of the official notice from the National Rifle Association announcing the change:—

"It will be seen by the above that the Council has acceded to the general wish of the Volunteers to have rectangular instead of circular "outers," and that at the same time they have taken the opportunity of assimilating to a considerable extent the match with the Regulation targets, adopting divisions that can be described in feet, and can therefore be checked as to accuracy by the 6-inch squares that are cut on the face of all Government targets.

"The many H. P. S.'s that were obtained at 200 yards during the past two years rendered it imperative to reduce the bullseye for that distance, while the very few made at 500 and 600 yards has induced them to adopt the Government "bull" for that distance, which is so very little larger than that used at Wimbledon.

"It is believed that the reduction in the sizes of the "inner" and "magpie," as compared with the corresponding divisions ("center" and "inner") of the second class Wimbledon target, will reduce the number of ties at 500 and 600 yards, notwithstanding the addition of two inches to the diameter of the bullseye.

"In view to there being no confusion between the names of the divisions upon a Government and upon a Wimbledon target, the term "center" has been dropped for Wimbledon, and the portions into which it has been cut have been called "inner" and "magpie" respectively, the former being a term not used in Regulation practice, and signalled by the red disc, which is also foreign to Government practice, while the term "magpie" is one that has established itself by usage at Wimbledon, is just as appropriate as "bullseye" for a division of a target, and, moreover, is signalled by the disc which bears that designation.

The order of the signals for the making known the hits, as also their respective values, remain the same as in previous years—viz., white 5, red 4, black and white 3, black 2; so that there can be no mistake on the part of the register-keepers in recording the value of the hits as shown by the discs, although they may never have been told of the change in the designation of the several divisions of the targets."

E. ST. JOHN-MILDWAY, Sec. N. R. A.

THE DITMAR POWDER FOR RIFLES.—A correspondent writes us under date of Jan. 1st regarding the use of Dittmar powder for rifles. We think, however, that the question of superiority for all purposes should not be decided by a test with rifles alone, and we are under the impression that Curtis & Harvey's No. 6 would be almost too slow for rifle shooting. That the Dittmar powder has done well at the targets can be seen at once by reference to Mr. D's. scores at the matches of the Massachusetts Rifle Association:—

"I notice in your journal, and more in the *Rod and Gun*, that some sportsmen are still in doubt as to the superiority of the Dittmar powder over any and all other powders. Three young sportsmen and myself gave the Dittmar a thorough test a few days ago, and also tested the best black powder, C. & H. No. 6 at the same time. We each fired five shots with our rifles, viz., one Maynard, 35 cal., one new Ballard, 40 cal., one Stevens, and one Frank Wesson, both 38 cal. Each of us fired five shots of "Dittmar" at 100 yards, and then we fired five shots each at same distance of C. & H. No. 6. The sights on the rifles the same in both cases, and to our great surprise the balls fired by us with the black powder fell from 2½ to 2¾ inches lower than when we used Dittmar. This, I think, gives the Dittmar the superiority over all powders, at least over the best I can get, which is C. & H. No. 6. Will some brother sportsman tell me where I can get any better black powder than C. & H. No. 6?"

R. M. S.

N. R. A.—We published last week a portion of Col. Wingate's very elaborate Report of the N. R. A., on behalf of the Range Committee. We now give the remaining sections of it, or at least such portions as will be of interest to our readers:—

"The Committee were, originally, in hopes that the great cost of the iron-framed targets could be saved by using a light wooden frame, which could be replaced at small cost when damaged. They have found, however, that the wooden frame of the Sanford target (although quite heavy) is shot away so fast as to occasion much delay and inconvenience. The canvas targets have not proved popular among either the riflemen or marksmen. The former complain that, when a ricochet bullet throws the dirt from the bank against the target (as is often the case, particularly with troops), the dust sticks to the paste, with which the face of the target becomes more or less covered after a few shots, giving it a very dingy appearance. The main objection, however, is that, while it is almost impossible for a marker, upon an iron target, not to know that it has been struck, and a telescope will disclose any carelessness upon his part, shots frequently slip through a canvas target without attracting the marker's attention, while, if he is careless, there is no check whatever upon him, the telescope not showing the shot. The marking upon the canvas targets has been found to be slower than that upon the iron targets. During the practice of the National Guard, the squads upon the canvas target have always been behind the others. In the company matches at the spring meeting of the National Rifle Association, while one of the teams completed their forty-five shots on an iron target in fifteen minutes, nearly an hour was required to do the same on the canvas targets (except, perhaps, upon Jewell's), the delay arising from the time taken by the marker to locate the shot hole. Since Mr. Sanford's target has been altered to the double system, it works much more rapidly, the only delay being for the marker to find the shot. From the fact that the disc is exposed but for an instant, it is complained that the location and value of the shot are sometimes left in doubt. So strong have been the objections by the riflemen to the canvas targets, that, during the National Guard practices at Creedmoor, officers have refused to allow their men to use canvas targets at all, and many of the regimental teams would never shoot upon them, if iron ones could be had. Before the erection of the new butts, your Committee discussed the subject with a large number of the best riflemen at Creedmoor, and received a unanimous expression from them, that the iron targets were the most satisfactory, and should be introduced on the new butts. The markers on the range are also unanimous in their prefer-

It is painful to American gunmakers to read the editorials and some of the correspondence in your paper in regard to the merits of their productions as compared to those of foreign makers. A case now before us, on page 381 of the FOREST AND STREAM, and fully indorsed by the editor, the writer extols at great length the productions of noted British makers, and the casual reader gets the idea that none others are fit to use. We do not begrudge our British cousins their well-earned laurels, but with all due deference to the good judgment and extended facilities your correspondent has had to ascertain the actual merits and demerits of guns at the Centennial, I beg leave to differ with him and you on some important points. That the productions of some of the makers enumerated by him are all that is claimed for them I frankly admit; but how they all belong in the same category, or anywhere near it, is what I cannot understand. I thought (and I examined them very carefully) that there were several exhibits superior to that of Mr. Rigby for good work and fine appointments. Among them were some Belgian guns, which your correspondent regards as unfit for the average American sportsman. The Powell gun, too, has some good work on it as any in the exhibition; its only objection, if any, is the upward movement of the lever. Clark & Snyder, of Baltimore, showed a gun better than Mr. Rigby's. The triplex lever grip fastening referred to is a delusion and a snare, but we presume the proprietors will find American fools enough to buy and pay for it, at least for a time. One good locking bolt is better than more. Of this class of guns the Powell is as good as any, and it will stay intact and wear as long as any triplex or quadruplex. In regard to rifles, our British cousins cannot justly carry off the prize. Being a maker myself (though not an exhibitor) I will draw no comparisons in this branch of the exhibit. In conclusion I must say, however, that it is fortunate for American gunmakers that the FOREST AND STREAM does not represent the average American sportsman, but only the higher or wealthier class. I know of a great many comparatively impecunious sportsmen whose senses of art and justice are quite as acute, and whose performances at the trigger are quite as good as those of our wiser or wealthier brothers, who do actually think and believe that some, at least, of the American guns are just as good in the forest and field as the best imported. It appears to us from our standpoint to be unfortunate for the FOREST AND STREAM that it does not cater in some degree to the requirements of this class. Every one who knows anything of manufacturing guns in different parts of the world knows very well why fine guns cannot be made here as cheaply as in Europe. Let our friends over the sea pay their mechanics and artisans three to five dollars per day as we have to, and see how they will come out. To overbalance this our indomitable Yankee has to bring labor-saving machinery to his aid, and make one man do the work of three or four Britons. Then he must make and sell a large number. To this end it must be a good, sound, common sense gun and low price, shorn of all superfluous ornamental appendages, involving the necessity of a great amount of high cost hand labor.

Again, our English cousins have a happy facility of getting a fine mirror-like glass on the outside of their goods, which is apt to be regarded as of too much importance.

In practice it is a mistake, and here Mr. Rigby comes in for a good share of common sense, which I know he possesses. Now suppose we have considered all things else, does any one begrudge their mechanics and laborers the mere pittance they receive for doing the exquisite and complicated work on the goods under consideration. Do any of us wish to see American artisans reduced to the same extremity? How many of us in wandering through that great exhibition thought of the weary fingers, the hungry mouths, and we add the smarting backs, that toiled over the fabrics of that great show of the world. These are unpleasant thoughts, and over them we must throw a veil of forgetfulness or our hearts will sink to nothingness and our great and successful show will turn out a failure.

L. L. HEPBURN.

[We fear that Mr. Hepburn is but an occasional reader of FOREST AND STREAM, or he never would have accused us of extolling imported guns, or anything else, to the disadvantage of home manufacturers. If he will take the trouble to look over our files, which we trust are preserved in the manufactory over which he presides, he will find that we have spoken in equally high terms of guns of American manufacture, where prices were equal, as of any of foreign make. Why, have we not within a few weeks retained for a week in this office an American gun ordered for a friend, and called editorial notice to the same, from the fact that we desired every one to see what a beautiful piece of work was now being turned out for the low price of fifty dollars? Have we not extolled the Remington, the Parker, the Clark & Snider, the Fox, the Lefevre, the Dane, and who knows how many more guns of American manufacture? It is not a week since we complimented Mr. Snider in his own shop in Baltimore on the beauty of workmanship displayed in his guns, and if Mr. Hepburn will look back not more than a month in our files he will see attention called to at least three other guns of American manufacture. Mr. Hepburn, and other captious critics, should take into consideration the fact that an editor who is repeatedly asked for an opinion occupies no easy position. He cannot be supposed to be free from preferences any more than another, yet he must do strict justice to all. The letter which appears to have caused Mr. Hepburn's ire was written by a gentleman who was one of the judges of guns at the Centennial. His remarks and comparisons referred entirely to the English exhibits, and none were drawn between them and American manufacturers. He spoke of the Belgian guns, and said they would stand first as low-priced guns; but Americans don't want guns ranging from one dollar and eighty cents to sixty dollars each. Mr. Hepburn says that it is fortunate for American gunmakers that we do not represent the average American sportsman, but only the higher and wealthier class. We question whether American gunmakers will agree with him, and if Messrs. Nichols & Lefevre, Messrs. Clark & Snider, or the American Arms Company, or any other maker, will give us their views on the subject and state who their customers through FOREST AND STREAM are, we should be glad to have them do so. However, be that as it may, we believe we are speaking correctly when we say that the average American gunmaker wants the customer who buys the highest priced guns.

As for the triplex lever of which Mr. Hepburn speaks so contemptuously, we can only say that we should prefer on that point the testimony of, say Capt. Bogardus, or some other man who shoots with one, and who kills his thousands of birds every year. In a word, we claim that this paper has always been the champion of American manufacturers, as witness the "American Ammunition" (Vol. 5, page 216 and following numbers) and other questions we have discussed. Mr. Hepburn, as representing perhaps the largest manufactory of rifles and shot guns in this country, is entitled to be heard, and we wish him to take our reply in the same spirit in which, we trust, his remarks were written.—ED.]

The Kennel.

—From complaints we are daily receiving we are led to believe that much valuable matter intended by the writers for this and other departments of our paper has never reached the printer's hands. Our friends are justly annoyed at our seeming indifference to their contributions. The cause is owing to their not having addressed their letters to The Forest and Stream Publishing Company, as requested by a standing notice heading our editorial page. Had they done so they would have received attention of some kind at once.

A NEW YORK BENCH SHOW.—We had hoped to announce in this issue the date of a Bench Show to be held by the Westminster Kennel Club. Owing, however, to some proposed alterations in the Hippodrome, the place proposed, the lessee, Mr. Sheridan Shook, can not name to the committee of the Club for a week yet the precise date on which the building will be available for the purpose. We are assured, however, that the show will be held early in March, with Mr. Lincoln to superintend the details. There is no place in the world equal to the Hippodrome for such a purpose, and with the liberal prizes which the Club propose to offer, it should be a very grand affair.

POISONING DOGS.—Our correspondent, "Smoke Stack," writes us from Titusville, Pa., that last week seven of the most valuable dogs in that part of the State were poisoned. Among them was Mr. L. Beaumont's pointer Quail, a dog which cost his owner \$250. We hope the miscreant will be discovered. Our correspondent tells a good joke about one of the Titusville sportsmen, who, under the impression

that the charge had been drawn from his gun, bantered another to shoot at his hat, when the taker quietly slipped in an Ely shell, and quickly made a sieve of a new Philadelphia tile.

SLEAFORD.—This fine pointer, who took first prize in the small pointer class at the late Birmingham Show, has been purchased for the St. Louis Kennel Club, and will shortly arrive in this country. Sleaford was bred by Mr. J. H. Whitehouse, whose name is a household word in connection with pointers, and is by Macgregor (894 E. K. C. S. B.) out of Nina (1253). We have not heard the price paid for him, but as his catalogue price was £1,000, it must have been something stiff. Sensation and Flake will now have to look out for their laurels.

ST. LOUIS KENNEL CLUB.—At last advices the gyps Polly and Sue of the Waddell & Sherwood Kennel, were at St. Louis visiting Rock; also Pickles and Kate, belonging to Mr. F. C. Demuth, and Kirby, belonging to Capt. Foster, of Leesburg, Va. Mr. Von Culin's Fire Fly was also visiting Elcho.

—Mr. Robert Wray, of Pittsburgh, claims the name of Flora for his setter gyp out of Eaton's Fairy, by W. G. Sargent's Mike. We cannot give the pedigree our correspondent desires.

THE MERIDEN BENCH SHOW.

The Bench Show of dogs took place at West Meriden, Connecticut, on the 2d and 3d of January, under the auspices of the Meriden Poultry and Pet Stock Club. Although considerable interest was taken in the affair by local sportsmen, and quite a number of good dogs exhibited, still, it is to be hoped, that at the next show there will be a greater number of dogs on hand, for Meriden and vicinity is full of them, and some very good ones too. A number of fine dogs were exhibited, comprising setters, pointers, retrievers, terriers, etc., to the number of seventy-five or more. The following is the list of prize winners:—

NATIVE SETTERS—First premium dog, Geo. and Charles Foster; second, J. H. Seymour; third, W. P. Clark. First premium bitch, Geo. and Charles Foster; second, E. C. Bingham; third, W. E. Miller. First premium dog pup, Dr. G. H. Wilson; second, G. L. Strong.

POINTERS OVER 50 POUNDS—First premium, Nelson Cornwell; second, James Malley; third, F. Stevenson, Jr. First premium bitch, S. H. Alger.

POINTERS UNDER 50 POUNDS—First premium, dog, Isaac Ferguson; second, N. A. Roberts; third, James Malley. First premium bitch, Amos Ives. First dog pup, G. L. Strong.

SETTERS IN BRACES—First premium brace, George and Charles Foster; second, Dr. G. H. Wilson.

Our correspondent writes:—

Much surprise was manifested by sportsmen on account of Dr. Wilson's liver and tan dog not taking a premium in the native setter class. He is a noble looking dog, and it was confidently expected by many that he would receive the first prize. If the above award occasioned surprise, the award in the native setter puppy class beat it all to pieces. In this class Mr. G. L. Strong's black and tan dog pup was unmistakably the "boss," and how he came to be beaten by such a looking dog (a white and red mottled pup, owned by Dr. G. H. Wilson), is something wonderful to believe. The following were accorded special prizes:—

Best pointer under fifty pounds, I Ferguson; best native setter bitch, E. C. Bingham; best native setter dog, E. G. and C. Foster; second best pointer under fifty pounds, N. A. Roberts; best native setter pup, Dr. G. H. Wilson; best brace of setter dogs, G. and C. Foster.

"Pete," the champion black pointer, was exhibited, but not in competition for prizes. His progeny were out in full force. Dr. Cochran's (of Springfield,) pointer was also shown. He is not much of a beauty, but is said to be a fine field dog.

Mr. E. E. West's English retriever won the prize in his class. The judges on dogs were E. H. Lathrop, of Springfield, and that veteran sportsman, James Warburton, of New Britain.

BENCH SHOWS.

I do not know under whose auspices the contemplated New York Bench Show is to be held, but hope that some of the gentlemen of the FOREST AND STREAM will be officially connected therewith, in which case one may with reason expect to see some improvements upon the system of judging, classifications, and general arrangements of the Bench shows that have been held in this country, at most of which originality rather than excellence seems to have been aimed at in some important respects. If, at the outset, the English system and rules had been adopted, a good example would have been given to those following, with the opportunity of making such changes as experience and local requirements would suggest as desirable, and with the result, I believe, of a much higher degree of excellence than has yet been obtained.

Those of our sportsmen who have witnessed Bench Shows in Great Britain or Europe, will appreciate how much room for improvement there is with us. For instance, in the matter, and most important one, of judging, how much more gratifying to the public, as well instructive to sportsmen, if the awards are announced upon the first public day. And the owners of dogs entered should be as well pleased, although necessarily the majority of them are not winners of prizes, than if the awards are made public at the close, or even after the close of the exhibition.

Naturally, such exhibitions are very largely supported by those making breeding a business, being the best possible advertising medium and means of sales; and such breeders can make the best exhibit in quantity, and very often in quality. Many sportsmen who shoot over dogs every season, and fine ones too, have very little of the knowledge of dogs requisite to be able to judge well of their merits, unless it may be in the field, and these sportsmen will purchase dogs upon the judgment of others, when

they are convinced that such judgment is superior and trustworthy. Then there are many sportsmen justly proud of their choice stock, who exhibit solely for the honor that their pets may win, and if disappointed in not winning a prize, yet please at a high number of points awarded. The judges should perform their duties here the public is admitted, and should have no information furnished them in regard to the dogs, except as regards their classification, the number of points awarded to each dog should be given in detail upon a card affixed to each bench, the bench being numbered as per card and catalogue. Then the public, paying to see the exhibition which is supposed to be given for them, will derive knowledge that will add to their entertainment. I have spoken particularly of sportsmen in this connection, since they compose a large proportion of those interested, but they are by no means exclusive, either as exhibitors or spectators. In this country of magnificent distances, it would be greatly conducive to the success of Bench Shows, as well as rendering them of more than a comparatively local character, if the railroad or express companies would furnish facilities for owners of dogs to transport them safely and cheaply, which at present can only be done in a few localities, unless the dogs be accompanied by the owner or attendant, and even in that case too often the element of cheapness—quite important to many—is an unknown quantity. A dozen years ago one could usually take a dog into the smoking car, where I have never known a well bred dog to be considered in the least as a nuisance by the passengers, nor other than an agreeable companion.

I have seen in Scotland, cars with compartments constructed under the flooring between the wheels, after the manner of such as are sometimes used in this country for storing tools, and into these compartments the dogs are locked, safe from the danger of being abused or stolen, or of being crushed or smothered, and made comfortable by a bed of clean straw. FOREST AND STREAM is doing much by its reports and criticisms, to improve the character of Bench Shows, and further the growing interest in them, and I contribute my mite as suggestions of some of the possible improvements that I hope to see adopted.

ROAMER.

[Had our correspondent been present at the late Baltimore Bench Show, he would have found that in almost every particular he mentions the arrangements were perfect. As regards posting up the number of points given by each dog, where there are a large number of entries, and the judging is done single handed, it would be a difficult matter to foot up all the points, and at the same time announce the awards immediately. This, however, could easily be done before the close of the show. At all Bench Shows there are always dogs exhibited that the veriest tyro in such matters can see at a glance should have been left at home. The judge will at once discard these, and confine himself to the better specimens. But if all, good, bad and indifferent, are to be examined critically for an award in points, much valuable time would be wasted, and the awarding of the premiums delayed.—ED.]

EXPRESS CHARGES ON DOGS.

January 6th, 1877.

EDITOR FOREST AND STREAM:—

I noticed in the last issue of your valuable paper, an article on the Expressage of Dogs, and as I have frequently been imposed on by the Express Companies, it gives me much pleasure to see so important a subject taken hold of by you. Nothing seems to sportsmen more trouble than the transportation of his dogs. A few days since I paid Adams Express seven dollars and a half (\$7.50) for the transportation of a setter from Newport, Rhode Island, to within a few miles of Albany, which seems to me an outrageous charge. Again, if a man takes his dogs with him, he must hand them over to the charge of the "Baggage Master," and receives neither a written check, receipt, or anything else. Why cannot a dog be checked the same as a trunk, and a charge be made for him the same as for extra baggage?

At present when traveling with a dog, the railway employees seem to take pleasure in throwing obstacles in your way; no one can tell you what to do with it, except that it cannot be taken in the passenger car, and you are left to hunt up the baggage man, and to try and induce him as a special favor to take the animal. Hoping that you will continue to agitate the subject, and that a reform may take place in the right direction, I am, gentlemen, CRACK SHOT.

SCOTTSVILLE, Pa., Jan. 9th, 1877.

EDITOR FOREST AND STREAM:—

In "C. S. K.'s" letter, dated Washington, D. C., Dec. 26th, 1876, he desires the "information promulgated" with reference to "Express fares on dogs." He verily believes the Express Companies impose upon the people in making outrageous charges on dogs. Having had considerable experience and knowledge of the inward working of the express business in days gone by, will, by your permission, and for the benefit of "hunters," endeavor to throw some light upon the question at issue. The printed instructions furnished by an Express Company, under which all agents act, is precise and to the point, as far as I can remember:

"Dogs in boxes, weighing less than one hundred pounds, charge double classification rates; when weighing one hundred pounds and over, charge double freight rates. Dogs not in boxes, to be estimated at one hundred pounds each, and to be charged at double freight rates, but not less than \$2.50 for any distance." In ninety-nine cases out of a hundred—the shipment of dogs by express—the owner does not accompany. He goes as a passenger, and his dog in the baggage car, where he is classed at baggage rates, a matter entirely different. But, when a "hunter" on board of a train, not wishing to be burdened by the care of his dog, turns him over to the Express Company—perhaps on board same train—the business transaction is of a different complexion entirely.

The railroad ticket agent will tell you the fare to B—is so much. If an express agent desires to go to B, he must pay that rate of fare or remain at home. If the railroad ticket agent is desirous of shipping his dog per express, the express agent will tell him the charges to B—is so much, and he must pay the Express Company their charges, or his dog will not be received or shipped. Each and every Railroad Company and Express Company have

their distinct and established rates and classifications. Dogs, whether boxed or not boxed, do not come under merchandise class, but as live stock—a class much higher—and in many instances come under the same rate of fare as a passenger, because dogs, as well as other animals, while in transit entrusted with Express Companies, their employees must feed and water, and receive the same attention as a helpless person. Not only this, but whether ferocious or tame, boxed or chained in an express car, they are by no means agreeable companions. Nothing can be placed near or upon them, and occupy very important room, which otherwise could be used for packing boxes, bundles, etc. For these reasons and many others, Express Companies are compelled to make such rates on dogs as will pay in a small measure for their trouble and responsibilities while in their charge. SPORTSMAN.

We think that our correspondent is wrong in some respects. He says "that when a 'hunter' on board of a train, not wishing to be burdened by the care of his dog, turns him over to the Express Company, etc." Now, if we know the wishes of sportsmen on the subject, there are none but who would be only too glad to have the "burden" of their dogs if they could, but they have no option but to pay either the Express Company or the baggage man. And again, as to such each and every railroad and Express Company having their distinct and classified rules, we know that this is not so as regard dogs. Most roads have no classification at all, and we have paid half a dozen different rates on as many trips over the same road. If all the great trunk roads would do as the Pennsylvania Railroad do, allow their baggage masters to charge a fixed reasonable sum, there would be no trouble. A baggage master on that road is allowed to charge 50 cents for a dog to Philadelphia. We have been charged \$3 by a baggage master for bringing a brace from Sufferns, distant thirty miles from this city. As for express agents and station masters being compelled to pay the same rates over their roads as outsiders—whew!

DOGS OF CHINA.

EDITOR FOREST AND STREAM:—

I cannot conscientiously agree with you in your theory as to the absence of rabies in the dogs of the East, by attributing it to a fish and rice diet. Personal observation of the habits of these animals has led me to believe it more owing to an entirely distinct cause, and presumably traceable to climatic influences. An equable temperature the year round, has, I fancy, far more to do with the general health of our Eastern canines, than supposable at first blush. Of course, in an empire so thickly populated as China, and where poverty in all its stages among the lower classes is visible it cannot be expected that dogs subsist upon the same diet as natives, and when fish and rice are obtainable it goes to satisfy the cravings of a human stomach rather than that of the dog. Nevertheless these animals are not delicate in regard to food and will eat anything, and are usually found by the dozen about the stands of itinerant restorateurs and fish marts, where they eagerly devour all offal and garbage thrown aside, thereby benefiting the public by acting as scavengers and satisfying the pangs of hunger. I verily believe that were it not for the fact of these brutes filling the capacity of a well appointed sanitary department, that some of the Chinese cities would become uninhabitable, or be depopulated by disease arising from want of drainage or a vitiated atmosphere. Acting in the light of a benefactor, the dog of China is, therefore, an almost necessary appendage to every household, and is no doubt as much an object of family solicitude as paddy's pig, although the same stricture is equally applicable to the pig of the Celestial Empire, who, like the dog, knows not from where or whence his next meal will come. Offal eating is attendant with its long train of diseases, the most prominent among which is Chorea, and with this complaint these animals suffer dreadfully. Aside from the diseased portion of their race, the average Chinese animal usually looks in fair condition, and generally manages to escape that scourge with which his cognate of the Western world is afflicted—distemper. TOJIN.

January 2d, 1877.

KENNEL DISINFECTANT.

EDITOR FOREST AND STREAM:—

In giving the prescription for the disinfectant in your issue of January 4th, I see you used the letter z to designate quantity. When I wrote it did not strike me that you might not be provided with the proper signs. As it now stands one is as liable to take it for drachms as ounces. The prescription should read thus:—

Tinct. Camphore, oz. iij.
Tinct. Myrrine, oz. iij.
Tinct. Saponis Camph., oz. ij.
Acidi Acetici Glacialis, m. clx.
Olei Picis, oz. j.
Mix. Add in the above order.

Now I wish to give a hint in the use of areca nut. On the day that it is given, the dog should fast. Give three times a day, following with a dose of castor oil early the following morning; a little turpentine added to the castor oil will do no harm. If this does not prove successful, give twenty grains of areca nut three times, every other day, until nine doses have been taken—the dog fasting the days on which the nut is given; the days succeeding the administration of the nut the dog is to be well fed, and also receive the dose of castor oil and turpentine early in the morning. In case of failure—as will rarely happen—after such administration, I will speak of another time.

ARCHER.

THE CAST IRON DACHSHUNDS.—The *Chicago Field* defends its celebrated pictures of these dogs, and publishes a letter from Dr. Twaddell, the owner of the dogs, in which he says in reply to those who think the engravings to be caricatures of the dogs, they may be, but if they are, the delineator alone is to blame, for with the exception that in the engravings the tails are a trifle thicker at the end, the *Chicago Field* gave accurate copies of the sketches furnished. The credit of the sketches is thus transferred to the artist and Dr. Twaddell, for caricatures the sketches are not certainly are. It is curious to see how American experience corroborates that of English breeders in regard to the time it takes to correctly appreciate this peculiar breed of dogs.—*Paniers' Gazette*.

TREATMENT OF DISTEMPER.

PHILADELPHIA, Jan. 8d, 1877.

EDITOR FOREST AND STREAM:—

While shooting in Maryland this fall, a friend of mine had two setters. One eighteen months old, and the other two years. Both were taken with distemper in a very violent form, and it looked very much as if he would lose both. The only course of treatment he pursued was a teaspoonful of honey three or four times a day, and tar in the roof of the mouth once a day, about the size of a hickory nut, using a small paddle for the tar. At first he kept them near the fire, but they got so much worse he removed them to the barn, where they had a warm bed in the straw. In ten days both dogs were perfectly well and able to do their work. I do not know if you know of this remedy, but as it worked so well with both dogs I thought it might be of use to others.

P. S. My friend has cured several dogs which had the distemper, using no other treatment, as he always has one or more young dogs coming on. MORSE.

National Pastimes.

SKATING.

In the forcible language of our city boys the rain of Monday night and the rise in the temperature of Tuesday "knocked spots out of skating," at least so far as sport on the ice was concerned, but it decidedly improved business at the new Valley Skating Rink in Brooklyn, which, under excellent management, has just been opened as a sort of American model of the London and Paris skating rinks. This week has been set apart for a series of school receptions at this establishment which include the Polytechnic and Packer Institutes, the Adelphi Academy and other prominent schools of Brooklyn. The floor of the rink has been laid with Parisian asphalt, and a model surface for the Plympton roller skates has therefore been provided. In the evening band concerts add to the attraction presented by the lively scene on the floor.

—Races on skates are now a feature of every Saturday's doings on the Capitoline Lake, Brooklyn.

—The new Skating House at Prospect Park has been thrown open to the public, and it is much admired.

—The fashionable skating resort in the metropolis is McMillan's Skating Park on Madison avenue.

—Over \$100,000 worth of skates have been sold in the metropolis this season.

BASE BALL.

—The International Professional Association is to be organized at Pittsburg at the Convention to be held there on February 20th.

—The Chicago nine for 1877 will be McVey, Spalding, Bradley, Barnes, Anson, Peters, Glenn, Hines, and Waite. This is a strong team.

BANGOR, Me., Jan. 12th, 1877.

EDITOR FOREST AND STREAM:—

If "Mr. Micawber" can answer the questions about Piquet I asked you I should be under obligations to him. I see that in the hurry of writing I misstated them. They should be thus: 1—A is elder hand, holds all the clubs and a quart major in spades. B holds all the hearts and a quart major in diamonds. A counts 10 for inches and 40 for the capot—50. Does he also count a "pique?" 2—A and B both are at 90. A is elder hand and holds only a quartorze of aces. B has a good quint. Which wins the game? WM. H. S.

BROOKLYN YACHT CLUB.—Last Wednesday the annual meeting of the Brooklyn Yacht Club was held at the rooms of the club, corner of Montague and Court streets. The chair was occupied by P. W. Ostrander. The Treasurer's report showed that the year's receipts had been \$4,209, and the expenditures \$4,053 36. The number of yachts now owned by the club is fifty—of which twenty-two are schooners, twenty-four sloops and four steamers. Thirteen yachts were added to the club during the past year.

The following officers were elected to the club for the ensuing year: Commodore, John S. Dickerson, of schooner yacht Madeline; Vice Commodore, James D. Smith, of the schooner yacht Estelle; Rear Commodore, R. H. Huntley, of sloop yacht Niantic; President, P. W. Ostrander; Secretary and Treasurer, William T. Lee; Assistant Secretary, George G. Dunning; Measurer, John N. Sawyer; Fleet Surgeon, J. G. Johnson, M. D.; Judge Advocate, John Oakley; Trustees, Robert Dillon, W. R. Wadsworth, Chas. W. Blossom, S. McElroy, and the President, Secretary and Treasurer *ex-officio*; Committee on Membership, A. L. Blood, William N. Ringwood and Edgar F. Grout; Regatta Committee, Henry W. Turner, William Bishop, and John F. Ames.

QUAKER CITY YACHT CLUB.—At the annual meeting of the Quaker City Yacht Club, of Philadelphia, held on Wednesday evening, January 20th, the following officers were elected for the ensuing year: Commodore, Charles S. Austin, yacht Coquette; Vice Commodore, A. F. Bancroft, yacht Lillie; Rear Commodore, John Mintz, yacht Goddard; President, N. B. Boyd; Secretary, Charles S. Salin; Treasurer, Robert Baird; Assistant Secretary, J. G. Baughman; Measurer, Samuel Taylor; Regatta Committee, J. S. Pomeroy, J. L. Wills and Charles B. Magee; Trustees, Alexander Wood, D. W. Murphy, E. S. McDowell and J. L. Wills; Membership Committee, Charles Muhlbauer, A. F. Bancroft and Charles Mason.

THE AMATEUR ASSOCIATION.—Detroit Selected for the Regatta of 1877.—The Executive Committee of the National Association of Amateur Oarsmen met on Saturday at the Knickerbocker Cottage. After the transaction of some routine business the committee went into consideration of the time and place for holding the regatta of 1877. A letter was read from the Excelsior Boat Club, of Detroit,

and also one from the Detroit River Navy, requesting the association to consider favorably a proposition to hold the regatta on the Detroit river. Mr. W. C. Stoepel, Secretary of the Excelsior Boat Club, of Detroit, and Mr. James Johnston were named by the Commodore of the Detroit River Navy to represent their association at the meeting. Both gentlemen were present, and Mr. Stoepel addressed the committee on the facilities for holding the regatta there, and the majority of the committee seemed to favor the idea. When put to a vote it was unanimously decided that the regatta of 1877 be held at Detroit on the 15th and 16th of August. Ed Smith, of the Argonauta Boat Club, who took part in the Centennial regatta, was disqualified as an amateur. A resolution was adopted to the effect that any disqualified amateur shall be regarded as a professional, and that competing with such disqualified amateur shall be deemed a violation of the constitution. The Argonauta Club, on account of the decision in the case of Ed Smith, tendered its resignation from the National Association.

—The annual meeting of the Seawanhaka Boat Club, of Brooklyn, was held last Wednesday evening. Mr. Robert H. Orr in the chair. The report of the Treasurer showed that the club was at present in a sound financial condition, and after the transaction of some unimportant routine business, the following officers for the ensuing year were elected: President, Frederick A. Fox; First Vice President, Daniel A. Moran; Second Vice President, James F. Bendernagle; Treasurer, William A. Kelly; Secretary, William H. Goodnow; Captain, Robert H. Orr; Lieutenant, John M. Ranken; Investigating Committee, A. Harris, Jr., J. Moller, T. McFarland; Board of Trustees, W. Wilson, C. Searles, C. D. Jones, A. W. Fisk, J. M. Ranken.

SCHUYLKILL NAVY.—The Schuylkill Naval Board has elected the following officers for the ensuing year:

Commodore—Alex. Krumbhaar, Philadelphia Boat Club; Vice-Commodore, John Hockley, Jr., Undine Boat Club; Secretary, Wm. C. Brown, Crescent Boat Club; Treasurer, Calhoun Megargee, College Boat Club; Log Keeper, Wm. R. Tucker, Undine Boat Club.—SCULLS.

A BUSY EDITOR.—Mr. D. G. Smith, Editor of the *Mira-michi Advance*, published in Canada, is an active coal dealer, agent of the Anchor Line Steamship Company, proprietor of an extensive book and stationery establishment, a job printer, agent for four insurance companies, and agent for Hall's Safes, and yet finds plenty of time to devote to snowballing.

ALL ABOUT FLORIDA IN FLORIDA NEW YORKER, 21 Park Row, New York. Specimen copy 10 cents.—*Adv.*

Ambition is rarely satisfied with any attainment. The greatest men have been the most restless in achievement. Another example is found in B. T. Bubbitt's Toilet Soap, his latest invention. In this are combined delicate, natural scent, and the purest material to be found. As a result it is unequalled, and will soon become the great popular favorite.—*Adv.*

New Publications.

The February *Galaxy* will be an unusually bright number. In this number will be commenced a new serial story by Justin McCarthy, called "Miss Misanthrope." It will run through the year. Henry James, Jr., will contribute on article called "The Letters of Honore de Balzac." Walter Burlingame writes on the "Murder of Margary." Secretary Welles's articles on "Lincoln Administration" will be continued. "Applied Sciences" will be treated on by Chas. Barnard. Poems by Bret Harte, W. Winter, and Mary Ainge De Vere will be found in this number.

THE *Illustrated Weekly*. We observe that the price of our spirited contemporary, the *Illustrated Weekly*, has been reduced to five cents per copy, which makes it probably the cheapest illustrated paper published, and yet the material is excellent and the cuts equal to any.

Tiffany & Co., Silversmiths, Jewelers, and

Spratt's Patent

Meat Fibrine Dog Cakes.

GENUINE

STAMPED.

From the reputation these Meat Fibrine Cakes have now gained, they require scarcely any explanation to recommend them to the use of every one who keeps a dog, suffice it to say they are free from salt, and contain "date," the exclusive use of which, in combination with meat and meal to compose a biscuit is secured to us by Letters Patent, and without which no biscuit so composed can possibly be a successful food for dogs.

The St. Louis Kennel Club.

(C. B. WHITFORD, TRAINER)

are the owners of the following dogs:
ROCK, an imported English setter (formerly owned by Luther Adams, of Boston.) He was a field-trial winner in England, and won first at the Springfield, Chicago and St. Louis bench shows. Also won first at Baltimore (1877), the Special prize for the best setter in the show, and other Specials.

ELCHO and ERIN, both imported red Irish setters. Elcho won first at the Chicago Show; was a winner in the Puppy class in Ireland, and first prize at Baltimore (1877). Is sire of Aileen, the red Irish bitch which won first at the Centennial bench show; and of Norah, who won 1st at the St. Louis show. ERIN won 2d at Chicago in the Open class, and 1st as the best Irish setter for stock purposes shown with two of his get. He won the "GREENWOOD CUP" in the FIELD TRIALS LATELY HELD at MEMPHIS, also with DRAKE won first in the BRACE stakes.

The price for the service of either of the above dogs is thirty-five dollars.

The club are also the owners of the imported English setter bitch Dora. She is either the dam or grand dam of all the "blue blooded" English setters that have won prizes at field trials in this country.

They also own the English bitch ROSE and the red Irish bitches LOO II, and ROSE. The English setter bitch Rose is by Rock, out of the pure Laverack bitch Pickles. LOO II, and the Irish bitch Rose are both bench show winners.

Paints.

PROTECT YOUR BUILDINGS.

Which may be done with one-fourth the usual expense, by using our

Patent Slate Paint.

(Fifteen Years Established.)

MIXED READY FOR USE.

Fire-proof, Water-proof, Durable, Economical and Ornamental.

A roof may be covered with a very cheap shingle, and by application of this slate, made to last from 20 to 25 years. Old roofs can be patched and coated, looking much better, and lasting longer than new shingles without the slate, for

One-third the Cost of Re-shingling.

The expense of slating new shingles is only about the cost of simply laying them. The paint is FIRE-PROOF against sparks or flying embers, as may be easily tested by anyone.

It Stops Every Leak,

and for tin or iron has no equal, as it expands by heat, contracts by cold, NEVER CRACKS nor scales. Roofs covered with Tar Sheathing Felt can be made water-tight at a small expense, and preserved for many years.

This Slate Paint is:

EXTREMELY CHEAP.

Two gallons will cover a hundred square feet of shingle roof, while on tin, iron, felt, matched boards, or any smooth surface, from two quarts to one gallon are required to 100 square feet of surface, and although the paint has a heavy body it is easily applied with a brush.

No Tar is Used in this Composition

therefore it neither cracks in winter, nor runs in summer.

On decayed shingles it fills up the holes and pores, and gives a new substantial roof that will last for years. CURLED or WARPED shingles it brings to their places, and keeps them there. It fills up all holes in felt roofs, stops the leaks, and although a slow dryer, rain does not affect it in a few hours after applying. As nearly all paints that are black contain tar, be sure you obtain our genuine article, which, for shingle roofs, is

CHOCOLATE COLOR.

when first applied, changing in about a month to a uniform slate color, and is, to all intents and purposes, SLATE. On

TIN ROOFS

our red color is usually preferred, as one coat is equal to five of any ordinary paint. For

BRICK WALLS

OUR BRIGHT RED is the only reliable Slate Paint ever introduced that will effectually prevent dampness from penetrating and discoloring the plaster.

These paints are also largely used on out-houses and fences, or as a priming coat on fine buildings.

Our only colors are CHOCOLATE, RED, BRIGHT RED and ORANGE.

Sportsmen's Goods.
WIND-PROOF
Leather Vest and Jackets,
Flannel-Lined.
 (Made and sold only by Messrs. G. W. SIMMONS &
 Co., OAK HALL, BOSTON.) are considered the most
 sensible protectors ever devised for winter wear. They
 are especially adapted to the requirements of sporting
 men, whose rapid walking is likely to be followed by
 frequent halts in the cold wind. Price, Vest \$7;
 Jacket \$9. Measurements required are Waist, Breast
 and Inside Seam of Sleeve. Mention Height and
 Weight.
LADIES LEATHER VESTS AND JACKETS
 made to order. Indispensable to all who are in any
 way exposed to the weather.
G. W. Simmons & Son,
 32 to 38 North St., Oak Hall,
 Boston, Mass.

The Boston Shooting Suit.
 MANUFACTURED ONLY BY
G. W. SIMMONS & SON,
 Boston, Mass.

Sold everywhere in the U. S. by all first-class
 dealers in
SPORTSMEN'S GOODS.
 EACH GARMENT DISTINCTLY MARKED
 "BOSTON SHOOTING SUIT,"
 made by
G. W. Simmons & Son.
 This new design of WATERPROOF SHOOTING SUIT,
 made from extra quality duck, has attained such
 popularity as to be called for from all parts of the
 country, and even from England.
 "Shipping clothing to England strikes us very much
 like sending 'Coals to Newcastle,' but the merits
 of the "BOSTON SHOOTING SUITS" have been
 heard of in the Old Country, and that land of sports
 men has sent an order to Messrs. Simmons & Son,
 which will doubtless be followed by many others."—
 Boston Paper.

The design embraces the best points of the English
 and French Suits, combined with the necessary re-
 quirements for American service. Particular atten-
 tion has been paid to color.
 Each suit is water-proofed by a new patent process.
 The seams and pocket corners are securely fastened,
 and nothing neglected to render the suit perfect in
 every respect.
 THE PRICE HAS BEEN FIXED AT \$13, TO IN-
 CLUDE HAT OR DOUBLE VISOED CAP, DE-
 TACHABLE HAVELOCK, COAT, VEST, AND
 PANTALOONS.
 One hundred suits will be kept ready in stock, so
 that we can furnish to order any size required, at a
 moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper)
 the enthusiastic editor writes:—
 "We were shown, the other day, a new water-proof
 suit, specially adapted for sportsmen, designed and
 made up by Simmons & Son, of Boston, and to which
 we call the attention of all brethren of the out-door
 and shore-shooting fraternity, because it meets the
 demand of personal comfort and convenience beyond
 anything of home manufacture seen by us before.
 As a sportsman, we give it our unqualified endorse-
 ment, as combining the best points of the English
 suits, and in addition skilfully adapted to the neces-
 sities of the American service. It is a most admirable
 and satisfactory contrivance in color, style, water-
 proof quality and capacity. The coat is a marvel
 in this latter respect."
 PERSONS ORDERING FROM A DISTANCE NEED
 SEND ONLY THE FOLLOWING TO BE SURE OF
 A PERFECT FIT: BREAST MEASURE, WAIST
 MEASURE, INSIDE SEAM COAT SLEEVE, IN-
 SIDE SEAM PANTALOONS; MENTION HEIGHT
 AND WEIGHT.
G. W. SIMMONS & SON,
 "OAK HALL," BOSTON, MASS.

"THE BOSTON SHOOTING SUIT.—One of the most
 successful manufacturers of Waterproof Shooting
 Suits is the firm of G. W. Simmons & Son, Oak Hall,
 Boston. We had one of their suits on duty at Hun-
 ter's Camp at Philadelphia Centennial Exhibition.
 It has grown gray in service, but is good
 for use yet. This suit is known as the 'Boston
 Shooting Suit,' in contradistinction no doubt, from
 the garments which are manufactured out west and at
 Washington, each of which has a local demand of its
 own. It is said that the western prairie fowl can
 distinguish any sportsman who visits their domain
 by his clothes. They can tell him 'by the cut of his
 jib,' and the old educated birds (which no one cares to
 eat, by the way,) know exactly what distances to
 keep from the rail shooters, the brant men, and the
 chicken-killers respectively, to be safe. They have
 'got them all down fine.' This used not to be so be-
 fore the waterproof shooting suits were invented.
 Bostonians, Hoosiers and Buckeyes all stood the same
 chance then. But now it is—with a sarill pipe to lee-
 ward by the old-weather cock—'here comes a Sim-
 mons; cheese it!' or, 'Ere's a 'Enning—he low!' or,
 'Look out for Holabird! Scatter! you beggars, scat-
 ter!'—FOREST AND STREAM 1

BULLETIN OF THE NUTTALL OR
NITHOLOGICAL CLUB.
 A QUARTERLY JOURNAL OF ORNITHOLOGY
 This journal (now entering upon its second volume)
 is at present the only serial publication in America
 devoted to GENERAL ORNITHOLOGY. While it is in-
 tended to serve primarily as a medium of communi-
 cation between working ornithologists, it also contains
 matter of a sufficiently valuable character to interest
 all who take any interest in the general subject of
 which it treats. Although devoted mainly to North
 American Ornithology, it will be so far general in its
 character as to give notices of all the more important
 works or memories relating to Exotic Ornithology.
 The list of contributors to its pages already embraces
 nearly all of the leading ornithologists of the country.
 Among them are Dr. Elliott Cones, Mr. Robert Ridg-
 way, Mr. George N. Lawrence, Dr. T. M. Brewer,
 Dr. T. Hale Streets, Mr. H. W. Henshaw, Mr. Wil-
 ham Brewster, Capt. Charles Bendire, U. S. A., Dr.
 J. C. Merrill, Dr. J. G. Cooper, Mr. E. W. Nelson,
 and numerous others more or less well known to ornitho-
 logical readers. Its editorial supervision is in
 charge of Mr. J. A. Allen, assisted by Prof. S. F.
 Baird, and Dr. Elliott Cones. Although published by
 the Nuttall Ornithological Club of Cambridge, Mass.,
 it is not in any narrow sense the organ of any section
 or locality. It being conducted as a MAGAZINE OF
 ORNITHOLOGY, its department of reviews gives prompt
 notices of all papers relating to North American Ornitho-
 logy, as well as of all important ornithological
 works or memoirs wherever appearing; while its de-
 partment of "General Notes" is rich in notices of rare
 or little known species of North American birds, and
 gives the latest and fullest intelligence attainable re-
 specting the progress of ornithology in our own
 country. It is hence a journal no one interested in
 ornithology can well afford to be without.
 Terms: \$1 00 a year (including postage), strictly in
 advance; single numbers, 30 cents. Back numbers
 can be supplied. Circulars, giving a list of contents
 of Volume I, sent on application. Address Mr. H.
 B. BAILLY, Newton, Mass. Dec21

THE "FLORIDA NEW YORKER."
 Published at 21 Park Row, New York,
 Is read by everybody in the North, East and West in-
 terested in Florida. There is no better medium for
 advertising any Southern property for sale or rent.
 Advertising rates very low. Subscription price \$2
 per year; single copies, 10 cents. Every Floridian—
 every Southern man—ought to feel a pride in sustain-
 ing this able and influential advocate of Southern in-
 terests. The number for Nov. 1st, with immense
 map and beautiful Florida views, is a Centennial pro-
 duction which, as the New York Graphic says,
 "places Florida one hundred years ahead." dec23

Highest Honors

AT THE
CENTENNIAL WORLD'S FAIR, 1876!

THE

SHONINGER ORGANS

PRONOUNCED UNANIMOUSLY AS THE
Best Instruments.

Their comparative excellence is recognized by the
Judges in their Report, from which the following is
an extract:—

"The B. SHONINGER ORGAN CO.'S exhibit as
the best Instruments at a price rendering them pos-
sible to a large class of purchasers, having a combina-
tion of Reeds and Bells, producing novel and pleas-
ing effects, containing many desirable improvements,
will stand longer in dry or damp climate, less liable
to get out of order, all the boards being made three-
ply, put together so it is impossible for them to either
shrink, swell or split." THE ONLY ORGANS
AWARDED THIS HONOR.

This Medal and Award was granted after the most
severe competition of the best makers, before one of
the most competent juries ever assembled.

New styles and prices just issued, which are in ac-
cordance with our rule, the BEST ORGAN for the
least money.

We are prepared to appoint a few new Agents.
Illustrated Catalogues mailed, postpaid, upon appli-
cation to

NEW HAVEN, CONN.

PAINTING. THE PATRONS' PAINT COMPANY are manufac-
turing the **INGERSOLL READY-MIXED PAINTS**, and
BRUSHES, and selling them at full trade discounts, delivering them freight
paid, and no money required until the goods are received—making them cheaper
than even the material can be bought elsewhere. They are an absolutely pure
article, possessing great endurance and brilliancy, and are giving great satis-
faction all over the country. We have a Patron friend who saved enough alone
on Paint purchased to pay his Grange expenses for a life-time. They also sell
ROOF PAINT 30 per cent, cheaper than any one else. It is to the interest of
all about painting to write and have sent free their book, "Every One His Own
Painter." It will save much money, whether you buy their Paint or not. Ad-
dress, 259 FRONT STREET, NEW YORK.—(From "The Farmers' Friend.")

GIBSON'S
New Book for Sportsmen.Complete American Trapper. The Tricks of Trapping
and Trap-making.

THE MOST COMPREHENSIVE WORK EVER PUBLISHED.

Containing the fullest directions for Trapping all our leading game. Valuable recipes for scent baits.
Detailed instructions for the manufacture of Traps of every conceivable kind, from a humming-bird trap to
a bear trap. Full directions for curing and tanning skins for market, and an extended chapter on life in the
woods. How to build log huts, bark shanties, boats, canoes, etc. Valuable suggestions on suitable food,
etc. An encyclopedia of the Trapper's art. 300 PAGES, SUPERBLY ILLUSTRATED WITH 150 EN-
GRAVINGS. PRICE: IN CLOTH, \$1.75; CLOTH GILT EXTRA, \$2.25. Send for circular containing
notices of the press. JAMES MILLER, 647 Broadway, New York, Publisher. dec73mo

Gunpowder.

CHALLENGE.

The undersigned is prepared to prove all the supe-
rior qualities he claims for his powder.

Safety, Cleanliness, Strength, Little
Recoil, Little Smoke, Small Report,
Less Heating of the Barrel in Rapid
Firing, and its Regularity in Shooting.

He challenges all riflemen to shoot against him with
black powder, 200 rounds, without wiping; 100 rounds
off-hand, at 200, 500 and 1,000 yards respectively, and
100 rounds in any position at same distances; the 200
rounds equally divided at the three ranges; sighting
shots extra.

Will shoot for money if desired.
The powder is also well adapted for shot guns.
Inquire for the "Dittmar Powder" of your dealer

The Hazard Powder Co.,

MANUFACTURERS OF

Gunpowder.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of
strength and cleanliness. Packed in square canis-
ters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) 3 (coarse). In 1 lb. canisters and 3 1/2 lb.
kegs. A fine grain, quick and clean, for upland and
prairie shooting. Well adapted to short gun.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters
and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very
clean, shooting remarkably close, and with great
penetration. For field, forest and water shooting
it ranks any other brand, and it is equally service-
able for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25
12 1/2, and 6 1/2 lbs. and cans of 5 lbs. FFG is also
packed in 1 and 1/2 lb. canisters. Burns strong and
moist. The FFG and FFG are favorite brands
for ordinary sporting, and the "Sea Shooting" FG
is the standard Rifle powder of the country.

SUPERIOR MINING AND BLASTING POWDER.

GOVERNMENT CANNON AND MUSKET POW-
DER; ALSO SPECIAL GRADES FOR EXPORT
OF ANY REQUIRED GRAIN OR PROOF MAN-
UFACTURED TO ORDER.

The above can be had of dealers, or of the Compa-
ny's agents in every prominent city, or wholesale at

WITHOUT THE CHILDREN.

O H. the weary, solemn silence
Of the home without the children!
Oh, the strange, oppressive stillness
Where the children come no more.
Ah! the longing of the sleepers
For the soft arms of the children;
Ah! the longing for the faces
Peeping through the open door—
Faces gone for evermore.

Strange it is to wake at midnight,
And not hear the children breathing—
Nothing but the old clock ticking,
Ticking, ticking by the door.
Strange to see the little dresses
Hanging up there all the morning;
And the gaiters—ah! their patter,
We shall hear it never more
On our hearth-forsaken floor!

What is home without the children?
'Tis the earth without its verdure,
And the sky without its sunshine;
Life is withered to the core!
So we'll leave this dreary desert,
And we'll follow the Good Shepherd
To the greener pastures vernal,
Where the lambs have "gone before,"
With the Shepherd evermore.

For Forest and Stream.

Deer Hunting in Michigan.

PART II.

AS "Old John" is to figure more or less conspicuously in the account of the next day's hunt, it will be well to introduce him on the start. He is a stallion of almost regal magnificence when he is in shape; but it is not usual in the hunting season to find him in this condition, for his master is almost constantly on his back, and they rough it together, scouring the country in all weathers, and it is a matter of almost daily occurrence to see them come in at nightfall—'Lish on foot followed by Old John bearing a buck, or a bear, or a brace of turkeys slung over his back; and when we consider the pure white of his coat it is easy to imagine that with such usage he does not at this season appear at his best, as far as looks are concerned, being blood stained and soiled; but as soon as the hunting season is over he appears in his dress suit, which is pure glossy white with jet black spots scattered about his loins and shoulders, with a mane and tail flowing thick and long like silken floss prepared for the loom. A sight of him impressed one with supernatural strength and endurance, combined with the most perfect symmetry and grace of form and movement. 'Lish bought him while a colt, and commenced his education at once. We call him *Old John*, but he has only turned his sixth year, and is therefore not yet in his prime. His natural intelligence is something wonderful, and after he had been taught that he had an absolute master it was perfectly easy for him to be made to understand and to perform anything. He will acknowledge but one master, however, and it is worth the life of a stranger to attempt any familiarities with him, and yet 'Lish will put his little six-year old Gussie and five-year old Nellie on his back, and Old John will follow him like a pet dog even into the house, proud of his precious burden. But the noble animal shows best his mettle when on the hunt with his master on his back. The bridle lines are always hanging loosely over his neck, for they are rarely used. 'Lish has his Winchester slung over his shoulder, his breech loader over his arm, his knife in his belt, and off they go like the wind, through thickets, over ditches and fallen logs, turning this way and that, guided by his master's voice or the sway of his body, or a wave of his hand; it is a picture worth going miles to see. Now we will imagine 'Lish and Old John coming home together after a hard day's hunt. They pass in the lane and stop at the side door of the house. The game is taken off Old John's back, and the bridle also removed and done up snugly; no such encumbrance as a saddle is used. Old John is then made to take the bridle in his mouth and receives his orders there. "Now, sir, take your bridle down and hang it up, and go into your room and shut the door," and Old John starts off at a lively gait for the barn at the end of the lane, while 'Lish goes in, kisses wife and babies, takes his game into the dressing room, and then goes down to make Old John comfortable for the night. He finds the bridle hung on its peg all right, and lifting the latch finds the old fellow awfully impatient for his oats; so the feed

box is filled, and just as Old John is going for it with a rush, he hears a warning, thus: "Stop, sir! Don't you dare touch an oat until I tell you." We go out and latch the door and look through a crack, keep perfectly still and watch. John stretches out his nose towards the oats just near enough to get a sniff, then throws back his head and looks all around slyly; then once more slowly and cautiously allows his nose to get within an inch of the tempting pile, and holds still a moment, then the lips begin to quiver, then to open and stretch forward. "T-a-k-e-c-a-r-e, sir," and back goes his head with a sigh and a half whinney, when 'Lish says "Go in, old chap," and his nose goes in half way up to his eyes, and he is happy. Such is Old John.

In order that the plan of the second day's hunt may be clearly comprehended, it is necessary to explain that the Black river runs through the country due south, passing directly through the village where our headquarters are located. All the deer that are started west of here make for this river, which is mainly a deep stream, and probably ten or twelve rods wide, with an occasional fording place. The banks on either side are mostly high and precipitous, of clay and gravel, and fringed with the virgin forest. The river is generally full of logs, which are floated down from lumber camps above to a large saw mill at the village. The deer, when pressed by the hounds, will plunge into the river and hide under the floating masses of logs, with nothing above water but their nostrils, and many of the countrymen who do not own hounds take their stations along the east bank of the river trusting to luck for a shot at some deer who may have run the gauntlet of hunters beyond. Our plan for this day's hunt was for Buxton to take the hounds and go west about a mile, then north two miles, and drive towards the river, while we were to go directly up the east bank of the river about two miles, tramping the whole distance, as there are no roads from the village in this direction, and then take our several stations. I was to take the station furthest north, and 'Lish was to go on Old John and scour a limited district north of me for bear, wildcats, or turkeys, and when he found them he was either to return to me and let me know, or, if circumstances would not permit of his leaving the game, he was to give two quick shots from his Winchester rifle, and I was to make my way as best I could to where he was, being guided by an occasional whistle from him, he keeping the game cornered or treed as the case might be, until I should come up. We were honored on this trip with the company of Mr. Wildman Mills, the owner of countless broad acres in this and adjoining counties, and whose great industry and success in clearing and reclaiming the wild swamp lands of the district causing them to blossom as the rose, has rendered his name a synonym for industry, progress and civilization. Well, Buxton gets an early start with the hounds, and we a little later go our way. Mr. Mills takes the first station, Bertham next, and myself to the extreme north of the line. As we get located 'Lish rushes by on Old John, and with a nod at me he is out of sight in the timber in an instant. We are now all ready for whatever may turn up, and waiting on the tip-toe of expectation for something to happen to call our energies into action. Besides listening for the hounds I have an eye and an ear in the direction whence 'Lish disappeared, and while there waiting I am slightly exasperated by a duck flying around the bend of the river below, and settling in the water directly in front of me—a splendid shot for my rifle, but I dare not shoot for fear of frightening off nobler game, which is liable to appear on the opposite bank at any instant, so I content me by drawing a bead on the duck's head, and betting myself a hundred dollars that I could take it off as clean as a whistle, if I only chose to pull the trigger. We have waited now nearly an hour, and yet no sound from 'Lish or Buxton or the hounds. Meantime Bertham has come up to my station for company, and being a trifle chilled we have built a blazing fire from the fallen pines and birches, and have almost forgotten the excitement of the hunt in the delicious comfort of the situation, and the chat over the camp fire in the midst of the grand, wild surroundings. Bertham does not expect much from this hunt, particularly in the way of deer, as the range of the hounds is too limited and the wind is wrong, having changed to the east since we started, and the deer running towards us against the wind might scent us and turn to the north and be lost to us in the swamps abounding in that direction. He acknowledges, however, that with 'Lish's proverbial good luck it would be unusual if he did not start something; and just as he comes to the conclusion we are startled by two quick cracks

of the rifle, apparently from a direction a little west of north. Bertham thinks they are from across the river. The wind, however, being from the east might deceive us a point or two, and so I start directly up the river bank, being assured by Bertham that if I have occasion to cross, there are plenty of good places where it can be done. I follow up the bank of the river perhaps quarter of a mile on the run; but here I am stopped by a dense undergrowth, which it seems impossible to penetrate. I try it, however, and I am startled by a sudden whirr! then another, and another, until it seemed as if at every step I must almost tread on a partridge. Fairly bewildered with excitement at the idea of losing so much of what we in the east would call first class sport, I press forward and come out finally on the edge of a small clearing, where I stop to take breath, listen, and get my latitude. While there listening I notice on the other side of the clearing, moving closely beside the debris of roots and branches which form the northern boundary of the clearing, a long, lithe, brownish figure creeping close to the ground, but rapidly, in the direction of a large pile of roots and logs at the further corner of the field. It was surely a cat, but certainly larger than any I had heard described in these parts. The suddenness of the apparition, so entirely unlooked for, checked my ardor quickly, and led me to consider with such faculties as I remained master of, whether in this case discretion would not be the better part of valor. Alone in the forest with a wildcat, or something worse, for I felt sure from its size that if it were a cat it must be the father of the whole tribe. What shall I do? "I want to go home!" Had he seen me? I could not be sure of it. Could it be possible that this was the game that 'Lish had found, and was he lurking around somewhere taking notes of the situation? No, this could not be, as his shots were further to the westward, and I had been trying to work to the westward as fast as the river would let me. The cat, or whatever it was, had now dragged his sinuous course to the log pile and had disappeared under it, and at this moment I heard a whistle from 'Lish, and evidently on the other side of the river, and not far away; so I concluded at once to retrace my steps to a point where I could hail Bertham and let him have the wildcat all to himself. Back I went—at good speed, too, for I imagined every time a twig snapped that my "friend" was behind me. Reaching a tree that had been uprooted and fallen over the river, with the top nearly to the opposite shore, I crossed on it and down the opposite bank until I could see and hail Bertham, to whom I gave all the points concerning the cat. He seemed to comprehend everything clearly, and started for the game at once, while I turned and made my way towards the sound of the whistle. I had not far to go before I saw 'Lish at a distance lying on the ground and rolling over and over in a manner to astonish me. I hastened to him, thinking he was hurt, but on coming up found him in an fit of uncontrollable laughter. Old John was lying behind a clump of bushes prone on his side and still as a mouse, while all 'Lish could do was to point in a certain direction and laugh until his face was purple. I looked in the direction he pointed, but could see nothing until my attention was attracted by the falling of a piece of bark, or something like it, from a tree near by, and guided by that I soon saw the cause of the "trouble." Only a few rods from where we were was an old pine tree which had been broken off short so that only about a third of the original tree was left standing, and about the top, say perhaps fifteen feet from the ground, a few large branches were left, while from that point down almost to the ground were innumerable small stumps of branches a foot or more in length, the branches themselves having been torn and twisted off by storm and accident so that the stubs were left mainly sharp and slivery. Up in the top among the large branches was a bear cub about two-thirds grown, and he had gotten himself wedged in between two of the large branches so that he could neither advance or retreat, while his hinder parts were astraddle of a long, sharp stub that stood out from the tree directly under him. He was so wedged that he could neither raise himself much above it nor get around it. In endeavoring to keep himself clear of it he had clawed the bark all off, so that now there was no hold for him, and he was continually slipping down on the sliver, which would pierce him every time he touched it, and at such times the snarling and growling and scratching were something terrific, and when undertaking to look around under him to see what the trouble was his head would bump savagely against the limb that held him, and his eyes would fairly shoot fire with rage; in his calmer moments he would look down at us and seem to say: "This

may be fun for you, but wait till I get down, that's all." We had now had all the laugh that we could possibly endure, and it was really a feeling of alarm for ourselves as to the consequences of immoderate laughter that led us to consider measures of bringing the affair to an end. I proposed shooting him where he was. "Oh! no," says 'Lish, "give him a chance for his life; and besides I want to see him come down from that tree himself. Its a mighty handy tree to climb, but a mighty aggravating one to descend. I'll start him." So saying, 'Lish slipped in a cartridge loaded with No. 6 shot and sent it up to the bear. It stung him perceptibly, and stimulated him to a tremendous effort, which resulted in getting his hinder parts around sufficiently to get one of his hind feet on the sliver, then raising himself up, lifted his foreshoulders out of the crotch and gave a long sigh of relief, and looked again at us as much as to say: "Now I'll attend to *you*," he then backed around to the other side of the tree and commenced letting himself down. We started also for the other side, and reached there just in time to see him brought up by another sliver. When about a third of the way down his hinder parts had by this time become very tender and susceptible, and his rage at this latter infliction was intense. He bit at the tree with a savage snarl, taking out a piece of bark and shaking it as a terrier would a rat. Everything now assumed a decided air of business. I stood ready with my rifle, 'Lish by my side with his breech-loader ready, in case I should miss. Down came old Bruin, and on touching the ground faced us and raised himself, evidently determined to fight. I could wait no longer, but pulled trigger, aiming directly between his foreshoulders. Expecting to see him drop at once, I did not then reload, and when I saw him come rapidly for us after my shot, I confess to a "buck fever," or something else, that rendered me incapable of any reasonable action, for I let another cartridge into the chamber and pulled the trigger without raising the gun, and the dirt and chips flew in all directions where the shot struck, and if 'Lish had not quickly put two charges of buckshot in a vital spot, I will not pretend to say what the end would have been. The last charge was put in at very short range, tearing a hole in his neck that saved any use of the knife in bleeding him. We soon rigged a purchase, raised him up, opened and cleaned him. We found that my ball had entered just to the right of his breast-bone, and instead of penetrating it had glanced and followed the bone around just under the skin, lodging under the shoulder-blade at the joint; an inch further to the left would undoubtedly have finished him at once.

While we had been entertained by the bear we had heard two shots in Bertham's direction, and we had also imagined that we had heard the hounds far to the south and west of us, but we had been so busy that we could not feel certain. 'Lish now called up Old John, and placing him in a convenient position, by dint of some tugging and lifting Mr. Bear was placed across his back and started for a ford of the river near where we expected to find Bertham. At the ford the banks on either side were comparatively low, and we had no difficulty in crossing. John, however, did some powerful jumping and plunging on the way, but his eye was continually on his master, and he followed his footsteps closely no matter where they led. Reaching Bertham at last we found that he had got his cat, and had it propped up on a stump as if in the act of springing. Old John didn't like the looks of the animal in that life-like attitude, for he was about giving it a wide berth, but at his master's command he came up to it trembling and snorting, and finally stood quietly beside it. The cat was a large one, but not as large as he had seemed when I saw him in the field.

We now took up our line of march homeward, and related our several experiences. Bertham had made an easy capture of the cat. He tracked him into the pile and ascertained that he had not left it, hence he concluded that the cat had seen me and was keeping dark. Gentle means failing to dislodge him, Bertham had gathered some dry birch bark, which burns like kerosene, and filling up the crevice on the windward side of the pile, started it burning and stood off waiting results. Pussy soon took the hint, and left, being brought up all standing at the first shot; but Bertham didn't feel like carressing him much until after the dose had been repeated.

On coming up to Mr. Mills's station we found the lunch basket open and Buxton and Mr. M. going for the choice cuts before a blazing fire of birch bark and pine knots. The hounds were tethered near by, and we all sat down to the feast. Any hunter can imagine the delights of the situation at this moment. It was a time for unbridled indulgence in all the propensities that actuate the true bred, genial and jolly sportsman. The incidents of the day, thus far, had been sufficient to furnish material for all sorts of sparkling sallies, which were mostly aimed at your good-natured correspondent. Of course it was wholly my *generosity* that gave Bertham a chance at the wildcat! Nervous? who said anybody was nervous? That shot in the dirt was the fault of that confounded mechanic who put the weapon together and manipulated the lock to pull at a good deal less than the regulation three pounds. Of course it was. Why certainly. No buck fever in this crowd—oh! no! This might have continued indefinitely had not Buxton suddenly started and run up the bank of the river, soon followed by the whole party. We had learned on first reaching them that Buxton and the hounds had started a doe, but had lost him in the river and the chase had been given over, they supposing that they had seen her tracks up the eastern bank, indicating that she had crossed and was probably on her way to the lake. Buxton had seen some circling ripples in the water up near a bend in the

river above us, which was the cause of his sudden start. On arriving at the bend it was evident that something had been agitating the water, though nothing could be seen. It might have been a duck starting up, or a muskrat. Buxton, meantime, had made his way to the foot of the bank, and was looking intently at a small pile of rubbish which had lodged on a snag near the middle of the river. As this game, whatever it might turn out to be, belonged of right to Buxton and Mr. Mills, we did not interfere. Buxton called on Mr. Mills to put a charge of buckshot in that clump of rubbish, which he did, and immediately a doe's head came to the surface and turned for the opposite shore. Another charge did not stop her. The water now shallowed, and as she was making a final plunge for a foothold, a ball from Buxton's rifle laid her over as quiet as a lamb. Buxton paddled over on a log and towed her across, when we all set to and had her hung up and dressed in short order. We now had a short rest at the fire, and then for home.

Within forty-eight hours from that moment I was treading again the stones on Broadway, but with a lighter step than I had known for years, being now resolved that another hunting season—Providence permitting—will find me once more in Michigan, and with the same genial and kindly companions.

Finally, I would say that the articles I took with me all served admirably, and I would duplicate them on another trip, but with the addition, I think, of a good breech-loading shot gun, for the smaller game is so plenty as to be an aggravation unless one has the means of bagging it. After my next trip I trust I may feel sufficiently initiated to abandon the cognomen of GREENHORN.

LOOSE LEAVES FROM A SURVEYOR'S JOURNAL.

STARVATION.

WE started from Portage City in April, and proposed to bring up somewhere near Hudson, opposite St. Paul, which we did in August. We had some good boys in our party, and it is in hopes that in your widely circulated paper some one of them, if still in the land of the living, may see this article and let me know their whereabouts. I want to trade stories with them, and hear how time has dealt with them since our camp life of 64 days twenty years ago. Where is genial Cleveland, our companion; classic Davis, our leveler; Daniels, our chief I am grieved to have learned, has made up his estimates and turned them in for another world. "Peace to his ashes." But rollicking Webster, and jolly, honest Mike, and roaring Ralph, and several others whose physiognomies I recall, but not their names. Where are they?

We were approaching Black river, and a swamp of unknown dimensions. The teams with the tents, provisions, etc., were ordered around, while twelve of us were detailed to run the line through. We were instructed to run a certain direction until 4 p. m., and then camp and wait for orders, the supposition being that we would be but a short distance from Black river, along which there were known to be settlements, and if our teams had not been able to get around, scouts would meet us and bring us out all right. We obeyed orders, and at 4 p. m. brought up in a Tamarack Swamp. We pitched our tent on the only hardwood knoll we could find and awaited events. We had toiled hard, cutting our way all day and were tired and hungry. No welcome scouts came in with tidings of bread and pork. Supperless we turned in; breakfastless we passed the forenoon, the sun sank to rest through the tamarack trees and our stomachs were still an aching void. Another night and another day, and no sign of scout or grub. We could not move, for we knew not which way to go, and were told positively not to stir until further orders. The third day broke upon us, and as it advanced it showed a demoralized set of men. Of the twelve men only four could walk without staggering, three could with difficulty arise from the ground, and, singular to state, the largest and strongest of the party were affected the first and most powerful. The terrible cravings and gnawings! Words cannot describe the sufferings of those strong men in their agony. The undersigned being the slightest as well as the youngest of the party, seemed to stand it better, and then again he assuaged his hunger to a certain extent on the tender basswood buds and elm shoots, and on the last day, with the help of Webster's botanical knowledge, we boiled up several kettles of greens (he said they were harmless, and they proved to be) which went far to carry us through.

There was a cock grouse that daily drummed on a log not 200 yards from our camp; but all the ingenuity of twelve starving men could not snare or capture him (our firearms were all with the other party). The undersigned has set snares with some success, but he was completely baffled by this outrageously tantalizing *Tetrao umbellus*. He knew things, he did, for he would spring the snare deliberately while we lay watching him strutting on the log not thirty feet away. Several times we came near bagging him with a club, but he was too good at dodging. Perhaps our very necessities and circumstances made us nervous, for we could by no manner of means inveigle him into our tin pail. And for all we know to the contrary he may be drumming there yet.

About 9 a. m. of the morning of the fourth day a shout was heard, and two men were seen approaching with heavy packs strapped aback. They were soon surrounded by those able to meet them. They had lost their way, or failed to find us the night before. Their packs consisted of a kind of fresh biscuits, or cracker rather, and salt pork,

The men were nervous, and they tore off great chunks of the pork and devoured them raw like beasts. But three of us were more self-denying, and eat of the bread, but sparingly of the meat. I hid a large piece of the pork in a hollow stump, the remainder I cut up in small pieces and boiled with the greens, and made a capital and nourishing dish. The two scouts started on their return immediately, saying they would be back again with a fresh supply with orders from our chief before night. But night came and no scouts.

I had recourse, as I expected, to my hollow stump; that pound of pork was boiled six times in pots of greens for his fellow sufferers, and I really believe it saved the lives of two, if not three of them, because eating so much raw salt pork on an empty stomach brought on a severe diarrhoea that came near checking them off. Another night of anxiety, and the scouts appeared. After a hearty breakfast we broke camp and followed our guides the best we could in our weak condition; but many of us could go but slowly, and that with only uncertain steps.

Toward the afternoon we came out in a clearing and were welcomed by a squatter away in those wildwoods. He could only offer us boiled potatoes and salt. Ah! "Cleve," do you remember how delicious those esculents tasted boiled with their jackets on in that big sugar kettle? Have you ever had murrhies go to the right spot as they did that day? Never, never will I forget them. In the afternoon we brought up on the Black river and a sawmill settlement. Our team soon arrived and all was lovely, but not soon will any of us forget our three days of starvation.

JACOBSTAFF.

DUCKING IN LINE.

A ROUGH shake, followed by a sudden and forcible transition from dreamland and romance to stern, chilling realities, is the first announcement vouchsafed of the fact that it is three-thirty o'clock of a crisp, cold November morning, and if we are to be of the ducking party to-day a stir must be made at once. Twenty minutes have scarce elapsed ere we are discussing the prospects of the day over our steaming coffee, and barely double that time has passed before, seated behind old Whitefoot, snugly escosed in the buffaloes, pipe in mouth, we go whirling over the hard frozen turnpike. The rosy-fingered daughter of the morn will be wrapt in virtuous slumber for a good two hours yet, and we shall anticipate her to-day. Ducking in line is to be the "*ordre de jour*," and for the benefit of those ignorant of the *modus operandi*, we will briefly describe it: A number of boats, perhaps twenty, each containing one man, one or more guns, together with an anchor, thirty feet of rope and a buoy, start for some predetermined point of land near which the birds feed. The boats range themselves off from the shore about gun shot apart, forming a cordon through which the ducks are expected to fly. The anchor is attached first to the buoy, and this in turn is snapped to the painter. When a bird is shot down, the boat can in this way quickly slip the buoy, and save the time and trouble of raising the anchor. The birds at sunrise fly into the bays and estuaries for food, and in passing over the line give good shots to the gunners.

We have reached the shore, and a number of dark forms clustered around the boats disclose, as we draw near, our companions of the day, preparing their light skiffs and ducking floats for the start. A hardy, jovial set of fellows they are—hard working farmer's and fishermen—most of them, with pleasant word, ready wit—keen sportsmen all. Preparations soon completed, the boats pull off one by one. As we slowly recede from the shore we see Luna, whose brightness is now dimmed, just sinking from view behind the hills, while low down on the horizon opposite Aurora is just beginning to redden the eastern heavens. How apt the words of the immortal Grey: "And all the air a solemn stillness holds," here broken only by the monotone of the oars, or the voice of some early oysterman, who laboring by with his unwieldy craft salutes our boats as we pass.

A pull of half an hour brings us to the point where the line is to be formed, and we select positions. Those who have stools put them out. Hardly have we all arranged ourselves before a gun is heard close in toward the shore, and immediately the plaintive and human-like cry of an old loon comes floating through the twilight. He had, in the darkness, flown right on the boats, and being turned at the first shot glides along the line looking for an opening. Each boat, as his shadowy form is discerned in the dusk of the morning, hurls after him its ounce of lead; but the old fellow seems to care but little for it, and finally passes through the barrier, and is lost in the gray, filmy mists of the bay. So the sport of the day is inaugurated.

Far out over the water, at the report of the guns, the faint whistling of a million wings is borne to us, and ever and anon we hear the "honk!" "honk!" of gangs of geese as they pass high overhead. The sky grows brighter and brighter, and its whole expanse seems now one mass of molten gold, till with a great burst of light the sun lifts himself from his billowy couch, illumines the broad waste of waters and day breaks. The birds begin to appear in small bunches, then joining forces they fly back and forth, marshalling their legions. Their continued and peculiar cry, "owl!" "owl!" "owly!" rippling musically across the waters to us, announces that the principal sport of the day will be confined to the "Old Squaws," a bird with a dozen names in ducking parlance, known to naturalists as the long-tailed duck (*Harelda glacialis*). He affords good

sport on account of his rapid flight, but poor table food owing to his fishy diet. We notice also a goodly representation of old "Bell tong coots" (*Ordemia fusca*), and occasionally a bunch of broad-bills go swiftly by overhead, too high for gun to harm. Way over the placid water the ducks are seen flying to and fro, looking as large as geese at times as they rise, and skimming along disappear in a second, so suddenly as to make it seem almost magical. It is the deceptive effect of mirage; the sun just over the water gives a quivering appearance to the atmosphere, and the shimmer of wing, apparently so distant, is in reality quite near. The old coots are seen in countless numbers still further out, stretching in a dense black mass as far as the eye can reach. It seems impossible that these thousands can all find subsistence from under the waters of the Sound; but this vast magazine of nature's bounty is ever replenished.

Sport now begins in earnest, and such sudden ejaculations as "All solid to the east'r'd!" "To the south'r'd!" "All down!" etc., are constantly passed from boat to boat, as the birds come on from the different points. We are warned by a cry from our left, and flattening ourselves on the dry grass carpeting the bottom of our craft we look in the direction indicated. A fine bunch of old-wives are sweeping down toward us, close over the water. They are within sixty yards of the line, when some over-anxious gunner raises himself too soon, and they whirl off, only to return, however, to another portion of the barricade. Now they are around again, and quicker than thought are on us. Bang! bang-bang! bang-bang-bang! The guns are fired in quick succession, as the birds skirt the boats seeking an opening. It sounds like the discharge of a whole battalion. Birds drop right and left. Some merely wing-tipped disappear as they touch the water. Others from sheer impetus bound ten or twenty feet, then floating lightly rise and fall with the swell. We unsnap the buoy-rope and row for our game. They are soon retrieved, and now all the birds which were within the circuit of a mile have been put on the wing by the rolling and reverberation of the gun reports. They come towards us from every direction, and a sharp lookout must be maintained or some good chances will pass unnoticed. Our Scott & Son's 10-gauge choke-bore breech-loader stands us in good stead, and some long range shots call forth hearty and frequent applause from our neighbors on right and left. We are kept busy shooting, retrieving, and getting into place again, and the time speeds merrily. Now and then the old white-winged coots in pairs, or mingled with "Old Injuns," sail over the line and become the target for a dozen guns. So the sport proceeds, and the hours glide by, until when the village spire sends its music quivering across the bay, telling the hour of eleven, we weigh anchor and start for the shore. Counting our birds we find our two boats aggregate forty-five, among which are three broad-bills and a black duck, the balance being Old Squaws and a few Coots. So ends a morning's ducking in line on the Connecticut shore. RAMON.

THE HAYDEN SURVEY.

SUMMARY OF THE FIELD WORK OF THE ZOOLOGICAL AND GEOGRAPHICAL SURVEY OF THE TERRITORIES UNDER THE DIRECTION OF PROF. F. B. HAYDEN, FOR THE SEASON OF 1876.

(Concluded from our issue of Jan 18th.)

VERTICAL walls inclose the narrow river-bottoms, and the slopes of the higher portions are ornamented by thousands of curiously-eroded rocks. "Monuments" of all kinds, and figures that can readily be compared to those of animated beings, enliven the scenery, which otherwise would be very monotonous; 2-3,000 feet may be stated as the height of the walls inclosing the White river.

Geologically speaking, the district was one of singular uniformity. Traveling westward, the older formations, reaching back as far as the triassic, were found. This was followed by cretaceous, which in turn was covered by tertiary. About three-quarters of the region surveyed was found to contain beds belonging to this period. Owing to the lithological character of the strata, water was a rare luxury in this region, and men and animals were frequently dependent upon looking for springs. Farther west still the Green river group sets in, forming those numerous canyons of which that of the white river is one.

Having completed their work by October 14th, the party marched eastward through Middle Park, and after twelve days of rain and snow, reached Boulder City, Colorado.

The field-work of the Yampah division during the past season was principally confined to a district of northeastern Colorado lying between the Yampah and White rivers, and between Green river and the subordinate range of mountains that lies west of and parallel with the Park range. The area is embraced between parallels 39 deg. 30 min. and 40 deg. 30 min., and meridian 107 deg. 30 min. and 109 deg. 30 min.

The party consisted of Mr. G. R. Bechler, topographer, directing, accompanied by Dr. C. A. White, the well-known geologist. They proceeded southward toward Rawlin's Springs, a station on the Union Pacific railroad, August 6th, toward their field of labor. From Rawlin's Springs to Snake river, a distance of eighty miles, table lands form the chief feature of the topography, while from Snake river to the Yampah river the surface is more undulating, and thickly covered with sage. Between the Yampah and White rivers, a distance of fifty miles, the country is mountainous, and on the divide between the Yampah and White rivers the elevation is 8,000-9,000 feet.

Mr. Bechler, after having formed the geodetic connection with the work of previous years, concluded to finish the more mountainous portion of the area assigned to him, which began from a line of meridian with the White river agency, and extended westward to about 108 deg. 10 min. Here the party found water and grass in abundance, with one exception. The plateau country, however, was so destitute of water and so cut up with gorges and canyons, with scarcely any grass or timber of any kind, that traveling was rendered very difficult. The party therefore made White river its base of supply for water and grass, making side trips into the barren hilltops or plateaus in every direction.

From the Ute agency, which is located approximately in latitude 38 deg. 58 min., and longitude 107 deg. 48 min., the White river takes an almost due west course for fifteen or eighteen miles, most of the way through an open valley, with here and there narrow gorges. About fifty miles from the agency the river opens into a broad, barren valley, with only here and there scanty patches of vegetation. Soon after, the river enters a deep canyon, with vertical walls 1,000 feet or more in height, and continues to increase in depth until the river flows into the Colorado of the west.

The Yampah, or Bear river, deviates from a westerly course only for a few miles occasionally. Like White river, it flows through a plateau country, which rises gently from the river, back for a distance of about eight miles. South of the river lie the Williams river mountains, which have a gradual slope to the north. Williams fork, flowing from a southeastern direction, joins the Yampah river west of the junction. Yampah traverses the country more or less in a canyon, occasionally emerging into an open, grassy valley, then enters a deep canyon, cuts through the Yampah mountains, when it joins with the Snake river. The place of junction resembles a fine park, surrounded on all sides with eroded terraces and plateau spurs that rise by steps to the divide on either side. This park is about eight miles in length from east to west. After leaving this park the river enters a huge fissure in the mountains, where it remains, until completing its zigzag course, it joins the Green river in longitude 109 deg. 30 min., and latitude 32 degrees. After the junction with the Yampah, the Green river continues in a canyon for fourteen miles, where it passes through the picturesque palisades of Spiti mountain into an open, broad valley, longitude 109 deg. 15 min., latitude 40 deg. 28 min., from which point it takes a southwest direction through the Wamsita valley, where it unites with the White river. Into both White and Yampah rivers numerous branches extend from either side, forming deep canyons the greater portion of their length. We may say, in brief, that the sides of the valleys expand and contract, at one time forming the beautiful, grassy valleys, which in olden times were celebrated as the favorite wintering places for the trappers, or contracting so as to form narrow canyons or gorges with walls of varied height.

The walls of Yampah canyon average about 1,000 feet, while the mountains receding back to the northward, attain an elevation of 4,200 feet, while the highest point of the plateau on the south side is 3,400 feet above the river level.

Of the plateaus between White and Yampah rivers, Yampah plateau is the largest, and occupies an area of 400 square miles. The surface of the summit is undulating, and on the south side it presents a steep face, several hundred feet in height, covered with debris, rendering it almost inaccessible. This plateau is covered with excellent grass and gives origin to numerous springs, all of which dry up within a short distance of their source.

As a whole, this district is very arid, barren, and almost destitute of tree vegetation.

The total number of stations made by Mr. Bechler in the district assigned to him was forty, and the entire area was about 3,000 square miles. Barometric observations were made whenever needed, and about 2,000 angles of elevation and depression with fore and back sights, so that the material for obtaining the correct altitudes is abundant.

The rocks of this district embrace all the sedimentary formations yet recognized by the investigators who have studied the region that lies between the Park Range and the great Salt Lake, namely, from the uinta quartzite (which underlies the carboniferous) to the Brown's Park group, or latest tertiary inclusive. Not only has the geographical distribution of these formations been mapped, but all the displacements of the strata have been traced and delineated. The last named investigations bring out some interesting and important facts in relation to the orographic geology of the region, especially as regards the eastern termination of the great uinta uplift and the blending of its vanishing primary and accessory displacements with those of the north and south range above mentioned. Much information was also obtained concerning the distribution of the local drift of that region, the extent and geological date of outflow of trap, etc.

The brackish water-beds at the base of the tertiary series, containing the characteristic fossils, were discovered in the valley of the Yampah. They are thus shown to be exactly equivalent with those, now so well known, in the valley of Bitter creek, Wyoming Territory. These last-named localities were also visited at the close of the season's work, and from the strata of this horizon at Black Buttes station three new species of *unio* were obtained, making six clearly distinct species in all that have been obtained, associated together in one stratum at that locality. They are all of either distinctively American types or closely related to species now living in American fresh waters. They represent by their affinities the following living species: *Unio clavus*, Lamarck; *U. securis*, Lea; *U. gibbosus*, Barnes; *U. melanoceros*, Rafinesque; and *U. compianatus*, Solander. They are associated in the same stratum with species of the genera *Corbulo*, *Corbiculo*, *Neritina*, *Vitiparus*, etc., and which stratum alternates with layers containing *ostrea* and *Anomia*.

The close affinity of these fossil *unios* with species now living in the Mississippi river and its tributaries, seems plainly suggestive of the fact that they represent the ancestry of the living ones. An interesting series of facts has also been collected, showing that some of the so-called American types of *unio* were introduced in what is now the great Rocky mountain region as early as the jurassic period, and that their differentiation had become great and clearly defined as early as late cretaceous and early tertiary times. Other observations suggest the probable lines of geographical distribution, during the late geological periods of their evolutionary descent, by one or more of which they

have probably reached the Mississippi river system and culminated in the numerous and diverse forms that now exist there.

The work of the past season shows very clearly the harmonious relations of the various groups of strata over vast area, that although there may be a thickening or a thinning out of beds at different points, they can all be correlated from the Missouri river to the Sierra Nevada basin. The fact also that there is no physical or paleontological break in these groups over large areas from the cretaceous to the middle tertiary, is fully established. The transition from marine to brackish water forms of life commences at the close of the cretaceous epoch, and without any line of separation that can yet be detected, continues on upward until only purely fresh-water forms are to be found. Dr. White, an eminent paleontologist and geologist, says that the line must be drawn somewhere between the cretaceous and tertiary epochs, but that it will be strictly arbitrary, as there is no well marked physical break to the summit of the Bridger group.

Fish Culture.

ABSTRACT OF THE TENTH ANNUAL REPORT OF THE FISH COMMISSIONERS OF THE STATE OF MAINE.

CONSIDERING that the whole amount appropriated by the Maine Legislature for the use of the Commissioners was but \$2,000 the amount of work accomplished is remarkable. Of the appropriation of the previous year the Commissioners had subscribed \$1,000 to the Penobscot Salmon Breeding Works. The return from this sum was three hundred and twenty thousand salmon eggs, which were sent, one hundred thousand to Dixfield to be hatched and distributed in the Androscoggin and tributaries, and the remaining two hundred and twenty thousand to Norway and Songo, to be hatched and distributed in the tributaries of the Pesumpscot river. Prof. Baird, U. S. Commissioner, presented to the State of Maine through the Messrs. Coffin, of the Pembroke Iron Works, seventy-two thousand ova, which were successfully hatched and planted in the Penquaman and Dennys rivers by Mr. Supt. Whitman, to whom Maine is so much indebted for fostering and cultivating an interest in fish culture in his section of the State. Two hundred and fifty thousand salmon eggs were turned over by the U. S. Commissioner, of which one hundred thousand were assigned to the town of Surrey, and the balance were planted in the Mattawamkeag, at Bancroft and Kingman, and in the Penobscot at Winn. The Commissioners acknowledge their obligations to President Jewett and Superintendent Cram, of the European and N. A. Railway Company, for many acts of courtesy and kindness in the transportation of fish. Of the young salmon planted in the rivers of Maine in previous years large numbers have been seen, the *smolts* congregating in large numbers from the branches of the Penobscot to Bangor. On the Androscoggin, where the first salmon fry were turned in four years since at Norway, more or less are caught both in smelt nets and weirs, as well as with hook and line, and there is no doubt that were a good angler to make a cast below the dam at Brunswick or Topham, with rod and fly in July or August, he would take either smolt, grilse or salmon. A large number of letters from intelligent persons are printed, all going to show that the turned out fry have returned to the rivers. The Commissioners suggest, as the surest mode of succeeding, that a close term for six or more years be declared, during which period all fishing save with hook and line from source to mouth be declared illegal. The demand for the ova of the Schoodic or Land-locked Salmon continues. Mr. Atkins has organized an establishment on Grand Lake Stream, something after the plan of that at Bucksport. At present the subscribing parties are United States Commissioner Baird, and the Commissioners of Massachusetts and Connecticut. The Commission only exact, as compensation to the Grand Lake waters, that the parent fish, after being used, be turned back alive into the waters whence taken, and twenty-five per cent. of the hatched product of the ova. It is hoped the Legislature will enable the Commissioners, another year, to become subscribers, that they may be able to stock those immense wastes of unproductive waters that have been cut off from access to the migratory fishes; all that line of lakes emptying into the Kennebec at Hallowell and Gardiner and Waterville. These waters are all capable of not only producing an important amount of food, but of making the towns on their shores as favorite places of summer resort, as much frequented, and introducing as much money into the State as Moosehead Lake. About thirty thousand eggs of this fish were distributed in various ponds in Oxford, Penobscot and Somerset counties. The presence of pickerel does not seem to interfere with the increase of land-locked salmon as it does with brook trout, as in Sebéc, Sebago and the Grand lakes, the pickerel are said to be in such numbers as to be very destructive to the young water fowl that feed in still water among the lily pads. Several of the Sebago salmon have been taken in Rangeley with a fly, weighing from half a pound to four and a half. Moosehead Lake should be stocked with these fish, and it is hoped that the sportsmen who visit Moosehead in the season, will see to it that a hatching house be provided there, by subscription, if necessary, and its care enforced upon the hotel keepers. One million, at least, of young trout, should be turned into the lake every year, to supply the immense drain upon its waters. If a hatching house is provided, the Commissioners will endeavor by some means to obtain Schoodic salmon eggs enough to stock its waters.

The demand for black bass has so increased that the Commissioners have been unable to supply the demand. This fish seems to hold its own against all comers, and it is hoped that every pond in the State into which the pickerel have been introduced will be stocked with them. Several parties have been provided with fish. At Monmouth, Mr. G. H. Prescott is ready at all times to furnish bass, or to go out with visitors and assist in catching the fish. In all these cases, the Commissioners furnish the applicants with cans, which are kept at Mr. Philips', in Dedham, Penobscot county, and at Mr. G. H. Prescott's, Monmouth, Kennebec county. The law relating to the catching of black bass having been most injudiciously altered last winter by the Legislature, from July 1st to June 1st, the Commissioners urge that it shall be again changed to July 1st, as this fish spawns in Maine from the middle of May to the middle of July. It is hoped also that white perch will be included in the same close season.

Surveys were made last summer for two fishways on the Mattawamkeag; the one at Gordon's Falls, and the other at Sluegundy, and they will be built at a favorable stage of water next summer or autumn. A fishway is petitioned for at Sebec Village, and should be made. Sebec Village would become a favorite resort for anglers, and a popular place of summer residence for city families, if the salmon of the lake were enabled by a fishway to obtain access to the river below the dam. A fishway is also required at Milo, to give access to the salmon from the Piscataquis to Sebec river. All these streams are capable of being made favorite runs for trout, lake salmon, etc., by furnishing fishways by which they can go and come to lake and stream, back and forth, at will, and would fill all those pretty little river towns with summer boarders. The Kennebec river is still in a state of blockade, by the indifference to the wishes of the citizens of Maine of the alien owners of the Augusta dam. The Grand Jury of Kennebec county found bills of indictment against the putative owners, but as they are not citizens of our State, and the offense with which they are charged is not indictable in Rhode Island, a requisition upon the Governor of the latter State would not be of any effect in causing the surrender of the offenders. The residents on the Kennebec must continue to bear that "Old Man of the Mountain," as did Sinbad, upon their shoulders, until the Legislature grants them relief by the passage of a law that will allow them to proceed against the estate of non-residents. The Commissioners desire to state, that they have in no one instance ever from their personal desire, enforced a fishway upon any mill owner, and to force them upon a community would require an army of Fish Wardens. Nor have the Commissioners such powers as they should have. In cases of infractions of the fish laws, they can only act as any other citizens, and call upon the Fish Wardens to prosecute.

In concluding their Report the Commissioners speak thus pertinently on the subject of protection:—

"Let us take hold of this matter in earnest. Let the worthless lout who now nets our ponds and streams to obtain the means to prolong a drunken, dishonest, worthless life, be consigned to the shoe pegging or broom department of our county prisons. A severe penalty should be inflicted for netting our fresh water ponds and streams. The carrier should be severely punished, as well as the purchaser, for they incite and instigate the poacher. The carrier makes a double profit, for he speculates on the contraband rum with which he pays for the fish. Let it be an element in all our fishing laws that the possession of any fish during the close-time of that fish, shall be prima facie evidence that the possessor killed the fish, without regard to the place where killed. This will prevent poaching and stealing in the neighboring States and Provinces, and tend to destroy the wandering class of vagabonds, who vary their occupation by horse stealing and robbery."

The Report contains a valuable appendix, showing the operations of Mr. Atkins at Grand Lake Stream. From it we gather that one million eight hundred and twenty-five thousand eggs of the Penobscot salmon were forwarded to various places in the States of Maine, Massachusetts, Rhode Island, Connecticut, New York, Pennsylvania, Maryland, Ohio, Illinois, Wisconsin and Iowa. In every instance the eggs reached their destination in good condition, and better than ordinary success attended their hatching. Of the eggs of the Schoodic or Land-locked salmon there were taken, and to be divided nine hundred and thirty-three thousand five hundred. Of these the streams quota of one-fourth, or something in excess of that number, were hatched, and about two hundred and fifty thousand young fish were placed in the stream and in Grand Lake near its outlet. Under the patronage of the United States Commissioner, and those of Massachusetts and Connecticut, another seasons work has been begun at Grand Lake stream, with a new hatching house and proper appliances.

We are indebted to Commissioner E. M. Stilwell for an early copy of the Report.

AMERICAN FISH CULTURISTS ASSOCIATION.—The sixth annual meeting of the American Fish Culturists' Association will take place at the New York Aquarium, corner Thirty-fifth street and Broadway, on Wednesday and Thursday, February 14th and 15th, A. D. 1877. The place chosen to hold the meeting is propitious, as affording each member of the Association an opportunity of witnessing the finest collection of fishes in America, besides seeing the artificial propagation of fish as practiced by our most eminent fish culturists. It is hoped that each member will be present on this occasion, contributing in all ways to make the Association a success.

M. C. EDMUNDS, Secretary.

The Fish Culturists' Association is to be congratulated upon having a place for its meetings so admirably adapted

for the purpose. Here every appliance is at hand; the fish themselves are present, and any question as to species or distribution can be decided at once. By the bye, the Aquarium has just received a fresh consignment of brook trout, among them one monster which, judging from his length, must exceed six pounds in weight. It is rather unfortunate that the position of the *salmo* tank is such as to deprive it of some measure of attention. The fish it contains are not surpassed in the interest they should receive by any in the building. There is the magnificent Maine salmon, and his brother from the Pacific coast; the beautifully mottled trout of the great lakes, and the *salmo fontinalis* of the brooks. Much, regarding distinction, is to be learned at the trout tank.

ILLINOIS FISH COMMISSIONERS' REPORT.—Chicago, Jan. 15. —We have had the pleasure of examining the first report of W. A. Pratt, State Fish Commissioner for Illinois. The report gives much general information. It shows that during 1875-6 young fish and spawn of salmon breed have been procured from California, from the Penobscot, and other waters, and distributed within our borders, 210,000 in 1875 and 145,000 in 1876, leaving a balance not distributed, 125,000. These fish were mostly distributed in the Fox, Illinois and Rock rivers. There were also in addition to the above, 175,000 spawn given to the Fish Culture Association for various public waters during the past two years. In May, 1875, the State Fish Culture Association asked the Governor to appoint W. A. Pratt a Commissioner to receive in behalf of the General Government the proportion of fish spawn to which Illinois is entitled by Act of Congress, and to hatch and distribute the same, authorizing him also to dispose of enough of the same to defray attendant expenses. This request was granted. Mr. Pratt at once went to work and completed his arrangements; his work has given general satisfaction.

Illinois has 500,000 acres of public waters, every acre, properly stocked, will yield more food than an acre of cultivated land. As yet the Legislature has made no provision for the expense of receiving, hatching and distributing the allotment of Illinois.

A stringent enactment is also needed for the protection of fish in our waters. The laws for the protection of fish in this State are worse than those of game. We are glad to see that people are becoming alive to the necessity of a proper Legislative action in regard to fish culture. Decisive work is needed, as many of our streams are being fast depopulated.

ROVER.

FISH DISTRIBUTION FOR STATE WATERS.—Mr. Seth Green in the following card notifies the public of another opportunity to obtain fish for propagating the waters of the State:—

ROCHESTER, January 13th, 1877.

EDITOR FOREST AND STREAM:—

Parties desiring to procure Brook Trout and Salmon Trout for stocking the waters of this, New York State, can do so by addressing the undersigned, who will send them on, the applicants paying the traveling expenses of a messenger and giving full directions, the route to come, and who to call on for a settlement.

SETH GREEN.

Natural History.

AN AVIAN POET OF THE SEVENTEENTH CENTURY.

EDITOR FOREST AND STREAM:—

I have copied from my Ornithological Journal, for the edification of your readers, the following curious lines, taken from "A Description of America," written in 1671, by Ogilby, an Englishman. It is a poetic enumeration of the birds of the new continent. Here are 33 species mentioned, and all, with two exceptions (namely the "Stare," our Blackbird, and the "Madge," probably our whippoorwill) by names familiar to our ears at the present day. It is especially interesting to find some of the gunners names of to-day dating back upwards of 200 years! Notably the Oldwife (*H. glacialis*), the Sheldrake, (*M. serrator*), the "Dipper" (*B. albeola*), and the "Humility," (probably *S. semipalmata*, willet). Then how aptly descriptive his adjectives are! Quaint and correct.

F. C. BROWNE.

The princely Eagle and the Soaring Hawk
Whom in their unknown ways there's none can chalk,
The Humbird, for some Queen's cage more fit
Than in the vacant wilderness to sit—
The swift winged Swallow, sweeping to and fro
As swift as arrow from Tartarean bow—
The harmonious Thrush, swift Pigeon, Turtle dove
Who to her mate doth ever constant prove—
Turkey, Pheasant, Heathcock, Partridge rare,
The Carrion-tearing Crow, and hurtful Stare—
The long-lived Raven, the ominous Screech Owl,
Who tells, as Old Wives say, disasters fowl—
The drowsy Madge, that leaves her day-loved nest
And loves to roam when day-birds be at rest—
The eel-murdering Heron, greedy Cormorant
That near the creeks in moorish marshes haunt—
The bellowing Bittern, with the long legg'd crane,
Presaging winters hard and dearth of grain—
The silver Swan that tunes her mournful breath
To sing the Dirge of her approaching death—
The tattering Oldwives, and the cackling Geese,
The fearful Gull, that shuns the murdering piece—
The strong wing'd Mallard, and the nimble Teal,
And ill-shap'd Loone with his harsh notes doth squeal—
There Wiggins, Sheldrakes and Humilities,
Snipes, Dippers, Sea larks, in whole millions fies.

SCIENTIFIC NOTES.—The celebrated Paleontologist, Prof. L. de Koninck, of Liege, Belgium, has received a pension from his government after forty-five years of devoted service to science. He has just completed an important memoir on the Carboniferous fossils of Australia, and is about to commence his last great work on the coal measure fossils of Belgium, which is to be illustrated with one hundred and fifty 4to plates. Dr. de Koninck received the Wallaston Medal from the Geological Society of London, about two years ago, and a medal at the Philadelphia Exposition during the past summer, for his valuable contributions to Science.

Prof. Valerien de Moeller, one of the most eminent Geologists of the Russian Empire, and now of the School of Mines, St. Petersburg, is now engaged in preparing a monograph of the Fusulinas, a genus of minute foraminiferous shells, occurring in great numbers in our Carboniferous limestones in the west. He desires all the aid he can get from American collectors.

Mr. J. Schoette, Secretary of the Congress International des Americanistes, which will hold its second session at Luxembourg, 10th and 13th September, 1877, very earnestly desires all our countrymen who feel an interest in the subject of American history, to forward their respective communications at the earliest possible moment, in order to give the Committee time to prepare a short analysis before laying them before the said Congress. The Committee hope America will be largely represented, and that the savants of the New World will furnish at least matter enough for one volume of the *Comptes rendus*.

A HANDSOME PRESENT.—W. W. Judy, a prominent sportsman of St. Louis, Missouri, who it may be remembered had on exhibition in the Maine Building of the late Exposition, a very handsome Kiosk of stuffed birds indigenous to the West, and for which he received the first premium and gold medal, last week formally presented the same to the St. Louis Fair Association. The following extracts from the correspondence will show the purpose of both parties. Mr. Judy states that:—

"In making this present to your already attractive and extensive exhibition, I desire that you furnish suitable quarters for a permanent exhibition, and that I may be allowed to add from time to time any specimens I may want to contribute."

Mr. Judy promises that he will make this collection "the most complete in the country."

Mr. Walsh, the President of the Association, in his acknowledgement of the "magnificent donation of game birds," states that:—

"Suitable quarters on our grounds will be allotted the collection, the cases will be properly labelled with the name of the donor, and it will afford us pleasure to receive such further contributions as your generosity may dictate. This Association has with your contribution the nucleus of a grand museum, which will form an additional unailing attraction. It has been our policy in purchasing animals and birds, to purchase only such as we would be compelled to buy under any circumstances, from the fact that they came from foreign countries, and to rely in a great measure for American wild birds and animals upon the generosity of public spirited citizens."

This Association expended for improvements and in adding to their collections, for the year ending December 1st, 1876, about \$166,000.

THE LITTLE AUK.—Mr. Thomas J. Farron, of Newport, R. I., sends us a bird which he says was shot on the Seaconet river. It was a very swift flying bird. Has never seen or heard of anything similar in these parts before. Requests its name, and if it is found in the locality named. We reply that the bird is the Little Auk or Doykie, *Mergulus alle*, a northern species, which in winter is not uncommon along the coast as far south as New Jersey. It has even been reported from Florida by Mr. Maynard.

THE SHRIKE.

INDIANAPOLIS, Dec. 30th, 1876.

EDITOR FOREST AND STREAM:—

In your issue of 21st Dec. "Buckshot," of Tiffin, Ohio, inquires the name of the bird that visited his corn shocks and carried away the mice. You thought it a blue jay; but your "Ornithological friend at your elbow" was right in supposing it a shrike. This latter bird is also known in the northwest as the "meat hawk." I have known him to come right into camp and take bits of fresh meat lying about the fire. He is often called a jay by the unobserving in the pineries. I have met with him at Selkirk Settlement on the north, and in Brevard county, Florida, where he helps himself to young birds. In the tail feathers of this bird a casual observer might think there was a resemblance to the jay, but he is marked more like the southern mockingbird. In his flight no one need be mistaken; for it is with the same *ricochet* motion of the yellow hammer or the thistle bird—a rapid bounding billow sort of style.

In the winter of 1860 one of those fellows perched himself upon an elm tree three hundred yards away from where I was husking corn. When the shock was torn down and a mouse started out the shrike was upon it with the swiftness of an arrow, bearing it away to the elm tree where the victim was stuck into a fork of the limb. In this manner the butcher bore off and stuck away several morsels for a future meal. When relating this to a friend he said that he had seen "the work of a more scientific shrike, which carried its mice to a honey locust tree and pinned them to the thorns."

J. F.

[Of course our identification of the bird was doubtful as we had nothing to go by but Buckshot's very meagre description. There is no question about the fact that the shrike puts away his food, not only mice but birds and insects, in the manner described. It would be interesting to know what species of mouse the bird mentioned preyed upon. They might get off with a *Hesperomys* but we should think that an *Arvicola* would be too heavy to be carried far.

Since writing the above we have heard from our Tiffin correspondent, who says that the bird to which he referred was not a blue jay. It is quite certain that the mouser was a shrike, probably *Collurio borealis*. Apropos of the boldness of this bird in coming into camp as instanced by our correspondent above, is the startling impudence displayed by the Canada jay *Perisoreus canadensis* and his Rocky Mountain cousin var. *capitalis*. While in camp among the mountains of Montana we have always had our attention called to these birds, which take their station in the trees a

few feet above the traveler's head and remain in camp until after it is deserted. We have seen one of these Gray jays alight at the feet of a man who was dressing a deer and pick up the scraps which fell from his knife.—Ed.]

THE BIRDS OF WYOMING.

BY COL. A. S. BRACKETT, U. S. A.

The following is a partial list of birds found in South-eastern Wyoming, which has been carefully prepared by Col. A. G. Brackett, U. S. Army. The list is not complete, but is made up of birds which have been taken at different times by the Colonel and his friends. In that portion of the Rocky Mountain region where he is stationed many birds come in the spring and summer to rear their young ones, while in winter the alpine species descend to the lowlands to escape the severe cold and to procure food. The dates given are those on which the birds were taken or seen:—

- February 20th, 1875.—Horned sky Lark, *Eremophila alpestris*. Remains all winter near Fort Sanders, where it is called the snow bird. Hundreds of them are often seen together.
- March 16th—Gray-crowned Finch, *Leucosticte tephrocotis*, from Fort Fred Steele, Wyoming. A rare and beautiful snow bird.
- March 16th—Gray-crowned Finch, *Leucosticte tephrocotis*, var. *Littoralis*. Fort Fred Steele. See Bulletin No. 2, second series of Geological and Geographical Survey of the Territories.
- March 20th—Oregon Snow bird, *Junco oregonus*, at Fort Sanders.
- April 3d—Pintail or Sprigtail Duck, *Drallia acuta*.
- April 3d—Wild Goose, *Branta canadensis*.
- April 9th—Green-winged Teal, *Querquedula corollinensis*.
- April 12—Sparrow Hawk, *Falco sparverius*.
- April 12th—Scaup Duck, *Fuligula marila*.
- April 12th—Black or dusky Duck, *Anas obscurus*.
- April 13th—Red-headed Duck, or Pochard, *Fuligula ferina*.
- April 15th—Killdeer Plover, *Agialitis vociferus*.
- April 15th—California Squirrel Hawk, *Archibuteo ferrugineus*. Very common near Fort Sanders, where it finds an abundance of prairie go-pers and prairie dogs.
- April 15th—Widgeon, or Bald pate Duck, *Mareca americana*.
- April 16th—Grass Finch, or Bay-winged Bunting, *Pooecetes gramineus*.
- April 17th—Goosander, Sheldrake, Fish Duck, *Mergus americanus*.
- April 17th—Golden-eyed Duck, or Whistle Wing, *Bucephala albeola*. Found on Laramie river.
- April 18th—Wilson's Snipe, American Snipe, *Gallinago Wilsonii*.
- April 15th—Mallard Duck, *Anas boschas*.
- April 21st—Ruddy Duck, *Eristmatura rubida*.
- April 20th—Telltale, or Stone Snipe, *Totanus melanoleuca*.
- April 21st—Buff-breasted Sandpiper, *Tryngites rufescens*.
- April 21st—Mountain plover, *Aegialitis montanus*.
- April 21st—American Avocet, *Recurvirostra americana*. This graceful bird was killed by First Lieutenant W. P. Clark, on Hutton's Lake, about eight miles from Fort Sanders. They breed in the mountains near by, where there are some handsome lakes.
- April 23d—Bittern, or Stake Driver, *Botaurus minor*.
- April 25th—Red-winged Blackbirds, *Agelaius phoeniceus*. There seems to be no end to the number of blackbirds found in the uplands during the summer months, embracing all the different varieties.
- April 25th—Meadow Lark, *Sturnella magna*.
- April 25th—Solitary Sandpiper, or Tattler, *Totanus solitarius*.
- April 25th—Swainson's Hawk, *Buteo Swainsonii*.
- April 25th—Yellow Shanks, *Totanus flavipes*.
- April 25th—Blue-winged Teal, *Querquedula discors*.
- April 25th—Red-breasted or Cinnamon Teal, *Querquedula cyanoptera*.
- May 5th—Long-billed Curlew, *Numenius longirostris*.
- May 6th—Least Sandpiper, *Tringa minutilla*. Several of these handsome little creatures were found near a pond east of Fort Sanders. Their sprightly ways and neat appearance make them remarkably interesting.
- May 12th—Brewer's Blackbird, Blue-headed Grackle *Scolecophagus cyanocephalus*.
- May 13th—Burrowing Owl, *Spreotyto cunicularia*.
- May 13th—Butcher bird, or White-rumped Srike, *Collurio ludovicianus*, var. *excubitoroides*.
- May 13th—Cliff Swallows, *Petrochelidon lunifrons*.
- May 13th—Blue Heron, *Ardea herodias*.
- May 13th—Californian Vulture—*Cathartes californianus*.

[To be continued.]

[The above list is an extremely interesting one, but there are some points about it which need more extended notice than is given them here. *Anas obscura*, for example, has never, we think, been noticed as far west as the Rocky Mountains before, and we would ask our correspondent whether the bird was identified by himself, or only reported by sportsmen. Unless the former were the case we should be inclined to doubt its occurrence near Sanders. An unskilled observer might easily mistake some other species for this one. The *Pooecetes* mentioned is no doubt var. *confinis*, one of the commonest birds of the plains and foothills. The occurrence of the rare *Tryngites rufescens* is to be noted. *Cathartes californianus* is another species about which we wish to inquire. It has never yet been found east of Arizona, and its occurrence near Fort Sanders, where, of course, *C. aura* is very abundant, would, if authentic, be a most important fact. The consideration of one or two other minor points we must postpone for the present. We shall publish the conclusion of this list next week.—Ed.]

AN ANTLERED DOE.

EDITOR FOREST AND STREAM:—

I have recently had the pleasure of examining a full-grown antlered doe that has on the left side of the head a well-developed horn five inches in length and nearly one inch in diameter at the base. The horn is covered with a thin skin and fine short hair, apparently the same condition that buck's horns are usually in until matured.

The position of the horn on the right side is prominently developed, but no extended growth has taken place. The head and jaws are materially elongated, and skull quite narrow between the eyes and highly developed above the ears. The jaws are fully two inches longer than is usual in animals of her size, which, together with the peculiarly shaped head and single horn, gives her a remarkable appearance.

When discovered she was accompanied by two very large fawns, probably her own, as the udder shows presence of milk and recent sucking. This animal was killed December 2d by a party of gentlemen from this city, Messrs. S. B. and J. Amory and N. Boardman while

on their annual deer hunt in the northern portion of this State near the Menominee river. These gentlemen may well be congratulated on having secured and brought to notice such a rare animal, as it establishes not only the fact that horns are not always mature even in December, and that fawns suckle at that late date, but also that *does have horns*, notwithstanding the experience of all hunters here to the contrary. Even those who have grown gray in the service and claim a record among the hundreds have no story to match it, and silently admit in this case that even in a "deer story" truth may be stronger than fiction. TRIANGLE.

Fond du Lac, Wis.

[In December, 1874, a supposed case of a horned doe was noticed in this journal, but we believe it was never confirmed. We have a very strong impression that there has recently been noticed an authentic instance of this anomaly, but we cannot at the moment tell where it appeared. Our correspondent has our thanks for this interesting information.—Ed.]

ANTELOPE OR PRAIRIE DOG.—It was on the U. P. R. R. The old lady was going to visit her daughter in California, and for the first time in her life was on the "boundless prairie." But her thirst for information was as unlimited as the plains over which she was being whirled. Presently the train stopped at a small station, and the old lady anxious to see everything, puts her head out of the window and looks around. A "yaller" cur trots by. Eagerly the old lady looks at him, and seeing the conductor on the platform screams out to him, "Say! Conductor! Mr. Conductor! is that a prairie dog or an antelope!" She had not read Dr. Coues' works.

Woodland, Farm and Garden.

SPRING FLOWERS.

WE can never have too many of these "gems of earth" that "come before the swallow dares, and takes the winds of March with beauty." They should have a place in every garden however small; they should fringe the lawn and shrubbery borders, and if they peep up here and there on the fresh grassy turf itself, in sheltered nooks and sunny corners, or on outlying portions of the pleasure grounds, so much the better. By the irregular margins of woodland walks or drives and in other wild situations they are peculiarly attractive, and a single afternoon in fall spent in dropping a few seeds or planting a few common bulbs in such positions as those indicated will be the means of producing charming glimpses of bright color where otherwise there would be none. Violets, Blue Bells and Wood Anemones may perhaps be naturally plentiful in such places, but this should by no means prevent us from gilding the margins with Crocuses or golden Daffodils. The Dog's-tooth Violet is also very effective. Many of the dwarf and even the taller Irises, Aconites, dwarf Phloxes, Hepaticas, hardy Cyclamens, Sedums, the lovely little Houstonia or Bluets, and its congener the beautiful Claytonia or Spring Beauty, Solomon's Seal, Smilacina and Lily of the Valley, are but a tithe of those flowers which, planted in out-of-the-way corners and nooks, where they are dropped upon unexpectedly, will give an added charm to many a spring ramble.

COOL ORCHIDS.—I am about making a collection of orchids to grow in a cool house; will you kindly name about a dozen of the best sorts for this purpose. They will have a temperature of not less than 50°. J. P.

[You cannot do better than obtain the following cool-growing orchids as a commencement: *Odonto glossum*, *Alexandria*, *O. Nebulosum*, *O. Pescatorei*, *Masdevallia veitchii*, *M. Lindenii*, *Sophronitis grandiflora*, *Oncidium Macranthum* and *O. cucullatum*, *Disa grandiflora*, *Laelia anceps* and *Autumnalis*, *Lycaste Skinnerii* and *Cypripedium insigne*. These will all do well in a moist atmosphere that is not allowed to fall below 50° in severe weather. During hot weather let the thermometer range from 60° to 80°, and give plenty of air night and day. They should never be allowed to get quite dry at the root, and plenty of water should be thrown on the floor during clear frosty weather to keep the atmosphere of the house moist and congenial.—Ed.]

ORCHIDS.—The following is from a valued correspondent:

Of all our native orchids perhaps the most lovely is the *Cypripedium Spectabile*. Though scarcely found in the neighborhood of New York it is tolerably plentiful north of Albany, and quite common in the Western States. Many of your readers may not be aware that it can be forced into bloom quite readily by potting it early in the fall in peat and then treating it something similar to the Hyacinth. It can be had in this way to bloom from March to May, and makes a splendid addition to our plants for spring decoration. The forced plant should be allowed to ripen off gradually through the summer, and when well established can be brought into bloom at any time desired.

BANKING UP CELLAR WALLS.—We marvel that anyone should ever be willing to place a bank of manure against the exterior cellar walls of a dwelling, the odor as well as the appearance of which is not exceedingly attractive. Another common mode is to throw up an embankment of fresh earth, which is not much more ornamental. It may be too late at the present time to apply the protection which we have used with satisfaction, to buildings where a protection of this sort is needed. First, rake up the fallen leaves from under the trees of the door-yard or orchard, and bank them compactly against the wall so as to form a slope about two feet thick at bottom and less above—varying according to the amount of protection required. Then take the trimmings from the evergreen screen, or from other evergreen trees which need shortening into shape,

and place these neatly in an inverted position sloping against the leaves, cutting them just long enough for this purpose. They hold the leaves, add to the protection, and become a positive ornament instead of a disfigurement. They form a beautiful evergreen underpinning.—Country Gentleman.

IOWA STATE HORTICULTURAL SOCIETY.—Oskaloosa, Jan. 19, 1877.—The eleventh annual meeting of the Iowa State Horticultural Society was held at Oskaloosa, Jan. 16th–19th. The meeting was a decided success. The reports of the Secretary and Treasurer showed that the Society was in a prosperous condition, and the display of fruits and plants greatly exceeded that of any former meeting. Probably the most important exhibit was the truly magnificent collection of apples. Any person who saw the display of Iowa fruits at the Centennial can form an idea of the extent and variety of this collection. Mahaska County bears off the palm in regard to apples, the exhibit consisting of about 600 plates. One gentleman in this county, Hon. John N. Dixon, has the largest apple orchard in the State, numbering over 11,000 trees. Until recently it was the prevalent opinion that apples could not be successfully raised in Iowa. This is humorously illustrated by a picture shown at the Hall, representing a Hoosier about to return to Posey County. The two-wheeled wagon, filled with "chips of the old block," is drawn by an ox and a mule, and underneath is inscribed this legend: "Gwine back to Injeanny; these young-uns must have apples and you can't raise them in Iowa." During the meeting, numerous very interesting and valuable papers were read by eminent horticulturalists, and by Professors of the State Agricultural College.

The following officers were elected for the ensuing year: President, H. W. Lathrop, Iowa City; Vice-President, John N. Dixon, Oskaloosa; Secretary, J. L. Budd, Shellsburg; Treasurer, Henry Strohm, Iowa City. W. L. E.

Imantophyllum miniatum.—This is a remarkably fine and free growing plant that makes a good specimen, when well-grown, for room or other indoor decoration. It requires little attention for several months in the depth of winter, and if it be grown freely and is carefully tended in summer, it will stand under a stage without injury, and require but little water. In the spring, if put in a temperature of about 55° at night, it will flower in about three weeks, and if removed to a cool house will last in bloom for a long time. A plant now in bloom in the camellia house with six large flower stems bids fair to last two months in bloom.

Flatbush.

W. B.

SPANISH MELON GROUNDS.—The Melon grounds of Alicante, in the province of Murcia (says a correspondent of the *Times*), are somewhat disappointing. Never would you believe that from those dusty, little-watered plots would come all the wealth of succulent Melons that lie in heaps at every street corner. The Melon grounds look like an English ploughed or fallow field, with a thin carpeting of Vegetable Marrow plants. Yet here and there you see the great, juicy, round fruit, half covered with dust, lying on the cracking earth. All those that were ripe were gathered over night. The Melons are planted in May; in less than a month they begin to bear fruit, and keep on bearing till the commencement of October; they require less water than any of the other plants. The Melon takes, from the time that the white or yellow flower falls off, to the time of plucking, about forty days to arrive at maturity. These Melons are of two kinds—first, the Melon proper, with its yellow, luscious, honeyed fruit, so well known in England; secondly, the Sandia, or Water Melon, grown on the coarsest and most sterile soil, and which is the cheapest fruit in Spain, and the salvation of the thirsty masses. The Sandia weighs from 8 to 25 lbs., and is sold at a farthing or less per pound. Its huge bulk, its hard coarse-looking dark green rind, the rude way in which it is kicked about, would never lead you to believe that it is so justly prized as it is. Every traveler in Spain has been offered a slice of its flesh, that looks like a crimson rock, yet melts in your mouth before you can taste its flavor. On every long, hot, dusty journey, the second-class traveler buys a huge Sandia and offers a slice to his fellow passengers; every *table d'hôte* groans beneath these crimson crags; a lump of this cools the fevered blood; 2 lbs. may be eaten without fear of harm. The growth of the various kinds of Melons is so much in advance of the immediate consumption, although poor and rich alike live almost upon them during two months of the year, that the gardener cuts thousands just before they arrive at maturity and hangs them up for the winter. Half or three-quarters of an acre, as nearly as I could calculate, would produce no less in a favorable season than 400 arrobas of Melons. Each arroba weighs exactly 25 lbs. avoirdupois. Now, at a rough calculation, these 400 arrobas, weighing 10,000 lbs., may be estimated at the value of three farthings per pound, giving 30,000 farthings, which, roughly speaking, is equivalent to about £32. This calculation will give some, although but a slight, idea of the importance of the Melon trade. And, in forming his idea of the wealth of Spanish irrigated ground let my reader remember that four crops annually are raised upon the same plot; and that growing amid Melon or Apricot grounds stand the Peach, the Fig, the Pomegranate, or the Almond tree.

CATALOGUES RECEIVED.—From James Fleming, 67 Nassau street, New York, Fifteenth Annual Catalogue of vegetable and flower seeds, with practical directions for sowing, etc. Brimful of a life's experience.

From Young & Elliott, 12 Courtlandt street, New York, wholesale list of vegetable and flower seeds, ornamental grasses, palm seeds, etc. Very full and complete.

From John S. Bush, Tremont Botanic Garden, New York, Plant Catalogue of many good standard plants, as well as many novelties. Mr. Bush is determined to be second to none in the business one of these days. His list shows great research and care.

RAT FISHING.—A few days ago a *sergent de ville* followed some boys he saw entering one of the sewers in the Rive Gauche, and found them, with their hooks baited with frizzled bacon, seated fishing for rats in the stream. When taken before the Commissaire they deposed that the gloves gave them from 20 to 30 centimes apiece for their catch, to make ladies kid gloves of. When asked his occupation, one of these *pescatori* said he was *un flot*, which, being interpreted, signifieth that he ran to and fro under the blue canvass at one of the theatres to imitate the waves of the sea. This fisher in troubled, and by no means savory waters, however, was by Monsieur le Commissaire committed as a vagabond to the House of Detention.—*Land and Water*.

The Kennel.

THE EDINA KENNEL.—Mr. Sherwood writes us that his or. and white gyp Sue, (1st at St. Louis) out of Murcelliot's Pet, and Morford's Don; also the black and white gyp Polly, out of the Rink gyp and Colburn's Dash, both, on the 5th inst., visited the St. Louis Kennel Club's Rock. On the 11th inst. they sent to Mr. Arnold Burges's Rob Roy their lemon gyfs Faun, and black gyp Nellie. Their pointer gyp Fan has visited Old Phil, and Jule and Sancho have also mated recently.

THE FOREST CITY KENNEL.—Plunket was visited in his new quarters at Cleveland on the 13th inst. by Mr. H. K. Wicks's liver and white gyp Dolly, from Youngstown, Ohio. Rapp was visited on the 12th by J. H. Williams's black and tan gyp Fan, from East Rockport, Ohio. The dogs are attracting a great deal of attention, and will do much to bring up the Ohio stock.

BEAGLES.—Mr. Geo. Pounall, of Christiana, Lancaster county, Pennsylvania, writes us that he has a good strain of beagles from which he has been breeding for the past ten years. His advertisement of puppies for sale will be found in another column. We should like to have a photograph and dimensions of Mr. Pounall's dogs, as pure beagles are very rare.

THE DESTROYERS.—We have received a letter from Mr. C. H. Cone which our space prevents our printing, in which he desires to bear testimony to the efficacy of Steadman's Flea Powder, sold by Holberton & Beemer, in ridding his dogs and kennels of fleas.

A correspondent writes:—

Present indications are that the next Chicago Bench Show will prove a success and the entries much larger than any previous year. Letters have been received from the owners of dogs in various sections of the Union promising to be on hand with their favorites.

[We were informed at Baltimore that the Chicago Bench Show had been abandoned.—Ed.]

—We regret to hear that Mr. W. T. Steel, of Piermont has lost, from pneumonia, his promising Laverack puppy, Pride of the Hudson, by Pride of the Border out of Fairy

—Mr. J. M. B. Rees writes us that he has purchased of W. Humphries his red Irish setter gyp, Belle, the consideration being \$150. But Mr. Rees does not say which Belle he has bought

—Mr. C. S. Keller's (of Washington) white setter gyp Mollie has visited the imported red Irish setter Rock, the property of Gen. Beale, Minister to Austria.

—The fine pointer bitch Dolly, belonging to Allan Dodge, Esq., of Georgetown, D. C., is now visiting the Westminster Kennel Club's imported pointer Sensation.

—Mr. S. C. Magraw, of Colona, Md., has sent his pointer gyp, Heart, to be visited by Mr. Steel's Flake.

A GOOD RETRIEVER.—The Newark *Advertiser* tells the following story, which shows how carefully a well-trained dog will retrieve birds. While not wishing to detract from the merits of the fine pointer in question, we believe that there are hundreds of dogs who would convey live birds in their mouths in an equally delicate manner:—

"Dr. Hunt, of Livingston, has an English pointer dog, which is the admiration of the neighborhood and the terror of tramps. Madam has canary birds. Yesterday morning one of them escaped, and the usual stern chase succeeded. The bird made a long detour, closely followed to her occasional resting places, until nearly an hour had been wasted, while the pursuers had grown six in number—we might say seven, for old Dash had been 'at heel,' and was interested in the result. Suddenly the bird flushed, sailed swiftly across the street, with Dash hard after her. The bird was flying low, all the pursuers trying to call off Dash, but he kept on, made a sudden leap in the air, caught the bird in his mouth, as an Irvington boy would a ball on the fly, and dropped to 'charge.' Of course the bird was eaten up and swallowed? Of course not. Mr. C. W. Harrison ran up, and there was the bird tenderly imprisoned within the capacious jaws of Dash, and the old fellow promptly surrendered 'Dicky' to Mr. Harrison's hands, with hardly more than a ruffled feather. The affair was wonderful in two things—the accuracy of the catch, and the gentle shelter Dash gave the little fugitive in the only spare room he had—his capacious mouth. Where is the border line between reason and instinct?

FASHION IN DOGS.—Parisian journalists have time and energy to bestow some share of attention on the census of dogs. The returns afford a ready means of arriving at the relative favor in which, as compared with last year's, the several breeds are held. The Paris *Journal* very disconcertingly remarks the diminution of patronage accorded to that ancient favorite, the Italian greyhound. Not long ago the ladies of good family were almost exclusively devoted to this particular race.

But all human fashions, even though patronized by aristocratic ladies with sesquipedalian names, are liable to rapid subversion. Moreover, there were grave charges to be alleged against the elegant *leopards*. An extreme stupidity, combined with a not unfrequent disposition to snap, etc. So the greyhounds have almost been discarded and replaced by the comparatively vulgar-looking terriers and *haramese*. And in this connection we would mention Sport—the property of H. H. Hart, Esq., a promising young lawyer of this city—a most beautiful specimen of the diminutive maltese, silken white in coat, with intelligent black eyes which glare like stars from beneath his floating cloud-like coat of silken floss, with ears of lemon, pendant at the head side,

yet beautifully pricked as the little fellow performs his many tricks. In a utilitarian sense his reputation is that of an acute-eared, prompt-voiced, resolute watch dog, with a soul above bribery.

THE KENNEL REGISTER.—The following named dogs have been entered in the Kennel Register since the list was last published:—

SETTERS.			
Storm—Bl. w. and tan;	F. G. Simpson, Owen Sound, Canada.		
Blue Daisy—Blue Belton;	do do		
Dick—Black and tan;	do do		
Ruth—Bl. w. and tan;	do do		
Chance—Red;	H. H. Gilmer, Savannah, Ga.		
Prim	do do		
Tib—Black and tan;	G. H. Bigelow, Natick, Mass.		
Rap II	do Charles Keeler, Washington, D. C.		
Lou	do W. M. Tileston, New York.		
Pilot II—Orange and white;	Charles Keller, Washington, D. C.		
Beauty—Red with white;	Miller Ketchum, Westport, Conn.		
Floss—Orange and white;	M. D. Moore, Fredonia, N. Y.		
Prairie Flower—Black and tan;	Dr. S. Fleet Speir, Brooklyn.		
Sable Cloud	do do		
Leo	do do		
Warwick	do H. Bacon, do		
Victor	do Charles Baker, Unionville, L. I.		
May Queen	do R. O. Gates, Derby, Conn.		
Oberon	do E. S. Sanford, Jr., Brooklyn.		
Romeo	do P. A. Hegeman, do		
Ben	do L. R. Cassard, Baltimore.		
Flirt—Orange and white;	do do		
Trump—Orange and white;	F. H. Niernan, Yazoo City, Miss.		
Netty—Black with white;	H. Myers, Glen Mills, Pa.		
Pansy—Black and tan;	F. L. Gay, Providence, R. I.		
Pride of the Hudson—Liv. and wh.;	W. F. Steele, Piermont, N. Y.		
Stannan—Red;	G. W. Frazier, New Gallilee, Pa.		
Catherine—Red;	B. H. Gillespie, Stamford, Conn.		
Fan—Red;	Edward Ford, New York.		
Grouse—Red;	C. H. Thomas, Duxbury, Mass.		
Kate—Lemon and white;	F. H. Putzman, San Francisco.		
Flash—Orange and white;	C. O. Arnold, Woonsocket, R. I.		
Floss—Orange and white;	E. D. Hemphill, Allentown, Pa.		
Sylph—Lemon and white;	W. G. Ely, Norwich, Conn.		
Speed—Orange and white;	do do		
Albert—Red;	F. H. Hall, Brooklyn.		
Fanny—Red;	R. W. Reid, Brooklyn.		
Gypsy Queen—Red;	S. A. Livingston, East New York.		
Tom—Red and white;	R. W. Reid, Brooklyn.		
Dash—Red and white;	E. B. Rose, Brooklyn.		
Inverness—Black, white and tan;	Jacob Glahn, West Meriden, Conn.		
Shannon—Black;	do do		
Ben Nevis—Black and tan;	do do		
Maggie—Black and tan;	do do		
Jeff—Red;	A. W. Blevans, Newark, N. J.		
Prince—Black and tan;	W. M. Tileston, N. Y.		
Belle—Orange and white;	Chas. E. Coffin, Muirkirk, Md.		
Prize—White with liver;	Wm. Reid, Jr., Boston.		
Procyon—Blue Belton;	C. H. Raymond, New York.		
Lilian—Red;	W. T. W. Ripley, Rutland, Vt.		
Shot—Red	do do		
Rob Boy—Red;	W. G. Edgerton, do		
Nita—Black and tan;	G. W. Beaman, do		
Scrap—Black and tan;	M. G. Everts, do		
Caspar—Red;	S. B. Pettingill, do		
Plunkett II—Red;	Dr. M. Goldsmith, do		
Grouse—Red;	do do		
Di—Red	do do		
Lady Plunkett	do do		
Bess—Red and white;	H. C. Glover, N. Y.		
Marquis—Black and white;	do do		
POINTERS.			
Jack—Liver and white;	Charles L. Austin, Boston.		
Peg—Black and white;	E. C. Alden, Dedham, Mass.		
Tom—Black;	do do		
Centennial—Liver and white;	R. H. Gillespie, Stamford, Conn.		
Countess—	do do		
Ponto—Liver;	C. E. Coffin, Muirkirk, Md.		
Bob—Liver	do do		
Snop—Black;	W. C. Odiorne, Muirkirk, Md.		
Ginger—Liver;	do do		
COCKER SPANIELS.			
Dom—Liver and White;	D. M. Sharpnack, Petroleum, West Va.		
Witch—Liver and white;	F. H. Hoe, Tarrytown, N. Y.		

DOGS IN SMOKING CARS.—A Binghamton correspondent writes as follows: "I have read with considerable interest the different articles in your paper regarding railroad fare on dogs. It seems to me that every sportsman would greatly prefer to have his dog in the car with him, and as most of us ride in the smoking cars while going on a shooting trip, why not have the dog as well as the gun in the same car? No reasonable objection could be urged against it on the part of the railroad authorities, as the dogs would be much more quiet and quite as cleanly as the majority of smoking car passengers. This would relieve every one but the owner of all care and responsibility of the dog, and I think the owner would be only too glad to assume it all.

ONE WHO LOVES HIS DOG.

SANTONINE FOR WORMS.

WITH A CASE.

A correspondent sends us the following case, which will be of great interest to our readers. If our correspondent will pardon us we would suggest that the dog died from too much medicine, and are inclined to think that unless congestion of the lungs was the predisposing cause, which might have been the case, that thirty grains of areca nut and half an ounce of castor oil would have effected a cure, certainly as far as the worms were concerned. Will not some other correspondent give us his views?

"Dandy, a pure black and tan Gordon setter pup ten weeks old, was taken sick on December 24th with what appeared to be inflammation of the lungs. The symptoms were rapid pulse, hurried breathing and frequent hacking cough. I gave him one drop of tincture of the root of aconite every three hours until all the above symptoms disappeared, which was at the end of twenty-four hours. At that time a profuse diarrhoea set in, the operations being large, of a dark color and accompanied with a great deal of flatulence. This condition continuing, on the second day I prescribed calomel one-fourth of a grain, sugar of lead one-half of a grain, and sulphate of morphine one-sixteenth of a grain. These powders were repeated every three hours. In about thirty-six hours the amount and frequency of the discharges had decreased. At this time his strength was greatly reduced and he refused food. I gave him regularly four times a day either milk or beef essence with a spoon in moderate quantities. On the fourth day, after taking his milk, he vomited, throwing up with the milk four *lumbrici* or round worms. I gave him a grain of calomel, and in three hours ten drops of spirits of turpentine and a desert spoonfull of castor oil. The operation of the oil was scanty and accompanied with the discharge of one worm. His bowels became quiet, and I addressed myself to sustaining the strength of my patient. In twenty-four hours more dysentery set in, characterized by frequent small discharges accompanied with great pain and *tenesmus* or straining. For these symptoms I prescribed

ten drops of laudanum and half a grain of sugar of lead every three hours with an apparent abatement of the disease. At this juncture of the case he vomited another worm five inches long. I then gave him one grain of *santonine* and two grains of sugar of milk, morning and evening, until he had taken three powders, and followed in three hours with a desert spoonfull of castor oil. In about four hours he passed a hard fecal mass about an inch long as large as the end of my thumb, and attached to the extremity of this was a bundle of *lumbrici* which when being uncoiled and counted amounted to fifteen, varying from three to five inches in length; and during the evening of the same day he passed six more. He had two or three small operations after this, and the action of the bowels became quiet, but his strength and vitality were greatly reduced. I now put my patient on milk punch pretty stiff with whisky and small doses of quinine, but he continued to sink and died in thirty-six hours after he discharged the worms and ten days after he was taken sick. I should add that during all the time of his sickness he was carefully blanketed and kept in a warm room.

Autopsy six hours after death: The lungs contained a little mucous, but there was not present any indications of previous inflammation. The stomach contained undigested milk punch. The mucous coat was healthy and thrown into folds. The intestines throughout their entire extent, were empty and contracted, and singularly free from mucous and fecal matter. Not a trace of a worm could be found. The bladder was empty and contracted.

Remarks. Worms are capable of producing symptoms of almost all the diseases to which the human family is heir, hence the great uncertainty of worm symptoms. Indeed, the existence of worms cannot be definitely determined until they are expelled. This great variety of symptoms has given rise to a corresponding discrepancy in the action of remedies administered for worms. I apprehend that the same will hold good in the lower order of animals. In the case above reported there were good reasons to believe that the pup had inflammation of the lungs; then irritation of the upper bowels; then dysentery; the first tangible proof of the existence of worms was when he threw them up. I relied then for their expulsion on calomel, turpentine and oil, which were regarded as orthodox remedies when I was in the practice. They failed. If the *santonine* had been administered then, with as good results as followed its use later, I believe I would have saved my patient.

Santonine is the active crystallized principle of the unexpanded flowers of *Artemisia cina*. It is in the form of white flattened crystals, soluble in water and tasteless. The dose is from one-half to two grains, and may be found in all well assorted apothecaries. It may be administered morning and evening until three or four doses are taken, to be followed by a dose of oil. The dose will depend upon the age of the dog. If the first course is not successful it should be repeated in two or three days. This agent has taken foremost rank as an althematic when any class of worms are suspected, and is in daily use among physicians. I trust that if any one has occasion to use the remedy they will have better success so far as the patient is concerned, and will report the result in the *FOREST AND STREAM*.

BOATHOUSE DESTROYED.—The boathouse of the Dartmouth College Navy, at Hanover, N. H., was destroyed by a heavy gale on the night of the 20th, together with its contained boats, shells and sculls. The loss is estimated from \$2,000 to \$3,000.

For Forest and Stream.

TRIMMING.

THERE are men—generally rather young—who, having made a voyage across the Atlantic, feel themselves qualified to express quite learned opinions upon points, in the discussion of which a certain amount of knowledge of seamanship is necessary. Such men, in their occasional surreptitious confidential chats with "the man at the wheel," have become quite familiar with the terms "lee" and weather "helm," and the fact that "she carries" it because of defective trim also becomes patent. To be sure, in after days, when speaking of such matters, there is a possibility of some confusion; "she" (the vessel) "carries" one or the other because she is "down by the head" or "stern" is certain, but which effect is produced by which cause, may, as Lotta says, be a little mixed in his mind.

The above is personal, and will be resented by one of your readers, with whom I a short time since had a bit of a talk about yachting and boat sailing. He owns a yacht, not a very large one, and he *thinks* that he sails it—the old shellback, who is nominally a sort of mate, I think very likely has a different opinion. My friend is a clever fellow—plenty of money; has run over Europe for three or four years; talks well, I suppose, on horse, dog and gun subjects, and when he speaks of a fine looking horse "steeping up tip-top" finds me in such a deplorable state of ignorance as to his meaning that he has gradually got to think that I don't know much of anything. But the other day we got to talking of fishing, and I had him, at least I thought so, until when I began to tell him of a method of sailing a boat, and without steering gear of any description, working her to windward, or in any other desired direction, he said it "couldn't be done," and when I began to explain how it could he took issue on the very first principle in-

volved, and was so absurdly positive in his views, backed by his experience, that I apparently gave in, but I was not in earnest. Through your columns, shielded by the safe cloak of a *nom de plume*, I shall say my say, and he cannot interrupt me. My friend has made a voyage, and has sailed his yacht, I think once to Martha's Vineyard, but like myself he can be taught a lesson in boat sailing. I thought I knew about all there was to be learned in it. I have sailed cutters with lug sails, gigs with sprits, whale-boats in a sea and breeze, when close reef and a long steering oar were necessary—sampans, felluccas, catamarans, foonags, sloops, schooners, brigs, barks and ships, tugs of eighty tons and side-wheel steamers of a thousand, but I had yet to learn how to manage a boat, under all circumstance by simple alteration of her trim. I learned it of my boatman, Albert Stevens by name, one of a race of boatmen to whom all of the secrets of bass fishing—on Ontario are unfolded.

Throughout the day, while simply rowing and trolling, Albert wasn't particular where I or he or our luggage was placed in his trim little boat; but when toward evening we would prepare for a homeward start, with fifty or sixty pounds of bass, filling a box in the morning empty; an uncertain number of pounds of pork, potatoes, bottled tea, coffee and lager had been removed from a basket in the bow to one farther aft he became, I thought, "fussy," arranging the various parcels, himself, myself, minnow pail, jugs and anchor with a care that indicated that he thought that something depended upon it, and something did. With a little spritsail—big for the boat—substituted for his starboard arms, our progress homeward in a fresh breeze became another matter from the slow, monotonous trolling stroke. With his work apparently over for the day, Albert would make fast his sheet, so fitted that it was all right for either tack, like a cat boat's, and seating himself on the midship thwart, back forward, apparently pay no further attention to the doings of his little boat, but occupy himself putting away the miscellaneous collection of divers spoons, flies, hooks, gaffs, lines, polishing rags, files, etc., etc., which in a day's fishing for varieties of fish become scattered about a boat. Presently we would approach the shore; without looking ahead Albert would lean back as though tired, or perhaps shift the minnow pail a few feet forward; obeying the signal like an intelligent creature the little boat would luff, pass the wind; then replacing the pail (which he had pretended to have simply moved for convenience of changing the water) abaft the thwart, and resuming his former position, she would fall off, gather headway, come up, and start away on her new course. This manœuvre was managed so skillfully that at first I was puzzled enough at seeing a boat thus tack itself, that simple leaning over to the lee bow to change the water on the minnows was so natural a performance as to attract no attention. Nor did I at first see this connection between his movements and their effect. As we neared the wharf—on the wind—he had every landmark "down fine," and did not need to look ahead to know where we were or where we were going. Stepping into the stern sheets to hand me my arranged gear, and was natural enough, and a slight slacking of the sheet, not noticed by me as I received the traps, then stepping forward and gathering in he let go his sheet and stepped to the foot of the mast and gathered up his sail. The boat had responded to the slight alteration, keeping off a bit and increasing headway as he handed me my box, luffing as he went forward, and stopping in the wind's eye as he furled the sail, snug alongside the wharf, on which I stepped, convinced that I had learned a wrinkle in boat sailing.

Of course it's simple enough theoretically, but if anyone who has made displacement and trimming ships a study thinks that he can thus manage a boat, by judgment alone, he may, as I did, find himself mistaken on trial.

PISCO.

[The oystermen of Fair Haven, Ct, have a sprit-sail, schooner-rigged craft called a "sharpie," which they work with great facility by trimming. It is a delight to watch them, as we have done since early childhood.—ED.]

New Publications.

THE LAND BIRDS AND GAME BIRDS OF NEW ENGLAND.—By H. D. Minot, Salem Naturalist's Agency, 1874, 8 VO. pp., XVI. 456 cuts.

This new claimant upon the favor of ornithologists and those desiring to become so is likely to win for itself an enviable position as a work of scientific merit well adapted for popular reading. Too many of our treatises secure scientific precision and technical purity only at the sacrifice of those qualities which render a treatise attractive and enterprising. The newest student need not fear that Mr. Minot's work will be beyond him, and need not hesitate to trust it implicitly; while the advanced scholar or worker will find a store of information nowhere more conveniently accessible. The character arrangement and price of the work bring it within the reach of all for easy, every day reference, while for every sincere lover of birds, Mr. Minot's fresh and breezy narratives, smelling of the wild woods and pastures green, will have an irresistible charm. Such a work makes and fills a niche for itself, and specially recommends itself to farmers, sportsmen, and others whose daily life is in contact with the birds here accurately described. The work is of a thoroughly original character, based upon the personal experience of one to whom its preparation has been a labor of love, and who has proved himself an ardent and successful collector of this delightful branch of Natural History. It possesses several novel features, such as its practical information for beginners on the formation of egg-cabinets, an ornithological calendar for the entire year, and artificial "keys" to the birds and eggs of Massachusetts, by means of which identification of specimens is facilitated without wading through dry and tedious technicalities. The indices of scientific names mark the accent of these foreign words. Something very helpful to the student, which we believe is not given by any other American treatise on birds. The biographies of the birds, especially of the *game* birds, form the most attractive as well as the principal feature of the work, and include accounts of the song, nest, and eggs, as well as of the general habits of the species. This is a work which, in short, we can confidently recommend to our readers as one with which they can not fail to be pleased. It probably gives more for the money than any one now before the public.

Copies of this work will be sent, post paid, on the receipt of three dollars by the Naturalists' Agency, Salem, Mass.

THE ART JOURNAL. New York. D. Appleton & Co.

The prospectus for the current year contains ample assurance that the "Art Journal" is in no danger of being allowed to fall below its present high standard. "The Scenery of the Pacific Railway" will form a feature of the year, and judging from the initial instalment will not be the least of the attractions of the publication. We are glad to learn that the illustrations of art features of the Centennial Exhibition will be continued. Those in the January number are remarkable specimens of drawing and engraving, and we should have regretted their discontinuance. "The Homes of America" will also be continued, and a due share of attention will be paid to the practical arts. Each number will

contain three steel engravings, from works of both ancient and modern artists. In the January number we are presented with "Cleopatra and Caesar" from a painting by Gerome; "Simpletons," from a painting by S. L. Fildes, and a very beautiful representation of Foley's statue of Gen. Jackson. Taking the "Art Journal" as a whole, in beauty of appearance, the artistic nature of its illustrations and in editorial ability we know no similar publication to be compared with it. It is to the fullest extent what it now implies—an Art Journal—and while gratifying the artistic tastes of its readers conveys a vast quantity of information in every branch of art. It should find a place on the parlor table of every cultivated household.

Answers To Correspondents.

No Notice Taken of Anonymous Communications.

W. S., Rouse's Point, New York.—Where can I purchase a good spaniel trained for partridges, duck and land retrieving? Ans. We do not know of any spaniels possessing all these qualifications.

A. J. C., Brooklyn.—Is there any fishing through the ice in either salt or fresh water to be had in the vicinity of New York city, so that one could go and return the same day? Ans. We know of none.

T. H. T., New York.—Will you be kind enough to tell me the best part of the West to go to for farming and cattle raising? Ans. We should recommend Southern Kansas. You can hardly go amiss on the line of the Kansas Pacific Railway.

S. L. H., Menasha, Wis.—Can you give me any information of the Ward-Burton gun, or the address of the manufacturers? Ans. We believe a company has been formed for the manufacture of the Ward-Burton rifle. A letter addressed to the care of the Ladin & Rand Powder Company, would probably reach Mr. Burton.

B. M. S.—Will R. M. S., from page 378 FOREST AND STREAM, try his Dittmar powder against Curtis & Harvey No. 6 in his 38 and 40 calibre rifle at 500 yards, and report the result? There are conditions quite common too, and little understood, under which one powder will shoot higher than another at short range, and lower at long range in the same rifle and with the same bullets.

C. E. T., Petersburg, Ill.—1. My dog in color is black and white, short hair, double nose, short head, medium long ears. I bought him for a pointer. Can you inform me of what breed he is? 2. Will you please inform me where I can buy a greyhound pup? Ans. 1. From your description we should say that your dog was a pointer, but it would be necessary to see him to determine whether he is pure bred or not. 2. We do not know of any greyhound puppies.

W. E. DeL., Chattanooga, Tenn.—Near what towns in Florida is there the best hunting and fishing? Ans. Enterprise, Bronson, Stillmarks, New Smyrna and Charlotte Harbor. What town in Florida would you recommend to open a gun shop in? Ans. No better than Jacksonville for a Sportsmen's Emporium. Is this a good time of the year to go to Florida? Ans. Yes; October would have been better to commence business.

Buz, Cincinnati.—Will a cannon ball fired in a perpendicular line return with the same velocity? If not, why not? If it does, why does it? Ans. A cannon ball will not descend to the ground with the same velocity with which it leaves a cannon's mouth, for the reason that it starts with an initial velocity proportioned to the charge of powder which propels it. On its return journey it has but the attraction of gravitation to bring it down.

J. M. M., New York.—Can a stock owner in the Rangeley Lake Angling Club have their board and boats free? 2. Will a Flobert rifle shoot a 22 cartridge, and will a 22 pistol shoot a Flobert cartridge? Ans. 1. He has the use of boats but pays for his board. 2. Yes; but the cartridge in the first instance must be a rim-fire, and the pistol must be fitted for rim-fire cartridges.

J. M. D., Irwin Station, Pa.—1. Where do J. White & Son manufacture guns? Do they make first-class guns? Would one of their breech-loaders that could be bought here for \$75 be a good gun? 2. Would you call it good or bad shooting for a man with one arm to hit half the shots on the wing? Ans. 1. We do not know of any such makers and therefore cannot speak of the qualities of their guns. 2. Yes, very fair shooting for a man with two arms.

F. H., Oceola, Mo.—I have a No. 12 gauge, 8 pound Parker breech-loader, and in testing it on target shooting I find it to make a very even distribution, with exception of center of target; very few shot in center of target, and even distribution in other parts. Why is this? And secondly what will remedy it? Ans. A gun will sometimes shoot in the manner described, although no cause can be given. It is, in all probability, owing to some peculiarity in the boring. We should suggest sending the barrels to Messrs. Parker Bros., and having them re-bored.

J. H. S., Keene, N. H.—1. What breed of dogs are the best for partridge hunting? Are color and size of consequence? 2. Are dogs of any breed naturally good hunters of partridges? I mean to hunt by treeing and barking. Where can such a dog be had? Ans. Small sized setters make good partridge dogs, but they should be broken on this game. Any color that can be seen plainly will answer, orange and white for instance. Cocker spaniels should make good dogs for treeing partridges, but we do not approve of this mode of shooting.

SENECA, Ithaca.—1. In your issue of November 9th, 1876, you inform W. E. A. that a muzzle-loader can be altered to a breech-loader for from \$20 up to \$50. As I know of no firm that alters guns as cheap as \$20, I would ask to be informed where the job could be done? 2. Is the Weston gun a reliable one, and where is it manufactured? Ans. We were wrong; \$40 would be the minimum price at which it could be done by a responsible party and done well. 3. We have seen cheap English guns marked "Weston," but we do not know of such a maker.

X. Y. Z., Boston.—Can you inform me why pointers are not used more in this section of the country, and who has good ones for sale? Also can you tell me where I can get a trained black pointer, and what the cost would be? Ans. We cannot, except that setters are more fashionable just now. The Westminster Kennel Club, whose present headquarters are at Springfield, Mass., have very fine imported stock. You might get a trained black pointer in the neighborhood of West Meriden, Conn., where there are many of old Phil's and his son Pete's get. Write to G. A. Strong, West Meriden, Conn. You should get a good dog for about \$100.

C. S. McC., Peekskill.—When, where, and by whom was Smuggler bred, and by whom is he now owned? What is his best record? How much ought a good bloodhound to weigh, and how high should he be at the shoulders? Are there many of pure blood in this country? Ans. 1. Smuggler was bred by J. M. Morgan, near Columbus, Ohio, and is now owned by Col. Russell, of Milton, Mass. His record is 2:15½. 2. A bloodhound should weigh about 80 pounds and be 28 to 30 inches high at the shoulders. There may be some pure bred ones in this country, but we do not know them.

E. S. K., Boston.—I have a fine setter 15 months old. Is he of the right age to commence to break, say on snipe this spring? If so, who is there that you can recommend to take his education in hand in Rhode Island? 2. His hair is now, and has been for some months, falling off badly. What will prevent it? Ans. Your setter's education should have commenced much earlier; if he has been yard-broken, however, it is not too late. We cannot recommend breakers, nor do we know of any in Rhode Island. 3. Give your dog a ball of tar the size of a hickory nut three times a week; feed little or no meat, but plenty of oatmeal or mush, and see that the dog is regularly exercised.

H. Q., Philadelphia.—Will you be kind enough to inform me in your next issue what part of Australia would be most suitable for a young man with very little money to settle in, and what business would you advise him to go into, and what is the fare from Philadelphia? Ans. If you are going to Australia the practical information you could obtain on

your arrival at Melbourne or Sydney would be so much more valuable than anything we could give you, that it would be folly to proffer it. Sheep raising is the most profitable pursuit now followed in the colony, and we have heard that Queensland was the section which offered the best inducements. The fare by sailing vessel would be about \$200; by rail and steam via San Francisco about \$300.

D. T. E. Strasburg, Va.—1. What is the make of the revolver that Mr. Lord used at Conlin's Gallery, about three or four weeks since, described in FOREST AND STREAM? 2. Does the size of a ball in a rifle have anything to do with its accuracy and penetration, and in making a longer line shot; if so, which is best for these purposes, a long line shot or point-blank one? and for accuracy and for penetration at long distances, a heavy ball or a light one? Ans. 1. Mr. Lord used a single barreled Stevens pistol, throwing a .22 ball. 2. For long distance shooting the heavy ball is best as permitting heavier charges of powder with less windage.

F. K. G., Jr., Noroton, Conn.—1. Do you consider pigeon shooting a sport that a true sportsman would indulge in? 2. Is No. 6 Orange Lightning powder too coarse for a 12-bore, 28-inch barrel shot gun with a charge of from 3¼ to 4 drs.? 3. What kind of a gun is the Dexter B. L.? Ans. 1. Yes, very many true sportsmen shoot pigeons. 2. We should prefer a size or two finer, as with 28-inch barrels and the charge you mention, a large portion of the powder would not be burned in the gun. 3. There is an English gun called the Dexter, and also a single barreled gun made in this country; which do you mean?

J. H. S., Homosassa, Fla.—I would like to ask what size gun, 8, 9, or 10 bore, you recommend for ducks, to be used almost altogether from a blind, and what pattern such a gun ought to make at 65 yards with No. 4 or 5 shot, 30-inch circle, with such a charge as you would consider a proper one? Give the charge—powder and shot. Ans. A 10-bore by all means, and weighing not less than 10 pounds. Such a gun, with 4½ or 5 drachms powder and 1¼ to 1½ ozs. shot, should make a pattern of from 125 to 150—No. 4 shot at 40 yards; not much more than half this pattern could be expected at 65 yards.

J. L. D., New York.—1. Do you know where I can buy a good squirrel dog near Willimantic, Conn., and what would be a fair price to pay for one? 2. Does it hurt a hunting dog to keep him in the city through the winter? 3. Are Clabrough Bros. considered good gunmakers. 4. Is shellac a good polish for gun stocks? 5. What will take rust out of gun barrels? Ans. 1. We do not, and the price would depend on the qualities of the dog. 2. No, if he is properly fed and exercised. 3. Yes, first-class. 4. Linseed oil is better. 5. It depends upon how badly rusted it is. Sometimes simple benzine will take it out, and again emery and the scratch brush may be necessary.

J. M. J., Harvard.—Which is the best line of steamers to Jacksonville, Fla? What is price of passage? What is the price of board at Alfred Jones's, at Homosassa, and what rod I had better take there? Would there be good quail shooting there in March? Ans. Find choice of steamer in our advertising columns. The direct line from New York to Fernandina is the cheapest—\$30. Others prefer the lines via Charleston or Savannah; fares, \$27.50. Board at Homosassa, \$2. Take a good black bass trolling rod, with reel and spoons; also some extra large bait hooks, and 100 yards of stout braided silk or linen line. March is almost too late for shooting, except for migratory birds.

COUNTRYMAN, Laconia, N. H.—1. What is the address of "Al Fresco"? 2. I am shooting a breech-loader, Lefauchaux action, check grip and fore end, backaction locks, with but little engraving, marked on rib, London fine twist, and on locks, T. Upton. Do you know any maker of that name; if so, what reputation do his guns bear? 3. I understand that quail have been seen and shot in a town six miles south of here. Is it not uncommon to find them so far north as this? Ans. Dr. Charles J. Kenworthy, Jacksonville, Fla. 2. We do not know the maker you mention. 3. It is certainly rather far north for quail to be seen, and is probably to be ascribed to the fact that owing to the extreme mildness of last winter the birds increased greatly in numbers, and consequently scattered over a wider range.

E. H. L., Boston.—I have a small tan terrier dog about six years' old, who has fits. While apparently as well as possible, he is taken by them, falling over backwards or on his side, his limbs stiffening and perfectly helpless, rigid all over. Can you tell me what's the matter and how to prevent them? He is very fat, but has had these attacks for a long time, at intervals? Ans. Your dog is suffering either from epileptic fits or worms, probably the former. Give him one tablespoonful of the following mixture twice daily: Bromide of potash, 1 drachm; water, five ounces, mix. Feed him on oatmeal mixed with beef broth, or rice and milk. A few drops, say 15, of Chlorodyne, given, when consciousness returns will counteract the depressing effect on the nervous system. If worms are suspected a dose of areca nut will remove them.

WATERPROOFING.—In reply to an inquiry in your last week's issue as to the quality of a receipt (taken, I think, from the London *Field*) in rendering boots and shoes waterproof, I should say "it is as old as the Poles," so to speak. It may be found in Col. Hawker's "Instructions to Young Sportsmen." I do not recollect what your formula is, having parted with my copy of FOREST AND STREAM, but the ingredients are the same as in Hawker's. I have tried it in former years, and thought it tended to harden the leather by frequent applications. The use of it once in a while is all that is necessary; it doubtless will act as a preservative, and in conjunction with the more frequent application of equal parts of suet and neatfoot oil, will answer a good purpose.—SENEX.

F. K. P., M. D., Pittsfield, Mass.—I am contemplating a trip to Florida, for about two weeks shooting. Do you know of any one going within a week or two on a similar excursion, whom I could join? Where is the best shooting ground? Ans. We hear of sportsmen going to Florida daily. Possibly some of them may like to correspond with you after noticing your invitation. For quail you can hardly go amiss in Florida, starting from any point on the lines of railway. Ford's, at Rosedale, on the Fernandina and Cedar Keys Railroad, is a good point; so is Bronson, or Cedar Keys. There is also good duck shooting at the latter place. Good bird and deer shooting within six miles of Tallahassee, also at Bronson and near Gainesville. The Indian river is a good place for game and fish in great variety.

C. S. K., Washington, D. C.—1. Please inform me if either of the following named dogs were imported, viz., Maud, by Waddell's Pilot, out of Gypsy, by Rodman's Dash, and would a pup out of Maud, by the imported red Irish setter Don be entitled to compete at bench shows as the progeny of imported stock? 2. What prizes has Dr. Goldsmith's Rap taken at bench shows, and where? What is his color—black and tan, or black, white and tan—and how old is he? 3. Won't you, at some future time, republish Dr. Webb's mode of treating the distemper, for the benefit of numbers of your readers? Ans. 1. As neither sire or dam of Maud were imported she could not be called "progeny of imported dogs." Pil t was by Jarvis's Dick. 2. We do not know that Rap (or Rapp) was ever exhibited for competition at a bench show. He is black and tan, and was whelped in 1874. 3. We shall publish in this or the next issue Dr. Webb's distemper remedy and course of treatment.

INEXPERIENCE, Hagerstown, Md.—1. Never having been on a ducking shore, I am thinking of taking a trip to Currittuck, N. C. How far is it from Norfolk, Va.? 2. What is considered the best season for ducks there, before, or after the 1st of Jan.? To go and stay four or five days, do you think I would have any shooting between the present time and 15th Feb.? 3. What kind of weather is considered the best for duck shooting; cold and windy, or mild and calm? 4. How should I load for ducks? I have a Parker gun 12-bore, one of the first he manufactured, and it is not very thick at the breech; would I run any risk in shooting 4 or 4½ drachms of powder? I now shoot 3 drachms at birds. 5. What size shot is best for ducks? Ans. 1. Knott's Island is about forty miles from Norfolk, and is reached by steamer. 2. The months of November and December are probably the best, but you will get some shooting at the time you mention. 3. Cold and windy, as then the birds are more on the move. 4. You do not give the weight of your gun, but if it exceeds eight pounds, four drachms should not be too much. 5. No. 4.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INOCULATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, JANUARY 25, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

Trade supplied by American News Company.

CHARLES HALLOCK,

Editor and Business Manager.

TO CONTRIBUTORS.—We are overwhelmed with the favors of our contributors,—chiefly miscellaneous sketches—which it will take a long time to print. We crave the indulgence of our friends, and trust they will possess their souls in patience, assuring them that all will appear in due time. We endeavor to acknowledge receipt of articles as soon as read, notifying the writer of acceptance or rejection. We do not return manuscript unless requested to do so.

LOCOMOTIVES FOR AUSTRALIA.—Americans as railroad engineers and bridge builders hold the foremost rank the world over. In South America, and especially in the mountain regions of Chili, their achievements have been wonderful, the Verrugas Viaduct (one pier 252 feet high) being the highest in the world. But at every step among foreign countries Englishmen have disputed their progress. At last, despite this opposition, the British lion is bearded in his own den. We learn through the eminent engineer, W. W. Evans, Esq., that two Rodgers' locomotives are about being shipped for Australia, the first American engines ever sent to that country.

TRIBUTE FROM A NAVAL OFFICER.—An officer in the Navy sends us the following complimentary letter:—

LITTLE FALLS, January 14th.

EDITOR FOREST AND STREAM:—

Yesterday a. m. I arrived home from a trip to Washington, and found that most valuable addition to my library—the bound volume of FOREST AND STREAM. I am delighted with them, and spent all day over Volume 1. I cannot but wonder how there is anything left to write up. At first I thought your field a narrow one, and that but a few men would care for the paper—the small class of real sportsmen; but there is aggregated an amount of information upon almost every subject—enough to supply a whole village, from the Dominie to the gardener—including the ladies, with interesting reading matter for a year.

I have read every number as it came out, but yesterday, turning over leaf by leaf, and stopping to read, when I was attracted. I spent the whole day over the first third of the first volume, and from your answers to correspondents have jotted down at least twenty bits of information, which I considered worth having in the house. Accept my thanks, and believe me, that now I know and realize their value. I'll neither lend nor give away (the same thing) any more of my weekly numbers. **

—In Stock operations the bullseye of the target is very often the target of the Bulls' eyes.

DOES FREEZING PURIFY WATER.

A correspondent calls our attention to an article recently published in these columns, entitled "Salt in its relation to Mankind," in which he takes exception to the statement that "Water in freezing separates from itself all impurities and substances held in solution." He says:—

"I have read a number of opinions, based on scientific investigation, to the contrary.

A little discussion on this subject at this season, when many are engaged in harvesting their ice crop, might be interesting to other readers as well as to myself."

Our correspondent's point is well taken, and we thank him for calling our attention to the matter. The extract quoted is too sweeping, and should be modified to read: "water in freezing separates from itself the greater part of the impurities and substances held in solution, etc." This is shown in many ways, and some of the examples are familiar enough to all of us. If a pan of maple sap is exposed to severe cold, it will freeze almost solid, the ice having a slightly sweetish taste, and the unfrozen residuum at the bottom of the vessel being thick and sweet like syrup. The sweet taste is due to the particles of saccharine matter entangled in the ice during the process of congelation, and perhaps in part to the presence of such particles on the surface of the ice. The same experiment may be tried with cider, or, as remarked in the articles referred to, with salt water, though this last must be exposed to a very low temperature before it will freeze. In every case the result will be the same, namely, concentration of the solution in the unfrozen liquid.

Of course matter held merely in suspension is frozen into the ice, and many of the particles of a solution may be so caught, especially if the freezing takes place rapidly. The idea conveyed by the paragraph referred to, that ice is necessarily pure, is an erroneous one, and we hasten to correct it. It is apparently the water only that freezes, but in its congelation many impurities may be entangled in the ice, and there retained to be set free on the melting of the mass.

The often cited case of icebergs having streams of fresh water running down their sides, has nothing to do with the point under discussion, for icebergs do not consist of frozen sea water, but are masses broken off from the glaciers and ice cliffs of circumpolar regions.

FIELD JOURNALS AS MEDIUMS FOR ADVERTISING.—We expect the thanks of our sporting contemporaries for calling the attention of the commercial public to the fact that in London the leading field journals are preferred by business men as the channels through which to reach the purchasing public. The advertisements of the *Times* and other dailies do not begin to reach the number printed in the journals devoted to field sports and out-of-door pastimes. We find each weekly number of the "Field" for instance, to contain often, in the busy season, twenty-eight four-column pages of small (nonpareil) type, the income from which must be enormous. Indeed we have been semi-officially informed, unless our memory fails us sadly as to figures, that the net profits of that journal reach £50,000 per annum. Each weekly issue of the *British Mail*, whose scope is somewhat wider than the *Field's*, contains forty-eight pages besides supplementary sheets! *Bells Life* and the *Sporting Gazette*, and, indeed, all the kindred papers have a ponderous line of advertising. This choice of the public is of course based upon experience.

In America the people have not yet fully learned the value of the medium we refer to. The impression has prevailed until recently that the circulation of field journals was confined to turfmen, gunners, and anglers, and that they were useful to no other classes of advertisers than those who dealt in sportsmen's specialties. The premises taken are wholly wrong, and their conclusions are based on fallacious reasoning. The advertiser should start from the point that gentlemen of leisure are most apt to be gentlemen of wealth, and buyers, not only of luxuries, but necessities of life. Men's wants multiply with their means, and advertisements of novelties suggest new wants. There is no class of advertising sheet that begins to be scanned with the scrutiny that a field journal is. Papers of this ilk are read in moments of leisure, as a pastime, and read through and thoroughly, and not hastily glanced at for latest news, and thrown aside. They are preserved and filed, and constantly referred to. They are passed from hand to hand; they lie on Club tables, and in Society libraries, so that a 10,000 circulation of a journal of this character is really equal to 50,000 of a daily paper.

Now, if our readers will take the trouble to refer to our own advertising columns, they will see evidences of a growing appreciation of the facts and arguments which we have presented. Our line of advertising patronage is decidedly large and miscellaneous in its variety. At first, the columns contained little else than the advertisements of dealers in guns and fishing tackle. Now, fully one-half of our space is occupied by general advertisers, very few of whom have anything but satisfaction to express for the results of their ventures. We can assure those who hold back from lack of confidence, that they will be astonished at the returns which almost invariably follow.

"Think on these things."

LIGHTING RAILROAD CARS.—That vigorous corporation, the Montclair and Greenwood Lake Railway Company, have just introduced on their road a brilliant light, known as the "mineral sperm," a substance literally non-explosive, and standing the fire test of 300. An evening ride in their cars is a luxury.

THE DISTRIBUTION OF ANIMALS.

NO branch of natural history has been more cultivated of late, and has shown better results, either in number or kind, than that which inquires into the distribution of animals over the earth's surface, and seeks to find out the reasons for their being placed as we find them. The master in this department, in many respects, is Alfred Russell Wallace, who last year was President of the biological section of the British Association, and whose instructive address we have been printing in our Natural History columns. Mr. Wallace has always been a leader in the Darwinian ranks, and has the credit of originating that aspect of it which is known as "natural selection." His "Maylay Archipelago" with its history of the resplendent Paradise birds, attracted much attention upon its appearance three years ago, and Mr. Wallace has just issued an exhaustive work, which has been reprinted by the Harpers, upon the Geographical Distribution of Land Animals. Some of the more remarkable and interesting facts in this volume we wish briefly to indicate.

The object of his studies, Mr. Wallace tells us, "has been to show the important bearing of researches into the natural history of every part of the world upon the study of its past history. An accurate knowledge of any groups of birds or of insects, and of their geographical distribution may enable us to map out the islands and continents of a former epoch—the amount of difference that exists between the animals of adjacent districts being closely related to preceding geological changes." This well shows the scope of the work, and marks out the depth to which his investigations and arguments often carry us, startling us sometimes by the portentous conclusions to which we are led by the irresistible logic of the simplest facts.

The author first shows that all land animals have means of locomotion, are naturally disposed to wander, and that their means of dispersal are limited only by unfavorable climatic conditions, the resistance of enemies, and by such barriers as rivers, arms of the sea, deserts and mountain ranges. But as obstacles these of course vary in their significance according to the animals themselves. Many larger beasts, like the lion, rhinoceros and the oxen, seem to have the ability to go anywhere. But other groups are much more limited. Our gophers and prairie dogs would not extend themselves into a forest country; nor could our pronghorn and the antelopes of South Africa abandon their grassy plains. The open country limits the spread of such as these. On the other hand many groups, such as the lemurs and monkeys, the squirrels, the opossums, the arboreal cats, the sloths and others are so strictly adapted to an arboreal life that the edges of the forest forever limit their range. The camel and gazelle are well off only in the desert, where it would be death for the beaver and otter to venture. Rivers often form the boundary to the range of certain families, and high ranges of mountains, especially those extending north and south, always divide faunas with greater or less precision. This is the case even with birds, whose wings might seem able to bear them anywhere; yet it is found that nearly the same causes which limit the distribution of mammals from their metropolises act similarly upon birds—those which are adapted to forests rarely being found in a plain country, and *vice versa*. Even great rivers, like the Amazon, form boundary lines for many species.

The range of most insects seems to be determined by the presence of their food, and as in many cases this is confined to a single sort of plant, the area over which some species occur is narrow. In respect to terrestrial and fluviatile mollusks, the myriapods, and the like, they are almost entirely dependent upon accidental methods of dispersal—drifting from one shore to another on tree-trunks, having their eggs carried adhering to the feet of birds, etc., so that it is hard to attach much significance to their distribution at present.

The subject of migrations naturally follows, and it is regarded "as an exaggeration of a habit common to all locomotive animals of moving about in search of food." Much evidence is presented to establish the idea that migration is governed by certain intelligible laws, and it is a less mysterious matter than is generally supposed. The night-ingale is taken as a typical migrant, and the account of its annual movements brings out a very interesting bit of history. After describing its annual incursion in spring into the temperate parts of Europe and return to North Africa and Syria across the Mediterranean, Mr. Wallace says: "Migrations of this type probably date back from at least the period when there was continuous land along the route passed over; and it is a suggestive fact that this land connection is known to have existed in recent geological times. Britain was connected with the continent during and probably before the Glacial epoch, and Gibraltar, as well as Sicily and Malta, were also recently united with Africa, as is proved by fossil elephants and other large mammalia found in their caverns, by the comparatively shallow water still existing in this part of the Mediterranean, while the remainder is of oceanic profundity, and by the large amount of identity in the species of land animals still inhabiting the opposite shores of the Mediterranean. The submersion of these two tracts of land, which were, perhaps, of considerable extent, would be a slow process, and from year to year the change might be hardly perceptible. It is easy to see how the migration that had once taken place over continuous land would be kept up, first over lagoons and marshes, then over a narrow channel, and subsequently over a considerable sea, no one generation of birds ever perceiving any difference in the route." Mr. Wallace

dwells in great detail upon the migrations of North American birds, drawing his facts chiefly from the labors of Mr. J. A. Allen, of Cambridge, and tells us that the phenomenon may best be studied on our shores.

It is well known that in Tertiary times all the large animals which now inhabit North Africa, as well as many extinct forms, occurred throughout Southern and Middle Europe, to which no doubt they went every summer, returning in winter to their tropical home. But as the two isthmuses—so to speak—extending like causeways from Africa to Europe, grew narrower and narrower, by slowly sinking beneath the waves, less and less numerous herds would be able to go north of the Mediterranean in summer, and finally, as the land sank out of sight, the great carnivores and ruminants would be cut off from wandering to the northward, leaving behind them, however, a single colony of apes on Gibraltar.

These facts disclose one of the ways in which a knowledge of zoology can help the geologist to confirm the truth of his reading of the record of the rocks, or, by disagreement, make more manifest his errors.

In endeavoring to account for the distribution of animals over the earth's surface "the proportion of land and water, the outlines and distribution of continents; the depth of seas and oceans; the position of islands; the height of, direction and continuity of mountain chains; the position and extent of deserts, lakes and forests; the direction and velocity of ocean currents, as well as of prevalent winds and hurricanes; and lastly the distribution of heat and cold, of rain, and snow and ice, both in their extremes and in their means have all to be considered, not only as they are at present, but also with regard to their permanence."

If the dry land of the globe had from the first been continuous and level, the larger groups would probably have spread all over the world, and divided themselves only in accordance with tropical, temperate and arctic zones; and if such a condition of the earth remained a long time the result would be an almost perfect organic balance, and great stability of average numbers and boundaries. But let this evenness and continuity be broken up by the erection of mountain ranges, the introduction of arms of the sea, the influx of oceans by the subsidence of land, making several smaller continents out of what was before one large one, alteration in the temperature, winds and rainfall would ensue, and animal life be affected in every way. Slowly, to be sure, all these changes have actually taken place in the physical geography of the world, and have produced their effect upon its inhabitants in their structure, relations and distribution. In order, therefore, to understand the present zoological geography of the world it is necessary to study the distribution of its extinct races. This Mr. Wallace has done, and for the first time presents a connected view of the geographical distribution of mammals in Tertiary and Post-Glacial times. This part of the book is of the greatest value and interest, and its evidence, looked at from a purely zoological standpoint, is a wonderful corroboration of the conclusions of geology, and throws a flood of light upon every side of the natural history of animals to day.

The first and most startling fact brought out by this review of the past is the very recent and almost universal change that has taken place in the character of the fauna over the whole globe, since the time when enormous animals of every sort, and in astonishing abundance, roamed over the Tertiary world. Nothing like this revolution, resulting in the disappearance of so many forms, has ever taken place before since the introduction of life upon the globe, and clearly we are now in an exceptional period of the world's history. "We live," says our author, "in a zoologically impoverished world, from which all the highest, and fiercest, and strangest forms have disappeared; and it is, no doubt, a better world for us now they have gone. Yet it is surely a marvellous fact, and one that has hardly been sufficiently dwelt upon, this sudden dying out of so many large mammalia, not in one place only, but over half the land surface of the globe. We cannot but believe that there must have been some physical cause for this great change; and it must have been a cause capable of acting almost simultaneously over large portions of the earth's surface, and one which, as far as the Tertiary period at least is concerned, was of an exceptional character. Such a cause exists in the great and recent change known as the Glacial Epoch."

But space forbids further accounts of this highly interesting and suggestive book, which every thinking man ought to read, not only for the general considerations which have been indicated, but for the dryer facts of the distribution of animals and the vast information with which the two thick volumes are replete, and which is made readily accessible by a copious index.

FREE MARKETS IN BOSTON.—A correspondent as well known as a joker as a good sportsman, sends us the following: "Boston is always alive to reforms. For several years past there has been much controversy over the subject of free markets, to save the profits of the middleman by bringing the producer and consumer near together. That dream is now fully realized, judging from what we saw at the Poultry Exhibition at Music Hall this week. The hens drop their eggs, and the boys pick them up and suck them before they get cold."

—Notwithstanding the loss of 1,000,000 oranges by the late freeze in Florida, the shipment for the season is estimated at one-third more than last year.

GAME PROTECTION.

CONNECTICUT.—A correspondent writes from Fairfield county on the subject of Game Protection and Sportsmen's Clubs as follows:—

I notice a great many statements in your paper of the meetings of different Game and Fish Associations, and a great deal said about making of laws in one State conform to those of others. I am in favor of the protection of both "fin and feather." Now, I ask, take quail; will the same dates for the close season hold good in both Maine and Georgia? In this State I think the law would be improved by making the open season eleven days shorter than the twenty longer that many are now working for. On the 24th of last October I came across a brood of young quail; they were so small that they could not fly a foot; still the law had been off from them four days, and I think that was about the length of time they had been clear of the shell. I wish to speak of woodcock shooting, and a word for certain localities in favor of the summer part of it. I have shot for the last ten years over the same grounds, and when I came here there were some twelve different persons who shot over dogs that I can now call to mind, and I think eight or nine of them shot for market, or were in other words pot hunters, commencing with the cock in July, and keeping it up until January, and in those days a bag of twenty-five was nothing uncommon for one gun; but in the fall, by constant watching, you might get two or three day's of good autumn shooting, but seldom more. When they leave the corn in September they leave, or seem to leave this locality for good. I had thought that it must be owing to the promiscuous slaughter of them in July and August; but how is it to day? According to the last census, a population of twenty-five less, the breeding grounds as great, and perhaps greater than these, and for the past three years I have been over them in the months of July and June, and would find apparently more birds and only three dogs owned in the town that knew the difference between a woodcock and woodchuck. No, pot hunters, the birds have been left undisturbed; if not by law, by mutual consent. We have no fall shooting, and all have become disgusted, and say they are tired of raising birds for Jerseymen to shoot. Now, I say the theory is that if they, the woodcock, are left undisturbed on their breeding grounds, they will, after moulting, return to them, until they are ready to take their southern flight, as regards this section is *perfect bosh*. You will not find one in October where there are twenty in June and July, and that when they commence their southern flight from points north of us, more than for one day they will not wait for us. Oh! if they only knew, we are poor sportsmen at the best, and we only keep a few native stock dogs, 'cause why: we can't afford anything better; but I am afraid the poor birds know that, and they had sooner be used up with the imported stock, and the modern Scott and Grenner, for when we find them on their journey, we bang away until our guns are dirty, and by the time we get cleaned up they are off to the land of "Pride of the Border" and his ilk. On a trip to Litchfield county, in this State, this last fall, the same cry went up. We are tired of raising birds for Jerseymen to shoot. The Rhode Island Game and Fish Association say, that if summer woodcock shooting was not allowed, they would cross America's choicest bird from their list of game for the State. I do not like the hot July and August tramps as well as the cool frosty months, but I do love the juice and a bit of the meat of our choicest bird, hence, as the Fire Drinkers say, a word in favor of Local Option. GRUMBLER.

PENNSYLVANIA.—A correspondent writes from Pottsville, under date of January 8th, as follows: Ten of the most popular sportsmen of this city have organized an Association, entitled "The Sportsmen's Association," with a Constitution and By-laws, duly recorded in the office for recording deeds, etc., in and for the County of Schuylkill. The Association has leased a territory (in this county) of three thousand acres, comprising forest, field and stream, which it purposes stocking with a great variety of the choicest birds and fishes for propagation, the sporting field commencing but a few miles from town, and extending in one unbroken range, of easy access, either by rail, vehicle, or "shanks mare." The territory described is owned by fifteen farmers, the Association paying each farmer \$5 per annum, with privilege to "stock" and "hunt" at their discretion as before stated, and any person or persons caught trespassing upon the property of either of these farmers, with an intent of "trapping" or "shooting" any of the game, shall, upon conviction, pay a penalty of \$5 and costs of arrest, or undergo an imprisonment of thirty days. Half the net proceeds goes to the treasury of the Association, and the other half to the farmer interested. I heartily concur in a movement of this kind, and think it worthy the consideration of the readers of your valuable journal, as a plan of this kind is the only means whereby game can receive proper protection. One poacher on the leased ground has already come to grief this season, and has been fined \$20 for the pleasure of killing one rabbit. DOM PEDRO.

HARRISBURG, Jan. 15th, 1877.

EDITOR FOREST AND STREAM:—

Quail (*Ortyx virginianus*), and which most Pennsylvanians insist upon calling partridge, have been reasonably plentiful throughout this (Dauphin) and neighboring counties the past season; and when the shooting season closed, December 15th, a number of fine coveys were left unmolested; even in some localities where pot-hunters swarm respectable remnants of large flocks were found. The winter has been extremely severe upon poor "Bob White," and in several exposed localities along the Susquehanna river I hear of birds having been found dead in the snow-drifts, having either frozen to death or died of starvation. Quite a number of our farmers, who have manifested annual interest in our favorite bird the past year or two, have erected low sheds or booths at suitable parts of their estates provided with straw, leaves, etc., and which are supplied liberally with grain and seeds. Hundreds of birds will thus be able to survive the rigid winter, and go forth into the fields and meadows in order to breed when the proper season arrives. A well-to-do farmer, residing in the lower end of this county, near the Lancaster line, as-

sured the writer, a day or two since, that a large covey numbering some forty or fifty birds have become quite domesticated since the severe weather has set in, and came regularly to his barnyard, morning and evening, among the cattle for a supply of grain, which they pick up greedily and seemingly without fear.

Messrs. Boker and long, two sportsmen residing in the village of Hummelstown, nine miles east of the Capital, have trapped a large number of birds since the severe snow storms have set in, and in several instances found the "mottled beauties" almost in a starving condition—mere skeletons. These gentlemen have considerable over a hundred under their protection all doing finely.

Apologies of quail, what is your opinion (and your opinion is law among many sportsmen, I take it), about California quail? Will they stand the climate of the middle States? Last fall Messrs. J. D. Cameron, Secretary of War, Jacob R. Ely, Esq., a prominent agriculturalist ex-President of Pennsylvania State Agricultural Society, and Col. James Young, who owns seven of the finest farms in the State, brought home from California, whither they had gone for a few months' recreation, among other curiosities a number of California quail. The pair that Secretary Cameron had were kept in the stable with his fine stud of horses, and were carefully tended by the groom. The female fell a prey to a thieving Maltese cat, and the male died a short time afterward, it was supposed from cold. It may have been, nevertheless, from grief, at the loss of its mate. The bird came into the writer's possession, who had it handsomely mounted, and it now occupies a position under a glass case in the drawing room by the side of a magnificent drake of the wood-duck, prepared by an expert, an Englishman, of Philadelphia. The impression among sportsmen here is that the beautiful California bird is unsuited to the climate. ADUBON.

[We are of the impression that our climate is too severe for California quail, although if even a few could once be acclimated their progeny might survive. This has been done, we hear, in Delaware, and as this is the severest season they have had in that section for many years, if they survive it will be a good test. There is one peculiarity of the California quail which might aid in their preservation. It is their habit to roost in trees instead of on the ground, so that if they were turned out among thick cedars they would not be so likely to be snowed under. If flesh is any indication they are certainly a tougher bird than ours.—ED.]

LANCASTER, Pa., January 15th, 1877.

EDITOR FOREST AND STREAM:—

The heavy snows and intensely cold weather which we have had for some weeks past have killed off many of our birds, and our sportsmen should at once do all in their power to preserve such as have not already perished from the above causes, or been caught by the hawks. This is one of the hardest of seasons for them to live through, and, unless they are cared for now, they will die of hunger, as there is no food they can get at save around the hay-stacks and barn-yards. Our numerous friends of the dog and gun can do this at but very little expense, and surely they would have their reward increased ten-fold next October. In many parts of the country our sportsmen are trapping them alive to preserve through the winter to turn out in the spring, stipulating beforehand with the owners of the lands that a certain number shall be put on their respective farms, for what farmer is there who does not love to have our beautiful little quail on his farm, even though he be no disciple of Nimrod? GEORGIA.

[A season like the present shows the necessity for co-operation and sympathy between farmers and sportsmen. Not that farmers may not be sportsmen also, but we know that many of them have not time to spare from their farm duties to devote to dog and gun. With them, however, to a great extent, rests the fate of the quails this winter, and according as they may assist them with a little food and shelter, or as they may totally neglect them, rests the question of scarcity or abundance for next seasons shooting. Let all Sportsmen's Clubs enroll as many farmers as possible among their number, remitting their dues even, for shooting privileges granted the Club, and they will find that they have taken the right move in the cause of game protection.—ED.]

—Our correspondent, "Al Fresco," writes from Jacksonville, Florida, that he is confident that he can get a stringent Game Law passed by the present Legislature. Nothing can be more desirable than such a consummation. Quail and deer are sold openly, and furnished at all public houses in Florida until the 1st of May. There should be no deer shooting, excepting of bucks, after March 1st, at the very latest. We have aided the efforts of Dr. Kenworthy (Al Fresco) in this direction, to the best of our ability. There are already two or three Game Clubs in Florida, the most prominent originating at New Smyrna, through the influence of our correspondent, Maj. Geo. A. Aldern.

—We understand that a Committee of the Game Protection Society is now engaged in framing a new game law, to be submitted to the Legislature at its next session, and to take effect, if passed, at the expiration of the present law, which will be in September of this year. It is now the universal opinion that the enactment of the present law has been of immense advantage to the country in the protection of its game, and has been the means of saving the moose from utter extermination.

If the Legislature could be induced to continue the restrictive law for two years longer, we think it would be a wise enactment, but failing that, it will be necessary to pass some law, which, while allowing reasonable license in the hunting of these animals, will at the same time guard against the indiscriminate slaughter, which was too prevalent before the passage of the present law. There should be no killing of moose allowed in February or March, for it is in these months, when the snow is deep in the forests, that the greatest slaughter takes place—nor should hunting with dogs be allowed under any circumstances.—Halifax (N. S.) Reporter.

WRECKED ON A CORAL REEF.

EXPERIENCES OF FRED BEVERLY.

WE clip the following from the Bermuda *Royal Gazette* of January 9th. It sufficiently explains what follows:—

"We have just received late numbers of the *FOREST AND STREAM*, a paper published in New York, in the interests—as its name implies—of all lovers of Nature. Its pages, twenty in number, are replete with fresh and entertaining letters of travel and adventure by flood and field, notes on the haunts and seasons of game, sporting events of the week and other matter, making it a complete record of life out of doors for the time being. It has entered upon its fourth year of publication and is now a recognized and leading authority in the United States, upon all matters pertaining to the gun and rod, fish culture and the preservation of game.

"This success, we presume, is due to the ability of the editor-in-chief, Mr. Chas. Hallock, who visited and described the Bermudas some years since, and whose acquaintance we had the pleasure of making.

"The papers were handed us by Mr. Frederick A. Ober, a passenger on board the schooner *F. A. Magee*, which struck upon the western reef some two weeks ago.

"Mr. Ober was en route for the West Indies, under a special commission from the Smithsonian Institution at Washington, to study the Natural history—especially the Ornithology and Archæology—of those islands. As a writer upon natural history, hunting and fishing, Mr. Ober is well and widely known; his letters upon Florida, over the *nom de plume* of 'Fred. Beverly,' having been gathered into book form and published under the title of 'Camp Life in Florida.'

"He is under contract to write an account of his adventures for the *FOREST AND STREAM* in the shape of monthly letters, and his letter from Bermuda will appear shortly.

"The schooner in which he and a friend were passengers, is being repaired at St. Georges, and proceeds on her way as soon as her injuries are made good."

Mr. Ober herein details the account of his perilous voyage:—

"After three days of hurried preparation, we had finally concentrated our widely scattered luggage aboard the schooner. At sunset, Dec. 10th, we had left the shore astern and were rapidly running before a strong northwest wind. The Highlands showed only as a purple cloud, and a bright star twinkled from the summit, as we left the deck and went below at the call to supper. We ate, that night, as prisoners might the night before execution, for we knew that meal would be our last for many hours.

"I cordially hate the ocean. The great, heaving, billowy monster; rapacious as a wolf, merciless as a cannibal, ever devouring men's lives, wrecking their hopes, engulfing fair ships. It is the receptacle of all the filth of the world; the great reservoir of corruption, retaining the offscourings of the earth's surface, and continually evaporating from its filthy bosom the water that falls again to the earth in showers, accumulating to itself all that is bad and corrupt and eliminating the good and pure. Thus do I vent my spleen upon you, old Neptune!—and upon your empire—for you are continually goading me, eternally tossing upon your trident the ships in which I sail, thumping your back against our keels and deluging our decks with your nasty spray. I never ventured a dozen miles from land, that you didn't pick up a dirty sea, causing me misery and pain, and making me generally wretched. Give a fellow a chance; don't drive him to land (as you did us) before he has accomplished two-thirds his voyage.

"I know it is unwise to fling at old Nep., with a thousand miles yet remaining between me and my destination, and expect he will retaliate the very first day I proceed on my voyage again; but I will vent my disgust, if he sinks us. And so the Doctor, (the Doctor is my *compagnon du voyage*) and myself, crept into our bunk (a bunk two feet six inches wide had to serve us both) with a very clear idea of what we were to expect—for I had told him just how old Nep. always treated me and cautioned him not to feel at all afraid. Conscious that I knew the worst to come, I fell asleep and awoke at mid-night with the worst case of seasickness that I ever wrestled with. As for the Doctor, he knew he should die, as it was his first attack. Having had the disease twenty times or more, I knew he would not, and told him so, whereat he waxed exceeding wroth. The wind drew ahead and the waves ran high, and to say that we enjoyed life would be a variation from the truth. I will not detail the weary days and nights in which we fought with winds and calms. On the third day we were in the warm waters of the Gulf Stream, and in its stormy winds, as well.

"Our course was S. S. E., diagonally across the tide of the stream. Storms and rain attended us and the captain and mate sought faithfully, but vainly, an opportunity for 'taking the sun.' But once or twice during six days did he show his face, and then did not linger long enough to do us good.

"The sixth day out had been a day of tedious rolling on a billowy sea, with no wind, the sails shaking and flapping with a violence threatening to tear them away. At night, the breeze freshened and we ran more smoothly, though the waves were very rough.

"For some reason, the Doctor was watchful, continually springing up and going on deck, fearing something, he could not explain what, nor why. From an uneasy sleep, I awoke, about 2 o'clock, and became conscious that something was wrong. The mate and captain were in anxious consultation—had been so all night, the Doctor said. The man at the wheel called, the mate went on deck, and I heard him say something about the light ahead being the light of a schooner, that all the preceding day, had been seen to leeward. Then I fell asleep, to be awakened, an hour later,

by a loud cry "Hard up!" from the captain, and a rumbling, grating noise, like the letting out of chain, and then a shock. They all occurred in the same moment, one after the other, but before the shock came, I was out of my berth, desperately groping for my stockings. Never before had those articles of apparel so successfully eluded my search. Finding that no immediate danger threatened, or seemed to threaten, I calmed myself and leisurely dressed, finishing my toilet, even to buttoning the last button of my boot. During this time the vessel was pounding on the rocks with increased violence; at every thump sending a disagreeable thrill through us, knocking our heads against the ceiling, jarring loose articles from their places and grinding her keel to atoms.

The Doctor had burst in with a wild cry of "She's lost!" had hastily donned his overcoat and disappeared. Where he went, I will soon relate, and show how my turn came to laugh at him, in a most unexpected way. I went on deck, but little could be seen. It was very dark. The captain, clinging to the wheel, was flung, first to port and then to starboard, as the rudder was dashed against the rock. The figures of the men, as they silently walked about, were dimly visible; the white breakers surrounded us, and the wind whistled dismally and threateningly through the shrouds. Far in the distance, burned a light, anon disappearing, a revolving light in a light-house tower, bearing, in its fitful gleams, a strong resemblance to the light displayed from a vessel—for which it had been mistaken.

There was but one place that we could have brought up upon so soon, and that place, Bermuda. We were 80 miles out of our longitude, through the evil working of a defected compass. Instead of quietly pursuing our way to the Tropics, we were hard and fast on one of Bermuda's outlying coral reefs.

Daylight came slowly, the wind increased, and, when day dawned, the waves were crested with foam and the whistle of the wind in the rigging was loud and fierce. Looking landward, we could see the outlines of a beautiful island, green hills, dark valleys and rocky shores. The flag was hoisted, Union down, a signal of distress, and we waited anxiously for some indication of life on shore. Soon a black speck appeared—another and another—until the water seemed fairly alive with boats. Meanwhile, the vessel was pounding heavily; looking over, we could see the white reef, with coral points like iron; to the windward roared the breakers, to leeward, also, breakers; but close under the lee of the vessel the water was smooth, chalky white, floating a fragment of gulf weed, and, at times, a sad sight,—long pieces of the shoe—the timber protecting the vessel's keel. The captain stuck to his post at the wheel, and, just as the more advanced of the boats reached us, the rising tide floated our little craft so that she shot into a basin, over another reef and into a safer resting place. She went ahead perhaps a mile and then the rudder suddenly broke away, her bow came about and she drifted at the mercy of the waves. To let go the anchor and furl the foresail was short work, with our increased force, and we lay, at last, breasting the wind, which was now increasing to a gale.

We were now surrounded by boats, and every boat was full of negroes—not a white man among them. Had we been on the Spanish Main, instead of only 600 miles from New York, I should have thought oftener of my revolver and rifle in the cabin, instead of so carelessly viewing them as they eagerly clambered over the rail. Their faces were not unkindly, and yet there was a look of grasping eagerness in them that indicated the nature of their calling. For they were wreckers, and the motto of a wrecker is, property first, life afterwards. When one of them, in apparent endeavors to aid in disentangling the fore sheets, drew a knife and would have severed them, thus effectually preventing the hoisting of the foresail, and our escape from the reef, I only wondered—my gratitude to them preventing me from realizing the enormity of the offense. And when the mate bellowed out to him to stand back, or he would break his head, I thought him unnecessarily harsh. Subsequent events proved the mate was right, I was wrong, and that, if the threat had been carried into execution, the fellow would have but got his deserts. Giving them all due credit for humane intentions when they are ashore, nevertheless, I cannot but confess that their actions when on board a wrecked vessel are unaccountable save on the ground above set forth. They have been known to board a vessel in distress and cut her rigging to prevent her getting off the reefs, thus making her a prey to them and their agents, increasing their gains in a measure corresponding with the vessel's distress. As we were safely afloat again without assistance, as there was very little water in the hold and nothing to do, our captain engaged but six men (a boat's crew) to remain aboard, while he went ashore to engage the assistance of a tug. Though but six were engaged, over twenty men claimed salvage when the vessel's claims were about to be adjusted.

At breakfast, the steward, who had unconcernedly gone on with his cooking, mentioned a loss of all his cookies, a large plateful of which he had cooked the day before. At mention of this, a gentle blush mantled the Doctor's whiskered cheek, and he confessed that he was the culprit, and had filled his overcoat pockets, with a prudent foresight most commendable, when the vessel struck. Spite of our forlorn situation we had to shout with laughter.

When the noise subsided, the Doctor explained to me: "Just as soon as the vessel struck, I thought of that dreadful experience your brother had, and I resolved that we, if we had to take to the boats, shouldn't go without food. All I could find was those cookies, and I took them." This

explanation sobered me, for a younger brother of mine had, last June, an adventure, the mere thought of which made me shudder. With a mate, he was lost, in an open boat, on the Newfoundland Banks, for eight days. Eight days and nights they wandered without food, surrounded by midnight darkness of impenetrable fog. When discovered, they were so exhausted as to be unable to move, and my brother's companion was delirious, striving to throw himself into the sea. The thought of that dear fellow's peril, made our situation seem as nothing, from contrast.

In the afternoon an opportunity prevented for going ashore. The wind blew a gale, the seas dashed over the deck; but the confinement on board was so irksome, the promise of rest on shore seemed so greatful, that we decided—the Doctor and I—to risk a trip. Eight miles intervened, though the distance looked less than six. The boat, in which were six stout negroes, was brought alongside. Again and again it was dashed against the vessel's side, kept from being shattered only by the extended oars of the crew. Watching our chances we leaped aboard, settled ourselves in the stern sheets and away we went. The dashing, overwhelming waves came over us so often that to enumerate would seem monotonous. As the management of the rudder deprived the crew of one good man, I took the tiller-ropes myself, and, under their guidance, we safely reached shore.

My duty was to avoid the reefs and keep the boat to, when a dangerously big wave approached. Two miles from the vessel they hoisted sail, under which we sped, driving through huge breakers, grating over coral reefs, and taking aboard water almost as fast as it could be bailed out. At last we ran on a reef, the boat careened, and things looked ugly. The sail was furled, the oars resumed, and I again took the helm, as we glided through and over the dangerous reefs. Had the water been calm, we should have admired those beds of coral and sea weed, presenting every hue, from dark green to pearly blue; but we did not care for a close examination, under the circumstances, and my anxious thought was to avoid them.

To the very beach, the waves and wind pursued us, bestowing upon us a parting baptism just before I turned our prow sharp on to the rollers, preparatory to beaching. Notwithstanding our danger, I could not but remark upon the beauty of the shores; we passed secluded bays, sheltered by rocks of fantastic shape; rocks hollowed out into caves, arches and wave-worn pillars. From out the dark green trees peered many a white-roofed cottage. Beautiful, to our eyes, were these little dwellings, hidden in valleys, perched upon rounded hilltops and gleaming over the dark rock, or white sand beach. Tom Moore, who once enjoyed the beauties of this island, aptly pictures them:—

"Along the margin, many a brilliant dome,
White as the palace of a Lapland gnome,
Brightened the wave."

"Running upon the sand, our boat stuck fast; then did the Ethiopians carry us to the shore upon their backs. And thus, just a week from New York, at the close of a stormy Sabbath day, did we land at Somerset, Bermuda Isles, shipwrecked mariners, with all the worldly possessions we expected to save, in our hands. How green the mangroves appeared! I welcomed the prickly peer and Spanish bayonet as old friends; and when our guide conducted us to a little cottage, white, as they all are; low roofed and tiled with stone, as they all are; where oleanders grew in wild luxuriance, pigeon berries hung in orange clusters from waxen leaves, and huge lilies filled the air with their fragrance, the Doctor and I were content—even with the vicissitudes of our ill luck. And the two days we were in Somerset we feasted sumptuously every day, though our hearts smote us, when we remembered our poor shipmates on that leaking wreck, and at night, when the wind roared around the northwest corner of the cottage and dashed the oleanders fitfully against the blinds we would arise and peer anxiously into the darkness; and the earliest dawn would find us climbing the hill, only to see our little schooner safely riding the gale, eight miles off shore.

"The queerest incident of my trip occurred at Somerset. When in Florida, last summer, I had promised a friend, a native of Bermuda, who had not visited the island for fifteen years, that, if I ever saw Bermuda I would call upon his mother. As I never expected to visit these islands I considered myself safe in the promise; but here I was, within three months of that time, wrecked within sight of his mother's house. The day after my arrival, I sought out my friend's house, gladdened the dear old lady's heart with news of her son, and passed a very enjoyable day; visiting the beach on which the famous shells are cast after storms—a beach of creamy sand, strewn with gulf weed, and hemmed in by high cliffs of wave-hollowed rock.

"Were this an account of our stay in Bermuda, I might prolong it many a page, but I shall confine myself to the incidents growing out of our trip, and leave these 'leafy isles' for some other letter. We went to Hamilton by boat, and thence to St. George's, where we met the vessel, which had been towed around by a steam tug to that place, as the only one where she could be drawn out of water for repairs. The morning of our last day on the reef a schooner hove in sight, heading directly for our vessel. With a strong breeze, she drove straight for the reefs; a weak hand seemed to guide her helm, her sails were slack. She struck, raised her bow a minute, then settled into the hollow of a reef. No one appeared above her rail; no boat was launched; her sails tugged vainly at their fastened sheets. A boat put out and boarded her. A dreadful sight met their gaze, stretched upon the deck were men so emaciated that they could hardly walk—they were starving

to death! For ten days they had had nothing but a pound, or so, of flaxseed meal and two rats, with a little slush or refuse grease. The vessel was the "Georgie Staples," from Brunswick, Georgia, for New York, thirty-nine days out. Five times had they approached the coast, every time to be driven back; once when within 200 miles of New York. In despair, the captain shaped his course for Bermuda, and struck the reef, as I have above narrated, without a mouthful of food aboard the vessel.

"Here were sufferings which put ours to shame. I conversed with the captain, afterwards, and he told me that he lay at Brunswick while the yellow fever was raging there; lost one of his crew; was at enormous expense during his stay; finally got away, was driven back, and started again, with the result shown. The account he gave of the sufferings of the little town was pitiful. I could hardly realize that the cheerful, quiet town that I had seen in August, could, in less than a month, be the deserted village he described to me.

"The captain, a Maine man, was cheerful under his heavy misfortunes, and bore himself manfully. A day or two after our vessel was towed away another vessel struck the reef close by, and, yesterday, another, a brig, was reported ashore at the same place.

"When I hear any one disparaging our Government, especially the coast service, I cannot but reflect upon the criminal negligence of the home government of England in allowing such a reef, or system of reefs, to remain without a light-house, light-ship, bell buoy, or even a beacon, to mark their bearings. These reefs are one vast cemetery of noble vessels.

"In St. Georges, when we arrived there, there were twenty distressed vessels in port. The account of the sufferings of the crews would fill a volume. In so short a letter I can not give the particulars of the wrecking business here, as I intended, and must reserve that for future use.

"Our vessel is now repaired and reloaded and we await only a fair wind to sail again on our voyage. When next your hear from me I hope to be a thousand miles nearer the equator. The mail soon closes, thus effectually closing me.

"FRED BEVERLY.

"Hamilton, Bermuda, Jan. 10th, 1877."

Rifle.

REPORT OF INSPECTOR GENERAL OF RIFLE PRACTICE.—Col. Geo. W. Wingate in making his annual report to the Adjutant General mentions that:—

"To the ranges at Creedmoor, Mount Vernon, Oswego, Poughkeepsie, Yonkers, Newburgh, and Rochester have been added during 1876, ranges at Buffalo, Elmira, Auburn, Watertown, Binghamton and Ithaca. These are described at length. Others are contemplated at Albany and several other points. The State has issued twenty-six target slabs to Creedmoor range during the past year to replace those worn out by the practice of the troops during the past three years. This range has been used during 1876 by 8,000 troops under orders, and by nearly 4,000 other individuals. As a rule \$1,500 has been allowed to each division district for the purpose of fitting up and maintaining its ranges, the amount being reduced whenever practicable. The tendency in laying out and constructing rifle ranges has been to make them upon too large and costly scale. From 500 to 600 yards is the utmost distance that is required for military practice. To obtain a longer range than this is difficult and expensive, and the number who desire to shoot at greater distances is always small. Neither is it necessary that they should be exactly level, as inequalities of the ground can be overcome by the erection or firing platforms at a slight expense. Accessibility is of the greatest importance, and is too apt to be disregarded from an erroneous idea of the necessity of having a 1,000 yards range. If not convenient a range will never become popular or the regiment using it likely to have many good shots. If land is high, the right to shoot over it on certain days can generally be secured at a moderate expense.

"The skill displayed by the troops in their practice during the last year has been in proportion to the care devoted to their instruction in their armories during the drill season. The aggregate number reported as practicing in 1876 is 10,687 as against 7,670 in 1875. Of these 5,266, or 50 per cent., qualified in the third class (100 and 150 yards); of these 2,881, or about 54 per cent., qualified in the second class (300 and 400 yards)—a gain of 3.50 per cent. since 1875; the total number qualifying as marksmen was 907 (as against 533 in 1874), being 8.48 per cent. of those shooting. These figures show an average improvement in the infantry of the 1st and 2d Divisions of 5.02, which is equivalent to a gain of 18.17 per cent. In the 2d Division 83 per cent. of those practicing remain in the third class (Dec., 1875, 50 per cent.) In the 1st Division there are but 36 per cent. remaining in the third class (Dec., 1875, 60 per cent.) The new bronze badge is alluded to. Those who qualify as marksmen in the beginning of the season are excused from further practice, but to prevent loss to their regiments they are allowed a credit of twenty-five points each man in their class practice; an increase to thirty-five points is recommended. The annual improvement would have been greater if the sub-calibre rifles ordered for armory practice had been delivered according to contract; but twenty have as yet been delivered. The improvement in regiments from the interior of the State is marked. They obtain a reputation beyond their immediate locality; their ranges are more accessible, business of members less engrossing, and consequently opportunities are better than those of the 1st or 2d Divisions. The result will be that eventually they will as a whole attain a higher average standard of marksmanship. Care must be taken not to make the practice burdensome on the troops. The duties of the rifle inspectors which have been overdone during the past year will be lightened as the company officers become familiar with this branch of their duty. Col. Wingate recommends that hereafter the practice at Creedmoor shall be by regiments; markers to be detailed from another regiment. The number of targets at Creedmoor at the disposal of the National Guard should be increased from fifteen, to twenty or twenty-five. Several aiming tri-

pods should be kept there also for use by men awaiting their turn to fire; prizes should be offered for correct estimates of distance. The great object to be kept in view is not the training of a few skilled marksmen, but the instruction of the entire rank and file. The shooting of the division matches is postponed until too late in the fall. A time prior to the fall meeting at Creedmoor (September) is advised.

"To prevent future disputes in regard to the filing of sights by competitors as well as to improve marksmanship, it is recommended that an established gauge be adopted for the sights of the infantry rifle based upon the most approved models, and that all sights be allowed to be altered so as to conform to that gauge. In this manner the sights would be improved without the cost to the State which would follow an attempt to purchase new ones, while the gauges (which would be in the hands of all range officers) would form a standard which would enable a decision to be made on the spot as to whether a rifle had been improperly tampered with. The recommendation of last year in regard to the sights of the carbine is renewed. Those now in use do not permit of accurate shooting even at the short range at which the carbine is available, as they are placed so high upon the barrel as to carry over at short range."

We regret that the demands upon our space prevent us from printing more than a brief abstract of this voluminous and valuable report.

AN OLD RIFLEMAN ON RIFLE SHOOTING.

PUTNAM, Conn., Jan. 15th, 1877.

EDITOR FOREST AND STREAM:—

Somehow as a sportsman I don't see the utility of shooting at these long ranges. I have shot the rifle for about 40 years, and although my eyes begin to fail and I have to use spectacles, I find these crack shots at Creedmoor ranges don't beat me at a proper distance for all practical purposes, say from 75 to 150 yards, off-hand. Last winter I had a Creedmoor friend with me shooting in Florida, and he often said he only wanted me to show him a deer anywhere within 500 yards, it would be his venison sure. Well, I gave him every chance in the first case, we creeping up to the top of a ridge overlooking a valley (near Orange Dale, in Marion county). I saw two deer within 75 yards quietly lying down. "Now" said I, "Charley, take your time, don't get flustered, they don't see us, be careful. You shoot the buck and when the doe jumps up I'll kill her." Charley fired and the deer jumped to their feet, standing perfectly still. Said I, "Charley, put in another shell and give it to him again." Bang went his rifle and away bounded the buck. The doe stood just half a second too long and received my ball. Says Charley, "What the devil was the reason I didn't kill him?" Oh! said I, "He wants a Creedmoor target." Charley had two more good shots, one at a deer and one at a turkey, before he killed, and said it was one thing to shoot at a target and quite another to kill game.

The sight of a deer or turkey is usually a surprise; they put in an appearance just when and where least expected, and the first view is either the bounding away with erected plume of the deer, or the skulking swift run of the turkey, dodging behind everything for a screen, with no time to take rest or call shots. Thirty or forty years ago we rifle men used to practice in this way: Take three barrel heads and nail them together, then select a hillside where they would roll swiftly down, and at the foot of the hill drive two stakes thirty feet apart, shooting at the wheel while it is going between these stakes. Then stand off 50 or 75 yards, and if you can hit the wheel near the center most every time you can stand a good chance to kill a deer on the jump between the trees, as they strike into an opening or cross a road. The bounding of the wheel compares with the running of the deer.

One seldom shoots at a deer or turkey at over 100 yards, and usually within 50 yards. Seventy-five yards in the woods seems farther than 150 out on an open field. One old hunter told me he killed a deer over 300 yards; afterwards he showing me just where he stood, I paced it and it was only about 90 paces. I will allow that when one paces his own shots he steps only, say two feet and four inches, and when he paces the shots of others he generally straddles or steps at least three feet and two inches.

G. F. W.

AMERICAN ARMS ABROAD.—The Providence Tool Co. has commenced to complete its contract with the Turkish Government, and are about to put on their usual quota of hands, numbering 1,800, distributing thereby \$100,000 monthly for help and materials. It is well known that the Ottoman exchequer has been much depleted, and until the Sultan could settle little differences over here, he could not expect any more Martini-Henry rifles from this quarter. The threatened war has caused an imperative demand for the balance of the original contract for 600,000 pieces, of which there are yet to be delivered 325,000 guns. The gold having been forthcoming the Company has entered upon its labors with renewed vigor, with the double assurance that in future no such contingencies shall arise again.

CONLIN'S GALLERY.—Most of the best gallery shooting on record has been made at Conlin's Gallery, 930 Broadway. Mr. Conlin now offers an elegant gold badge to each person who can excel any of the following scores of the various styles of shooting. They are the best ever made in the various galleries:

RIFLE SHOOTING, OFF-HAND, DISTANCE 110 FEET.

L. V. Sone, 10 consecutive bulls eyes, 200 yards, Creedmoor reduced target; Charles A. Cheever, 144 out of a possible 150, 200 yards, Creedmoor reduced target; J. B. Blydenburgh, 97 points in 15 shots, cartons counted; L. V. Sone, 10 shots measuring 4.6 8 inches from centre of bulls eye; W. E. Bliss, 4 swinging pipes out of 5 shots.

RIFLE SHOOTING, OFF-HAND, DISTANCE 75 FEET.

W. B. Farwell, 20 shots measuring 7.7-8 inches; G. W. Hamilton, 11 consecutive bullets (size, old-fashioned musket balls); Wm. Hayes, 175 consecutive bulls eyes (3 inches diameter); Gen. W. E. Strong, 60 consecutive bells at word; Wilson MacDonald, 41 bells out of 45 shots at word "one;" Charles A. Cheever hit 26 pipes out of 30 shots.

PISTOL SHOOTING.

Frank Lord, 10 shots, 60 feet, measuring 11.7-16 inches; L. Livingstone, 6 shots, Colt's revolver, 60 feet, measuring 10 1/2 inches; H. Baraquanth, 60 feet, 15 shots, measuring

15.11-16 inches; J. T. B. Collins, 60 feet, 20 shots, measuring 17.7-16 inches; Frank Lord, 60 feet, 4 bullets out of 8 shots; Pemberton La Grand, 60 feet, duelling pistol, 8 bulls eyes in 10 shots; Frank Lord, 12 paces, 2 caps out of 3 shots (common musket caps), 46 out of possible 50.

Game Bag and Gun.

GAME IN SEASON IN JANUARY.

Hares, brown and gray.

Wild duck, geese, brant, &c.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, and Wild Fowl.

REMARKABLE FLIGHT OF WOODCOCK.—Our correspondent, George A. Boardman, writes that, recently while at Charleston, on his way to Florida, he heard of a wonderful flight of woodcock, more than they had for twenty years. The market was glutted at \$1.50 a dozen, and a bag of 30 to 40 for a half day's shooting was common. The very cold weather has driven them south.

NEW YORK.—*Utica, Jan. 20th.*—Very little shooting has been done in Oneida county this winter, on account of the snow, which is now about 40 inches deep on the average. Most of the ruffed grouse are in the trees; woodcock, though plenty this fall, we have heard nothing of; probably very few remain here now. Deer in the Adirondacks are plenty, as usual, but sportsmen have had no opportunity to get at them; but if we should have a thaw, it would score considerable for the hunters. One of the Beecraft's killed a fine buck with a knife a few weeks ago, and just before was chased by a panther. Ptarmigan have been seen in some of the northern counties, but no reports of any bags are given. Snowy owls never were so plenty, and the taxidermists are reaping a rich harvest of them for the summer trade. A flock of *Parus hudsonicus* were seen near here on the 18th.

"AVIS."

Meacham Lake, Jan. 20.—Winter is fairly with us; we have about two feet and a half of snow, and for the last week intense cold. The deer find it difficult getting about. A very little more snow will oblige them to travel. Partridge have kept under the snow. I have not seen a track since December 28. If there is not a let-up to this severe weather soon they will suffer greatly. The foxes are very busy.

A few days since I discovered a fox on the lake crossing from the Spawning Bed to Green Point. The lake is one mile wide between these two points. I let him get out about mid-way, then called my puppy (Jack), a Scotch Retriever, nine months old. I ran out with him till he saw the fox, then I fired a shot in front of the fox, when he turned to back-track; the pup instantly scented; they were about forty rods apart; each did his best, but the pup caught the fox when he was within thirty feet of shore. There was just snow enough to give them good footing, and it was certainly a fine race. Many of your readers will understand the situation, and some, no doubt, will remember the dog, as one of them when here asked me why I kept such an ugly pup. But he is not ugly now, and shows good points and will hunt anything.

I have had no mail since November 25, but expect some New York papers this week.

A. R. FULLER.

SOUTH CAROLINA.—*Port Royal, Jan. 14th.*—On the 12th inst. we had a pleasant change to warm weather; the Mercury at 60 to 70° Fahrenheit. I am too much occupied with my grounds to go out shooting. Some parties have had good success lately shooting deer on the Hunting Islands. Mr. Wallace made a notable double shot, securing two with two barrels. The Russian fleet has left us out in the cold, much to the disappointment of those parties who were expecting to profit by its patronage. The great northern cities offer more attractions than Port Royal in its present condition.

C. G. K.

AMERICAN GUNS.

NEW YORK, Jan. 2d.

EDITOR FOREST AND STREAM:—

If not taking up too much of your valuable time and space, I should like to say a word about American guns. I have had considerable experience in American guns, both as a sportsman and as a dealer, and I do not think there is any prejudice one way or the other among buyers. They will take the gun which they consider the cheapest for the money. It matters not to them whether it is English or American. There has been a great improvement of late years in the manufacture of American guns, and there are a hundred sold now where there were five sold ten or fifteen years ago. The great trouble at present, is the want of good sound work. There is no use in making one gun good and the next ten bad. I do not wish to mention names, but I have seen some American guns act very badly while out shooting this fall, and know of some very slovenly work having been done. This must be remedied before American guns can take the place of the English. In rifles it is a different matter, there we seem to be ahead. Judging from what I have seen of American work during this past year, I believe that in five years from now, the American guns will drive the foreign makers out of the market. But even now the fine locks, barrels and stocks are imported.

W. HOLBERTON.

BENDING GUN STOCKS.—A correspondent writes us from Stanford, Ky., on this subject as follows:—

"As a suggestion to W. H. C., of Attleboro, in reference to having the stock of his shot gun dropped, I state that an accomplished gunsmith dropped mine by sawing through the 'checker work,' and then gluing. The neatness of the job defies closest inspection, and the strength is not impaired. The stock being too short was lengthened by a piece glued to the but."

J. T. B.

We can not agree with our correspondent. If a gun stock is sawed through it never can be glued together again as tight as it was before the wood was cut into. Besides a drop of an inch can be obtained by steaming, and we have known of one being bent an inch and a half by this process.

—Beavers are again becoming abundant in the western parts of Nova Scotia.

—Journal of Commerce.

MAINE.—The State authorities have paid a bounty of \$5 each on 549 bears killed in the State during the year. Washington county, as usual "bears" off the palm in numbers, reporting nearly 100 killed. A bad year for bears but a good one for trappers.—ROAMER.

For Forest and Stream.

TRAPPING ON FLAG LAKE.

While waiting until after the holidays for a canoe trip to some of the good trapping country down toward the Tallahatchee, our friend Joe M. Lindley, and self, concluded to set out a few traps in Flag lake, a small body of water in which are many flags and numerous hollow cypress trees. We found a small bateau which, after corking up the cracks with cotton, answered well our end to cross and go up and down the lake to set the traps. Finding one large hollow cypress with a great mass of sticks, mud, and flags heaped around the base, we knew it was the home of a small colony of beaver. Near by reaching out from the main shore was the top of a fallen cypress, and we could see the late sign where the beaver had been sitting on the limbs eating bark from a fresh cut stick. Cutting a pole we slipped on it the ring of a No. 2 trap, and drove it firmly in the mud, and chopping out a hollow on top of the log set the trap, covering it lightly with old moss. We also set a No. 4 trap at the base of the tree, firmly staked in about eighteen inches of water in a way that the beaver could not in any way wind up when taken. Going to the end of the cypress we found it hollow in about two feet; here we set a No. 1 trap for coon, throwing some ducks wing in beyond the trap, and strewing a few feathers about to attract attention. Getting into our bateaux we followed toward one end of the lake in the direction of an old beaver dam, but from the drought it is now dry. Going up to another fallen cypress we found plenty of fresh otter sign, and accordingly set a No. 2 trap near the end of the log where they come out, and going back toward the bank found a hole cut in the side of the log showing the log to be hollow from end to end with about four inches of water on the inside. Thinking this an excellent place for the otter to play through we set another No. 2 trap, dogging it firmly into the side of the hole, placing the trap just inside in about three inches of water without any cover. We set several more traps, amounting in all to nine No. 2 and five No. 1. We had them set about ten days, catching five beaver, nine coon, four mink, six muskrat, and one opossum, when a sudden freeze came and froze them all nearly up tight except the otter trap in the hollow cypress. The night following the severe freeze there fell about four inches of snow, and that morning on visiting our otter trap we found that it had caught an otter which after jerking and pulling at the trap until nearly morning, had got the dog loosened in the frosty log and gone off trap and all. We tracked

him through the snow nearly half a mile to a point where he went into the river. We shall have to try for another otter, and faster our trap more securely. SHERMAN-BOZNAI.

MINK AND MUSKRAT.

EDITOR FOREST AND STREAM:—

I noticed in the last issue of your paper a communication from Mr. M. A. Howells, Jr., giving a very interesting account of a deadly struggle between a mink and muskrat. A somewhat similar occurrence which came under my observation a few years since may prove of interest to your readers. On the 26th of July, 1872, I was shooting "bay snipe" on a piece of marsh bordering a brackish creek, near the sea coast, in New Hampshire. The day was just breaking, and I was lying quietly ensconced in my "booth" waiting for the commencement of the morning flight, when I noticed a muskrat swimming down the creek past my stand. He was nearly opposite, and within about twenty yards of me, when to my surprise a large mink came leaping down the further bank, and stopping only at the water's edge to gather himself for a spring, launched into the air, and lit directly on the back of the unfortunate muskrat, fastening his teeth almost instantly in his throat. A furious struggle ensued, and for several moments the combatants, rising and disappearing beneath the surface, lashed the water into foam; but the mink never for one instant relaxed his fatal hold, and the poor "rat" soon gave up the life which he had defended against such fearful odds, and floated motionless on the surface. The mink then went energetically to work to tow the body of his victim to the shore, and having dragged it out of the water with much difficulty, disappeared with it in an old stone wall. I should have mentioned that the muskrat was apparently a full grown animal, and looked nearly three times the size of his adversary.

WILLIAM BREWSTER.

Cambridge, Mass., Dec. 23d., 1876.

EDITOR FOREST AND STREAM:—

The theft of a duck by a mink, related by one of your correspondents, reminded me of a story told me years ago by an old trapper of Little Otter, "now with God." He was paddling silently down the stream one day in the fall, in pursuit of ducks, when a "black duck" (dusky duck) arose from the marsh some distance ahead of him with a great flutter, some six or eight feet above the tops of the sedges, and then fell back again. This was repeated several times till Uncle Josh, getting within range, dropped her dead during one of her towerings, and with her a mink; her efforts to escape whose deadly grip having caused her till then, unaccountable struggles.

It is a fact well known to trappers here, that mink prey upon muskrats; and when one considers the superior activity of the mink, especially on land, it does not seem so strange that he overcomes and kills his larger but clumsy victim. By these trappers a bit of muskrat is held to be the most taking bait for a mink trap.

I wish all trappers had the same consideration for the rights of hunters that Mr. Kellogg, who is trapping in Virginia, has. He finds foxes plenty there, but will not trap them, as "he does not wish to interfere with the sport of the huntsmen of the country."

Fox hunting in New England is not at all like fox hunting in Virginia, the nature of the country mostly precluding the possibility of hunting on horseback. Yet, though our style of fox hunting has not the stamp of British authority as "legitimate sport," a large and respectable class of sportsmen here hold it as the best and manliest sport to be had here; immeasurably better in all that constitutes true sport than shooting before hounds the silly hare, harmless alive, and worthless, dead, but which has said stamp. Wherefore should not this sport, beloved of those good men and true, receive the consideration, not of the sneaking fox trappers who prowl about like sharp thieves, caring as little for the good sport they spoil as they do for the good dogs they maim in their traps, if only they get an occasional fox skin worth an almighty dollar and a quarter—but of honorable sportsmen, and above all, of the best paper in America devoted to field sports, which would no more be guilty of giving instructions how to snare grouse or quail or hares, than it would of advertizing a prize fight or an indecent book, but does from time to time publish the most approved methods of trapping foxes! Dous not this wrong any more, O, FOREST AND STREAM! but lift up your voice against those who "in ways that are dark, and by tricks that are vain," take our foxes, yea, our little foxes.

AWAHOOSE.

TRAPPING IN MISSISSIPPI.—A correspondent writes us from Hudson, Mississippi, as follows:—

"There are more trappers in this county this winter than we ever previously encountered, but from the continual cold weather which has lasted now more than a month, with but very few warm days, and the decline in price of furs, we think many of the amateur trappers will not try it here another season. There are generally one or two cold days or nights which are here always followed by three or four, or sometimes a week's weather warm enough to go without an overcoat, and this is the time when the coons, beavers, wild cats, and other animals stir out."

TRAPPING IN THE BLACK HILLS.—Beavers are abundant on Red Water, Upper Rapid creek, Upper Whitewood, Beaver creek, Spring creek and other streams in the Black Hills. They are hunted for their skins, and are caught in traps which are set in their slides. When they slide down from their houses into their dams, they fall an easy prey to the hunter and trapper, and will soon all be killed or driven out of the Hills. A great many persons who have mined all summer have turned trappers this winter.

The otter is also found on the Rapid creek and Red Water; their pelts sell for about \$10 apiece in Yankton. The Upper Red Water is truly the paradise of the hunter and trapper. This region is easily reached from Deadwood City, via the Union Pacific R. R.

CUNNING OF THE FOX.—A Litchfield (Ct.) correspondent writes, January 8th:—

"An article in your last issue about a fox springing a trap with a stick, recalls a similar case in this section. A man who had been troubled by a fox set a trap for him, but the fox would dig under the trap, and having sprung it would devour the bait at his leisure. After a few times, however, the man fastened the bait on the bottom of the trap and set it upside down. The next morning he found he had at last outwitted the cunning marauder."

E. H.

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

SOUTHERN WATERS

Pompano, *Trachinotus carolinus*. Grouper, *Epinephelus nigritus*.
Drum—two species. Family *Sciaenidae*. Trout (black bass) *Centropomus* *undulatus*.
Kingfish, *Menticirrhus nebulosus*. Striped bass or Rockfish, *Morone* *saxatilis*.
Sea Bass, *Sciaenops ocellatus*.
Sheepshead, *Archosargus probatocephalus*. Tailorfish, *Pomatomus saltatrix*.
Snapper, *Lutjanus caxxus*. Black Bass, *Micropterus salmoides*.
M. nigricans.

FISH IN MARKET.—Since our last report was written our fish market has been without material change. Our quotations for the week are as follows:—Striped bass 25 cents per pound; smelts, 18 cents; bluefish, 12½ cents; salmon (frozen), 30 cents; California, 30 cents shad (southern), 40 cents each; Spanish mackerel, 75 cents per pound; white perch, 18 cents; green turtle, 20 cents; terrapin, \$12 to \$24 per dozen; frostfish, 8 cents per pound; halibut, 20 cents; haddock, 8 cents; codfish, 10 cents; blackfish, 15 cents; herring, 6 cents; flounders, 15 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 25 cents; scollops, \$1.75 per gallon; whitefish, 18 cents per pound; pickerel, 18 cents; salmon trout, 18 cents; ciscoes, 12½ cents; hard shell crabs, \$3.50 per 100; soft shell crabs, \$1 per dozen.

—Mr. Holberton (Holberton & Beemer), writes us to state that the "Brainerd clip" used in his fly books, is the invention of Mr. J. James Hyde, well known as one of the best anglers and amateur fly-fishers in this city. We have so stated repeatedly in these columns, in months gone by, but have no objection to keep the fact before the public, who are certainly indebted to Mr. Hyde.

—Messrs. Abbey & Imbrie, of 48 Maiden Lane, are busy filling orders to the Fishing Tackle trade throughout the country, and express themselves well satisfied with the prognostics of business, for the coming season, which promises to be more active than for two years past.

FISHING DISASTERS.—Gloucester, the great fishing port of the United States, is in mourning, and, like Rachel, weeps for her children, and will not be comforted. The present winter has been a terrible one, even to these hardy men who are accustomed to brave the perils of the sea in every form, and the loss of life and property foots up a larger aggregate than in any year since the business was established. Up to date 27 vessels are known to be lost, and the drowned fishermen amount to 212. The vessels aggregate 1,693 tons and were valued at \$150,000. Ninety-eight Gloucester men alone went down in the December gales. No wonder that the town is in mourning, for nearly every family in it has its share in the general disaster.

MOVEMENTS OF THE FISHING FLEET.—The number of fishing arrivals reported the past week has been 21, viz., 2 from the Banks, 12 from LaHave, 4 from Boone Bay, 2 from Fortune Bay, and 1 from Grand Menan. The receipts of fish have been about 3,500 bbls. pickled herring, 200,000 frozen herring in number, 120,000 lbs. fresh halibut, and 250,000 lbs. codfish. The fish market remains firm with an improved demand and an upward tendency in prices.—Cape Ann Advertiser, Jan. 19th.

—A new cod-fishing ground has been discovered on the Labrador coast. The Halifax Chronicle says:—

A long fringe of islands, averaging twenty miles in breadth, runs from Cape Hille to Cape Mugford, and outside of this long archipelago are found the banks and shoals which "form the great autumnal, spring and summer feeding grounds of the cod." Still further out is another line of banks where the fish probably congregate in winter. On the inner bank there are from twenty to forty fathoms of water, and large fish are caught with bait. "The island studded area," says Professor Hind, "forms an immense cod fishing ground which covers between Cape Harrison (Webeck) and Cape Mugford, a boat fishing ground, exclusive of the banks or shoals outside, nearly as large as the combined area of the English and French boat fishing grounds on the chart of Newfoundland."

During the past season some four hundred vessels passed Cape Harrison on their way to the northern fishing grounds, the craft varying between 18 and 90 tons burden, and carrying an aggregate of 3,200 men. The estimated catch was 60 quintals per man, an aggregate of 144,000 quintals for 24 fishing days, the fishery being prosecuted without the aid of bait.

The Cape Ann Advertiser says:—

"These grounds are a continuation of a fishing field long known and occupied. The coast fisheries have been pursued as far north as Sandwich Bay for nearly a century and a quarter, and from Sandwich Bay to Cape Harrison or Webeck, latitude 54.54, for a generation or more. North of Aillik, latitude 55.09, about forty miles from Cape Harrison, Newfoundland fishing craft have occasionally frequented the coast waters for the last fifteen years. The coast here is fringed with a vast multitude of islands, forming a continuous archipelago for a long distance. Outside of the islands, and about fifteen miles seaward from shore, are numerous banks and shoals which form the great autumnal spring and summer feeding grounds of the cod, while outside of the shoals there appears to be a second range of banks which are probably their winter feeding grounds. The island-studded area forms an immense cod fishing ground which covers between Cape Harrison (Webeck) and Cape Mugford, a boat fishing ground, exclusive of the banks or shoals outside, nearly as large as the combined area of the English and French boat fishing grounds on the chart of Newfoundland. These Labrador grounds are peculiarly valuable on account of the perennial supply of food supplied to the cod by the icebergs which strand upon the banks. The fishing season is later than on the Banks, opening at Aillik about the 20th of July and closing October 1st. During the past season some four hundred vessels passed Cape Harrison on their way to the Northern fishing grounds, the craft varying between eighteen and ninety tons burden, and carrying an aggregate of 3,200 men. The estimated catch was sixty

quintals per man, an aggregate of 144,000 quintals for twenty-four fishing days, the fishery being prosecuted without the aid of bait. One vessel of thirty tons, carrying six men and two boats, and which had been fishing about the islands near the missionary station, got three hundred quintals in three weeks of six days each, and had she come a fortnight earlier could have easily secured a catch of eighty quintals per man. Another vessel, a sixty tonner, had in six weeks got sixty quintals per man, and took her cargo to Notre Dame Bay to "make" there. For the proper prosecution of the fishery on these new banks, however, large boats will be required."

MURDOCK LAKE.

St. Louis, Mo., January 13th, 1877.

EDITOR FOREST AND STREAM:—

The last number of FOREST AND STREAM has come to hand, and I have spent an hour most pleasantly, reading its many interesting and varied articles. Among them I note the letter from St. Louis, signed Pedrix, which gives a description of duck shooting on Moredock (or as we denote it, Murdock) Lake. This sheet of water is an old cut-off of the Mississippi river, with both ends entirely stepped up some dry seasons. It is located in Illinois, about twenty-six miles south of this city, and has been for many years a favorite resort of sportsmen. I am confident there is not a more favorable locality in which to indulge in these sports, within many hundred miles of here. The Saint Louis and Murdock Lake Fishing and Shooting Club has been in existence twelve years, have a large, comfortable house on the west bank of the lake, with an average membership of about forty. This year our list already embraces forty members, and we shall soon have a complement of sixty. The Club has leases of the most favored shores for fishing. Our register foots up a catch of over ten thousand black striped (or rock) and white (croppy) bass. Officers for present year, President, D. L. Dickinson; Executive Committee, A. B. Bowman, E. M. Leeds, and Judge L. S. Lanham. DICK.

[Is our correspondent right about the striped bass being caught in Murdock Lake?—Ed.]

LAKE TROUT TAKING THE FLY.

January 8th, 1877.

EDITOR FOREST AND STREAM:—

In your paper of the 21st ult., you relate an incident occurring in your individual experience, of the lake trout taking the fly on the north shore of Lake Superior, Canada, and for the benefit of one of your correspondents who made an inquiry to that effect some time ago, I would say I have seen them take the fly—a large, gaudy, golden pheasant one—on several occasions.

In July and August, 1867, while up on the north coast of Lake Superior, with Messrs. Beatty, Ducharme and Anderson, of Detroit, and Lewis McIntosh, Esq., of Pittsburgh, while on our way one day from Gros Cap to Batchewaughna Bay, Mr. Beatty, who was leisurely casting his fly as we slowly made our way along the shore, had a rise from a large lake trout, and hooking him the boat was stopped to give him an opportunity to bag him. It proved a long and stubborn fight though, for after tiring out Messrs. Beatty and Ducharme, one of our Chippewa half-breeds, Louis Wattup, took the rod, which was a nine and a half ounce trout one, and after he had played the fish for some time, Mr. Beatty, who had in the meantime refreshed himself with a cigar, smiled and took his turn again, and shortly afterward had the game in the boat. On weighing him he was found to pull the scales down at nine and three-quarter pounds. The next day I struck and hooked quite a large one, but after playing him for a short time my gut leader parted and I lost him.

GEORGIA.

SMALL FLIES FOR BLACK BASS.

THE FERGUSON FLIES.

PHILADELPHIA, January 13th, 1877.

EDITOR FOREST AND STREAM:—

Being a constant reader of FOREST AND STREAM, I noticed in your issue December 28th, an interesting article from your correspondent, F. W., Leesburg, Virginia, on "Habits of Black Bass on the Potomac." He mentions the Ferguson and Academy flies as the most killing, and as I tie my own flies, should like to have you post me as to where I can procure a sample of each of the two flies named. I have a goodly variety of all kinds and shades, but am always inclined to experiment on the fancies and the experience of others. I fish for this gamy fish altogether with fly, and in season have excellent sport on our Schuylkill river. Our stream being open and very little wooded along its banks, the fish are wary, but find at times when well on the feed will take most any kind of fly. I fully agree with your correspondent as to a small fly being the most killing. If one would hope for success, he should not tax his patience with the use of large flies. I have taken several bass past season, weighing three and four pounds, on hooks no larger than 6 Limerick.

OCDONIA.

[The flies can be bought of Abbey & Imbrie, 48 Maiden Lane, New York, and of John Krider, corner Walnut and Second streets, Philadelphia. —Ed.]

STRAIGHTENING SNELLS.

ORANGE, N. J., January 19th, 1877.

EDITOR FOREST AND STREAM:—

In your brief notice of Holberton & Beemer's Fly Book, this sentence occurs:—

"The advantage of the Brainerd clip is, that the flies can be carried without bending the gut lengths or snells on which they are tied, thereby obviating the necessity of soaking them in water to straighten them for use."

Why is it ever necessary to soak snells in water to straighten them? I have always found that the most curled and refractory snell can be made as straight as the tip of a fly rod, by two or three passes of ordinary India-rubber. Yours, ever,

J. CLEMENT FRENCH.

[Just so; and the India-rubber chafes and frays and weakens the snells, perhaps inappreciably sometimes, but nevertheless it is better to dispense with its use.—Ed.]

Rational Pastimes.

THE METROPOLITAN RIDING ACADEMY.—Mr. Fred. J. Engelhardt has now got his new enterprise at the American Institute Building fairly under way, and seems likely to attain the success we wished him when noticing his new establishment a few weeks ago.

It was previously pointed out that Mr. Englehardt opened this magnificent establishment in connection with the Central Park Riding School. The advantages of a more spacious track, and greater convenience for exercise, training, and the teaching of horsemanship were the chief inducements to acquire it. The weekly entertainment was planned "to foster and stimulate a taste for health-giving exercises and rational pastimes." There can be little doubt that this object will be gained, and that the academy will soon become a favorite resort both for young people desirous of developing their strength and testing their athletic prowess, and for all who take pleasure in witnessing the contests of the arena, and graceful horsemanship. The entire establishment can only have one effect in a city like New York. The need of such a practice ground has long been felt. It has all the advantages of an out-door course, and although under cover it has, by reason of its unusual size, none of the disadvantages of an in-door gymnasium. The latter in many cases stimulates without adequately gratifying athletic propensities. The academy does both.

Apart from general athletic sports, and looking at the establishment merely as a riding academy, its value is even greater. We do not require to expatiate upon the benefits of equestrian exercise. To be able to ride well is one of the most graceful accomplishments either a lady or a gentleman can possess. The academy offers a track of one-eighth of a mile, open to gentlemen daily for the exercise of their trotting horses, and of sufficient size to permit of steeple-chasing. It is also one of the best resorts for ladies and children. Both horses and riders are taught. The teachers are believed to be the best obtainable, thoroughly competent, skillful and careful. In this, however, as in the case of athletic sports the resources of the place are equal to both the acquisition of knowledge and putting it in practice. These combined advantages it possesses in a degree which can be claimed for no other establishment of which we have any knowledge.

—We are glad to be able to give our friends at the Fourth street Russian Baths a hint. The process and all it includes—the steaming, the plunges, the shower, the douche, and the shampoo—are now no doubt sufficiently pleasant and very invigorating, but there may be other people than Mr. Isaac Vossius of a similar way of thinking. "Many people," he says, "take delight in the rubbing of their limbs, and the combing of their hair; but these exercises would delight much more if the servants at the bath and the barbers were so skillful in this art that they could express any measures with their fingers. I remember that more than once I have fallen into the hands of men of this sort, who could imitate any measure of songs in combing the hair, so as sometimes to express intelligibly, iambs, trochees, dactyls, &c., from whence there arose to me no small delight." Although we have hitherto classed the Russian Bath among the greatest luxuries of life, it is possible that its charms might be increased if the rubbing were performed to the tune of "some soothing and heartfelt lay."

SKATING.

—On Thursday, January 25th, the first of the series of grand fete nights is to take place at the Brooklyn Rink, where a very attractive and varied entertainment is to be presented, the programme including figure skating by amateurs and experts, boys and girls races for silver medals, and evolutions on roller skates by a company of the Twenty-Third Regiment. Mayor Schroeder is to be the umpire on the occasion, assisted by Col. Ward. A grand concert by Contorno's band is to be one of the features.

—A thaw set in on Friday last which put a stop to ice skating at all the Park Lakes, and snow on Monday added to the temporary embargo laid on the out-door form of the sport. But at the Rink skating was fully enjoyed, the races on Saturday causing a large attendance.

BASE BALL.

—The base ball world is unusually excited at present with the preparations making for the season of 1877. Over 40 professional clubs will enter the arena in May next. The majority governed by the International Professional Association, and the minority by the Professional League. The former will adopt a regular twenty-five cent tariff as admission to their games. The latter will charge fifty cents admission, and lose money by it.

—Devlin has been paid his advance money and will play in Louisville this year.

Battin denies the Philadelphia story of his refusal to abide by the League rule making players pay for their uniforms, &c.

—No base ball games have been played on the Prospect Park skating lake this winter on account of the snow which covers the lake.

—Fisher has been expelled from the West End Club of Milwaukee for selling a game.

CRICKET.

—The Canadian Cricketers Guide is to be published in April next.

—The Australian eleven has defeated the English professional eleven, which went out there last year, and the result has set up credit there to quite a considerable extent.

—A professional team is coming out here next August and they propose playing twenty-two base ball players at Boston and Chicago and Philadelphia.

OBITUARY.—William Devoy, one of the best racket players of his day and for a long time connected with the Gotham R. C. Club, and the Thirteenth street Gymnasium Club, died in this city on the 3d inst., age, 45 years.

RAQUETTE.—Sorry to see that FOREST AND STREAM follows Rev. Mr. Murray's spelling of Raquette; E. G., p. 376, "The French word Racquette."

There is no such French word as Racquette. See Littré's French Dictionary for the word, and its various significations. W. W. ELY, Rochester.

[We stand corrected.—Ed.]

THE INTERNATIONAL CURLING MATCH AT CHICAGO.

The annual International Curling Match began at Lincoln Park, January 17th. The following Clubs were entered:

The Milwaukee Curling Club, of Milwaukee.—Samuel Brown, S. E. West, John Johnston, Jas. A. Bryden, skip.
The Detroit Curling Club, of Detroit.—J. N. Dean, Thos. McGregor, James McGregor, Peter Young, skip.
The Four Brothers Club, of Toronto.—Duncan Malcolm, Hugh Ritchie, Andrew Fleming, Robert Malcolm, skip.
The Portage Club, of Portage City, Wis.—C. R. Gillett, E. L. Gaeger, R. B. Wentworth, J. Graham, skip.
The Thistle Club, of Chicago.—John Burns, David Hamil, Robert Duncan, L. T. Martin, skip.
The Chicago Club, of Chicago.—Geo. Wilson, James Halton, Wm. Fores, Geo. Keyes, skip.

Several other Clubs had signified their intention of being present, but the severe snow storms no doubt prevented their coming. The contest on Wednesday was for the Gordon medal. Three matches were played simultaneously, three rinks being set close by each other. The playing commenced at 1:20 o'clock, and continued until five.

The following is the result of the day's playing:—

RINK NO. 1.	
Detroit.....	22 Milwaukee.....13
RINK NO. 2.	
Thistles of Chicago.....	21 Chicagoes of Chicago.....19
RINK NO. 3.	
Four Brothers of Toronto.....	23 Potage City of Portage City.....17

The last match was the most exciting, the Portage City and Toronto men showing some very fine playing. The Milwaukee and Detroit match was also a very interesting one.

The first game on Thursday was between the winners of the matches of the day before for the Gordon medal. There were the Four Brothers, of Toronto; the Thistle, of Chicago, and the Detroit. The Four Brothers and the Thistles played the first game. It was won by the Toronto Club by a score of 21 to 17. The Detroit Club then objected to play the winner. It was played in the contests between the "North" and "South," and resulted in a victory for the Toronto Club by a score of 16 to 15, after a close and exciting game.

The game between the Thistles and the Detroit Club for the district silver medal, was won by the Detroit Club, 20 to 18.

The following is the score:—

RINK NO. 1.		RINK NO. 1.	
South.....	19	North.....	8
RINK NO. 2.		RINK NO. 2.	
South.....	21	North.....	19
RINK NO. 3.		RINK NO. 3.	
South.....	22	North.....	20
RINK NO. 4.		RINK NO. 4.	
South.....	21	North.....	16
RINK NO. 5.		RINK NO. 5.	
South.....	16	North.....	15

In the evening a banquet was given at the Sherman House, where mirth and jollity prevailed. ROVER.

Household Receipts.—ECONOMICAL SOUP.—Take what remains of a cold goose or turkey, and put to boil in sufficient cold water to cover all the bones, and boil steadily four hours; season with salt and pepper, and add a few vegetables, as for other soups; thicken with a little rice and it makes a relishable dish.

To COOK SHAD.—This delicious fish is best broiled, with a *maitre d' hotel* sauce; it is also good cut in slices and sautéed.

FOR FRYING SCALLOPS.—Roll soda crackers fine, dip the scallops in well-beaten egg, then in the cracker crumbs; fry with lard and butter; requires considerable cooking.

—The curious public, when they read of B. T. Babbitt's Toilet Soap, may rest assured that no toilet soap in the world can compare with this for all the advantages of purity and pleasantness in use. It only needs to be tried.—Adv.

Baths.

Russian Vapor, Marble, Baths.

NO. 25 EAST FOURTH ST., NEAR BROADWAY
The most extensive, luxurious and popular baths on this continent. Call and see the testimonials, signed by the most eminent physicians of the city, to their value as a remedy in Cold, Catarrh, Sore Throat, Gout, Rheumatism, and many other afflictions which originate in an inert skin. dec7-3m

The Kennel.

The St. Louis Kennel Club.

(C. B. WHITFORD, TRAINER.)

are the owners of the following dogs:
ROCK, an imported English setter (formerly owned by Luther Adams, of Boston.) He was a field-trial winner in England, and won first at the Springfield, Chicago and St. Louis bench shows. Also won first at Baltimore (1877), the Special prize for the best setter in the show, and other Specials.

ELCHO and ERIN, both imported red Irish setters. Elcho won first at the Chicago Show; was a winner in the Puppy class in Ireland, and first prize at Baltimore (1877). Is sire of Aileen, the red Irish bitch which won first at the Centennial bench show; and of Norah, who won 1st at the St. Louis show. ERIN won 2d at Chicago in the Open class, and 1st as the best Irish setter for stock purposes shown with two of his get. He won the "GREENWOOD CUP" in the FIELD TRIALS LATELY HELD at MEMPHIS, also with DRAKE won first in the BRACE STAKES.

The price for the service of either of the above dogs is thirty-five dollars.
The club are also the owners of the imported English setter bitch Dora. She is either the dam or grand dam of all the "blue blooded" English setters that have won prizes at field trials in this country.

They also own the English bitch ROSE and the red Irish bitch LEO II, and ROSE. The English setter bitch ROSE is by Rock, out of the pure Laverack bitch Pickles. LEO II, and the Irish bitch ROSE are both bench show winners.

Paints.

PROTECT YOUR BUILDINGS.

Which may be done with one-fourth the usual expense, by using our

Patent Slate Paint.

(Fifteen Years Established.) MIXED READY FOR USE.

Fire-proof, Water-proof, Durable, Economical and Ornamental.

A roof may be covered with a very cheap shingle, and by application of this slate made to last from 20 to 25 years. Old roofs can be patched and coated, looking much better, and lasting longer than new shingles without the slate, for

One-third the Cost Re-shingling.

The expense of slating new shingles is only about the cost of simply laying them. The paint is fire-proof against sparks or flying embers, as may be easily tested by anyone.

It Stops Every Leak,

and for tin or iron has no equal, as it expands by heat, contracts by cold, NEVER CRACKS nor scales. Roofs covered with Tar Sheathing Felt can be made water-tight at a small expense, and preserved for many years.

This Slate Paint is EXTREMELY CHEAP.

Two gallons will cover a hundred square feet of shingle roof, while on tin, iron, felt, matched boards, or any smooth surface, from two quarts to one gallon are required to 100 square feet of surface, and although the paint has a heavy body it is easily applied with a brush.

No Tar is Used in this Composition therefore it neither cracks in winter, nor runs in summer.

On decayed shingles it fills up the holes and pores, and gives a new substantial roof that will last for years. CURLED or WARPED shingles it brings to their places, and keeps them there. It fills up all holes in felt roofs, stops the leaks, and although a slow dryer, rain does not affect it in a few hours after applying. As nearly all paints that are black contain TAR, be sure you obtain our genuine article, which, for shingle roofs, is

CHOCOLATE COLOR,

when first applied, changing in about a month to a uniform slate color, and is, to all intents and purposes, SLATE ON

TIN ROOFS

our red color is usually preferred, as one coat is equal to five of any ordinary paint. For

BRICK WALLS

OUR BRIGHT RED is the only reliable Slate Paint ever introduced that will effectually prevent dampness from penetrating and discoloring the plaster.

These paints are also largely used on out-houses and fences, or as a priming coat on the buildings.

Our only colors are CHOCOLATE, RED, BRIGHT RED and ORANGE.

RUBBER GOODS OF EVERY DESCRIPTION.

Sportsmen's Goods.

The Boston Shooting Suit.

MANUFACTURED ONLY BY

G. W. SIMMONS & SON,
Boston, Mass.

Sold everywhere in the U. S. by all first-class

dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT,"

made by

G. W. Simmons & Son.

This new design of WATERPROOF SHOOTING SUIT, made from extra quality duck, has attained such popularity as to be called for from all parts of the country, and even from England.

"Shipping clothing to England strikes us very much like sending 'Coals to Newcastle,' but the merits of the 'BOSTON SHOOTING SUITS' have been heard of in the Old Country, and that land of sportsmen has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—*Boston Paper.*

The design embraces the best points of the English and French Suits, combined with the necessary requirements for American service. Particular attention has been paid to color.

Each suit is water-proofed by a new patent process. The seams and pocket corners are securely fastened, and nothing neglected to render the suit perfect in every respect.

THE PRICE HAS BEEN FIXED AT \$13, TO INCLUDE HAT OR DOUBLE VIORED CAP, DETACHABLE HAVELOCK, COAT, VEST, AND PANTALOONS.

One hundred suits will be kept ready in stock, so that we can furnish to order any size required, at a moment's notice.

In the *Golden Rule* (Rev. W. H. H. Murray's paper) the enthusiastic editor writes:—

"We were shown, the other day, a new water-proof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skilfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, water-proof quality and capacity. The coat is a marvel in this latter respect."

PERSONS ORDERING FROM A DISTANCE NEED SEND ONLY THE FOLLOWING TO BE SURE OF A PERFECT FIT: BREAST MEASURE, WAIST MEASURE, INSIDE SEAM COAT SLEEVE, INSIDE SEAM PANTALOONS; MENTION HEIGHT AND WEIGHT.

G. W. SIMMONS & SON,
"OAK HALL," BOSTON, MASS.

"THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of Waterproof Shooting Suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp at Philadelphia Centennial Exhibition. It has grown gray in service, but is good for use yet. This suit is known as the 'Boston Shooting Suit,' in contradistinction no doubt, from the garments which are manufactured out west and at Washington, each of which has a local demand of its own. It is said that the western prairie fowl can distinguish any sportsman who visits their domain by his clothes. They can tell him 'by the cut of his jib,' and the old educated birds (which no one cares to eat, by the way,) know exactly what distances to keep from the rail shooters, the brant men, and the chicken killers respectively, to be safe. They have 'got them all down line.' This used not to be so before the waterproof shooting suits were invented. Bostonians, Hoosiers and Buckeyes all stood the same chance then. But now it is—with a sarill pipe to leeward by the old-weather cock—'here comes a Simmons; cheese it!' or, 'Ere's a 'Bunning—lie low!' or, 'Look out for Holbird! Scatter! you beggars, scatter!'—FOREST AND STREAM 1

The Hazard Powder Co.,
MANUFACTURERS OF

Gunpowder.

Hazard's "Electric" Powder.

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 5 (coarse). In 1 lb. canisters and 12½ lb. kegs. A fine grain, quick and clean, for upland and prairie shooting. Well adapted to short guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6½ and 12½ lb. kegs. Burns slowly and very clean, shooting remarkably close, and with great penetration. For field, forest and water shooting it ranks any other brand, and it is equally serviceable for muzzle or breech loader.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25 lbs., and 6½ lbs. and cans of 5 lbs. FFG is also packed in 1 and ½ lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard rifle powder of the country.

SUPERIOR MINING AND BLASTING POWDER.
GOVERNMENT CANNON AND MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPORT OF ANY REQUIRED GRAIN OR PROOF MANUFACTURED TO ORDER.

Musical Instruments.

Highest Honors

AT THE

CENTENNIAL WORLD'S FAIR, 1876!

THE

SHONINGER ORGANS

PRONOUNCED UNANIMOUSLY AS THE

Best Instruments.

Their comparative excellence is recognized by the Judges in their Report, from which the following is an extract:—

"The B. SHONINGER ORGAN CO.'S exhibit as the best Instruments at a price rendering them possible to a large class of purchasers, having a combination of Reeds and Bells, producing novel and pleasing effects, containing many desirable improvements, will stand longer in dry or damp climate, less liable to get out of order, all the boards being made three-ply, put together so it is impossible for them to either shrink, swell or split." THE ONLY ORGANS AWARDED THIS HONOR.

This Medal and Award was granted after the most severe competition of the best makers, before one of the most competent juries ever assembled.

New styles and prices just issued, which are in accordance with our rule, the BEST ORGAN for the least money.

We are prepared to appoint a few new Agents.

Illustrated Catalogues mailed, postpaid, upon application to

B. Shoninger Organ Co.,
97 to 123 Chestnut Street
NEW HAVEN, CONN.

Taxidermy, Etc.

Sportsman's Emporium,

No 148 William St., two doors North of Fulton.

R. C. SCRIMGEOUR & J. W. THOMPSON,

TAXIDERMISTS AND NATURALISTS.

This branch of the business a specialty. Anything mounted from a Humming-bird to a Cameo Leopard. Always on hand a large collection of specimens from all parts of the world.

Fine Fishing Tackle in every variety, such as Split Bamboo rods and others by the best makers. Reels and lines; in fact every thing that a sporting man requires for a complete outfit, can be found at this establishment at reasonable rates.

Also a line of first class Segars and Tobacco.

LESSONS GIVEN IN TAXIDERMY.

Taxidermists instruments for sale. Eyes in every variety.

17 Chatham St. (City Hall Sqr.)

Joe Payne.

THE FISHERMAN OF THE LITTLE FALLS*.

THERE was an ancient fisherman,
His name it was Joe Payne;
His like along the Little Falls
We ne'er shall find again.

He was a bronzed old grizzly man,
And tall, and straight, and tough;
And looked as if he in his days
Had journeyed over rugged ways,
And weathered seasons rough.

Within sound of the Little Falls
Was born our good old Joe—
The Falls whose roar his music was
For seventy years or so.

His education was but slight—
Small his scholastic lore;
But of Potomac's fishy folk
Few men than he know more.

A fisherman he long had been,
For fishing was his joy;
And shoals of herring, rock and perch
He caught, both man and boy.

And many a sturdy sturgeon, too,
To those old shores he brought;
And catfish numberless, and bass,
With dip and hook he caught.

The phantom-drummer oft he heard,
That haunts the Little Falls,
Who with his weird tattoo, 'tis thought,
Some fated fisher calls.

Or else the river from its deeps
The body of one drowned
Brings up, when echoes o'er its waves
That drum's mysterious sound.

Joe did not fear the phantom much,
Yet once, as he averred,
When into the "upper spout" he fell,
Borne on the wind with mournful swell,
That drum he thought he heard.

And once, too, when a floating log
His fishing-boat upset,
And in he soused, the Falls below,
He heard a note, which, drum or no,
He never could forget.

"And I will take my oath," said he,
"One moonlight night did climb,
While I was fishin' free from care,
The drummer into my boat, and there,
As beatin' a tattoo, the air
He beat a good long time.

"I'm growin' old," said Joe, "and though
Perhaps I should prefer
To have my body laid in earth,
As all my forbears were.

"I should not be surprised nor care
To hear that drummer's drum
Beat its tattoo for me at last,
And I, into the waters cast,
Thence nevermore should come."

How he lived on from year to year,
I' faith, I scarcely know,
For fishing was his only trade,
And honest, aye, was Joe.

A quite large family raised he,
Of girls and boys some ten—
"How fast time flies!" quoth Joe, "they all
Are women grown and men.

"Ah, where are now my good friends all—
The big men I have known,
With whom I've rowed in former days—
With whom the line I've thrown?

"Many o' them to forrin' parts
Have wandered far away,
And—that's what makes me feel so old—
Many o' them have long been cold
Beneath the graveyard clay.

"How glad the city they would leave,
To have a mornin's sport,
To breathe the river's healthful air,
And to forgit all office care,
Returnin' happier for't!"

He liked to tell of Webster—Dan,
Whom very well he knew;—
"He was, indeed a whole-souled man!"
Quoth Joe—"good fisher, too.

"I mind me well the day when he
His biggest rock fish took.
When we swung o'er the waters wild,
He clapped his hands like a little child,
And joy was in his look.

"The fish weighed sixteen pounds. When he
The prize I gaffed beheld,
Into the boat his rod he threw,
And jumped upon his feet—'tis true—
And yelled—Lord, how he yelled!

"And when we got to shore, so pleased
Was he such fish to inveigle,
Into his poke his hand put he,
And out he drew and gev to me
A golden bright half-eagle!"

Then of George Gibson Joe would talk;
"A ginerall brave was he;
Light tackle—fancy flies he used—
Kind, gentle as man could be.

"A mighty fine old man!—he loved
Queer fishin' yarns to tell;
All through the country he had fished,
And he fished wonderous well.

"When last he came up here to fish,
His body-servant and I—
So weak he was—held the old man up,
That he mought throw the fly."

"Another of my friends," said Joe,
"Was Guv'nor George M. Bibb.
Great times together we have had!
When I say he was a most mad
On fishin', taint no fib.

"The Guv'nor was a gentleman
O' the genu-ine old school.
He hated flies—he fished with bait,
And heeded no man's rule.
From airly morn till evenin' late
His ardor did not cool."

And Crampton, British Minister,
A good friend was of Joe's,
Who, when a fish he couldn't catch,
Would take out sketch-book, and would sketch,
As his friend Lanman knows.

And Lanman, too, would fish with Joe,
Who, when a fish wouldn't bite,
Would buy the ones that Joe had dipped,
And, as to him the wink he tipped,
Joe always said, "All right!"

And Fredericka Bremer once
Acquaintance made with Joe,
Who questioned him till he was wild,
His way of life to show.

And o'er the rocks she skipped and tripped
Like a young mountain roe,
And many flowers and plants she plucked,
And watched the waters flow.

Joe she mistook, for in her book
Of things American,
She speaks of him as if he were
A rude, half-savage man.

With her was Dorothea Dix,
Who, as Bibb was on fishing,
Was almost mad—but it was in
Well-doing and well-wishing.

Oh, Joe was full of pleasant yarns
Of people he had known,
And days that did his fishing mar,
When o'er Virginian hills afar,
The blaring trump of civil war
Full long and loud was blown.

And Joe was aye a gentleman,
Though rough the clothes he wore,
And through a long and toilsome life,
With winds and waters wild at strife,
Heaped up no golden store.

None knew like him the Little Falls,
Its eddies, rocks and pools;
And few like him could dip the net,
The sturgeon grapple, the seine set,
And wield all fishing tools.

But honest Joe is dead and gone;
On January seven,
To death he yielded up his spirite,
And to his loved Falls bade "Good-night—"
His soul is now in heaven.

The phantom-drummer did not beat
For him his dread tattoo;
Upon dry land he found a grave,
And o'er his dust will wild-flowers wave,
And o'er it weep the dew.

The fish, no doubt, are glad he's gone,
For he was still their foe;

Rejoice will they of every class,
The rock, perch, sturgeon, catfish, bass,
But we must mourn for Joe.

Two years beyond three-score and ten
The kindly Fates had lent him;
The little Falls will mournful roar
Will aye for him a requiem pour,
And we shall long lament him.

W. L. SHOEMAKER.

*Joseph Payne, a man well known in Georgetown for many years, died at his residence near the Chain bridge, Sunday morning, at 6 o'clock, aged 72 years.—*The Evening Star*, January 8th, 1877.

**For most of the incidents and anecdotes embodied in the above ballad, I am indebted to an article by my friend, Charles Lanman, the well known angler, artist and author.

W. L. S.

GAME AND FISH OF LOUISIANA.

EDITOR FOREST AND STREAM:—

As there appears to be no person writing from this section of country in regard to game for both rod and gun, a description of some of the fishing and hunting grounds may not be uninteresting to your numerous readers.

Here, as in most of the inland waters of the south are found the bass and pike, the former called trout, the latter jack. Of the bass there are two varieties, the striped and black, though few of the latter. South of this place on Red river, at the distance of twenty-two miles, flows Little river, its general course being parallel with the Red, which passes through Catahoola Lake, which is merely an enlargement of the river, empties into Black river, which in its turn empties into Red river near its confluence with the Mississippi. Between this river and Little river there are three streams viz. Flagon, Clear and Big Creeks, distant, five, twelve and fifteen miles respectively, their general direction is parallel with the Red river, until they near their mouths where they make a sweeping bend to the north and east and empty into Little river. These streams all have their rise in the pine woods and fed by innumerable springs, and the water is always cool. In the spring these water courses rise from ten to twenty-five feet, overflowing their banks and submerging the bottom lands which extend back from a few yards to a mile. The continuance of high water depends upon the adjoining rivers, especially the "Father of Waters." They generally subside to within their banks by the middle of June and by the first of July they have resulted in a succession of holes of more or less depth, connected by passages of shallow water. The holes as a rule are mud bottom, while the passages are sand, gravel, and sometimes rock. The bottom lands are heavily timbered with cottonwood, ash, willow, holly, cypress, and the grand magnolia and a dense undergrowth. As the waters subside there is generally an open, clear space of from ten to fifty feet along the margin of the stream, thus giving ample room to cast the line.

About the middle of June the bass-trout, commence to run up these streams, but the best fishing does not commence until the first of July, continuing through August and September, though a few are taken through all the months of the year, excepting in very high water. On these streams, especially Clear and Big creek, one is sure to find the very best of sport.

There is one place I have not yet mentioned, three miles beyond Little river, which is *par excellence* the fishing ground for trout. The stream, Trout creek, is but fifteen miles long, running in a southerly direction, emptying into Little river. There is a dam five miles from the mouth which prevents the fish from ascending any higher, and none are found for two miles from its mouth, thus the fishing grounds are confined to a distance of three miles, but Oh! golly! However, more of this anon.

I do not mean to slight the "Jack," for he is a splendid fellow, gamy as he can be, and willing to fight to the death. I rather like hooking one, and there are some big ones, but they are not very numerous in these streams. Query: Are the bass too many for them? but west of here in some of the streams they appear to have their own way, keeping the upper hand of the bass. Of the Sackali there are but few. I wish there were more, for I consider them second to none as a table fish, and they are equally as gamy as the bass. Perch are abundant in all varieties. In the rivers are found the cat, buffalo, and other varieties; also the bar fish, which takes its name from always being found near sand bars in low water. I am of opinion they are a species of the bars, the marks being the same.

The game prevalent, is deer, wild turkey, ducks, geese, and quail, and occasionally bear, panther and wild cat. Of the first named there is probably no section of country where they are more numerous and where there is more sport in the hunt, which is generally on horseback and with

a pack of hounds. Catahoola Lake is the place, so I am told. I have not yet had an opportunity of visiting the locality—for ducks and geese—there they congregate in vast numbers, the feeding grounds being of the very best. Quail are abundant, and with a dog one need never come home without a good bag.

No better country can be found for the sportsman, but it will not be long, if there are not some game laws passed and enforced. All kind of game is taken out of season, and the only reason it is so plentiful, is because there are so few that hunt them. Deer is the only kind of game as yet being injured by the lack of protective law. It is astonishing how ignorant the people are of the great variety of food they have at their very doors, of which they do not avail themselves. One instance will suffice to show this: Starting one morning just after daybreak for a fish on Clear creek, having been out there but once before, I missed the road—one can easily get lost in the "piney" woods roads, they run in all directions—I soon discovered this, but as the road was leading in the right direction I concluded to keep on. After a long drive I came to a creek I supposed was Clear creek, but lower down than where I had been before. I was soon at my favorite spot and during the morning took twenty-four fine bass and three or four jack. On my way home I met a countryman and asked if it was Clear creek I had been on. He said "No, it was a branch called Beaver." He then said, "You been fishing?" I answered yes! "You didn't catch any though?" Oh yes, I said, showing him my catch. He said "Well deu tell, I have been born and raised on that ere creek and I never knowed there was eny fish in it." And strange as it may appear there are hosts of them who are as uninformed as this man, and those who do know better do not appear to take advantage of it; they would rather eat pork and corn bread, and when that gives out, go without and complain of hard times. The people of this country have yet to learn how to utilize what there is around them and make things yield to their benefits. But I have already occupied too much of your time and space and will reserve for a future letter the trip of myself and party to Trout creek and Sulphur Springs.

PLUME DEL ROSA.
For Forest and Stream.

THE LEHIGH VALLEY.

I had frequently heard the Lehigh Valley called "The Switzerland of America"; but confess to having regarded this complimentary baptism as the result of that outflow of enthusiasm which inspires the susceptible railway companion to declare that every romantic looking stream ten yards broad, that goes throbbing over a bed of stones, reminds him of "the rapids above Niagara Falls." Thanks to the enterprising railroad managers of our Centennial era, for a better appreciation of this beautiful and interesting portion of the country. As soon as the conductor of the excursion train called out "fall off" at Jonesburgh (or some such place), I was conscious of having passed into a different, if not a wilder region than that of New York State, but should never have known of the goodly store of romantic views packed in among the Lehigh Mountains, had I not concluded to "fall off" myself at Mauch Chunk. My opinion now is, that lacking the good sense to "fall off," I should have been much obliged if somebody had pushed me off. The scenery of Mauch Chunk is truly enchanting. It is not quite equal to Switzerland in natural cragginess, still its glistening piles of black diamonds, its begrimed mountain slopes and coal-pockets, give it a rough and sombre look, which amply compensate for that deficiency. Viewed by moonlight, there is something wild and spectral in its fascination. The group of high mountains among which the white village nestles "down so deep," look as black as ink by night. Standing out in the open street, you have the sensation of being in a deep pit of the "inferno" pattern, and have a fear of unjointing your neck straining after a glimpse of the far off sky. Perhaps you will wonder what on earth is the matter with the heavens! They look as though they had been partitioned off by some mighty spirit of evil, who had succeeded in obtaining all that desirable portion which lies contiguous to "our world." It takes some time to fully realize that you are only among mountains of carbon; that Mauch Chunk, or Machk Tschunk, translated from the Indian dialect, means Bear Mountain, and that it is this same mountain with its high, round top, that assists so largely in cutting off your proper allowance of celestial moonshine. Your first morning views of Mauch Chunk will most likely be taken from Prospect and Flag-staff rocks, to which you have scrambled by the well known "Donkey Path." Flag-staff rock is one of the highest points thereabouts, and takes its name from the lightning stricken tree, from which waved our stars and stripes during the late war. Afterward, when the Prussian flag essayed to wave therefrom, the old hemlock staff was felled to the earth. Moore's Wild Ravine, and Lent's celebrated Trout Ponds, beckon you onward, but the first is a rough clothes-destroying place, and the other is seven miles away; and you look at the smutty brow of Mount Pisgah, and her famous *Switch Back*, and feel that she cannot be slighted. The business history of Mauch Chunk is hardly less interesting than its romantic scenery. In 1791, Phillip Gintir, the brave hunter and pioneer, discovered some hard lumps of coal near Summit Hill, which the Philadelphia savans pronounced "good only for putting out fire." In due course of time it was declared combustible, and then came the long hard struggle to introduce it into the market by pitiful little wagon loads, drawn nine miles down the rough mountain sides. In

1827 the Gravity railroad was constructed. The cars were sent down by their own gravity, and were drawn back by mules. In 1844 the present Switch Back was adopted, and (Mr. Bergh, N. B.) the poor mules were emancipated. The contemplated ride on the Switch Back seems at first rather appalling, but after being told that Brick Pomeroy and other lesser luminaries have circled around in safety, you conclude to try it. You enjoy it exceedingly, particularly after the ascent is accomplished, and you are standing firmly on the summit of Mt. Pisgah. There is the mottled valley far down below; there is the Lehigh river, writhing about in its tortuous bed; there are the Blue Mountains, with their scalloped ridges; there is the "Water Gap," yawning in the distance; and over all is the smoke and dust of an immense industry, which in less than a hundred years of time has been wrested from the very heart of the mountains, and now furnishes heat, light, and employment, to hundreds of thousands of human beings. A. C.

For Forest and Stream.

A TRIP FOR QUAIL IN MARYLAND.

A recent trip on the Maryland peninsula, though not compensating in the way of game on account of contingencies that all hunters experience, may have yielded a point or so to interest sportsmen. The peninsula is wonderfully well supplied with railroads, most of them of recent construction—so well supplied that a drive of no more than ten or fifteen miles is required to reach any part of Delaware or the eastern shore of Maryland. The Delaware Railroad divides that State and terminates at Delmar on the border, where it is joined by the Eastern Shore Road which continues on to Crisfield, Maryland's extremity. Four roads branch from the Delaware Road running through Maryland to points on the Chesapeake, and four on the east running through both Delaware and Maryland. For availability they unquestionably open the best territory in the country for quail, English snipe, woodcock, and wild fowl, and it is without question more resorted to than any district in this country. It is the main out-look for Baltimore, Philadelphia, and a good many New York sportsmen. I have no means of estimating this kind of travel, but as a sample, a friend reports from his own count, seventy-four dogs on one train of the Delaware Railroad three weeks after the quail season had opened. Regular and reasonable dog fares are charged on this road—seventy-five cents a head to Delmar, or about half a cent a mile—with the privilege of taking the dogs in the smoking car. Our party started Dec. 13th, or about a week after the severe cold snap and snow storm, and stopped first at Princess Anne, Md. The weather was pleasant, but the snow and frost had left the level, light soil in a four inch mushy condition, and the quails having taken to the woods and swamps during the cold snap, still stuck to them, remaining in the dense cover, and only feeding on its edge. Before the storm they were located in the fields chiefly, and the covey shot could be had, with a fair average of open shooting in the first break. Some voracious hunters (non-residents) reported from twenty to forty covies a day as the raise from day to day, during a hunt of two weeks; and from the "signs" I saw, I should not question their statement. We (two) shot about two dozen birds in a day and a half, not wasting much shot, and not getting more than one fair snap shot out of a half dozen rises. The dense second growth pine undergrowth and greenbriars effectually protect birds that take to it. But the clearings out-accrue the woodland, and I should judge before rough weather drives the birds to timber, that a fair shot could readily bag two scores a day any where in this locality. Rider, at Princess Anne, keeps a middling good hotel, but his charges are too airy for the country. His tariff, as far as I could cipher it, was \$3 per day for board, and \$5 per day for a team, and \$1 to \$2 additional for driver. This is the highest rate in my gunning experience for country quarters. If he wish to encourage gunning patronage, it would be politic for him to conform to usual rates, which rarely exceed \$2 per day. Most any farmer in this locality, I was told, would board respectable gunning parties for \$5 a week, or \$1 a day, for less time. This is better than in a town, for you can locate right in good hunting ground. There are fine meadows hereabout for English snipe, and they and woodcock are said to be very plentiful in their season.

On Saturday we took the back track without a point decided upon for locating at, but resting between New Market on the Dorchester & Delaware Railroad, where it is said you can get comfort (at Bramble's house) and good shooting combined, and the Virginia peninsula. At Salisbury, the junction of the Wicomico & Pocomoke Railroad, Ike Mill's car was hitched to the train. It had come from Ocean City, where he and a friend had been ducking. I had heard much of Mr. Mill's prowess with the gun, and did not hesitate to intrude upon him, and met with a kindly reception. Being a keen sportsman and as Superintendent of the Delaware Railroad, commanding special facilities for moving from point to point, he is probably the best posted man on hunting on the peninsula. He stated that quail had been and were still unusually plentiful, and that you could scarcely go amiss for them in either State. He said if we would stop at Seaford he would show us as good quail shooting as we would wish for. We so arranged for a few days before our return, having decided to look at the ducking qualities of Chincoteague Island and the quail ground in Accomac and Northampton counties, Va. So we bade Ike Mills good bye with the expectation of a pleasant hunt with him. (Everybody knows "Ike" Mills about there, so he puts it, but "Mr." Mills is a stranger.)

We went over the Pocomoke Road to Berlin, where we heard something of Mr. Hallock's late shoot thereabout. This is the second time I have chanced upon his route (and he has the knack of getting upon good ones.) The other was in the Neosho Valley, Kansas—a district running on that meridian south—which I do not think is excelled, if equalled by any in the country for game. At Berlin we took the Worcester Railroad, which since spring was extended to Franklin on the shore of Chincoteague Sound, where a small steamer plies to and from the island in connection with trains. Owing to extreme low water the little steamer was seven hours making her seven mile trip, and did not reach Joe English's until after 1 o'clock Sunday morning. He has built a new house and it is a decidedly comfortable place for hunters in winter, both in table and rooms, and it has a tempting summer look too. His rate is \$2 a day, and gunners with outfit charge from \$2 50 to \$3 a day. We had trouble enough to get on the island, and our next anxiety was to get off. It grew very cold on Sunday and threatened a "freeze up," which means imprisonment upon the island until the "thaw out."

On Monday a couple of plucky and enduring young men got us to the main-land in a yawl boat by cutting through ice and going some fourteen miles roundabout. Other parties decided to take chances with the steamboat, but as the "freeze up" was accomplished the next night I judge they may be enjoying themselves upon the island yet. A party of two New Yorkers that had just arrived at Franklin, were patiently waiting there for the steamer to take them to the Island. Judging from their commissary they were out for a campaign. They had three trunks, 200 pounds of shot, ten gallons of whiskey, and other stores in proportion. We next went to Tom Pettit's at Horntown, Accomac county, whom we found to realize the standard of what a good landlord ought to be, well posted, and his guests interests and pleasure at heart rather than his own. We liked the appearance of the grounds we passed through to reach his place better than any we had been on. There were good thick stubbles and cornfields and brushy fence rows and much of the timber was the original growth, not matted with undergrowth, and practicable to shoot in. Birds were said to be plentiful. One farmer told us he had three large flocks in one small stubble, besides several other flocks, and invited us over. Some of the New Jersey dog trainers are located there with their kennels. One of them told us a dozen birds a day was a big bag for that locality. This was "business," for if true they had better stay in Jersey, in any part of which they could do that well or better. On Monday evening the rain changed to snow, which fell some four inches deep, thus effectually putting an end to any hope we may have had of field shooting, for a week at least, so on the verge of success, we had nothing to do but to debit our trip to profit and loss and disappointment, and take the next morning train for Philadelphia. But I feel satisfied that there is good field shooting to be had in the vicinity of Horntown, and from what disinterested residents told me it is better farther down the peninsula, about Bellhaven, and the late Henry A. Wise's locality. Tom Pettit's place is seven miles from Stockton, from which a stage runs. He has plain comfortable quarters, ducking outfits, boats, teams, oyster beds, &c., and voluntarily and heartily does every thing to further his guests pleasure and comfort. His terms are \$1 50 per day. I have struck upon so many cheerless, unhomelike hotels, when on hunting trips that I always like to hear of good places and to let others know of them. Railroad fares are not exorbitant as they are further south, but range about the same as they do north. Not traveling directly I cannot give through rates, but the fare from Philadelphia to Princess Anne, 144 miles, is \$4 30, and from Stockton to Philadelphia, \$5, or averaging three cents a mile.

The quail shooting in the northern parts of these states where the land is nearly all redeemed and under fine cultivation, is good enough to satisfy any sportsman at the opening of the season.

Before the Maryland & Delaware Railroad opened up its district to the sportsman, when shooting there, I was struck with the large proportion of old quail bagged. The explanation given by old residents was that covies were not much thinned by hunters, that they were large and often two or more together, and in the spring instead of quietly pairing and rearing broods, the cocks were perpetually at war, and the hens would scatter their eggs along the hedges and fences, where they were gathered in quantities by the negroes. The increase consequently was nominal. The fact shows Nature's law to guard against excessive increase, and also that the judicious thinning of a covey to two or three pairs, or to the point where they will mate and brood will insure an increased instead of a decreased stock of these birds.

B.

For Forest and Stream.

MY FIRST QUAIL.

THE vivid remembrance of my first quail shot on the wing, dwells as firmly in my mind as though my achievement had occurred but yesterday. It was a pleasant day in early December, though snow fell in large white flakes, covering the earth with its pure mantle. I was quite well advanced in my teens, devotedly fond of field and athletic sports, in which I considered myself, and perhaps with some foundation, a proficient for my age. On the morning in question, I was delighted to hear the cheery whistle of a quail, resounding, shrill and blithely from the coppice bordering the home farm. I ran to the house, seized my gun, shot pouch, and powder flask, and

hied to the field after game. I was not the possessor of a dog in those days. Indeed, in this instance the use of a dog was quite unnecessary, as the season was too far advanced to permit of the approach of either pointer or setter, upon quail, even had the character of the ground been more favorable. The fields were bereft of even the most minute cover, and the adjacent coppice whence proceeded the whistle of the quail, was but a very narrow one, bordering the high rail fence. Beyond the shrubs, for woodland, it could scarce be called, extended back some distance, consisting of small oak saplings and undergrowth; though the latter did not interfere in any wise with a clear view of the surrounding country for some distance.

Here and there large heaps of dried brush, dotted the ground, and upon one of these I soon perceived a full bevy of quail, now silent and watchful, doubtless observing my approach. I had taken but a few steps farther, when the quail rose, wild, and at least eighty yards distant. I withheld my fire, and marked the bird's down as closely as the circumstances would permit, in the verge of the field, some distance away. Warily and watchfully I threaded my way toward the bevy, knowing well the line of flight, but somewhat uncertain as to the distance. Upon reaching the fence I glanced carefully around, but in the broad open space beyond observed no trace of the bevy. Lightly I mounted the fence, when to my surprise, and equal confusion, the entire bevy of twelve or fourteen rose in a cluster, almost under my feet; from beneath a huge log, which covered as it was, with snow, had scarcely attracted my attention. Hastily scrambling to the ground, I essayed to shoot, but a single glance convinced me of the futility, as the fleet birds had traversed at the least computation a distance out of range. Again I watched their flight as they sped away, and at last, with much satisfaction, beheld them alight in a level stretch of tall brakes and weeds a few hundred yards to the left. This time I was successful in approaching the bevy, and, had I not fully determined that I would, under no consideration, fire at the birds upon the ground, I could, perhaps, have killed one half the brood, at a single discharge. The bevy was, at this time, feeding in close proximity to me, and upon flushing them the greater portion crossed to the left, one cock-quail, however, flying low and swiftly in a direct line ahead. It was but the work of an instant to raise the gun to my shoulder, take range with his flight, and at the report the bird fell lifeless. A stream of feathers drifting slowly down, marked the spot. Quickly wheeling to the left, the second barrel was discharged at two quails in the act of crossing, and one came down at a tangent, falling, possibly, a hundred yards away. Him, I never secured, but his fellow, which I had cut down with my first barrel, I soon found, one wing alone visible above the downy snow, in which he fell. Tenderly I raised him, smoothed the ruffled feathers, and with a feeling almost of regret at depriving the beautiful cheery bird of its life, placed him with something of pity in the game bag at my side. Thus did I kill my first quail, and thus mayst thou, young reader, kill thine, if perchance that exploit has not yet been performed; and, I warrant thee, a clear conscience, and untroubled spirit in killing it honorably and scientifically, as becomes a sportsman.

WILL WILDWOOD.

For Forest and Stream.

"MUDDYING."

SAVANNAH, Tenn., Jan. 2d.

The readers of FOREST AND STREAM, shut in as many of them are by snow and ice, and prevented from enjoying their usual sport by brawling rivulet, or on the bosom of the broad crystal lake, may not be averse to devoting a few moments to the perusal of an account of a method of taking fish, which will, in all probability, be new to most of them, for, so far as I am informed, it is practiced only during the summer months, and in the Gulf States.

In the spring the creeks and rivulets, swollen by the heavy rains of spring overflow their banks, and when they recede leave behind them in the low lying woodlands that border their courses, many ponds or lakes as they are styled. These lakes are often plentifully stocked with fish, which leave the channels of the streams as their waters spread through the woods, and are left behind by the receding stream. As soon as the heat of summer has thoroughly warmed the waters of these lakes, and has somewhat reduced their volume, the season for "muddying" begins. The appliances for this sport are very few and simple. They consist of several cotton hoses, gigs, a dip net or two, or, in default of that article, a basket attached to a light staff, and some splunges. The last named articles are made by inserting a hoe-handle into a hole bored in the center of a piece of pine plank, eight or ten inches long, and five or six inches broad.

After reaching the lake, the negroes, who do the muddying, enter it with their hoses and splunges and wade along, stirring up the muddy bottom as they advance. In a very few moments the perch commence to jump out of the water, and a large and game fish, styled in this section a trout, makes its appearance at the surface. Now is the time for the gigs to come into play. Many use the three-pronged gig, resembling the representations of the trident, as seen in the pictures of Neptune in the Mythologies; but those who pride themselves on their skill, will use nothing except the small, single-pronged gig, attached to a bamboo cane, eight or ten feet in length. It is by no means an easy thing to gig a trout, for they move with great rapidity, and even when struck, often break away. As the water becomes muddier the perch cease jumping, and appear at the top of the water gasping for breath. The trout and bream soon follow them, and are easily captured with the net or basket, and even with the hand. The sucker is the next to appear, and his curiously shaped mouth is the only part of him to be seen, which at a little distance can, with difficulty, be distinguished from an air bubble. A well aimed blow with the gig, directed a few inches below the seeming bubble, will almost certainly result in its capture,

for the sucker is not distinguished for its gameness, nor indeed for anything except the number and sharpness of its bones. After a while, as the water begins to assume the appearance of a hog-wallow, an old yellow catfish comes to the surface, and after showing his ugly head and beady eyes disappears. A few more turns of the hoses and the the catfish succumbs, and joins the unhappy funny throng on the shore. I do not know whether a pond can be made too muddy for the gar pike. I have heard that they have been taken in this way, but no case has ever fallen under my own observation. There is no great amount of sport to be had in this method of taking fish, and the fish thus taken have rather a muddy taste. Still it is followed at a season when there is no other sport to be had, and the fish thus caught would, in the end, become the prey of the hog and buzzard, for the ponds almost without exception, dry up entirely during the fierce heats of August. For this reason the sport is not so reprehensible as is the practice of poisoning the deep pools in creeks by using young walnuts and buckeyes; and, besides, in many cases, the young fry are kept alive and restored to the creeks.

The gigging of the trout and large perch as they dart around when the water first becomes discolored, is a matter of some little skill, and an occasional encounter with a water moccasin affords an element of danger that some might enjoy. The snakes, however, are among the first to leave the water, which most men regard as a matter of congratulation, as an old, musky cotton mouth, is by no means a pleasant neighbor. I will remark, *en passant*, that I do not know how to class the fish I have here, after the manner of the country, styled the trout. I believe it to be a species of bass, or, perhaps, it may be what Herbert styles the "weakfish," *Otolithus Regalis*. It has been a long time since I saw one of these fish, and, as at the time of my acquaintance with them, I paid no attention to such things as would enable one to locate them. I cannot pretend to describe one. These fish sometimes grow to a very large size. I knew of one caught by the muddying process that weighed fifteen pounds. But this was an unusually large one, as they generally vary from fourteen ounces to three pounds, sometimes reaching five pounds, but rarely exceeding six. The particularly heavy fellow I have just mentioned was, at first, from the noise he made in his frantic efforts to get fresh air, mistaken for an alligator, and cleared the lake of his enemies in a twinkling. At length, however, his true character was ascertained; and, after many unavailing attempts to gig him, he was stunned by a blow from a hoe in the hands of a negro, and then scooped out in a basket.

My first experience in this sport happened when I was several years younger than I am now. I was once fishing together with three of my boyhood's companions, in one of the tributaries of the Alabama. The month was July, and an unusually hot and dry one. We had fished patiently for some time without getting a nibble, and after refreshing ourselves by a bath in the clear stream, had settled quietly down to an old-fashioned game of euchre. I was just preparing to order up on a lone hand, when an old negro, whom we had seen a few moments before cross the log a short distance above us with his fishing poles on his shoulder, and who was accompanied by a young negro, with other poles and the inevitable bait-gourde (for no matter what may be said to the contrary, negroes are not in the habit of carrying their bait worms in their mouths), came running excitedly back to tell us that he had found a lake, which, he said, "was plum-fairly live with fish." He proposed that we should help him to muddy it, and, as we were ready for anything, we consented, and, following him, soon reached the lake. It was deeper, and being surrounded by bay trees, was somewhat colder than we liked; but the sight of several large trout soon overcame our hesitation, and in we plunged. Our appliances were one hoe, and two pieces of umbrella wire inserted in a pawpaw pole. This last implement the old negro styled his gig. Notwithstanding the paucity of our preparations in we went, splashing and kicking, stirring up the muddy bottom where we could reach it, and swimming where we could not, until we, at length, began to get the water muddy, and the perch and trout began to rush around in their usual frantic style. After many unavailing attempts, several fine trout were captured with the imperfect gig; and before we were utterly exhausted, the water was muddy enough for us to catch quite a number of perch, bream and suckers. Only one willow cat raised his whiskers above the surface, and the large gar pike, the sight of which, basking upon the only sunny spot on the lake's surface, had done so much to excite our sable friend, did not deign to favor us with a view of even the tip of his nose. "I tell you what, young massas," said the old darkey, "dis am 'nuff better dan de card play—you hear me?" and, as we looked at our long strings of fish, we agreed with him.

WILL.

A CALIFORNIA WOMAN EATS 30 QUAILS IN 30 DAYS.—It has been many times vigorously alleged that no person could perform the seemingly simple gastronomic feat of eating thirty quails in thirty successive days. What there is about a quail that makes the average human stomach decline its too frequent visitations, no one but an analytical chemist with a leaning toward anatomy can decide. The quail has been esteemed a great delicacy since the children of Israel passed through the desert and had their daily feast of the fowl—not singly but in showers—and the sacred chronicler fails to record that they were received with repugnance, and they were in the wilderness a month and ten days. A banquet without quails somewhere in the list of dishes has been almost esteemed a failure. Then why its indigestibility? Wherefore its billiousness? This feat, hitherto deemed impossible, has been recently performed by a lady resident of Oakland, who, in a spirit of banter and on a wager of \$500 offered by a humorous son-in-law, and \$100 guaranteed by a facetious son, undertook the task, not thinking it at all difficult. She decided to take the birds broiled, and for breakfast. All went on well for some days, and it was not until the end of two weeks that the matutinal quail began to be repugnant, breakfast revolting, and life a burden. A plucky, unyielding will came to the lady's aid, and she persevered, and through a season of daily recurring qualms, with frequent fits of dizziness, a little tendency to obscurity of vision, she finished the last bird amid the approval of a slightly alarmed household. But she says she does not care to renew the attempt—oh, no!—even for the sake of emulating the Israelites, who lived on them forty days and made no sign. She is now in perfect health, and her bank account is increased by the money so hardly earned.—*San Francisco Chronicle*.

Fish Culture.

AMERICAN SALMON IN NEW ZEALAND.—Although New Zealand is at the Antipodes, anything relating to fish culture even there is interesting, and particularly so when the fish in question are the progeny of the inhabitants of our own rivers. The letters which we print herewith give an account of what the New Zealand authorities have been and are doing with the salmon spawn shipped them by the U. S. Fish Commission:—

COLONIAL MUSEUM, WELLINGTON, }
NEW ZEALAND, December 13, 1876. }

MY DEAR SIR.—I have to thank you for your note of 3d Oct., and for the trouble you have taken in procuring the salmon ova for us. You will be pleased to learn that the venture has been, as you predicted, a perfect success. About 90 per cent. of the ova have been hatched. They have been divided among four different localities from one end of New Zealand to the other and we must now have nearly 300,000 healthy fish. The 84,000 you sent to me were sent on to Southland, where the best ponds are situated. They will be turned out in some splendid rivers along with young Scotch salmon. I still require a supply to stock the rivers on the west coast and particularly the large rivers that flow into the Fjords where they should thrive well. Government have authorized me to prepare to raise white fish. The sum of £800 has been voted this year for pisciculture. I believe we have to thank your strong expressions of interest for procuring this vote. Hoping to hear soon from you, believe me, dear sir, I remain yours,

THOMAS HECTOR.

The following letter will be found of especial interest as containing a detailed account of the treatment of and results from the ova forwarded by Professor Baird:—

AUCKLAND, NEW ZEALAND, Dec. 16, 1876.

THE HON. SPENCER F. BAIRD, Esq., Chief of the United States Fisheries Commission, Washington.

SIR.—In accordance with your wish (conveyed to me by my friend Mr. Creighton), I avail myself of this opportunity to give you a short account of the results so far, of the salmon ova which you, as Chief of the U. S. Fish Commission, so generously presented to this colony.

As I have already informed you, I forwarded with fresh supplies of ice, the various boxes of ova to Napier, Canterbury and Wellington. You will be pleased to learn that all these parcels arrived in excellent condition at their respective destinations, and have all hatched out with great success.

I now come to the treatment and results of the salmon ova you kindly forwarded to the Auckland Acclimatization Society. The rivers of this colony are remarkably destitute of fish. Except five or six kinds, all, either small or of little value either for sport or food, our rivers have no inhabitants, except eels, and of these, some of our northern rivers are full. These eels with the wild ducks and sea-shags are very terrible enemies to all the finny tribe. I think it not unlikely that these creatures have produced that remarkable absence of fish in our rivers to which I have already alluded. There is one other difficulty with which we in the North have to contend in introducing such a fish as the salmon, viz., a high temperature of our rivers. North of 37 deg. S., (on which Auckland city is placed,) I do not think we shall succeed with this fish.

With this digression, permit me now to describe the three locations in which I placed the ova, and the appliances I had prepared for their treatment, together with the results of these operations:—

1. The first location was in a wooded dell in the "Domain" near the city of Auckland, a very charming and romantic spot, rich in indigenous plants and trees. Through this little shady dell a cool streamlet runs, with a temperature of 62 deg. at this season, our early summer. Here I erected a fish house fitted with sixty boxes, each four feet long, twelve inches deep, and ten inches wide. The bottom of each box was covered with small shingles. On a notched frame two inches from the top, we placed a row of hollow glass tubes three-sixteenths of an inch apart. In these we deposited the ova. The boxes were placed in tiers of five, one above the other, like steps. The water ran from the upper box to the next of the tier on a little fall of four inches, imparting a gentle and constant motion to the water in each box. The day after they were deposited the ova began to hatch, and in five days all were hatched except about one per cent. of ova which had not been perfectly fecundated.

Shortly afterward we noticed a rather heavy mortality, arising, probably, from the circumstance that one of the original packages of ova had had a fall, or had in some way been crushed a little. The weather becoming more sultry, the mortality continued, though at a less ratio. The young fish having absorbed the "sac" (about thirty days after being placed in the boxes), are fine, lively, healthy fellows.

2. The second location is fifteen miles south of the city, on a pretty shingled river named the "Oratia." A similar arrangement was adopted to the one already described. In this case also the ova hatched splendidly, and were doing well until the fourteenth day, when the temperature of the atmosphere suddenly rose to 99 deg., and that of the water from 65 deg. to 70 deg. In that day we lost one half the fish. On being apprised of the calamity, I immediately rode out, and finding the water at 67 deg., and the remaining fish looking sickly, I at once turned them out into the main river where the water was at a lower temperature. The absorption of the "sac" was not complete, but I hope that a fair amount of success may be realized.

3. The third location was made on a charming river full of shingle, little rapids, and deep pools. This river, called the "Rapurapa," has very clear cold water, and is one of the numerous head waters of the river Thames, which is itself the beau ideal of a salmon river in every respect, having abundance of shingle, rapids, deep holes, with bright cold water, and after a course of about one hundred and fifty miles debouching into the sea at a fine shallow but extensive gulf called "Hawraki." The point I selected on the "Rapurapa," was where a small low island afforded a branch about sixty feet long by fifteen feet broad, and two feet deep running with a pleasant music and sparkling motion over a shingle bed. At the upper point of the little island I made a breakwater of shingle rising two feet above water level, and running across to the river bank. I constructed a similar breakwater at the lowest point of the island to the bank, in this manner inclosing a space sixty feet long by fifteen feet wide. Shading this little spot from the sun's

rays, I placed among the shingles, with the ready and skillful help of the Maoris, (the aboriginals of this country,) about 36,000 ova, which, though I had transported them a long distance over a somewhat rough road, were in excellent condition. A few ova near the edge of the original packages were just hatching out as I placed them in the river. This location has been most successful. Two days after I deposited them, three eels insinuated themselves into the enclosure; but my Maori friends, faithfully carrying out the promise they made me to watch closely for every enemy, whether eel, duck, shag, or kingfisher, caught them at once, but not before they had swallowed some of the ova. For, on cutting them open they took out some ova which they put again in the enclosure, and which have since hatched out. And by way of "utu" or payment as they term it, the Maoris immediately cooked and ate the enemy, since when the place has not been molested. Every duck or shag that made his appearance was at once shot by these watchful guardians. You will be glad to learn that in this location the success has been complete. As they absorbed the "sac," batches of bright, strong young fish worked their way through the shingle barrier and went up stream, and so on day after day, till now, nearly all have migrated from the hatching ground.

The great success of this third location leads me to the conclusion, that, where you can find a suitable and safe spot in the small shingle streams forming the headwaters of the main rivers, it is much more advantageous to place the ova there, than in any more artificial hatching ground.

Pardon this long account, with which I should not have presumed to trouble you, unless Mr. Creighton had conveyed your request to me.

I believe the localization both this year and last, of the salmon in this colony to be completely successful, and for this great boon, filling as it will, our beautiful but barren rivers with this most valuable fish, and providing abundance of wholesome food for the present and coming generations—we have to thank the noble and disinterested generosity of the United States people, who by means of their Fish Commission, directed with so much success by your earnest and unwearied efforts, are conferring so great a blessing upon people who are strangers to them. In the coming times it will be a grateful thing for us to remember, and a proud memory for you to know, that to the United States this colony will owe the "King of fish."

J. C. FIRTH.

President of the Acclimatization Society, Auckland N.Z.

COMMISSIONERS REPORTS.—We have received and will publish abstracts thereof as rapidly as we can, the annual Reports of the Fish Commissioners of the States of Michigan, Wisconsin, Connecticut, and Minnesota.

CONNECTICUT.—The Senate has just referred in concurrence a bill "exempting breeders of fish from the laws regulating the taking and selling of fish."

PENNSYLVANIA.—The special committee of the Pennsylvania Legislature appointed to investigate matters pertaining to the fish interests of the State desire to receive communications from all persons interested in fish culture, containing recommendations, suggestions, etc. They also invite such persons to meet with the committee in Committee Room No. 10, on January 30th, at 10 a. m.

CURIOUS FEATURES OF FISH OVA.

MILWAUKEE, Jan. 13th.

EDITOR FOREST AND STREAM:—

In my last letter to your valuable journal a description of the State Hatchery establishment was given. In this letter I wish to lay before you and the readers of your journal (those interested in the science of fish culture) some curious features of fish ova. Last fall another gentleman and myself were employed in the procurement of fish ova for the State Hatching establishment here. In our mode of handling and impregnating the ova, we endeavored to follow what we supposed and believed to be the manner in which it is performed by the fishes themselves. A pan about 13½ inches in diameter by 4 inches deep, with sufficient water in it to float and counteract concussion with the bottom by the egg was the receptacle in which they were taken. The male and female were stripped at the same moment into the pan, by this means bringing the fecundating liquid of the male fish in contact with the ova of the female. As it is claimed by many writers on fish culture that there is an expansion of the egg when it comes in contact with water, you will perceive that the simultaneous evacuations of the male and female prevented such an action on the part of the egg. Again, no pressure of the hand was allowed in stripping the fishes, no eggs being taken except those running perfectly free. Many a female white-fish with considerable ova in their ovaries was thrown aside which might have been taken by a slight pressure of the hand upon the abdominal cavity. This action was taken on our part the better to comply with nature's manner. The water stood about 44° Fahrenheit, and the contents of pans thoroughly shaken to prevent sticking, and after an interval of twenty minutes were thoroughly washed and placed in a large tub free from paint, grease, oil or any other deleterious substances. My reason for going into details is simply to show the care which we exerted in the procurement of the ova. When we had the ova safely landed in the hatching-house and on the trays, we took some of them and placed them under the microscope, and an apparent convolvolution growth was noticeable upon the top of the globules in the inner spheroid; having never seen the like before became alarmed and thought it a blemish. We knew it was not the effect of a concussion, as the outer shell was perfectly clear, and possessed an unbroken outline. What it was or is is the cause of the writing of this letter. Many claim it frost, but on the contrary we have now in the house here some 25,000 eggs which we know to have been frozen solid, and they also possessed this growth I mention, and to-day are in a thoroughly good condition, the formation of the embryo being plainly discernable. This fact places a question on the frost question. Can any of your readers explain the phenomena? In view of all the details herein described, and the manner in which the ova has progressed, we have come to the conclusion that it requires, to insure positive success in taking spawn, that two persons should be employed in taking, and both in same pan. One to tend the female fish and the other the male. In proof of the above

I will say of the great number of eggs procured here, those taken by one operator have the most signally failed of being impregnated, while those taken by two operators have 98 to 100 per cent. been impregnated. Another peculiarity of which I wish to mention is this the ova procured at other places remote from fishery where ova which possessed that peculiar growth was taken, did not possess the same; they were also different in color both exteriorly and interiorly; the one being of a light color; the other a bright golden color; the yolk of the egg resembling that of the salmon, the ova in question possessing the golden color. Some of the ova in question were of a deep red color, and where they mingled with others looked like a streak of blood. As we have much to learn yet in the science of pisciculture, I hope that some one will explain the phenomena herein described, and its cause and effect. COREGONUS.

FEEDING GOLD FISH.

POTTSVILLE, Pa., Jan. 22d, 1877.

EDITOR FOREST AND STREAM:—

I had occasion the other day to call on a friend on business, and as I entered a spacious and gorgeously furnished and decorated hall leading off into an apartment situated on the southwestern end of the mansion, bright with airy comfort, my attention was immediately directed to an aquaria, which contained some half dozen variegated specimens of gold fish. Having forgotten the object of my visit, quite a lengthy conversation ensued, discussing the nature and habits of the fish, and the best possible means for prolonging their lives. He related his theory of feeding, and the essential means of supplying clean, pure water, etc. But notwithstanding his seemingly skillful treatment, a fish now and then would die. I think it is a great mistake to suppose that gold fish in aquaria do not want feeding. They may live some months on what they can gain from the water, but they evidently die of starvation. I have a friend who has quite a large aquarium full of gold fish, sunfish, etc. He feeds them with pulverized calf's liver. A small amount of this sprinkled on the water is very greedily consumed by the fish. He also stated that he has kept fish for years without loss, except by some mishap, giving them nothing but farina in small quantities. Though by experience I have found that they like cornmeal much better, I object to feeding fish much when they are kept in aquaria with plants, and when the water cannot be changed often. The water is very apt to become fouled, more or less, regardless of precautionary means. I prefer a clean tank, in which I refuse to keep plants, but change the water once a week, unless a supplying and washing pipe is attached, washing the tank, shells, pebbles, and sand thoroughly. It is not much trouble, and it is a great satisfaction to have the glass clean and water pure. Fish are much more lively and interesting than those in tanks where the water is not changed so often, and is poorly furnished with oxygen by the plants. With such treatment they are always healthy, and active, all of which I think makes great headway in taming fish.

DOM PEDRO.

A COLOSSAL AQUARIUM.—M. Toselli, the inventor of ingenious grappling irons and other marine apparatus, has devised an ingenious and novel plan for exhibiting his invention under conditions of actual use, and in connection with a mammoth aquarium to be erected at the French International Exposition of 1878. He proposes to erect a circular iron edifice, some 32 feet in height by 60 feet in diameter. In this will be a huge tank, which will be furnished with rocks and marine vegetation, and will contain a large number of fish of all kinds. On the sides of the tank, are to be inserted powerful lenses, and the annular space between tank and building will be divided into galleries, so that visitors in each gallery may look through lenses and thus view submarine life at various depths. In the tank will also be placed M. Toselli's submarine mole, a curious invention somewhat analogous to the diving bell, but which carries its own air supply and is capable of locomotion and also of illuminating the water in its vicinity by means of the electric light. After viewing the descent of this apparatus from the upper gallery, the visitor is to be conducted to the gallery next below. This corresponds to a descent of about 10 feet below the surface, at which point the water still retains its blue color. On the next floor below, a depth of 22 feet is reached, and here the water becomes green, the summits of the rocks on the bottom become visible, and the motions of the huge fish can plainly be followed. On the lowest floor, the visitor will be able to see the interior of the submarine mole as it rests on the bottom, and at the same time will view the sponges, corals and other inhabitants of the ocean bed illuminated by the electric light.

M. Toselli will occasionally wreck a small vessel loaded with ten tons or so of stone, allow her to sink and then will raise her again by a new automatic apparatus, which he calls the air-hydric chain. Visitors will also be carried down in the submarine mole, which is large enough to accommodate four persons.

A TRADITION OF PLUM ISLAND BAR.—That part of Plum Island which reaches at low tide nearly across to the Ipswich side, and known (locally) as Bar Island, has a legend connected with its ever-changing shape that rather knocks science. According to the "oldest inhabitant" it is as follows: Many, many years ago, a fellow named Harry Manis was hired to do a job of work in "Ipswich town," and when finished he not getting, as he thought, his full dues, so blasphemed the Almighty that he was condemned to shovel sand for a thousand years. There is at times a sort of singing sound heard here and said to be Harry grunting over his labors; and whenever the bar changes its general shape, owing to the currents of the river, these people say Harry Manis has shoveled his pile over again. There is also a tradition connected with this old town of Ipswich. In the olden time a certain Parson Whitefield caught the devil in his meeting-house, and chased him up the steeple, from whence the devil jumped to a rock near by. It is said that when the people are bad the footprints of the devil in the rock are plainly seen, but when the inhabitants are good they are invisible.

TEAL.

GLOUCESTER FISHING FLEET.—A statement of the number of vessels comprising the fishing fleet of Gloucester is as follows: Total number of vessels December 31, 1875, 504; new vessels, 30; old vessels bought, 20; vessels lost, 19; vessels sold, foreign, 12; sold to other ports, 15; tonnage, 32,260 tons.

Natural History.

NESTING OF THE HOODED ORIOLE IN COOKE CO., TEXAS.

WE take the following very valuable note on the breeding of a little known species, from a recent number of the *Oologist*. It was written by Mr. G. H. Ragsdale, of Gainesville, Texas, well known to the readers of FOREST AND STREAM as one of our most valued correspondents:—

"During the season of '76 I secured four nests and complete sets of the Hooded Oriole, each nest containing five eggs. The eggs of set No. 1 average .79 by .58½ inch, and the nest was placed at the extremity of a branch in a large red oak, fifteen feet high. The nest was placed above the crotch of several twigs, so that its sides impinged upon the twigs, and to those twigs it was fastened by a long, tough grass, which grows in flat or wet prairies, and is called here "wire grass." The nest is composed almost wholly of this long grass, and as it is placed in a clump of leaves and remains green for several days, the nest is hard to discover. The outside diameter is 4 inches, inside (at top) 2 inches; depth, outside, 4 inches, inside 2½ inches. The eggs are of a pale bluish ground, with a wreath of dark brown blotches about the large end, somewhat resembling the eggs of the Crow blackbird (*C. versicolor*). This nest is lined with feathers.

The second nest was suspended from the extremity of a post oak limb, seven feet high, and measures 3½ inches outside and 2½ inside in diameter; depth, outside, 3½ inches; inside, 2½. It is lined with wool and cotton, not a single feather being visible. The eggs average .83 by .58 inch.

The third nest was attached to the end of a poison-vine, over a stream of water, and is lined entirely with cotton. Average size of eggs, .79½ by .55½ inch.

The last nest was placed in a position similar to that of the first, in the twigs of a cherry tree, twenty feet above the ground, and measures a fraction larger. The eggs measure .78 by .55 inch. The nest differs from the others in having no lining except the grass with which it is built.

I have seen no record of this oriole nesting north of the Rio Grande, or even of being seen this far north. Cooke county is located at the head of Trinity river, five hundred miles north of the mouth of the Rio Grande.

The first was taken May 24th and the last June 3d. The habits of this bird are the same as those of the Texas variety of the Orchard Oriole."

THE BIRDS OF WYOMING.

BY COL. A. S. BRACKETT, U. S. A.

Concluded.

- May 19th—Shoveller Duck, *Spatula clypeata*.
- May 19th—King bird; bee Martin, *Tyrannus carolinensis*.
- May 19th—House Wren, *Troglodytes aedon*.
- May 20th—Say's Flycatcher, *Sayornis sayus*.
- May 20th—White-winged Blackbird or Lark Bunting, *Calamospiza bicolor*.
- May 21st—Mourning Dove, *Zenaidura macroura*.
- May 21st—Cow-bird or Cow Blackbird, *Molothrus pecoris*.
- May 21st—Hairy Woodpecker, *Picus villosus*.
- May 21st—Rocky Mountain Bluebird, *Sialia arctica*.
- May 24th—Mountain Titmouse or Mountain Chickadee, *Parus montanus*.
- May 24th—Chipping Sparrow, *Spizella socialis*.
- May 24th—Green-tailed or Blanding's Finch, *Pipilo chlorurus*.
- May 26th—Yellow-bellied Flycatcher, *Empidonax flaviventris*.
- June 6th—Golden Eagle, *Aquila chrysaetos*.
- July 26th—Red-breasted Snipe, *Macrorhamphus griseus*, Killed by Posey S. Wilson, Esq., at Hutton's Lake.
- July 25th—Coot or Mud Hen, *Fulica americana*.
- July 31st—Arkansas Flycatcher, *Tyrannus verticalis*.
- August 1st—Clarke's Crow, *Picocorvus columbianus*.
- August 1st—Lewis's Woodpecker, *Asyndesmus torquatus*.
- August 11th—Red shafted Woodpecker, *Colaptes mexicanus*.
- August 1st—Blue Grouse, Dusky Grouse, *Tetrao obscurus*.
- August 3d—Night Hawk, Bull bat, *Chordeiles virginianus*.
- September 11—Sage Hens, *Centrocercus urophasianus*.
- September 13th—Yellow Headed Blackbird, *Xanthocephalus icterocephalus*.
- September 23d—A wild duck flying over discovered some tame ones in the creek running through the fort and joined them. The wild duck appeared perfectly satisfied, and remained until forcibly driven off by some meddlesome fellows who had nothing better to do.
- September 3d—Broad Tailed Humming-bird, *Selasphorus platycercus*.
- September 3d—Magpie, *Pica hudsonica*, Seen near Chugwater creek, fifty miles from Sanders.
- September 3d—Mexican or Prairie Falcon; also named Lanier Falcon, *Falco mexicanus*. Killed on the Chugwater by Colonel Brackett.
- October 10th—Ring Billed Gull, *Larus delawarensis*.
- October 10th—Sharp Tailed Grouse, *Pediacetes phasianellus*.
- November 10th—California Grebe, *Podiceps californianus*.
- April 18th, 1876—American Dipper, Water Ouzel, *Gnathypops mexicanus*.
- May 9th—White Pelican, *Pelecanus trachyrhynchus*. Killed on Hutton's Lake. Envergned 88 inches.
- May 15th—Horned Grebe, *Podiceps cornutus*.
- May 23d—Black Headed Grosbeak, *Goniaphia melan-occephala*.
- May 23d—White Crowned Sparrow, *Zonotrichia leucophrys*.
- July 11th—Bullock's Oriole, *Icterus bullockii*.
- April 12th—Cassin's Purple Finch, *Carpodacus cassinii*.
- May 25th—Belted Kingfisher, *Ceryle alcyon*, on the Chugwater.
- May 22d—Robin, *Turdus migratorius*.
- June 1st—Bank Swallow or Sand Martin, *Cotyle riparia*, on Laramie river, near Hutton's bridge.
- July 30th—Cliff Swallows which had been at Sander's all summer and reared their young, disappeared.
- Nov. 28th—A Hairy Woodpecker, *Picus villosus*, which has been here all summer, getting a good living by finding worms in the logs of the houses of which the fort is made, is still at work, and seems determined to put in his winter here. The weather has been very cold, and why this bird does not go South with his fellows is something I cannot understand.
- May 26th—While traveling with several officers, just before sunset, near the banks of the Chugwater, a mile or two above Phillips's Rancho, we saw an immense Golden Eagle near the banks of the stream. It was the largest bird I have ever seen outside of a museum or menagerie, and so thought several of the gentlemen who were with me.

[The Prairie or Lanier Falcon mentioned by Col. Brackett above is at present regarded by most ornithologists as a variety of European *Falco lanarius*, represented in the South by var. *Mexicanus*, and in the North by var. *polyagrus*. The latter is, no doubt, the form noticed. It may be said, however, that an eminent authority on matters

ornithological, in a recently published work, prefers to regard the European and American bird for the present as distinct though closely related species.

Pediocetes phasianellus should, we presume, read, *Pediocetes phasianellus* var. *columbianus*.—ED.]

A TOUGH OWL.

NEW YORK, Jan. 6th, 1876.

EDITOR FOREST AND STREAM:—

On Thursday evening, Jan. 4th, a train on the Baltimore & Potomac Railroad, running at the rate of thirty miles an hour, collided with an owl, who struck a window in forward end of the car, smashing it completely. The little fellow was captured seemingly unharmed and was heard to remark in an undertone "Set 'em up again." R. T. G.

Another correspondent relates that while a "Shore Line" train bound for Providence, R. I., was between Mystic and Stonington, and running fast to make up lost time, a small sized owl, probably bewildered by the locomotive head-light, was caught upon the foot board of the engine, where he was seen and captured by the fireman, and taken into the baggage car apparently uninjured.

A SYMMETRICAL DEVELOPMENT OF FAT IN A STEER.—A correspondent, "M," writes us from Boston, saying: "The first wonder of the new year in Boston market, is an ox four years old, just slaughtered by Holden & Son. He was found to be much more heavily coated with fat on one side than the other, and on opening him the suet in one side was of the ordinary size—about twenty-five pounds—while the fat side contained a suet of the enormous weight of two hundred pounds. No indication of disease existed in any part, and notwithstanding the unequal distribution of the adipose tissue, the lively steer always seemed to have a well balanced mind. The combined weight of beef, hide and tallow, was nineteen hundred pounds."

We do not remember ever to have heard of a case like this, and should be glad if some of our correspondents could give us an explanation of its cause. Has the fact that the stomach in *Bos* is unsymmetrical, anything to do with this unequal development of fat?

WILD GEESSE IN CONFINEMENT.—A correspondent writes: "Speaking of wild geese breeding in confinement, I know of a very interesting case; a farmer up in Ontario county, this State, wing-tipped a wild goose one fall; he cut off the injured part, and the bird became quite a pet. In the spring it called down a mate; the farmer amputated the tip of this one's wing and they raised a brood. When I saw him last he had nineteen, and they were beautiful."

—A correspondent in Central Pennsylvania writes:—

"About twenty-five years ago David Buchanan, Esq., of Washington county, Pa., had about twenty Canada geese that he had reared from a single pair. This shows that they will breed, when domesticated, farther south than Canada. I well remember that the old goose, when sitting, was almost as noisy as the others, and that is saying a good deal. I do not think I ever noticed this in any other sitting bird."

REMARKS—Hon. Stephen Taber, of Roslyn, Long Island, has twenty domesticated wild geese at his shooting box in Worcester county, Maryland, which have the same range as the hens and other barn-yard fowls. Wild geese are used as decoys in many places in Maryland, Virginia and North Carolina.—ED.

MAN-EATING SHARKS.—EDITOR FOREST AND STREAM:—"Some time since some one started the inquiry whether a shark was ever known to attack a man in the water. The following (Bancroft's U. S., Vol. X, page 545) would seem to settle that question: 'Of the poor wretches who were cast into the sea some clung to bits of the wreck; the sharks, of which the fight had called together shoals from the waters round about, tore them all off, and even after the carnage of the day could hardly be glutted.'—JUNIATA."

PARISIAN PALEONTOLOGY.—The lake bed of Saint-Owen, which has hitherto proved very poor from a paleontological point of view, has just furnished Mr. Paul Gervais with an important discovery. In studying the bones collected by Mr. Reboux in Paris itself, in the neighborhood of the park of Monceaux, the learned anatomist has recognized the remains of a large Edentate, belonging to an entirely new genus.—*La Nature* (Paris, France.)

In the last session of the Berlin Anthropological Society, Prof. Virchow presented a communication from Dr. MacLay, on the result of his journey through the Malay Peninsula. In his zigzag course through the mountainous region he repeatedly encountered savage tribes, displaying many points of resemblance with the Nigrillos of the Philippine Islands. Two very interesting physical peculiarities of these savages attracted the traveler's attention. The first was the unusually prominent development of the so-called third eyelid, a feature by no means uncommon among many families of animals; and the second a remarkable inclination sideways of the three outer toes. This latter peculiarity has been noticed in several members of the ape family. In the course of his trip Dr. MacLay reached what he regarded as the highest mountain of the Peninsula. At its foot he found the most numerous remains of the prehistoric Milanese inhabitants, and encountered the dreaded "Bru," an ape above the human size. His accounts possess a special interest, as they supply the first accurate description of what are probably the only continental representatives of the insular tribes of the Malay Archipelago. Prof. Virchow exhibited also a bronze three wheel vehicle, excavated near the River Spree, which was ornamented with oxen heads and birds. Among a large number of anthropological objects shown to the Society, were a collection of outlines of the feet of negroes on the Loango coast, showing in the most striking manner, by comparison with the feet of Europeans, the clipping effects of modern costume.—*Nature*.

—The white whale in Mr. Coup's aquarium, New York, died on Saturday.

Woodland, Farm and Garden.

ORCHIDS.

AMONG the flowering plants that have been introduced into this country for cultivation under glass, there are perhaps none that are more worthy of attention than Orchids. The fantastic forms of the flower in a great number of the species, their exquisite perfume, and the blending of the gorgeous colors of many, together with a general appearance so different from all other plants, at once stamp them as among the most singular of Nature's vegetable forms. Their cultivation is still in its infancy with us, though gaining ground every year. Fifteen years ago the collections of Leinai, Van Vorst, Kelly, Buist, Buchanan and Menand, showed many good specimens, many of which were brought from South America by Capt. Dow, a great lover of plants, trading between New York and Para, and from Mexico, sent by that enthusiastic collector of rare orchids, the late T. Ure Skinner. Some of these have passed under the auctioneer's hammer; still, however, to be found in the collections of Paterson, Rand, Such, Tweedle, Rathbone, Corning and others, all enthusiastic in their cultivation, more especially the latter gentleman, who, at his country seat near Albany, has the finest collection in this country, and indeed rarely matched in Europe. Among the earlier species introduced were *Epidendrum cochliatum* and *Ciliare*, *Phajus grandifolius*, *Cypripedium insigne* and *barbatum*, *Gongoras stanhopeas*, *Dendrobium Lycaste*, *Cattleya labiata*, followed closely by *C. Mossia* in its many lovely varieties. Then the *Odontoglossa* and other varieties from the mountains of Brazil and Mexico made their appearance with the chaste *Pheelonopsis*, *Arides*, *Saccolabium* and *Vandas* from India, till now we have them from all climes, and so persistent are they, so varied in their color, fragrance and time of flowering that to the grower they form a perpetual pleasure, and for richness and novelty among cut flowers are unexcelled. As collections were formed, it used to be no uncommon thing to see plants from the dry West Indian isles associated with others from the moist Brazilian forests, the open prairies of Panama and Honduras, the hot and moist region of India, or the cooler and dryer atmosphere of China or New Holland. All having to conform to a uniform mode of treatment, the result was that though some flowered regularly, others did not flower at all. This led cultivators to study more closely the wants of each individual species and its requirements in its native habitat, and the result has been that plants are now cultivated as much as possible separately, so that those which did nothing but grow when kept too close, and without the light and air necessary to solidify their growth as it was formed, are now induced to bloom freely in their proper season. Indeed, even those from India, Ceylon, and the Eastern Archipelago, that have until lately received a very moist and warm temperature, and which generally do not require a season of rest, are found to grow better, bloom more freely, and to be less subject to that dreaded disease, the "spot," by receiving much more light and air and a cooler temperature that has generally been conceded as necessary to their growth and well doing.

POULTRY FOOD.—Fowls are exceedingly gregarious, and when allowed to roam about, feed on many vegetables or weeds that it rarely falls to their lot to obtain. Especially, is this the case with strong half-grown chickens, as these are most voracious, and seem never to tire of feeding. In well-kept gardens chickens are most undesirable visitors, but in grounds that are not "kept," in a garden sense, but are simply cropped in a rough way, they do little harm, and doubtless much good. As soon as let free in the morning they set out in search of insects, and, if observed, it will be seen that they pick up myriads of these, especially small slugs, caterpillars, and other destructive vermin. In return for this benefit it is well to allow them the pick of a piece of cabbage, or any rough kind of the Brassica family, as they are ravenously fond of certain kinds of green food. It is my experience, however, that their taste among the many plants found in a garden is a rather limited one, and the greater the range given the less mischief done. Grass is to them indispensable, the eagerness with which they devour it shows this to be the case, and where plenty is provided they less affect garden produce. All refuse trimmings of Cabbage, Broccoli, and other green stuff should be thrown to them away from the crops, and they will leave nothing of the leaves but bare stems. Small Potatoes and parings boiled up, then drained dry, and mashed with topplings, make capital food to be given once a day, and if a little grit gets mixed with it the fowls are none the worse. I have been surprised to see their excessive fondness for the soft, woolly-like leaves of the *Arabis albidia*, and as it is a very hardy and free-growing plant its cultivation is worthy the attention of poultry fanciers. Where there are poultry kept but little refuse food of any kind need be wasted. D.

The New York Horticultural Society holds its next regular meeting at its rooms, West Thirty-third street, near Broadway, on Tuesday, Feb. 6th, at 3 P. M. We are in receipt of their schedule of premiums for this meeting, and understanding they expect quite a good display of Hyacinths, Cyclenues, &c., if the weather is favorable, we hope our friends will avail themselves of the opportunity to see what the society is doing for the advancement of horticulture.

FATTENING AND KILLING FOWLS.—Although the manner of fattening poultry may seem easy, yet there is, nevertheless, a right and wrong way, a long and a short mode, of accomplishing the object desired. Never let poultry forage or shift for themselves for at least ten days before killing, for they are apt to range in the barnyards and pick up food, which permeates all through the bird, its flesh frequently becoming so tainted that it is unfit to be eaten. The best method for steady and regular profit or for domestic use, is to keep them constantly in high feed from the beginning with plenty of clean, cool water; then they are always ready for the table, with but very little extra attention, their flesh will be juicier and richer in flavor than those fattened from a low and emaciated state, always commanding quick sale at the highest price in the market, a healthful, nourishing, and restorative food.

Some cram their poultry before killing, to make it appear heavy; this is a most injudicious plan, as it shows at a glance the dishonest intention of the shipper to benefit himself and swindle others in his poor effort to obtain the price of poultry for corn; the undigested food enters into fermentation and putrefaction takes place, injuring their sale a great deal more than is gained in weight. Fowls should always be allowed to remain in their coops at least 24 hours previous to being killed, without food; then they will keep longer and present a better appearance. The best food for fattening fowls, old or young, is barley meal, or mixed with equal quantities of corn meal, and fed warm (a small quantity of iron in their drinking water is recommended), which will make flesh faster and more solid, giving it a fine golden color after being dressed. Good food is positive economy.

The best mode for killing poultry, as it "causes instant death without pain or disfigurement, is to suspend the birds by tying their legs firmly to a pole or heavy wire across the killing room, a convenient distance from the floor, and opening the fowl's beak, and with a sharp-pointed and narrow-bladed knife make an incision at the back of the roof, which will divide the vertebrae and cause immediate death. Dry-pluck the feathers and pin-feathers all off, neat and clean, while warm, without breaking the skin, then plunge it into a kettle of very hot water, holding it there long enough for the bird to "plump," then hang it up, turkeys and chickens by the legs, and ducks and geese by the heads. Do not remove the entrails, head or feet. This mode gives the poultry a nice buttery, golden color, that attracts the eye of the epicure.—*Poultry Journal*.

—A large proportion of our choice winter pears are obtained from France, Belgium, and the Channel Islands, but during the past week samples of Easter Beurré have been received in good condition from California, and larger consignments are expected; henceforth, therefore, Continental fruit growers, to whom we pay thousands of pounds annually for pears alone, will have to compete with the growers of the Western States of America, who have cheap land and moderate transit charges, and one of the best of all climates for choice late pears, these being likely to keep and travel better, owing to their having been ripened in a drier and more sunny climate than even that of Southern Europe. Newtown pippins are beginning to get scarce, the prices now realized for them varying from 30s. to 40s. per barrel; brightly colored Baldwins fetch about 22s. per bushel; russets, 25s.; and culinary sorts, such as Spitzbergen and greenings, realize 22s. 6d. per barrel. Blenheim orange pippins now bring from 8s. to 10s. per bushel, and French Dieudonnés and Remettes 12s. per barrel. Apple culture at half these prices would be more profitable than the growth of timber, and yet, while thousands of acres are being yearly planted with trees for timber, how seldom do landed proprietors ever plant an acre of apple trees!—*London Garden*.

—The *Album Benary*, published by M. Ernst Benary, of Erfurt, is a new publication to be devoted to the illustration of the choicest kinds of vegetables by means of chromolithography. It will consist, in the first place, of figures—with the names given in the English, French, German, and Russian languages—of vegetables which already have a high reputation for excellence, and to these will, from time to time, be added those new varieties which may have been found, after careful trials, to be entitled to a permanent place among the inmates of the kitchen garden. When we state that the colored illustrations are executed by M. Severens, of Brussels, whose skill in this art is well known, we shall have borne evidence to their excellence. The utility of these colored plates to the dealers in vegetable seeds will be at once apparent; and, in many cases, they will be useful in the garden as evidence of the possession of the true kinds of the different vegetable crops.—*Gardner's Chronicle*, London.

WINTER CARE OF HOUSE PLANTS.—A lady correspondent of the *New York Tribune* gives in that paper some excellent suggestions on the care of house plants in winter, from which we make and extract:—"Always give water just before the sun reaches them, and be very sure to use warm water. On bitter cold days I give no water unless there is danger of their drooping for want of it. Baskets require a great deal of water, and I generally give it them twice a day. Boxes of plants I always sprinkle—never pour water on them. Do not open windows directly on them, so that they are chilled by cold currents of air—remember they are hot-house plants, delicate pets, and the winds of heaven may blow too roughly on them; but be very sure to have your room perfectly ventilated, so that they may have pure air."

"At night leave your room door open, or partially so, unless the weather is exceptionally cold; also put a newspaper between the plants and the window during all the cold weather. I am specially particular about this last item, as then you are protecting from sudden lowering of temperature during the night—a thing which often occurs. At rare intervals give them a little bone-dust in water, or ammonia and water. They should not need this oftener than twice during the winter, if your soil is properly prepared."

"If insects, those terrible little pests, make their appearance, give them a dose of Scotch snuff, or white hellebore, blown on from a bellows, or a shower-bath of soap suds; this last more especially for roses. Pick off any leaves that begin to turn yellow, and put them in the earth about the plant—they soon turn to dust and help fertilize it. The musk plant I keep standing in the sunniest spot I can find, with water in the saucer all the time; this keeps it beautiful. Ferns I put in my darkest, shadiest places and give but little moisture."

CHEAP ORANGES.—The Columbus (Ga.) *Enquirer* of the 5th inst. says:—"A new York merchant, in sending some

goods to a Columbus merchant, forwarded some Sicily oranges to try 'what he could do with them.' He has shipped them to a bad market certainly, for there are now hundreds of boxes from Florida, the sweetest and best varieties known, offering at a cent per orange. A sale cannot be found in any of the principal cities. The orange market is glutted, and there is no demand for them. A large dealer told us yesterday he had telegraphed all around, seeking purchasers at a cent apiece. The best he received was an offer of \$3 50 per box of a certain number from Knoxville. It would cost \$3 75 to get them there so they did not trade."

WHIPS.—Jockey and riding whips are made of whalebone and pieces of cane spliced together, rounded to the shape required, and plated over with catgut. Whalebone cut in thin slices is also sometimes used for park whips instead of catgut.

A very pretty and expensive riding-whip, suitable as a present for young ladies, is manufactured from strips cut from the back of a rhinoceros hide, clarified, so as to look like amber, and set in silver or gold, and, if expense is no object, adorned with turquoise or other precious stones. Rough strips of rhinocerot hide are commonly used in Egypt to beat the famous donkeys, and at the Cape to flog bullocks, where they are called gainbacks.

Hunting whips are now made of a variety of woods, and of thick solid whalebone, as well as covered with catgut, like jockey whips. In English woods, blackthorn, oak, holly, and yew are used. The last makes a very neat light hunting whip for ladies. Hunting whips have for private use a buckhorn crook, on the thicker end, with a steel stud let in the under side of the horn, to stop a gate when needful; on the other end is a loop of leather, called a *keeper*, for attaching the thong. Hunting thongs are made of horse leather cut in strips, and platted by hand. The fashions of thongs loosely platted, and of colored brown are comparatively modern. Among foreign woods in favor for hunting whips are Malacca cane, a smooth red, stiff cane, with a very hard bark or natural enamel; rattan, which is jointed, smooth, and of a yellow color. Manilla cane is smooth, cream-colored, and very inferior to the other two. Bamboo is too brittle for hunting stocks.

Small light whips are the modern fashion for those not engaged in hunting professionally, like masters of hounds, huntsmen, and whips. They have come into favor with improved farming and light field gates, that open easily. The hunting whip, it must be noted, should rarely be used to chastise a horse; spurs should be enough for any horse capable of becoming a hunter. A thong is often of great use to hold a gate back, and to lead a horse over an un-jumpable place, or to retain for a time the over eager horse of a lady by an *impromptu* leading rein.—*British Mail*.

TAMING PRAIRIE CHICKENS.—Mr. James A. Storm furnishes some information regarding pinnated grouse or prairie chickens. He says that of all the birds of his acquaintance they are the most easily tamed. He has had them eat from his hand in the space of five or six days from the time they were caught. They will also breed while confined, if provided with a suitable run. He proposes this year to try the experiment of domesticating and breeding them, and thinks they can be raised to great advantage. One object of his experiment is to obtain a cross between them and the bantam. This, he thinks, will give the bantam more stamina and hardiness, making it less liable to disease, as well as tending to keep it of the diminutive size so much sought after. If crossed with the Dominique bantam he thinks the original markings of the prairie chickens will be thereby retained.

The Kennel.

DOGS AT THE CUSTOM HOUSE.—The Customs officers last week seized for non-payment of duties five terriers, brought over on one of the English steamers. This is quite right, as those dogs are brought over merely for profit. There is a difference, however, in the case of high bred pointers and setters. The law admits free of duty all animals imported for breeding purposes, as an encouragement to improving the stock of the country. We trust the Custom House people will bear this fact in mind in dealing with dogs, and make the distinction when necessary, without giving importers too much trouble.

PITTSBURGH BENCH SHOW.—We are indebted to A. H. Lowe, Secretary of the Western Pennsylvania Poultry Association, for a list of awards at the Bench Show, held at Pittsburgh from the 10th to the 17th of January. Unfortunately, however, reporters have an idea that if the name of the owner is given, that of the winning dog is of secondary consideration, so that we are without the names of any of the dogs exhibited. The fortunate owners in the sporting classes were as follows:—

J. W. Knox, Pittsburgh—First premium English Imported Setter Dog first premium English Imported Setter Bitch; first premium Native English Setter Dog.

J. S. Margaron, Washington, Pa.—Second premium Native English Setter Dog; first premium native English Setter Bitch; second premium Native Irish Setter Dog.

Theo. Gray, Allegheny City—Second premium Setter Bitch; first premium Gordon Setter Dog.

J. K. Duncan, Allegheny City—Second premium Gordon Setter Dog; second premium Cordon Setter Bitch; Native English Pointer Bitch.

Thos. C. Perine, Pittsburgh—First premium Native Irish Setter Bitch.

John S. Speer, Allegheny City—Extra Special Pair Irish Setter Pups.

J. P. O'Neil, Pittsburgh—First premium Red Irish Setter Dog.

William Martin, Pittsburgh—First premium Gordon Setter Bitch.

Daniel Arenheim, Allegheny City—Second premium Setter Bitch and Dog Pup.

Chas. Richardson, Allegheny City—Extra Special best collection Pointer Dogs.

D. Dyer, M. D.—First premium Pointer Dog.

Joseph J. Snellenburgh, New Brighton—Second premium Pointer Dog.

Joseph Watson, Pittsburgh—First premium Native Pointer Bitch.

Edward H. Ackley, Pittsburgh—First premium Pointer Bitch Pup.

R. H. Dalzell, Pittsburgh—First premium Cocker Spaniel Dog; first premium Cocker Spaniel Bitch.

A GOOD POINT.—The "point" in our spirited illustration this week will be recognized by all sportsmen. A fast dog catches the scent and stops in his stride with his head over his shoulder in the direction of the birds.

—Sun dogs are very common in the Arctic regions. They are more docile than the common Esquimaux dog, and are never known to bite anybody.

POOR DOLL! Have you seen her? Just before the picture was taken she must have been jammed "end on" between a locomotive and a stone wall. It beats the dachshunds, if that were possible. Now all we want is a portrait of the Otter hound, and Tom Bowling's pedigree to make the "Only Illustrated" perfect. We'll tell the pedigree joke if "Mohawk" don't let Dom Pedro rest on his "Highly Commended" and Centennial honors.

ST. LOUIS KENNEL CLUB.—It will be seen from our advertising columns, that the St. Louis Kennel Club offer for sale their dogs Rock and Elcho. These dogs are so well known as almost perfect types of the highbred English and Irish setters, that it is needless to say a word in commendation of them. Their progeny have so far proved equally good, and to any gentlemen desiring to establish a kennel under most favorable auspices, here is an opportunity such as is seldom offered. Elcho has lately visited Loo II.

DOG POISONED.—Mr. W. H. Wallace, of Titusville, Pa., has our sympathies in the loss of his fine setter Snow, who was poisoned by some miscreant last week. Snow was considered the finest dog in that part of the State, and was by old Bismarck out of Hammet's Kate.

FOX TERRIERS.—Mr. Robert Hume, of Richmond, Va., is establishing a Kennel of these game little dogs. He writes under date of January 26th: "Knowing your interest in those game little fellows, fox terriers, I think you will be interested to hear of my rising kennel. 'Fitch,' by Jester II, is doing well; he was bred by Mr. Porter, of Durham, a prize winner at English Shows. 'Lilly,' by Jester II, bred by Sir Geo. Wombwell. 'Faith,' bred by Earl de Grey, is by Jock out of Nell. Jock was owned by H. R. H. the Prince of Wales, and Nell is by that good dog Blucher. Yours, very faithfully,

ROBERT HUME.

A GOOD POINT.

THE DUTIES OF JUDGES.—The following letter from Capt. John M. Taylor, of Virginia, whose long experience in, and intimate knowledge of, canine matters, entitles his opinions to great weight, contains some very pertinent suggestions regarding judging at bench shows:—

My primary object in this letter is to urge the necessity of keeping performances and tricks of dogs of every kind from off the show bench. What difference should it make to a judge whether a dog can bring a dozen eggs without breaking them? Can he (the judge) tell if the animal can transmit this amusing trick to his get? If a spaniel can retrieve twenty birds in succession from land or water, the bench show is not the place to test it. If a terrier can kill one hundred rats in seven minutes that is none of the judge's affair. The bench is exclusively the place to show the quality of dogs (which, by the way, is a very comprehensive word in fancier's parlance) and it should be inferred that if an animal shows this "quality" in marked and undisguised form, it is fairly to be supposed that it can transmit this "quality" to its progeny. This high class condition and symmetry being equal in two dogs, the points having been judged alike, the best bred dog of the two, which means a champion of champions, like Palmers-ton, the Irish setter, or old Blue Dash, the Laverack, or Rattler, the fox terrier would be placed first.

I notice the letter of your correspondent "Roamer" in last week's issue, on Bench Shows. It is very much to the point with, I think, one exception. He says, in substance—"Why not give and publish the points as judged to every dog in the show?" Taking the Baltimore show as an example, although the entries were not large, yet the judges would have had to write down some 7,000 extra figures and a multitude of words. These figures in the coming New York Bench Show would most probably have to be quadrupled. Therefore, I trust the exhibitors will be satisfied at present with the points in judging of "firsts," "seconds," V. H. C. and H. C. JNO. M. TAYLOR.

THE GIRONDIN DISINFECTANT FOR KENNELS.—Mr. Chas. Lincoln, Superintendent of the Baltimore Dog Show, writes a letter to Messrs. James Meyer & Co., in which he says:—

"I used your 'Girondin Disinfectant' and found it an excellent remedy, fulfilling, as far as the Dog Show was concerned, all that you claim for it, and I shall confidently recommend it to all shows where I go. Yours truly

CHAS. LINCOLN, Supt. Baltimore Bench Show.

SPRATT'S DOG BISCUITS.—The growing popularity of this healthful and compact food for dogs is shown by the fact that Mr. F. D. de Luze, the agent has received by a consignment per S. S. Holland, this week, no less than five tons of the biscuit. Bench Shows have had much to do with the increase in the use of Mr. Spratt's preparation, and few sportsmen visit the plains for "chicken" shooting without taking a supply.

DEATH OF FORTE.—All visitors to the Centennial Bench Show will remember the fine pointers exhibited by Rev. H. C. Berg, among them Tell and Forte. We regret now to have to announce the death of the black and tan bitch Forte, a regret that will be shared by all lovers of fine dogs.

FINE DOGS FOR SALE.—In another column will be found an advertisement from Mr. G. Lowe, Secretary to the English Kennel Club, offering for sale two splendidly bred bitches, one a pointer and the other a setter. We are in possession of more particulars regarding these dogs than could appear in an advertisement, and will be happy to impart it to any of our readers who may think of purchasing.

—We regret to learn from Hartford of the death of Mr. T. Sedgwick Steele's fine setter dog Jeff. He strayed from home last week, and was killed by a passing train on the H. P. and F. Railroad. Finely trained, affectionate dogs are not so abundant in this country but what their loss is hard to replace.

Mr. W. J. Wright, of Duxbury, Mass., claims the name of Marquis for his black and white Gordon setter out of Mr. Ellerton Dorr's Don and Lady; born October 30th, 1874.

SANTONINE VS. WORMS.

CASE 2.

INDIANAPOLIS, Ind., Jan. 15th, 1877.

EDITOR FOREST AND STREAM:—

Joe, a vigorous setter pup of English antecedents, aged four months, was taken sick about the middle of December last. The symptoms were: loss of appetite, nausea; occasional vomiting, and a short hacking cough. These continued individually or in the aggregate, with the addition of occasional diarrhea, until Jan. 4th. He was then considerably emaciated, hair standing on end, back humped up, abdominal muscles retracted and constipated. His breathing was labored, the expirations being protracted and wheezing, which could be heard across the barn. He labored like a wind-broken horse, or a human subject affected with a severe attack of asthma. These symptoms had been present for three days.

I gave him one and a half grains of santonine in a little sweetened milk in the evening. The next morning his breathing was considerably improved. The santonine was repeated morning and evening, on the 5th. On the morning of the 6th his breathing was natural, and during the night had an operation from his bowels, the discharge being hard, white, and contained one or more round worms; the mass was frozen so that I could not determine definitely as to the number of worms passed. On the morning of the 7th I gave him an ounce of castor oil, which operated several times freely. Several round worms were passed, and a multitude that I could not did not number of *ascari-des*, or small thread worms. Nausea and vomiting, after taking food, continued for a day or two, but when this was given to him in small quantities it was retained, and all symptoms of disease gradually passed away. He is now feeling well, and is fast regaining his flesh and vivacity.

REMARKS.—The remarkable feature of this case was the derangement of the respiratory functions. I never saw a more marked case of asthma. The prompt relief to these symptoms following the administration of the santonine was striking. The case is interesting in showing the great diversity of symptoms that may be produced by worms. *Althenmeatics*, or worm remedies, are simple and easily administered, and in all cases of sickness of young dogs, that cannot be traced to some direct and sufficient cause, it would not only be

safe but wise to administer some of them. I believe that I lost the first case reported by putting off the use of them too late.

H. G. CAREY, M. D.

—It is said that a well-known novelist lately entered a printing office and accused a compositor of not punctuating properly, when the typo earnestly replied—"I'm not a pointer, I'm a setter."

—Mr. John G. Skinner, of Oswego, N. Y., has purchased of Mr. J. H. J. Doane, of New Bedford, a fine Gordon pup, black and tan, for which he claims the name of Luke. He is by Tom out of Chloe.

SOUTH CAROLINA.—Mr. E. S. Wanmaker, who is now in South Carolina breaking a large kennel of dogs, writes us from Millett, Barnwell county, under date of Jan. 18th, as follows:—

"The weather has been *hot* here for the past ten days—about 85°—and a fellow can't stand, much less the dogs, the great and sudden heat. The atmosphere is sultry and debilitating, and although one discards flannel, throws away bed clothing, opens every door and window, still its too warm for retreshing sleep. One of our hot, sultry, nights in August, north, will compare favorably with the weather we are now having. The birds (quail) are more plentiful than I at first believed, but, as I before stated the shooting is exceedingly difficult where a bag is the desideratum. The birds feed morning and evening in the pea patches, corn fields, and broom corn, or sedge grass, bordering the timber, swamps, and oak barrens, and when flushed seek cover therein. They, in many instances, would offer good sport when there, were it not for the leaves which cling tenaciously to the scrub oaks, which prevent you from seeing the birds when they flush long enough to cover with any certainty of getting the bird. The prevailing, aye, the only mode by which they are hunted by the natives, is from horse or mule back. Every one goes mounted and spurred. The dogs are half bred, mangy pointers, who go racing about regardless of master or game, but who, nevertheless, when winding game, draw up carefully, and point staunchly, giving the sportsman ample time to ride up, dismount, and get his shot. Speed is requisite, as the man moves rapidly from plantation to plantation, and field to field, and often travels 50 miles daily. On such occasions it is common to find from six to twenty covies of birds, and to bag from twenty to two hundred of them to a gun. There are not many bird hunters in this county, and few dogs (bird). Fox and cat (wild) hunting is one of their favorite sports, and several gentlemen own packs of hounds, in number, ranging from five to twenty. I am to go shooting to-morrow with a party of three gentlemen, all to be mounted, and am promised two days of extra fine sport and very many birds. Was out one day shooting from wagon and found it easy and a pleasant way of getting over and covering the ground. However, I always feel myself competent to walk down the best dog I ever saw, in time, and where a man hunts daily, a change of animals is a necessity. Besides this a dog is perfectly uncontrollable (not having been previously well broken) when hunting with his master mounted, and I don't take stock in any such way."

The dogs in Mr. Wanmaker's hands were all doing splendidly.

CAREFUL RETRIEVING.—A correspondent writes from Waynesburg, Green county, Pa., under date of Jan. 26th, as follows:—

"I have just read that item in the last FOREST AND STREAM, taken from the Newark Advertiser and it reminds me of what Flight and Bob, two setter dogs, that I have had in my care for about three months, can do in the way of careful retrieving. Bob, a fine young black, tan and white Gordon setter, was recovering from a severe gunshot wound when I took them out one Sunday for exercise. They found a covey of quail; I walked in and flushed them; marked them down and followed. Both dogs pointed. I could see Flight's bird, but Bob's bird had taken refuge under the snow; he was pointing with his nose within a foot of the break in the snow. I told him to 'get it up,' when he made a dive into the snow and caught the bird. I told him to 'fetch' and took the bird from him, a fine plump cock quail with scarcely a feather ruffled. I carried that quail home in my pocket, put him in a cage and kept him for a week or two, when one day while cleaning out his cage he made his escape. He flew 40 or 50 yards, lit on the ground and ran behind an out-house in the garden. I called Flight, and without going off the porch where I was standing, pointed in the direction the bird had gone and told him to 'go find and fetch.' He went and came back in five minutes with the bird alive and well. A few days afterwards the bird escaped in the same way. This time he flew against the high fence which surrounds our garden, fell to the ground and ran along by the bottom of the fence looking for a hole to get out at. I called Flight again and sent him after it. By this time the bird had reached the gate where he quickly darted under. I ran to the gate as quick as I could, but Mr. Bird was no where to be seen. I told the dog to look for it, and was quite provoked when he crossed the alley and entered an open coal hole two feet from the ground. I was going to rate him when he disappeared in the darkness of the cellar, from which he appeared in a few moments with my bird again in his mouth. I think he hurt the bird this time, although he hardly wet a feather on it, as it died in a day or two after."

The weather has been very hard on the quail this winter, but I have heard of no dead birds being found. I have a dozen live ones, six cocks and six hens, doing fine. Several of the 'boys who like to shoot' have been trapping them since the season closed to keep until spring. Pot hunting is at a discount here. The boys are beginning to have the right notion about these things, and you can accept most of the credit for it."

W. L. ALLISON.

INQUIRER, New York.—1. What formalities is one obliged to go through to enter a dog for the coming Bench Show at the Hippodrome? 2. What is meant when a dog is said to be of the Gibbons' stock? Are these dogs of a distinct strain, or are they only so named as coming from Mr. Gibbons' kennel? Ans. 1. If the show is held you will receive from the Superintendent, upon application, a blank, which is to be filled up and returned to him with the entrance fee. 2. Mr. Gibbons breeds some very fine dogs and as he has had at least one strain for a long time it is perfectly correct to speak of them as "the Gibbons' stock."

Answers To Correspondents.

AVIS, Utica, N. Y.—How many species of birds are now supposed to inhabit the various parts of the globe? Ans. Roughly, from ten to twelve thousand.

G. W. L., Stamford, Conn.—Will you tell me the cost, complete, of a Barnegat sneak-boat? Ans. Forty-five dollars.

W. M., Chicago.—Please give the address of a good sail maker in Philadelphia. Ans. Charles Lawrence, 16 North Delaware avenue, and Lewis Hess & Son, 308 South Delaware avenue.

T. C. L., Little Utica.—Could you inform me where I could procure Verplanck Colvin's "Survey of the Northern Wilderness" with its cost? Ans. Address Verplanck Colvin, Albany, N. Y. The book is not on sale. Price \$3.50.

F. H., Oceola, Mo.—Made inquiry last week regarding his gun, which while distributing its shot evenly, made no centre pattern. A friend informs us that his gun had the same peculiarity until he overcame it by increasing his charge of powder.

UNION, St. Louis.—Give me the pedigree of the Irish red setter dog, Reuben, formerly of Philadelphia, and did he take a premium at the Philadelphia Exhibition? Ans. We have not the pedigree of Reuben, nor can we find his name among the entries at Philadelphia.

WIN CHESTER, Philadelphia.—Where in Pennsylvania would I be most likely to shoot a bear? Ans. Take cars to Lackawaxen on Erie R. R. and drive out into the back part of Blooming Grove township, in Pike county. Go to Westbrook's tavern, and you'll find old hunters there.

F. H., Boston.—Can you inform me whether alcohol will remove paraffine from a lady's silk dress; also from a muslin one? Ans. Ether would be better, but if the silk dress is a colored one there will probably be a stain left. The muslin can be easily cleaned.

E. G. M., Boston.—Can you please answer, through your columns, what will rid a dog of a supposed tape worm. Ans. Areca nut, given in doses of twenty grains each, followed by an ounce of castor oil. If you cannot get it, Messrs. Holberton & Beemer, No. 102 Nassau street, this city, will send it ready for use, with directions.

O. T. S., Saint John, N. B.—I have a dog fourteen months old minus three of his front teeth. Two of these were knocked out by the kick of a horse. The other has been loose for some time and just fallen out. Will new teeth come in? Ans. No, the teeth will not be replaced.

C. S. H., Boston.—What would be the best kind of gun for a person to take either going to Florida or Colorado, a 12- or 10-bore? I want one for small birds and large, if I can obtain one suitable for both. Ans. A 12-gauge would be better than either. If it weighs, say eight pounds, it would answer for ducks.

W. S., Rouse's point, N. Y.—Will you tell me in your next paper what are the best partridge dogs, treeing or other ways, and where I can get one? Ans. There is no particular breed of dog used for treeing partridges. A good setter broken on these birds is the best to shoot over. Ethan Allen, of Pomfret Centre, Conn., has a fine strain of setters for this work.

BUCKSHOT, Pekin, Ill.—I would like to find out through your valuable paper how to rig up something in the line of a sink-box at low price. Ans. A cheap sink-box can be rigged up by making an oblong water-tight box, six feet or more long by three feet wide, and hinging a couple of barn doors on the sides. For a more complete description see *Scribner's Magazine* for December, 1876.

TRAP, New York.—1. What is the fastest time on record for running 100 yards; also for walking same distance? 2. Can you tell me what kind of game can be found in Orange county, N. Y., in November? Ans. 1. Running, 9½ seconds, by George Seward, at Hammersmith, England, September 30th, 1841. No reliable record for walking same distance. 2. Quail, ruffed grouse and woodcock.

J. W. T., New York.—How cheap can I buy a small farm in the State of Minnesota, say fifty or sixty acres, and is there any Government land to be got there? Ans. We are not posted as to Government land in Minnesota, but in several of the northern counties there must be quantities which can be taken up under the homestead or pre-emption acts. Farms vary in price according to the nature of the improvements upon them. From \$20 to \$40 per acre would buy such as you want.

S., Baltimore.—I have made a bet that the pointer, Sensation, cost the Westminster Kennel Club the equivalent of one thousand dollars or more, in currency, including duty, if any duty was paid, and all costs of importation. Have I won or lost? Ans. You lose. The total cost of Sensation to the Westminster Kennel Club was not much more than half the sum you mention. Being imported for stud purposes no duty was demanded.

M., Haw Branch, N. C.—For snipe or quail what length of barrel and what bore would you recommend? Would the size for snipe be suitable for quail? Also what size would be suitable for turkeys, in length of barrels and size of bore? Would a rifle or shot gun be best for turkeys? Ans. For general shooting, whether at snipe, quail or turkeys, the best gun is one of 12-gauge and 30-inch barrels. If it was intended for turkeys principally we should have it choke-bored; if for all the game mentioned have the left barrel choked.

E. E., Galveston, Texas.—What do you think of the merits of the new Remington breech-loading shot gun? Do you consider it a first class gun for general purposes? How does it compare with other guns of American manufacture. Ans. It is contrary to our custom to draw comparisons between guns of different makers. We consider the one you mention first class for the price, and as regards shooting qualities we have no doubt that it is equal to any other of American manufacture.

BRUSH, Baltimore.—Is there a reliable work published on the proper breaking of a dog? While considering myself competent to train a young dog I would nevertheless like the views of a "professional." I wish I could express in some manner not already used of the high appreciation with which I have learned to regard your valuable paper. Ans. You will find in "Diaks, Mayhew & Hutchinson" some capital hints on breaking dogs and their management generally.

F. B. H., Elmira.—My pointer puppy, six months old, was taken sick on Saturday. Symptoms are: Cold nose; froths some at the month; no operation; and this morning I find his throat is swollen up and it seems as if there was a large lump of some kind on one side as large as a lemon; seems to be all right excepting the above. Ans. Apply hot flaxseed poultices to your dog's neck, covering them with oiled silk to keep the heat in; report any further symptoms.

H. S., Central City, Col.—1. Is there an improvement on the Winchester rifle on carrying a cartridge with a heavy charge? 2. Is there no breech-loading gun, made one barrel rifle and one shot? 3. How is W. H. Baker's three-barreled gun (two shot, one rifle)? Ans. 1. One now being prepared, and will be brought out as soon as the machinery is ready. 2. Almost any maker, either foreign or American, will manufacture such a gun to order. 3. We hear it spoken of very highly.

C. E. T., Franklin, Pa.—1. Would you advise a 77 or 90-grain charge for a sporting rifle to be used in Texas? 2. Can you tell me what the fare is from Pittsburg down the Ohio and Mississippi to New Orleans, and from there to Galveston by boat? For the benefit of certain inquirers I would say that they can purchase the new model Springfield rifle, 50 calibre, 70 grains powder from the Great Western Gun Works, Pittsburg for \$22. Ans. 1. We should prefer the lighter charge, as at the distances at which game is killed it is abundantly effective. 2. We do not know; probably \$40 or \$50.

NIMROD, Whitinsville, Mass.—1. What is the fare to Denver, Colorado? 2. Can you tell me where the San Juan mining district in that state is situated? 3. Is that State a good place for a young man of energy, ability and education to settle, and what would be the prospects for business? Ans. About \$60. 2. Southwest of Pueblo, and you can reach it without going to Denver by taking the Atchinson, Topeka and Santa Fe R. R. from Kansas City. 3. Yes, if he had some capital. Sheep and cattle rearing are profitable.

H. W. DE L., Dansville, N. Y.—Can you tell me in your Answers to Correspondents whether Mr. Charles E. Whitehead, Counsel for New York Society for the Protection of Game, is the author of that delightful book "Camp Fires of the Everglades?" Also if the book is still in print. Ans. the book has been out of print for eighteen years or more, and the electrotype plates are destroyed. The author has but one copy, and other copies are as scarce as incorruptible politicians. The gentleman you refer to is the enviable author of the book.

C. R., Milton, Pa.—My pointer dog (eight years old), has a cough, which I noticed about the beginning of December last. I have tried several remedies, but have done him no good. A friend of mine says it is distemper, but I thought it could be seen by the eyes and nose running, which seem to be all right, except the nose being sometimes warm and dry. Have given him salt and water, which makes him vomit a white slime, and seems to cough whenever I take him out. Have not fed any meat or bones for the last two or three weeks. Ans. Your dog probably has nothing more than a cold. Give him a Dover's powder night and morning for two or three days. Sprinkle the powder on the back of his tongue; a little meat (cooked) will do him good.

W. W. W., New York.—1. Frank Forester wrote on Sporting, Horse and Horsemanship, "Fish and Fishing of the United States and British Provinces of North America," "American Game in its Season," two volumes, entitled "Sporting Scenes and Characters," Manual for Young Sportsmen." What other books on sporting did he write? 2. Are "Sporting Scenes and Characters" the same as "Frank Forester and His Friends," or the latter another publication? Ans. 1. In addition to those you have named Herbert wrote "Hints for Horsemen," "Warwick Woodlands," "My shooting Box," and a large number of novels and tales. 2. We think it is the same book.

CONSTANT READER, Newark.—Will you please inform me whether the judges in the Centennial Bench Show have issued their prizes, and did Mr. W. Humphreys, of this town, take any for his red Irish setters, Jack and Belle, and if so, what are they composed of, as I have asked him to show them to me and he has refused on one pretext or another? Ans. The medals and diplomas which were awarded, without exception, we believe, to all the dogs exhibited at the Centennial Bench Show, and also to some dogs entered in the catalogue, but who were not present, have not yet been delivered to the exhibitors. Unless Mr. H. won a special prize (which he did not) he has nothing more than the official announcement forwarded to all exhibitors.

QUAIL, West Lebanon, N. H.—If I put out two dozen quail here next spring, in a quiet place, what sort of shooting do you think they will afford one? Would they be inclined to scatter so as to make it impossible to find them? Would they do well in a light cellar from now until it is time to put them out; and what kind of food ought they to have? Ans. Much depends upon the nature of the ground. If the cover is abundant, with food near at hand, and particularly a swamp, they will be likely to remain. Turn them out by pairs and not all at once, to prevent packing. The cellar will answer, but you must arrange hiding places for them, and feed on buckwheat and rye, with water always handy.

R. T. A., St. John, N. B.—I have a small toy terrier pup, black and tan, which has been running at the eyes, and also has bald patches about his head, and should be much obliged if you would mail me a prescription for him, as I do not see in any of your late journals the proper quantities for so young and small a dog. Ans. One of the best mange remedies we know is comprised in the following formula: Proto-iodide of mercury, 2 drs., lard, 18 ozs., oil of turpentine, 40 drops, coal tar, 5 drs. Anoint the dog with this preparation every other day for three days, allowing it to remain on all day and washing him thoroughly on the alternate days with carbolic soap. Feed on boiled rice with a little gravy, and exercise. A teaspoonful of rochelle salts would do him good.

OLD SUBSCRIBER, Baltimore.—1. Can you tell me of some place on the eastern shore of Maryland or Virginia where I can go about the 1st of March and spend a month goose and duck shooting? I mean the coast of Sinepuxent bay or Chincoteague sound. Ans. Take rail from Wilmington, Del., to Berlin, and wagon six miles to Ocean City. 2. Do you know of any place where I could get cheap board, and the use of a boat and decoys? Ans. At Chincoteague Island, Accomac Courthouse, Horn Town Onancock, Pungoteague and Belle Haven—all in Accomac county, and at Eastville in Northampton county. Capt. Ayres will board you cheap at Ocean City. Capt. Coffin's is a favorite resort also. 3. What do you think it would cost me for a month's stay? Ans. Prices would vary from one to two dollars a day.

S. W. B., Vicksburg, Miss.—1. I have a tent made of eight-ounce Lewall's Osnaburg's that is not quite waterproof. Can you tell me of any preparation that will make it so? 2. What is the difference between a choke-bore and an ordinary shot gun? Ans. 1. We believe the old sugar of lead and alum recipe for waterproofing is about as trustworthy as any. Take half a pound of sugar of lead and half a pound of powdered alum, dissolve them in a bucket of rain water and pour off into another vessel and steep your tent in it, letting it soak thoroughly. If the quantity is not sufficient increase in same proportion. 2. The choke-bore is contracted at a certain distance from the muzzle. Our paper has contained numerous descriptive articles on this subject.

CRABBY, Boston.—1. Is Dupont's powder good for shooting, at 4 cents per pound? 2. Do you know of any place here where I can purchase the game laws for Massachusetts? 3. Do butcher birds kill the sparrows for mere malice or for future want, as I have seen sparrows hung up in trees and bushes with their heads torn off, and generally a butcher bird on a neighboring tree guarding his victim? Ans. 1. We should prefer a finer grade, the one you mention being rather dirty. 2. No, but we can send you for 50 cents "Fur Fin and Feather," with the game laws of all the States. 3. Yes, probably oftentimes from mere wantonness, although they are carnivorous and feed on insects and small birds. No satisfactory explanation has ever been given of their curious custom of impaling their victims.

J. F. T., Bloomington, Ill.—Can you tell me what is good for distemper and worms in dogs? I have an imported English setter pup that has both the distemper and worms. Ans. We know of no better mode of treating distemper than that recommended by Dr. Webb, which is briefly as follows: First, if the symptoms are acute, a dose of calomel, say twenty grains, to open the bowels well, and afterwards small doses, say five grains, or sufficient to keep the bowels moved, bearing in mind that the calomel must not be allowed to remain in the bowels, but that they must be kept open. In addition to this give five grains of quinine three times a day. Feed the dog on oatmeal and meat broth or rice and milk and keep him warm and dry. For worms, we know of nothing equal to areca nut, which must be given in three doses of 2 grains each, two hours apart, followed in four hours by one ounce castor oil. It is advertised for sale in our paper.

G. HILL, Ariel, Pa.—Will you be so kind as to give in your paper a recipe for making rubber cement for patching rubber boots, or can you inform me where I could get a small quantity? Ans. Cut virgin or native India rubber with a wet knife into the thinnest possible slices, and with shears divide these into threads as fine as fine yarn. Put a small quantity of the shreds (say one-tenth or less of the capacity of the bottle) into a wide mouthed bottle, and fill it three-quarters full of benzine of good quality, perfectly free from oil. The rubber will swell up almost immediately, and in a few days, especially if often shaken, assumes the consistency of honey. If it inclines to remain in undissolved masses, more benzine must be added; but if too thin and watery, it needs more rubber. A piece of solid rubber the size of a walnut will make a pint of the cement. This cement dries in a few minutes, and by using three coats in the usual manner, will unite leather straps, patches, rubber soles, backs of boots, etc., with exceeding firmness. The India rubber, unvulcanized, can be obtained at most large stores where rubber goods are sold, and at some drug stores, but we do not believe that the cement can be had ready prepared.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCTRINATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2332.]

Terms, Four Dollars a Year, Strictly in Advance.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 20 cents per line; outside page, 30 cents. Special rates for three, six, and twelve months. Notices in editorial columns, 40 cents per line.

* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, FEBRUARY 1, 1877.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

Trade supplied by American News Company.

CHARLES HALLOCK,

Editor and Business Manager.

NEW YORK PRESS CLUB.—The New York Press Club will give a literary and musical entertainment in behalf of the Relief Fund, at Steinway Hall, on Tuesday evening, February 6th. Mark Twain, who will read a humorous story, Charles A. Burbank, and Charles P. Roberts, elocutionists; Madame Pappenheim, soprano; the New York Glee and Madrigal Club (G. G. Rockwood, Director); Messrs. George Werrenrath and Wm. Castle, tenors; Mr. J. G. Lombard, Bass; Mr. Boscovitz, pianist; the Young Apollo Club, and others, will contribute to the evening's entertainment. Tickets may be had of members of the club, or at the hall on February 5th and 6th.

HOMOSASSA.—The following persons are boarding at the favorite establishment of Alfred P. Jones, Homosassa, Florida, on the Gulf of Mexico. Mr. Jones had one spare room at latest accounts: Mr. and Mrs. Greene Smith and Henry C. Wilson, of Peterboro, N. Y.; Thos. J. Higgins, of Chicago, Ill.; Theodore V. Johnston, Floy Johnston, and Geo. McLean, of Poughkeepsie, N. Y.; Mr. and Mrs. J. Hopkins Smith, nurse and child, Geo. Giles, Louis Giles, Geo. Curtis, Francis Endicott, and Dr. Ferber, all of New York; Bishop Beckwith, of Atlanta, Geo.; Rev. T. G. Weed, of Augusta, Geo.; Mr. and Mrs. Wood, nurse and three children, of Philadelphia, Pa.

—One of the most unique and elegant calendars of the year for counting-house and office use, is that issued by the well-known printing establishment of Martin B. Brown, 201, 203 and 205 William street, and 15 and 17 Frankfort, this city. It is an artistic novelty in color printing, the heading being a beautiful wreath of flowers in eleven different shades, from stereotype plates in close imitation of chromos. Another exquisite design by a different process, grouping a most effective bouquet of moss roses, daisies, forgetmenots, etc., has been presented to us by Dr. J. H. Schenck, of Sixth and Arch streets, Philadelphia.

—Messrs. Thomson & Son, whose specialty is the manufacture of Sportmen's goods, have sent us a copy of their new illustrated catalogue, which contains cuts and prices of almost everything pertaining to shooting and fishing gear. We presume a like favor will be bestowed on all applicants. Their address is No. 301 Broadway, this city.

—The Faculty of Harvard College, it is reported, have at last consented to receive applications from women for admission to the full privileges of the university.

THE BEST COSMETIC.

Many cosmetics have been launched upon the world in quest of public favor, and alas for human nature, have gained it. One will make the complexion clear, another renders it transparent, a third imparts an otherwise indescribable pearly whiteness to the skin, a fourth gives the very hue of health, and a fifth will beautify, even for ever. In two respects they resemble each other very closely. They were and are alike in the appeal they make to human vanity. They are also—as we might expect from the fact of their being one and all designed to take advantage of a weakness—very delusive whenever complexions cannot be reached by constitutional remedies; let the owners look for a lotion which will cure vanity, a something which will give them strength enough to resign with becoming grace their places among the sons of health or daughters of beauty.

For the sake of illustration, we may here introduce a few facts relative to a kindred topic, which were brought under our notice the other day. It appears that among the Hindoos, the girls are remarkable for graceful carriage and finely moulded forms. The explanation is to be found in a very simple although slightly laborious habit. They are accustomed from their earliest years to carry burdens on their heads, and the result is increased symmetry and strength in both back and chest, and greater elasticity of gait. Apropos of this subject we have the following medical recommendation: "The exercise of carrying small vessels of water on the head might be advantageously introduced into our boarding schools and private families, and it might entirely supersede the present machinery of dumb-bells, back-boards, etc. The young lady ought to be taught to carry the jar, as these little Hindoo women do, without ever touching it with her hand." It is not likely that, in our day, the water pail will be substituted for the "pile stupendous" of capillary attractions on the head of the typical modern belles, but the above facts teach a very good moral. They remind us that, better than any of the modern appliances for developing and improving the figure, are the good old-fashioned expedients of exercise and fresh air.

Coming back to cosmetics and the complexion, no external application can be permanently effective, no matter what a vitiated taste may make out of their temporary results. A clear, healthy complexion, can only result from healthy habits. If ladies will persist in indulging in late suppers and later parties, if they resort to any means of creating a fictitious appetite, if they dawdle away their mornings in bed or on the lounge, if, in short, like the immortal Foley:—

They lose their regular estate of sun,
By borrowing too largely of the moon,

all the cosmetics in the world will never do other than throw a thin disguise over their real unhealthiness. All that they can do is to give a very poor semblance of health, and a beauty not even skin-deep. The best cosmetics, let us repeat, are pure air and exercise. There is no reality about any other. They are the only ones mentioned in the pharmacopœia of nature, and the only ones which we can conscientiously recommend. Let it further be borne in mind that they ought to be applied together. In-door exercise is better than none, but it is under the open canopy of heaven, under the light of the sun, and among the free, fresh breezes, that exercise should be taken if its fullest benefit would be reaped.

THE MUSK-OX.

NO one of the larger mammals of our continent is less known than the musk-ox (*Ovibos moschatus*). Notwithstanding the fact that its existence has been established for so long a time, and that it is the largest ruminant inhabiting the extreme northern part of the continent, but little has been added to our knowledge of its structure or habits since Pennant published his admirable description in 1784. All Arctic travelers speak of the animal, and in many cases starvation or scurvy, that almost equally dreadful scourge of Polar exploration, has been warded off by the timely discovery and capture of a herd of Musk-oxen. The species is frequently mentioned in the recently published report of the British Polar Expedition, and as it is so little known we believe that a brief description of this animal will be of interest to many of our readers.

The Musk-ox is about the size of a small two-year old cow, and when fat is said to weigh about 700 pounds. It measures from the nose to the tip of its short tail about five and a half feet. The horns are broad at their base, covering the brow and crown, touching each other for their entire basal breadth, and are bent abruptly down against the cheeks, the points being turned up. The muzzle is covered with short white hairs, instead of being naked, as in the deer or ox. Except on the legs the animal is wholly covered with long hair—so long, indeed, that it almost touches the ground, and gives to the creature an appearance of being very short legged and clumsy in its movement. The tail is very short, and is wholly concealed by the long hair of the rump. The color of the hair is in general brownish black, but it fades on the neck and shoulders to light brown, and on the centre of the back passes into a patch of dirty white. The light colored mark was aptly termed by Capt. Parry, the saddle. Pennant tells us that the hair on the lower parts of the body is no less than seventeen inches long, and it will readily be conceived that with his oddly shaped horns, long hair, and

parti-colored hide, our Musk-ox is a comical looking fellow.

There was for a while some doubt among naturalists as to the relationship of the Musk-ox. Cuvier referred it to the genus *Bos*, thus making it a near relative of our buffalo and the domestic cow, but Mr. Blainville formed for it the genus *Ovibos*, indicating by this name its intermediate position between the sheep and the ox. As remarked by Dr. Richardson, however, "it is remarkable among the American animals for never having had more than one specific appellation, whilst other animals of much less interest have been honored with a long list of synonyms."

The first notice which we have of this species is that by Jeremie, in his "Voyage au Nord." This traveler brought to France a quantity of its wool, which he had made into stockings, said to have been more beautiful than those made of silk. Pennant, however, was the first naturalist who gave anything like an accurate description of the animal. In his Arctic Zoology (London, 1784), he gives a full and detailed description of the species, accompanied by a most excellent figure. He mentions among other things that the Esquimaux make caps of its skin, the long hair of which, falling down over their faces, serves effectually to protect them from the mosquitoes. The interesting account of its habits given by Dr. Richardson in his "Fauna Boreali Americana" is perhaps the best, as it is, the latest detailed information respecting it.

"The districts inhabited by the Musk-ox are the proper lands of the Esquimaux; and neither the Northern Indians nor the Crees have an original name for it, both terming it bison with an additional epithet. The country frequented by the Musk-ox is mostly rocky and destitute of wood, except on the banks of the larger rivers, which are generally more or less thickly clothed with spruce trees. Their food is similar to that of the caribou—grass at one season and lichens at another—and the contents of its paunch are eaten by the natives with the same relish that they devour the 'nerrooks' of the caribou. The dung of the Musk-ox takes the form of round pellets, differing from those of the caribou only in their greater size. When this animal is fat its flesh is well tasted, and resembles that of the caribou, but has a coarser grain. The flesh of the bulls is high flavored, and both bulls and cows, when lean, smell strongly of musk, their flesh at the same time being very dark and tough, and certainly far inferior to that of any other ruminating animal existing in North America. * * *

"Notwithstanding the shortness of the legs of the Musk-ox it runs fast, and it climbs hills and rocks with great ease. One pursued on the banks of the Coppermine scaled a lofty sand cliff having so great a declivity that we were obliged to crawl on hands and knees to follow it. Its foot marks are very similar to those of the caribou, but are rather longer and narrower. These oxen assemble in herds of from twenty to thirty, but about the end of August and beginning of September, and bring forth one calf about the latter end of May or beginning of June. Hearne, from the circumstance of few bulls being seen, supposes that they kill each other in their contests for the cows. If the hunters keep themselves concealed when they fire upon a herd of Musk-oxen, the poor animals mistake the noise for thunder, and forming themselves into a group, crowd nearer and nearer together as their companions fall around them; but should they discover their enemies by sight or by their sense of smell, which is very acute, the whole herd seek for safety by instant flight. The bulls, however, are very irascible, and, particularly when wounded, will often attack the hunter and endanger his life, unless he possesses both activity and presence of mind. The Esquimaux, who are well accustomed to the pursuit of this animal, sometimes turn its irritable disposition to good account; for an expert hunter, having provoked a bull to attack him, wheels around it more quickly than it can turn, and by repeated stabs in the belly puts an end to its life. The wool of the Musk-ox resembles that of the bison, but is perhaps finer, and would no doubt be highly useful in the arts, if it could be procured in sufficient quantity."

The Musk-ox is at present found only north of the 60th parallel, and seems to find its most congenial range of country between 65 deg. and 80 deg. It has been noticed as far north as travelers have been able to penetrate. The species, although at present confined to this continent, seems, at some time in the past, to have been an inhabitant of Siberia, as the bones of this, or a nearly related form, have been found there. It is, however, possible that these remains have been carried thither from the North American coast by floating ice.

In Post Pliocene times the Musk-ox ranged over North America at large, at least as far south as Kentucky, where its bones have been found associated with those of the many wonderful and long since extinct forerunners of our present fauna.

—The Blooming Grove Park Association has a system of Deer Traps leading into the wire enclosure of the Breeding Paddock, something like the funnels of a wire mouse trap, by which the game-keepers report three wild bucks have been caught since the snow fell. This is a cheap and easy method of procuring stock. In the fall, during the rutting season, bucks frequently press their way in, to make the closer acquaintance of the does.

—A Malay boy near Singapore was herding some water-buffaloes when a tiger sprang out of a jungle, and seizing him, would have carried him off, but two old bull buffaloes, hearing his cries of distress, charged upon the tiger and compelled him to drop his prey, thus saving the boy's life.

OBITUARY OF THE LATE EMINENT PALEONTOLOGIST, F. B. MEEK, Including Prof. Henry's Funeral Oration.—On the 23d of December, 1876, one of the most eminent of the scientific men of America passed away. He died within the walls of the Smithsonian Institution, where he had been permitted to occupy rooms for about eighteen years. He had been connected with the U. S. Geological and Geographical Survey of the Territories as a salaried officer for the greater portion of the time since its first organization in 1867.

Mr. F. B. Meek was born in the city of Madison, Ind., Dec. 10th, 1817. His grandparents were Irish Presbyterians, and emigrated to this country from the county of Armagh, Ireland, about the year 1768, and finally settled in Hamilton county, Ohio. His father, with his family, removed to Madison, where he was a lawyer of considerable eminence. His father died when he was only about three years of age, leaving his family in very moderate circumstances. His early youth was spent at Madison, where he was educated at the city schools. From his earliest recollection he was interested in the silurian fossils so abundant in the rocks of the neighborhood of his home. He had then never heard of geology, but studied them with admiration and wonder as to their origin. When he reached his majority he desired some position in which he might indulge his natural inclination for study, but by advice of his friends and against his own wishes he invested the small fund received from his father's estate in business with a merchant of good repute. In the pursuit of his favorite studies his business was neglected, and the consequence was that during the financial crises of 1847 he failed, and lost all of his property. During the years 1848 and 1849 he was an assistant of Dr. D. D. Owen in the U. S. Geological Survey of Iowa, Wisconsin and Minnesota, after which he returned to Owensboro, Ky. In 1852 he became the assistant of Prof. James Hall, the eminent paleontologist, of Albany, N. Y. He remained there until 1858, with the exception of three summers, two of which he spent in the Missouri State Geological Survey. In the summer of 1853 he was sent by Prof. Hall with Dr. Hayden as his associate, to explore the "Bad Lands" of Dakota, and brought back very valuable collections. This was the commencement of that long series of successful explorations of all portions of the west which have continued up to the present time. While at Albany he was constantly engaged in the most important paleontological works, the results of which were published in the proceedings of our learned societies.

In 1858 he went to Washington, where he resided until the time of his death, leaving the city only for a few months at a time, while engaged as paleontologist for the State of Illinois, Ohio, or in field explorations in the far west in connection with the U. S. Geological Survey under the direction of Prof. Hayden.

His publications, aside from the State reports referred to, were very numerous, and bore the stamp of the most faithful and conscientious research. They are regarded all over the world as authority on the subjects of which they treat, and in very few cases have his conclusions ever been questioned. They may be found in the "Proceedings of the Academy of Natural Sciences," Philadelphia; "American Journal of Science," New Haven; "Albany Institute," "Smithsonian Contributions," and various and important reports in the publication of the U. S. Geological Survey for the Territories with which he was so long connected.

He was so modest and retiring that he was scarcely known outside of a very limited circle of friends. His bodily infirmities prevented him from mingling in society, and when he came to die, although his fame as the most eminent paleontologist on the American continent had been acknowledged all over the civilized world among scientific men, his existence was scarcely known to the world at large, and probably hundreds will know of him through this notice for the first time. He was a member of the National Academy of Sciences, and many other prominent scientific associations in this country and in Europe.

The following extract from a private letter addressed to Prof. Hayden by Prof. J. D. Dana, of New Haven, written the day after his death, will show the esteem in which he was held by the most eminent of the scientific men of the present age:—

"Your telegram bearing the sad news of Mr. Meek's death reached me at six this afternoon. A great loss it is to the country, and a grievous one to me personally. What a blotting out of knowledge, artistic skill, untiring energy, moral excellence and friendly impulses! American paleontology has lost, as regards the Invertebrate Department, half its working force at a blow. His complete self-consecration to scientific research and his fidelity to the truth were most delightful to contemplate. Self, with him, was never in truth's way. He has gone before his work was done. But what he had finished was enough for half a dozen ordinary men; a marvellous pile, if we view only the aggregate of volumes and memoirs, but far more marvellous when we look within at the amount of labored descriptions and careful comparisons, and at the almost numberless illustrations, mostly from his own exact and beautiful drawings. I have much personal reason for a grateful remembrance of him. But the long, forward shove which he gave to American geology, through his labors, adds vastly to the debt and makes it a common debt for all who shall hereafter find delight in this science."

The funeral service over the remains of Mr. Meek were held in the Geological Rooms of the Smithsonian Institution, at which time Prof. Henry read a most impressive and appropriate address. Some excellent remarks were made by Senator McCreary and Gen. A. B. Stout, life-long friends, who had known him in his early days in Kentucky. The following were the remarks of Prof. Henry:—

"We are assembled to pay our respects to the remains of

our late associate and friend, FIELDING B. MEEK, and it is becoming in us that these remains should not pass from this building and this room without some special memento of the occurrence.

"He was no ordinary man, and though his existence was unknown to but very few of the thousands of the inhabitants of this city, his fame has been extended to every part of the civilized world. His remains will be deposited, with those of many of the illustrious of our country, in the Congressional Cemetery. It will be unnecessary, however, to mark the place of his sepulchre by a conspicuous monument of marble. It will be sufficient to designate his grave, like that of the illustrious Franklin, with a single slab resting upon the earth, and inscribed with his name. He has achieved for himself a prouder monument than money can ever erect.

"This quarto volume, a Report on the Territory Fossils of the Region of the Upper Missouri," will perpetuate his name in all the great libraries of the world.

"His life has been laboriously and unostentatiously devoted to the advance of science. He did not aim at general learning, but devoted his mental energies with signal success to a single branch of the extended science of geology. He first studied with critical accuracy the living invertebrate of the globe, and in connection with these he devoted his labors especially to the shells found in the different strata of the United States.

"It is unnecessary to specify the value of his labors in this line, since all who are acquainted with the science of geology know that by a knowledge of these ancient remains the relative ages of the several geological formations are principally determined. For this study Mr. Meek possessed peculiar qualifications. He had a mind of general powers consecrated in one pursuit, a well-trained eye to detect the slightest shades of difference, a facility in seizing upon characteristics which would indicate a species, a command of language necessary to accurately describe what he discovered, and a pencil which gave a faithful delineation of the minutest characteristics of a specimen. He possessed an uncompromising love of truth, an untiring industry, and knew no enjoyment greater than that of devotion to the subject on which he was engaged.

"Laboring under a disease of the lungs for several years past he was exceedingly anxious to finish this volume before he should close his career. On this he continued to labor while he sought prolonged days by visits in winter to Florida, and in summer to the mountains of Maryland and Virginia. In his journal we repeatedly find the entry, 'Very sick, but I work on.' Nor did he work in vain. A kind Providence permitted him to finish the task which he had set to himself, and he has left the world wiser, and we trust better, for his having lived. He has for eighteen years been connected with this Institution as a salaried officer, but as an honored collaborator, always ready to render service to the establishment, and while he was increasing knowledge by his individual labor, he was always ready to assist in diffusing special information among the numerous correspondents of this Institution.

"His memory will be honored as long as geology is a prominent object of study, especially in this country, and the simple stone which marks his grave will ever be an object of pious regard to the appreciative student of natural history."

A few but sympathetic friends only were present at his funeral, and the remains of one of the most eminent scientific men of the nineteenth century were borne to their final resting place in the Congressional Cemetery, without noise or ostentation, so quietly that no notice was taken of it by the public press. The last rites were in harmony with his life.

F. V. H.

GAME PROTECTION.

MAINE.—A petition being before the Maine Legislature to repeal the game laws, the Committee on Legal Affairs gave the matter a hearing on the 19th inst. Mr. Manasseh Smith of the International Association for the Protection of Fish and Game, was present and argued against the repeal. His statistics showing the vast destruction of game in Maine to supply the markets of other states, which preserve the game in their own limits by stringent laws, were very interesting and produced a marked effect on the committee. His position that all game is owned by the State and its disposal is a matter for State law was favorably received. The committee will probably report against the repeal. The same committee will report for the repeal of the bounty on bears. The Committee on Fisheries will report a bill to codify the laws relating to fisheries with a commission to consist of five persons, without pay, to report to the next Legislature; also a bill to prevent the killing of seal in Casco Bay.

The annual meeting of the Maine State Association for the Preservation of Fish was held at the Augusta House the same evening. The following officers for the ensuing year were elected: President, W. S. Badger, Augusta; Vice President, C. B. Hazeltine, Belfast; Treasurer and Secretary, J. W. Clapp, Augusta; Executive Committee J. H. Kimball of Bath, Manasseh Smith of Portland, Samuel E. Smith of Wiscasset. The Secretary was instructed to procure a change in the charter so as to include the protection of game within the scope of the society.

GAME LAWS OF NEW YORK.—We are indebted to the Hon. De Witt Webb (and also to another Albany correspondent) for copies of the amendments to the existing State game laws introduced by him into the Assembly during the present session. The bill has reached so far on its progress as a second reading, and after being referred to the Committee on Game Laws, was ordered printed. The first clause in the amendments reduces the open season for moose or deer from five months to three, viz., September, October and November, and allows but one month more—December—in which venison can be sold. It is made unlawful to pursue deer with hounds at any time.

Looking at the dreadful slaughter which has been made of deer in this State, and the comparatively few remaining, and also the fact that the number of persons who are dependent upon venison for meat is constantly decreasing,

we think that in order to save what is left, a reduction in the period of the open season is desirable. As regards hunting deer with hounds, we are not so well satisfied that it should be entirely prohibited. If it is, how are deer to be taken at all? Still hunting, with but few deer scattered over a great expanse of country, is almost out of the question. Certainly no more sport can be more legitimate than putting hounds on the scent of a deer, and having them driven past runways where it is impracticable to follow on foot or on horseback. Let the deer have right of sanctuary when water is reached, and let the lake or pond be as inviolate for the buck as the abbey or monastery was to the fugitive in days of old, but do not stop entirely the manly custom of hunting with hounds, a mode recognized everywhere as the acme of legitimate sport.

Section 2, which refers to the capture of wildfowl, is unchanged as far as the close season is concerned, but an important addition is made in prohibiting the killing between sunset and daylight, or with the aid of any light or lantern. This is one of the amendments proposed last year, and we hope it will be passed.

Section 6 is amended so as to make the close season for woodcock close on July 15th, except on Long Island, where it is to remain July 3d, as before. Why Long Island should be thus favored we do not understand, nor do we think that the date selected is a good one. August 1st would be better, if a compromise must be made; but for our part we should like to have woodcock protected for say three years, until October 1st. This would be ample time in which to demonstrate whether summer shooting is really exterminating the birds. The twelve days more of grace which it is proposed to grant the young broods may work some little good, if it is observed, but why make two bites at the cherry?

Section 7 restores the old close time for quail, viz., October 20th, which is a very righteous amendment. It also make a corresponding general close time for rabbits and hares, which excludes, however, the counties bordering on Lake Ontario and the St. Lawrence river, and the counties of Genesee, Livingston and Seneca. At present rabbits and hares are protected only on Long and Staten Islands.

Section 14, which now forbids the taking of ruffed grouse or quail with traps only, is amended so as to include nets and snares, and it is made lawful for any person to destroy such traps, nets, or snares.

Section 16, referring to trespass, is amended so as to make the trespasser liable for exemplary damages to the extent of \$10 instead of \$100, as now printed, and the same penalty is to be enforced for defacing or tearing down a sign-board.

Section 18 removes the privilege now existing to corporations or manufactories to throw into the streams as much refuse matter as they please. Many of the sections referring to certain localities are changed. If the bill is passed we will print them in detail.

Several new sections are introduced, the first of which makes a close season for crabs from November 1st to April 15th. We do not see that Section 33, the most obnoxious in the whole existing law, and which permits quail, ruffed and pinnated grouse to be sold in our markets until March 1st, is abolished. It is a provision which offers a direct premium for poaching and law breaking in this and contiguous States, and should be so amended as to allow a reasonable time, say fifteen days from the commencement of the close season, and no longer, in which dealers could sell game.

NEW YORK.—The Yonkers Game and Fish Protection Society is one of the most energetic organizations of the kind we have here. Their regular meeting was held on the 10th inst. Among the matters under discussion was the stocking of the Grassy Sprain reservoir with trout, Messrs. Frederic Shonnard, G. L. Morse and G. B. Balch being appointed a Committee to arrange with the water commission for the privilege of stocking and fishing for the members. Alderman Morse, Vice-President of the Yonkers Society, has kindly consented to take charge of hatching in his piscatorial establishment. The officers of the Yonkers Fish and Game Protective Society are: C. W. Torrey, M. D., President; G. Livingston Morse, Vice-President; H. T. Keyser, Secretary; James Ackerman, Treasurer; Alanson J. Prime, Counsel; Frederick Shonnard, Hyatt L. Garrison, R. E. Prime, Dr. G. B. Balch, J. G. P. Holden, Isaac D. Cole, M. F. Rowe, J. A. Sniffin, W. F. H. Getty and W. W. Wilson, Directors.

—A Philadelphia correspondent writes us that the Philadelphia Sportsmen's Club has begun suit against W. W. Jones & Co., Second and Lombard streets, Philadelphia, for having unlawfully in their possession thirty-one and a half dozen quail. Jones & Co. have entered security for \$4,000 with Squire List, and will fight for it. As the birds were shipped from Missouri, and they say they can so prove, where the law allows the shooting of quail until February 1st, some members of the Club fear that they will lose the suit. We are of a contrary opinion, providing that the quail were found in possession of Messrs. Jones & Co., at a date subsequent to the first of the month. The amendments to the game laws which passed the Pennsylvania Legislature, and were approved May 6th, 1876, name, as the commencement of the close season for quail, December 15th. Section 26 of the same act provides for the sale and possession of game, and permits the dealer to have in possession quail, etc., for a period of fifteen days after the close season has commenced. Now, the only quibble that could be made would be, that the act does not say definitely, whether the fifteen days shall

apply to the law of the State of Pennsylvania, or, only to that of any State in which the close season may extend for a longer period. That is, the defendants may claim that, as the laws of Missouri permit quail to be shot until February 1st, that they have a right to sell them until February 15th in Pennsylvania. We think that the second clause of the section, wherein it is *provided* that the possessor shall prove that such birds were killed within the period allowed by the act, or outside the limits of this State at some place where the law did not forbid the killing of the same, covers the point, and makes the meaning of the law perfectly clear. Otherwise, why did it not read simply that it would be lawful to have in possession quail, etc., for a period of fifteen days beyond the time named for the commencement of a close season in any State. In any case, however, the wording of the law is bad as affording a loophole for escape from its intended provisions, and should be altered.

VIRGINIA.—The subject of game laws is now being agitated in Virginia, and the Legislature has appointed a Joint Committee to consider and report an act looking to the better protection of both fish and game. The difficulty is to frame a general law which will be acceptable to all districts, but the severe snows of this winter, which have extended also into Virginia, show the necessity not only of stringent enactment, but of care and forethought on the part of land owners to preserve the quails. Brunswick county has a Game Association, under whose auspices local laws have been passed. In their district the following close seasons, which we find in the *Brunswick Advocate*, are observed:—

1st. The general law of the State which forbids the killing of deer from the 1st of January until the 15th of July.

2d. The statutory provision which forbids the killing of wild turkeys from the 1st of February to the 15th of October.

3d. The amended statute which absolutely forbids the netting and trapping and otherwise destroying partridges for five years, and permits them to be shot only from the 15th of October to the 1st of January.

FLORIDA BIRDS.—Mrs. Harriet Beecher Stowe writes a pathetic appeal to the *Semi-Tropical* on behalf of the song and other birds of Florida, and concludes by saying: "Who now will appear for the birds? Who will get a protection law passed that will secure to us the song, the beauty, and the usefulness of these charming fellow citizens of our lovely Florida?" We noticed in our last issue the fact that our correspondent "Al Fresco" and other Florida sportsmen were preparing a comprehensive game law to be submitted to the Legislature of that State. In its provisions we are confident that the mocking bird, the red bird, the nonpareil, and all others which delight the ear with their song or the eye with their bright plumage, will find ample protection. It will remain for all good citizens then to see that protection is something more than an empty word.

SAVE THE QUAILS.—A correspondent sends us from Philadelphia the following curious instance of severe weather driving a quail to very unusual haunts:—

"I have just been reading with much interest the editorial in your last issue entitled 'Save the Quail.' As an evidence of the importance of farmers and those interested in the preservation of game, doing something to save our game birds from starvation, I write to mention that yesterday afternoon I saw a quail walking along the sidewalk of Logan Square in this city, and picking up crumbs, &c., thrown out by the neighbors for the sparrows. The bird finally entered the square and I lost sight of it. Logan Square, as you probably know, is in a densely populated and closely built up portion of the city, and the poor bird must have been badly starved before daring to venture so far into the midst of civilization.

"A friend, who lately spent a few days near Oxford, in this State, relates that quite a large bevy of quail would come daily quite close to the house to pick up food thrown out to them. Game protective associations, I should think, could easily carry out such a plan as you suggest for feeding the birds during cold and snowy weather and save many of them for future sport and food." R. S. R.

Another correspondent writes from Bridgewater, Mass:—

"I came home the first of January, this year, and thought I would see if there were any quail left over from the fall shooting. I went out and within a radius of one-half mile of the house I found four flocks, in one there were three or four left, in another eight, another ten, and one bevy within 400 yards of the house contained twenty-four birds. This last flock had probably been overlooked by nearly all the gunners, there having been but seven birds killed from it. I saw a number of places where the quail had after flying a short distance buried themselves in the snow, it being just like flour, and from the looks of the places, should judge they stayed there all night. That night came a snow storm which turned to rain and sleet, forming a thick crust which I am afraid made a grave for most of the quail in this section, as I have not been able to find a single bird since. If I had been at home a few days earlier I could have prevented it, but as it was I was just too late, and I am very much afraid my quail shooting next year will be poor.

"Now if there are any of your readers so situated that they can keep quail through the remainder of the winter months I advise them by all means, whether they enjoy the fall shooting or not, to take it upon themselves to look after the interests of the game birds in their section during the remainder of the cold weather, and look especially after the quail, they will not stand the long cold winter like the ruffed grouse, and something should be done to alleviate their sufferings." C. A. R.

A Connecticut correspondent writes:—

"Your valuable journal is continually placing our sportsmen and lovers of out-door sports under obligations for its noble efforts to preserve our game birds and fishes, and your article in a late number of *FOREST AND STREAM* en-

titled "Save the Quail," is very reasonable indeed. Here in Connecticut we appreciate and understand very well how important it is to do something for poor "Bob White" during this severe winter, and the daily press, notably the *Courant* and the *Times* of Hartford, are doing good service to save our quail. The *Hartford Courant* published an appeal to the farmers, and very soon after received a letter from a gentleman who says, 'He has now thirty quail which he has trapped and is taking care of until spring, when they will be released.' I know of some other farmers in New London county, who have one or more bevys which are fed regularly every day. At one farm the lady of the house has between thirty and forty quail boarders, who appear at the kitchen door every morning for their breakfast. They are her pets, and I am sure receive as good, if not better, fare than is usually bestowed upon the barnyard fowl. Every one who can, should do something for 'Bob White' this distressing season, even those who dwell in cities. The city sportsman who enjoys his October vacation, can do something by hiring some trustworthy person to trap and keep over a bevy of quail, or at least to furnish the starving birds with a square meal occasionally. By doing this our city friend would be surprised at the increase of quail when he visits his hunting grounds next fall.

VON G.

The *Baltimore Sun* says:—"The Philadelphia Sportsmen's Club has secured 500 live quail for distribution among their members, to be put out in the spring, as without doubt the recent severe weather has destroyed many, and unless some such action is taken the prospect for quail shooting next season will be very poor. The same practice has characterized sportsmen in other sections, notably in Western Maryland and the Valley of Virginia, where huntsmen are paying liberally for trapped birds, which they propose to feed during the winter and turn loose in the spring. In Southern Maryland, it is learned, the flocks have not been decimated as much as was feared from the cold, and the true sportsmen are feeding and taking all the care of them possible."

Connecticut is not far behind, and we learn from the *Norwich Courier* that "the most extensive feeding of quails to preserve them from the severity of the weather, which has yet been reported in the State, is in Middlesex county where five farmer sportsmen are now feeding in rooms in their houses over thirty-three dozen quails for the purpose of breeding next spring, and one farmer is feeding three flocks of about forty under juniper bushes in a pasture lot. Another has quite a number under his corn house, that come out and feed regularly with his hens."

A North Carolina correspondent writing from Morgantown, under date of January 23d, says: The weather here has been fearful, twenty inches of snow fell, and fourteen inches of it remained on the ground for two weeks, the mercury being one morning down to 8° below zero. The poor birds suffered, many being frozen, and more killed by hawks, pot-hunters, and other vermin. I heard several boasting of killing a whole covey at one shot. I have done what I could, and have one hundred and twenty-eight quail which I am keeping for seed. It is surprising how tame they soon become. When I whistle some of the old cocks answer at once, and the moment food is put in they go to work like so many chickens.

GEO. H. MORGAN.

It is not often such severe cold is found as far south as North Carolina. From Massachusetts we learn from our correspondent, "Concha," that "the snow storms of the past month and severity of the weather, have proved fatal to many of the quails that were so very plenty in the fall. The trouble is, that in a storm, as the birds cluster together on the ground under a rock, or by the snow drifts over them, they perish of starvation. I saw, two weeks since, in a neighboring town, a flock of twenty-three come into the barnyard and feed among the rose bushes and the litter of the barn."

We regret to learn from our Niagara Falls correspondent that "the prospects for quail shooting the next season are very poor indeed. The early freeze and heavy snow must have made sad work with those that were left over, and they were very few. If there is not something done to replenish them, there will not be enough left for a square meal for a fox next season."

Our object in printing so much of this correspondence on the quail question, is that sportsmen in one section may see what those of another are doing to preserve the birds and profit accordingly. Our London correspondent, whose letter will be found in another column, puts the question very pertinently when he says that "protection" is not confined to merely passing a game law, and occasionally punishing an infringer of the close season, but in studying the habits of the birds and taking measures to restock and propagate.

BLACK BASS.—A correspondent writes us from Fall River, that "last week, Bigg & Dunham, of New York, shipped a lot of black bass to this place. Are such things allowed in New York, if so, where are the game protection societies? The parties here respecting the law, immediately returned the fish." The close season for black bass in this State extends from January 1st to May 20th. We see no reason why they should not be as closely protected as trout.

—The Putnam House at Palatka, pleasantly located on the St. John's river, is meeting with its usual favor. Its manager, Mr. F. H. Orvis, has enjoyed deserved popularity for many years among summer and autumn tourists in New England, as proprietor of the Equinox House, in Manchester, Vt.

—A Muskoka (Canada) correspondent tells us that so far the winter in that section has been unusually fine, only about a foot of snow having fallen; the days clear and bright, with sunshine, but quite low temperature.

Honesty in commercial labels is one of the most important safeguards to seller and buyer. When one reads the brand B. T. Babbitt's Toilet Soap, he may know that it is the best soap for the nursery. Therefore it is safe to reason nothing can equal it for bath and toilet. It is not artificially scented, yet as sweet and pleasant as it is pure and effective.

—Adv.

OUR WASHINGTON LETTER.

FROM OUR OWN CORRESPONDENT.

PROTECTION OF GAME—FEEDING THE PARTRIDGES—BROOK TROUT IN MARYLAND—THE POTOMAC FISHERIES, ETC., ETC.

WASHINGTON, D. C., January 20th, 1877.

THERE are many true sportsmen among the citizens of Washington, and they might be of incalculable value in the protection of game and fish, if they would unite and all work for a common purpose. Pot hunters are becoming more numerous every year, birds are killed out of season and trapped by them at every opportunity, but this could soon be stopped if our sportsmen would take the matter in hand. I believe a sportsman's club was organized here two or three years ago, but it seems to have given more attention to rifle practice than anything else, and has, therefore, not devoted that time to the protection of game which might be expected of the organization. Col. J. O. P. Burnside, a true sportsman and a genial companion, was one of the leading spirits in the club, and it is to be hoped he will take the matter in hand with a view to the organization of an association, the primary object of which shall be the protection of game and punishment of all offenders against game laws. I could name fifteen or twenty prominent gentlemen who will aid in such a movement, and I am sure there is no reason why Washington should not have a Game Protective Association second to none in the country, as to the standing of its members, or in its efforts to preserve game. The very severe weather of the present winter has demonstrated the fact that such organizations can be of great service, by raising means to have partridges trapped and cared for until spring, when they can be turned out to breed. A few hundred dollars would secure and keep a thousand birds during the hard weather, and instead of having them die of starvation in the fields, we would have at least twenty-five birds raised by every pair preserved and good shooting the ensuing fall would be the result.

Recent advices from Virginia are to the effect that in many instances the birds have starved to death. With everything frozen hard, the ground covered with ice and snow, it has been impossible for them to find necessary subsistence. In some cases I have heard of farmers feeding the birds, and if this practice was more general the result would be gratifying. A gentleman who owned a magnificent farm in Virginia, not many miles from Washington, always had plenty of birds on his place for himself and friends to shoot in season because he fed them in winter, and never permitted any one to molest them out of season. I have known of instances where partridges became quite domestic when fed in winter, and frequented not only the barn-yards but the neighborhood of the kitchen door to get their food. A correspondent of the *Baltimore Sun* mentions the fact that in Carroll county, Western Maryland, nearly every farmer has been feeding a covey of birds, and the sportsmen almost to a man, have trapped great numbers of them, which they will turn out in the spring. Some have a dozen, others have twenty, and some have as high as forty or fifty. This same correspondent says: "If the sportsmen of Baltimore will sit down with folded hands, and not exert themselves to protect game when they are dying from starvation and cold, is it any wonder that farmers object to them gunning on their premises to kill up the game which they (the farmers) themselves have protected and kept over the winter? But on the other hand, if the farmers would see that the sportsmen would do all they could to protect birds during the winter, very naturally there would not be as much objection to gunners. The Society for the Protection of Game ought at this time have at least one thousand partridges cooped to turn out in the spring. Parties in the country will trap them at ten cents a bird. I could have bought as many as I desired at that price."

The sportsmen of Washington, by efficient organization and united action, might accomplish a great deal, and there should be concert of action between the sportsmen of the two cities, as they oftentimes shoot over the same fields. Through their efforts wholesome game laws could be enacted, and properly enforced, which would give us plenty of birds in season. Two prominent restaurant keepers in Baltimore were recently arrested and fined for having in their possession partridges out of season. These prosecutions were instituted by the Association in that city for the Protection of Game and Fish.

A good deal has been said and written within the past few weeks as to the poisonous nature of partridges now on account of being compelled to feed upon laurel leaves, which are regarded as a deadly poison to man. A gentleman having some curiosity in the matter, recently dissected the crop of one of these birds, and found it filled with laurel leaves.

The Maryland Fish Commissioner, Maj. T. B. Ferguson, has a number of eggs of brook trout now hatching in the propagating waters at Druid Hill Park to restock the waters of Maryland with that speckled beauty. During the next month the young fish will be given to applicants free of charge, but a description of the waters to be stocked, extent, locality, source of supply, into what stream or bay they are discharged, character of bottom and water grasses, kind of fish now inhabiting the waters, etc., must in all cases accompany the application for the young fish. The Commissioner will decide as to the adaptability of the waters and localities. In distributing them preference

will be given to public streams and to clubs organized for protecting game in the State. There are numerous streams in Maryland well suited for trout, and there is no reason why they should not be filled with them in a few years; but there must be protective laws for fish as well as game. Can it be that in our rapid progress as a nation we are paying less attention to the preservation of fish and game than our forefathers did a hundred years ago? In the compilation of laws relating to the protection of the fisheries alone it is shown that the authorities of Massachusetts from 1623 to 1857 passed 359 acts for the protection of food fishes. Protective laws of Great Britain date back to the middle ages, and certainly our National Legislature, as well as State authorities, should see that ample protective laws are made and enforced. The preservation and propagation of food fishes especially is a subject of national importance, and deserves more attention. Our able Fish Commissioner, Prof. Baird, is doing all in his power to prosecute the good work, and there is no man more suited to the undertaking, both by nature and education, than he.

Mr. Morrill, of Vermont, recently presented in the Senate a resolution of the Vermont Legislature, declaring that under existing provisions of law and treaty there is no adequate means of preventing and punishing the wrongful destruction of fish in the waters partly within the jurisdiction of the several States and the British Provinces of North America, by reason of which great injury is done to an important branch of industry, commerce, and food supply of the United States. They, therefore, instruct their Senators and Representatives to use all proper efforts to the end of preserving and protecting such fisheries, and the interest of citizens of the United States in the same. The resolution was read and laid on the table.

Mr. Whyte, of Maryland, recently presented in the Senate a petition signed by a number of prominent citizens of the district, asking the passage of a law for the protection of fish in the waters of the Potomac, within the District of Columbia. The memorialists represent that the catch of fish in the Potomac has gradually decreased of late years, until it has reached an exceedingly low point, and that there have been used in the river for years past what are called stake, pond, or trap nets, placed in such a manner as to impede the passage of the fish and entrap them, so that few can pass up the stream. The number of this class of nets increases every year, and many of them during the night have been stretched entirely across the channel, when in no chance of being destroyed by vessels, so that no fish can pass. Gill netting is also followed to a great extent, but this does not interfere so much with the passage of the fish. Both these modes of fishing should be prohibited, and a restriction placed upon fishing with drag nets. The memorialists recommend that the regular fishing season begin on the 20th of March and end on the 20th of May of each year, and that no seine be hauled from 12 o'clock Saturday of one week to 12 o'clock Monday of the following week. They conclude by saying that if the young fish hatched here are prevented from returning to spawn, as they invariably do when they attain their growth, the time and money spent by the Fish Commissioner to restock the Potomac with shad and herring will be in vain.

It was referred to the Committee on the District of Columbia.

Sporting Notes From Abroad.

FROM OUR OWN CORRESPONDENT.

LONDON, Jan. 12th, 1877.

I observe that Polo has been numbered among the few out-of-door sports in which Young America occasionally indulges. And yet it can hardly be expected that it will ever flourish except as an exotic; and the reasons are apparent. Had you a large standing army, comprising many corps of cavalry with officers bred, as are the British, to a love of field sports, it might be possible; but having nothing of this kind, the game must depend entirely for its support upon civilians, with which aid alone it would quickly perish even here. Fox hunting is called the school of the British cavalryman, and it is a rare thing to find an Englishman, unless he is an out and out cockney, who cannot ride. How far is this from being the case, particularly at the North, with you? The personnel of the large clubs of England, that is those which are organized more particularly for out-door amusement, such as polo and pigeon shooting, is made up largely of army officers, a class who from their leisure and as a rule, wealth, are enabled to give them the heartiest support. This, taken in connection with the fact of there being a large class of civilians living under the same conditions as to means and leisure, and also that the love of sport is as innate in a Briton as lying in a Chinaman, explains why the interest in these things is kept up. The time is coming, however, when similar conditions will obtain with you, and the introduction of every new sport or means of recreation, however ephemeral it may be, is another wedge driven into the thick log of puritanical old-fogyism. Polo was introduced into England from India, where it has long been a national game, by the Ninth Lancers, and now the papers record the death from injuries received while playing the game, of Captain Clayton, of that corps, and one of the most popular men of the army. The sad event occurred at Delhi, on Christmas Day, and rather dampened the gorgeous festivities attending the *darbar* at which Her Majesty was publicly proclaimed Empress of India. The worst feature of this and kindred sports is, that only too often

they are attended by fatal casualties. Several deaths have occurred from injuries received while playing football; every once in a while some one comes to grief on the cricket ground, and the broken necks received while fox-hunting are neither few or far between.

By the bye, Mr. W. G. Grace, the celebrated cricketer, who, it is said, is as brilliant in the hunting field as he is before the wickets, had a fall from his horse the other day and was severely injured. I notice from the record that Mr. Grace in eight matches and twelve innings, scored the immense number of 890 runs, his highest number in one innings being 318 runs. This is unparalleled cricket, and has given rise to discussion as to whether the batting has not gone so much ahead of the bowling as to render necessary some modifications of the game which will bring them nearer together. For my part, I think such batting is merely phenomenal, and not likely often to occur.

The entries for the third Field Trial Derby for setter and pointer puppies bred in 1876, to be tried on partridges in Cambridgeshire on May 2d and 3d, have been published. The Kennel Club are to be congratulated upon having induced the large number of 109 entries, and the approaching event is causing as much interest in what I may call Kennel circles as the great three-year-old event does among votaries of the turf. The setters outnumber the pointers at the rate of more than three to one, but the very blueist of the blue blood of both classes are represented. Among the former are a number of puppies from different kennels, the get of Blue Prince, the celebrated Laverack who, if I remember right, was sired by Pride of the Border, now in your country. Mr. Barclay Field has a number in from his Champion Bruce. Mr. Purcell Llewellyn has two of Dans get; and Mr. Macdonald (G. de Landre), Mr. Lort, Mr. Lloyd Price, and Mr. T. Stutter, all names familiar to American breeders, will be represented. The Duke of Westminster, Prince Albert Solm, and Lord Downe, will also compete. Mr. Whitehouse sends some pointer puppies by Rap (now known as Rapid), and Mr. W. Arkwright, another celebrated breeder of pointers, sends two by General. Will you ever be able to have a Field Trial on this scale on your side of the pond? Not, I fear, until you pay more strict attention to preserving your game; not "preserving" to the mere extent of passing a game law, and at long intervals pulling up some wretch for killing a bird out of season, but by "preserving" in the true sense of the word; by studying the habits of your game, and aiding by such means as are within the reach of every dweller in the country their propagation and increase; by turning down birds in districts in which they have been exterminated, and by fostering by every means in your power among land owners a gentlemanly interest in sports of the field. The innumerable Sportsmen's Club or Game Protective Societies, which are scattered over the States, should have a strong influence in this direction; but I judge from the reports I read, that too many of them are organized solely for the purpose of trap-shooting matches among the members.

Among the "sports" which one sees recorded almost weekly in *Bells*, is the old-fashioned one of "Change Ringing." It seems almost a paradox to find what one would consider a portion of a religious service, chronicled alongside a walking match, or, perhaps, a prize fight. How would the following read in the *Clipper*:-

On Monday, November 13th, eight members of the Ancient Society of College Youths, established 1637, rang a true peal of Stedman triples, containing 5,040 changes, upon the bells of St. Stephen's, Westminster, in 3 hr. 10 min. The band was under:- J. Pettit, treble, G. Muskett, 2, F. Bate, 3, S. Reeves, 4, R. French, 5, M. Hayes, 6, E. Horrex, 7, T. Bugby, tenor. Weight of tenor 25 cwt., and called by M. Hayes. On Monday last twelve members of the same company succeeded in accomplishing a true peal of Stedman cinques at St. Giles's, Cripplegate, consisting of 5,014 changes, which occupied 3 hr. 52 min., and was rung by the following persons: H. W. Haley, sr., treble; H. Haley, jr., 2; G. Muskett, 3, J. Pettit, 4, R. Jameson, 5, G. Mash, 6, R. Haworth, 7, A. Wood, 8, E. Horrex, 9, J. M. Hayes, 10, L. Booth, 11, W. Greenleaf, tenor. The above peal was called by H. W. Haley, sr., and is a production of his own. Weight of tenor, 36 cwt. Key C.

But this was nothing to what the Yorkshire Association did at St. Mathews Church, on October 28th, when they rang 9,120 changes of Kent Treble, Bob Major with the tenor together, in 5 hr. and 15 min. It must be grand to hear one of these "changes" ringing from the spire of some old Cathedral.

VAQUERO.

Rifle.

THE RIFLE SEASON.

THE shooting season is not far off and the marksmen of the last busy year are beginning to reflect over their practical experiences, patiently waiting for a suitable time to experiment on some new theory; for American marksmen never will be satisfied, and are always experimenting, either with their rifle, powder, bullets, shells, sights or position—a good point, and one which perhaps affords an explanation of their continued supremacy over their worthy foes, the Irish, Scotch, Australians, and Canadians, in the past friendly battles with the long range rifles:-

"Industry and time their work have wrought,
And honor crowns the skill that labor taught."

Those intending to become proficient in this manly, scientific and fascinating pastime during the coming season are generally occupying their spare time in making theoretical

investigations, and when the time comes will be ready to make practical demonstrations:-

"For vainly shall perceptive rules impart,
A perfect knowledge of this manly art.
Practice alone can certain skill produce,
And theory, confirmed by constant use."

Last year's competitions produced some new shots, who have made scores which are worthy of the admiration of all lovers of good shooting. As for the veterans, we all know how they shoot, and the good shots who will make themselves known in this year's shooting, will make the American team of '77 stronger than any of our previous teams.

There are more American long range breech-loading rifles to satisfy the demands of the shooting world this year. We have the Remington, Sharp, Ballard, Maynard and Wesson to choose from. Then, the composition and weight of the bullets, the quantity of powder to use, and the manner of loading, are all better understood than at the beginning of last year, and more confidence can be placed on the ammunition than ever.

The experience of past practice will be studied for the future and the prospects are, that the American team will hold its leading position during the coming season.

ONICKO.

AN IRISH-AMERICAN MATCH.—The Irish Rifle Association at a meeting held in Dublin on the 22d inst. decided to extend an invitation to a team of American riflemen to shoot again for the championship, the match to take place in Ireland during the coming season. Of course the match cannot be intended for the possession of the Centennial Trophy, as it was definitely decided that this match should be shot in the country of the holders.

A NEW RIFLE BOOK.—We have received from the author and publisher, Mr. Edwin A. Perry, some advance sheets of his forthcoming work entitled "Modern Observations on Rifle Shooting with an Improved System of Score Book, and including silicate slate for use on the Range." Of making rifle books there is no end, and from the scanty instalment before us of the one in question, we cannot conscientiously speak as to its merits. Should the table of contents be carried out, however, it will be unquestionably a valuable ready reference and addition to Range literature. The author's address is care of G. H. Madison, No. 564 Fulton street, Brooklyn.

A dispatch from Montreal announces that the Dominion Rifle Association has decided to present a trophy for competition at Wimbledon which will cost \$750.

THE FLOBERT RIFLE.—A Baltimore correspondent writes:- "I see that one of your correspondents proposes using a 22 cartridge in a Flobert rifle. A gentleman here lost his eye in this way. There is nothing behind the cartridge in the Flobert gun but the hammer, and in the instance I refer to it was thrown back by the explosion, and a part of the shell striking the shooter in the eye, completely destroyed the sight."

E. S.

[In the new Flobert rifle there is, or should be, an attachment, which prevents the hammer from flying back.—ED.]

CONLIN'S GALLERY.—The "Experts" match, which was announced for last Thursday evening, January 26th, took place, and after a very close contest with several of the best "gallery shots" in the city, Frederick Kessler won the prize. The conditions were: 20 shots; rifle 22 calibre; off-hand; distance, 110 feet ready measurement, the best total measurement of the shots measuring from the center of each shot to the center of bullseye to win the prize. Mr. Kessler, who is considered to be one of the best "off-hand" shots in this city or vicinity, made the score of 16½ inches, total measurement of the twenty shots. This is considered very good shooting.

MILEY'S GALLERY.—To accommodate increasing patronage Miley, of Brooklyn, has opened a new gallery under the Park theatre, in that city, and on Monday of last week a rifle tournament was inaugurated there. The distance was 120 feet, at a target graduated to a Creedmoor 200 yards target. Each competitor fired ten shots. The following is a record of the best targets made:-

Name.	Total.	Name.	Total.
D. T. McQuillan.....	39	J. F. Moon.....	37
John F. Burns.....	38	S. L. Brown.....	37
James Connors.....	37	Charles Reed.....	30

The match will be kept open until February 22d, when the marksman making the best six targets will receive a handsome prize.

RHODE ISLAND.—The Attleboro Amateur Rifle Club have held weekly meetings every Saturday this winter at their range on Newman's farm in South Attleboro. They have erected a comfortable building 15 by 30 feet, and from that can shoot 200, 300, 500 or 800 yards. Their shooting through the cold weather has been mostly at 200 and 500 yards. On Saturday, the 20th inst., the following scores were made by members of the club. The distance 500 yards; two sighting 20 scoring shots. The weather was cloudy and misty, with occasional rain; wind blew quartering and variable, requiring from four to eight points. Rifles, Remington, Creedmoor:-

Name.	Total.	Name.	Total.
E. L. Freeman.....	96	G. B. Draper.....	91
F. D. Freeman.....	95	E. L. Sylvester.....	95

Isn't that pretty good considering the season and the weather?

AMATEUR.

[Four scores so nearly approaching the possible 100 are rarely made.—ED.]

CONNECTICUT.—A trial of skill at the humming gyro took place on the ice on Community lake, Wallingford, Ct., last Thursday. The trio of contestants were all of Wallingford, and having the benefit of a fine day, the shooting was very good. The conditions of the match were fifteen ironclads each at 21 yards rise:-

Names.	Score.	Total.
Will Lane.....	11111111111111	15
J. Hall.....	11110110111110	12
J. Spencer.....	1100101111 withdraw.	

—The Brooklyn Union has been informed by a gentleman interested in the skating rink in that city that parlor skating is getting so popular that the rink was not large enough to accommodate its patrons, and that in the course of a week or two he should open two new places, one in South Brooklyn and one in the Eastern District.

Game Bag and Gun.

GAME IN SEASON IN FEBRUARY.

Hares, brown and gray:

Wild duck, geese, brant, &c.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, and Wild Fowl.

;**DIETMAR POWDER.**—A Philadelphia correspondent writes us that Mr. Worth, the gunmaker of that city, loaded him five shells with Dittmar powder and five with black powder. The result of his experiment we give in his own words:—

"I found a fence and stepping off 15 paces fired with one each of the shells. The shot over the Dittmar powder barely penetrated the wood; the black powder sent them clean through the board. I tried it again with the same results, and have also shot at grass plover when I missed the easiest shots with Dittmar and killed with black powder."

J. T.

We are inclined to think that the shells our correspondent used were not loaded properly. The penetration of the Dittmar powder, when loaded according to directions, could give no such results as those named, else why could Mr. Dittmar make such good rifle practice at long range as he does?

FLORIDA—Apalachicola, Jan. 23d.—On a recent cruise down the bay I found game very plentiful, and if this continues good all over the State our sporting visitors will have fine times this winter. We had fine sport with such game as curlews, plovers, snipe, rails, quails, ducks, and geese. A great many deer have been killed out by Green Point and Topsilbluff, distant about three miles from this city. A good dog is needed for the latter, which can be procured here at this place. Pelicans are arriving from their breeding grounds. Oysters and fish are very abundant in the bay and of the finest quality. Boarding can be procured at very low rates.

G. H. R.

PIGEON MATCHES.

LONG ISLAND SHOOTING CLUB.—The first monthly contest for the champion cup of this Club, was shot at the Dexter Park Grounds on Friday last. The conditions were as usual, 7 birds at 25 yards rise, the holder of the cup standing at 27 yards. The following is the score:—

Name.	Total.	Name.	Total.
B. West.....	7	Madison.....	3
Judge.....	7	Gildersleeve.....	3
Dr. Wynn.....	6	Hance.....	3
Van Wyck.....	5	Turner.....	2
Johnson.....	4	Radin.....	2
Walters.....	4	Hemming.....	2
Henderson.....	4	Robinson.....	1

Some sweepstakes shooting followed.

At the annual meeting of the Club, held on Wednesday, the following officers were elected: President, William M. Parks, re-elected; Secretary, Charles Wingate, re-elected; Treasurer, R. Robinson, re-elected; Executive Committee, Messrs. Eddy, Wynn and Gildersleeve. The Club now numbers ninety members in good standing.

—Captain Bogardus is still in California shooting matches, and he apparently has come across some "foeman worthy of his steel." Judging from the telegraphic reports received the Pacific Slope shooters have pushed the champion very close.

NEW YORK.—The Niagara Falls Shooting Club have procured two fine fox hounds from Detroit, but the deep snow has made it impossible to hunt them. There have been several snow bird shoots lately, but not important enough to be worth mentioning in the way of purses or shooting; but there is a match under consideration between the best three of this place and a crack team of St. Catharines, Canada, which I think will be quite exciting.

C. S. R.

PENNSYLVANIA.—A most interesting pigeon match came off at Columbia a few days ago, in which quite a number of gentlemen from Lancaster took an active part. The match was shot on the ice on the river in front of the city. It is greatly to be regretted that there were also present quite a number of pot-house roughs and loafers whose drunken conduct and blasphemous language was not only outrageous in the extreme, but also was the cause of several of the citizens of Columbia calling the attention of the city authorities to the same and asking that in future no such exhibitions be allowed within the city limits. Match for a purse of \$100 in gold; \$50 to first, \$30 to second, and \$20 to third; seven birds each, 21 yards rise, 80 yards boundary, staked off by poles set in the ice; ground trap:—

GEORGIA.

CHOKE-BORED GUNS.

We have received from a correspondent, who is entitled to be heard on the subject, a very lengthy epistle regarding choke boring in general, and Mr. Greener's last work in particular. It contains so much that is of interest to sportsmen that we gladly publish it, but are compelled, on account of its length, to divide it into two parts, the second of which will appear next week:—

BOSTON, Jan. 15th, 1877.

EDITOR FOREST AND STREAM:—

Much was anticipated when it became known that the winner of the *Field Gun Trial* of 1875 was going to express per book form, his opinion upon guns and boring, in fact, about matters interesting to the shooting public at all times. Great, however, must be the disappointment to find that under the cloak of a name that would more than usually excite attention among sportsmen i. e. "Choke-bore Guns." Mr. Greener, the author, has evidently made use of the opportunity by getting those interested in such matters to read through a long protracted advertisement, with an oc-

casional interspersment of something useful to encourage the reader through remaining portions that labor heavily to prove that only from W. W. G. can choke-bore guns be procured with advantage.

Now it is most certainly not my intention to depreciate in any sense the labors of people endeavoring to give to the shooter the best gun to effect a given object. I am quite prepared to admit that through such as Mr. Greener, the sportsmen of England have become aware of some of the advantages which their American cousins have been enjoying, when desiring a close shooting gun, for a long time previous to its advent in that country. I would merely urge that such a book, containing so much personal advertisement, could have been given to the public with a much better grace at half the price, and a division of the advertising portions from those parts which are intended to be useful to the gunner; and that there are such portions, no one, I believe, will dispute.

The first part, which gives passing interest to the reader after running through some minor trials, where little comparison could be instituted, and therefore useless, is the great London Trial of Guns, brought about through the mediumship of the *Field* in 1875, and to those who have not seen it before, it may be sufficiently interesting for perusal. Mr. Greener's winning gun in the 12 choke-bore class most undoubtedly proved itself a good one, but the assertion in the book that guns bored upon his principle give the most regular shooting, suffers a severe check when we find another of his guns in the same class vary between highest and lowest—85 pellets, in each barrel; in fact the one gun beats the other by a matter of 50, or 12½ per cent.; and this in a trial where doubtless every precaution would be taken to produce out of a large stock one or two of the most regular shooting guns for such a special trial. This is strong evidence that as yet no royal road has been attained to do away entirely with irregularity in shot guns. A good deal of credit for the good shooting of his best gun is almost done away with by his admission on page 139 that there is a prize powder, and within which possibly lay the element of his success: but he certainly was entitled to use the powder that suited his gun best, seeing that every one had the same privilege. The trial of class 1, or the heavy bores, is of little merit, all the guns using different charges. Mr. Greener, in his 8-bore, loading with 100 more pellets than any other competitor, rendering comparison with other guns impossible. Class 4, or the 20 gauge trial, was nearly wrested from him by a gun that was shooting 60 or 70 pellets less in the charge, and soft shot at that, the targets at 40 yards saving it from defeat, being beaten at the 60 yards by three of the competitors. The tear and wear trial which took place between Messrs. Greener, Maleham & Baker, at the close of the general meeting is interesting and creditable to these gentlemen, and proves the possibility of choke-bores possessing lasting powers beyond what is generally conceded.

It would have been more conclusive had the winning gun of the 12-bore trial been used in this match, and which the remarks on page 95 seem to indicate was not used. The last trial, and that made with soft shot, gives a very heavy per centage against Mr. Greener. Mr. Baker with the soft shots of Walker Parker, and Lane and Nesnam scoring 550-1; Mr. Maleham, 496-4; Mr. Greener, 493-4. It is worthy of observation in this trial that both pattern and penetration seem to suffer, the penetration more particularly; it comes to be a question whether the ordinary close paper pad is the best means to test soft shot, it being frequently observable that shot known to go with a higher velocity flattens a little more at the instant of impact with the paper and preventing thus its absolute penetrable ability.

Passing over the Chicago trial, which all here have doubtless satisfied themselves about ere this, we come to what may be termed the practical portion, and Mr. G. first makes the effort to determine what the original plan was of the American system of choke-boring, and putting it down as the recess system. This, however, is a mistake, as I have myself seen the systems enumerated by Mr. G., that here have been long in existence before that gentleman knew anything of them, and indeed, I am inclined to think that though effected through accident, still the first effort was a full choke-bore and came about in the following manner: this was related to me by Mr. H. Barrett, one of the oldest sportsmen in Massachusetts, and as he mentioned, occurred some 26 to 30 years ago. A Mr. Oliver Richardson, of Stoneham, Me., having nearly worn through at the muzzle, his old gun, which used a metal rod, thought it a good notion to cut off a small portion and then reverse it on to the barrel, closing in the barrel sufficiently for the ring of metal to be put on hot and shrink it on, thus increasing the strength of a part which seemed to require it. After this change he found a great increase in the shooting value of his gun, and as it certainly would, making it undoubtedly a full choke-bore gun. The Roper gun is another evidence of how long Americans have used the full choke-bore.

For Forest and Stream.

THE HABITS OF WILD GESE.

HOW TO CAPTURE THE BIRDS.

THE flight of wild geese is always watched with interest by the sportsman, though their habits are well known to him, and his experience of their pursuit teaches him he has but slight chance of getting a shot at their well organized ranks; and yet the habits of this largest of all our feathered game once understood, of all others they are the most easily captured. The method we have pursued for some thirty or forty years, and with never-failing success, is based on their well known confidence in each other. Every gunner must have noticed that a flock of geese flying over open country will, it may be said invariably, alight in a field where they see other (wild) geese feeding. Such is their confidence in their fellows that I have seen them endeavor to alight in my yard, on my lawn, where were feeding other wild geese which I had domesticated. These latter I had crippled at different times by shooting at long distances and accidentally wounding, and I had saved without other object than their gracefulness and beauty. Noticing this trait—unbounded confidence in each other—I conceived the design of confining my crippled geese in a pen in the center of a fifty acre wheat field, and building near this pen a fodder stack, to be hollow with apertures from the interior to the surface of the stack. At the first succeeding flight of geese two or three flocks alighted near my blind and decoys, and

remained all the day, but retired at night to a large pond near my farm. The next morning they returned and remained all day, and this I found to be their invariable habit, unless they were frightened.

This rule I have noticed for now thirty or forty years. I invited my neighbors, some five or six, during the following week to enter the blind with me and wait for a shot at the flocks. We were moderately successful, killing some ten or fifteen, and adding to my crippled decoys four or five. After shooting, we immediately turned homewards, and in a few minutes had the satisfaction of seeing the same flocks settle down within a few hundred yards of my blind. Such was their confidence in presence of their crippled brethren in the pen. Since that time, with some improvements, such a blind has afforded me sport from about the 10th of October to the 1st of April. Among the improvements I have made, I found it very important to have my blind warm and dry. To do this I raised the earth floor of the stack some six or eight inches, and then marked off a square, say 7 feet by 7 feet, and at each of the four corners put posts with a forked end up about 18 inches in the ground, and 7 feet out of the ground. I then connected the posts at the top with stout nails well nailed to the posts. From this to the ground I set other short rails with a slant outwardly of about two or three feet. On the top of these were laid stout rails. In both cases, at intervals of about one foot, over the structure so erected I laid a thatch of straw, and over this corn-stalks, with the blades of fodder attached, to a depth or thickness sufficient to effectually keep out all rain and snow, with a layer of straw on the floor of the blind of two or three feet. I had a house, so far as comfort is concerned. I further constructed of plank, port holes from the interior to the surface, taking care not to allow the ends of the planks to be visible outside. At first I had only a lower tier of port holes; but soon neighbors and friends, desiring sport, I added an upper tier. Then near the pen, and within range of my blind, I laid a bait (fodder) for my game. This bait runs straight from my blind, and in front of my port holes, and consists of corn, shelled and unshelled, and refuse wheat; and parallel to the bait, about four feet from its center I planted a trough to a depth sufficient to conceal its sides, and kept this filled with water. Thus finished, my blind affords infinite sport. I soon found the habits of the birds to be as regular as those of old merchants. They had a regular hour for their meals, arrival and departure; I may say almost minute. I knew in a week to within a few seconds of what time they would enter my field, and I knew to the moment at what time they would retire to the neighboring pond to spend the night. In frozen weather they sought the Potomac or Chesapeake Bay, where ice would not form and in foggy weather they generally waited until the fog lifted. Sometimes, but very seldom, frightened out of their course by a gunner trusting to their chance of killing one at long distance. They might be diverted from their direction for a time, but without fail they return to their accustomed feeding ground.

In early fall the geese are poor, but after feeding ten or fifteen days they become extremely fat and tender, and it is then that neighbors and friends come to my house the previous night. The next morning, after a hasty cup of coffee, we repair to the blinds, open the ends of loop holes and ensconce ourselves in position in the straw. Soon the cry of the leading goose is heard. His brother in the adjacent pen responds, and with a note lures on to swift death his trusting brethren. They alight on the bait, right before the breathless faces of their enemies, unconscious of danger, but hold fast, and the flock passing sweep round the field, and with a rushing of mighty wings throw themselves on the backs of the first occupants of the field; then ensues a babel of confusion. Battling with extended wing and threatening bills the geese meet each other. The squeak of the gosling is nearly unheard—drowned in the deep and fierce cries of the old ganders. The word is given "Fire!" The bundle of fodder that has been pulled in the hole to stop it as we entered the blind is jerked away, and before the geese recover their senses or fly, the sportsmen rapidly emerge; the older gentlemen watch the course of the crippled birds and mark the spots where they fall, the younger men proceed to pick up the crippled geese, which are examined. If wounded only in the wing an extempore surgeon removes the broken member, and he is put in the pen. Those badly wounded are killed.

Now if other flocks are expected to feed all hastily re-enter the stack to repeat the scene. (I have known five of us on such an occasion to kill 36 geese at one shot). The wagon is signalled for, and we return to the house to breakfast, having been out about an hour. Of course each participant claims to have killed about half the number bagged. The geese are divided, and we separate to meet again and repeat when we choose. SEMI-OCCASIONAL.

Furs and Trapping.

THE FUR TRADE.—One of our leading furriers told us the other day that his cash balance, on hand the first of the present month, was less than at the same time during the twenty-six years of his business life. If it were not for the sale of seal-sacques, he said, furriers would not have paid their expenses this season.

Seal is now the only fashionable fur, and the probability is that it will continue so for at least five years. It comes from the Shetland Islands. The finest fur is that of the cow or young bull. A sacque, made to suit the present style, ranges in price from forty-five to two hundred and fifty dollars, according to the quality of the fur. A few years ago the black fur of the skunk and monkey was in considerable demand, which has almost entirely ceased, and the skins are now worth less than half the former prices.

It has been noticed by furriers that of late years the color of the fur of the animals of this country is not nearly so dark as formerly. Twenty years ago out of every hundred skins of miscellaneous animals, from thirty to forty of dark hues could be selected, while at the present time only from fifteen to eighteen can thus be obtained. This change is believed to be owing to the older animals being killed off more rapidly than formerly, on account of the increased vigor with which they are hunted, leaving their progeny with not fully matured coats to fall victims to the traps. All the finer furs come from the northern regions. The skins produced in the tropical and temperate zones are more valued for leather; and although the hair is highly colored

the quality is inferior, being short and rough. A few years ago that rare fur, the Russian sable, was extensively imported to this country. Of this the annual product of the Russian territory is only about twenty-five thousand skins, about one-half of which are retained in that country. In the sable line, the Hudson Bay ranks next to the Russian animal, which is equal in quality; its inferiority is only in the color, which is two or three shades lighter. To the sable family belongs the pine marten, which produces a fine fur, and is found in the gloomy depths of pine forests. Another animal of the same species, called the stone-marten, makes his home among the rocks.

A fur much used in the past was the ermine, a native of northern Europe and Siberia. It is about the size of our weasel, and is always hunted in winter when its coat is perfectly white; at other seasons the color is brown. Another fur, which is still much used here, is the down of the grebe, taken from the breast of a duck which inhabits the Swiss lakes. It ranges in color from white to grey, and is much admired for its beauty, and esteemed for its enduring qualities. That popular fur five or six years ago, the chinchilla, is brought from South America, the best specimens being received from Beunos Ayres. The fox family produces some very valuable furs, the rarest being the black and silver fox, which are natives of the Arctic regions. Beaver is now in but limited demand, and the animal is consequently multiplying in our extreme western States and in Canada.

So far as the dictates of fashion are concerned, it is impossible to determine what fur will lead in the popular taste when seal has had its day. One thing is certain, and that is, there are no new races of fur-bearing animals, and when the skin of one species ceases to be a favorite, another which claimed that distinction a quarter of a century or so before, will again be re-established in its lost position.—*Germantown Telegraph.*

TRAPPING NOTES FROM ARKANSAS.—Our correspondent writes from West Point, White Co., Arkansas, under date of Jan. 26th, as follows:—

Such a prolonged spell of cold weather in Mississippi has been rather bad for trappers. With snow 17 inches deep and ice 6 inches thick, lasting almost three weeks, we took a favorable opportunity to make a short visit to White Co., Arkansas. Leaving Senatobia Jan. 17th, we arrived in Memphis just too late for the White river packet "Hard Cash;" so, after disposing of our lot of furs to Ashbrook & White, we took the train at 5 P. M., for Little Rock, and after some delay were again on the rail for Kansett, White Co. We were shown over much of the bottom by our friend Jas. E. Valentine, from the railroad to White River Crossing, from Little Red over Negro Hill, Jones' Island and Raft Creek. We succeeded in collecting together forty dollars worth of furs in two days, which we shipped by the "Ruth" to Memphis. Coons are very plenty and the fur fine; also abundance of mink and some sign of otter, but no beaver in this section of the State. Coons are very destructive here on the corn crops, and of course they are all fat and generally large. We hope to be able to give your readers some detailed accounts of our success in a few weeks. *SHETHAR-BOZNAI.*

A TRAPPING INCIDENT.—A correspondent at Atlantic City writes:—

"Dear Sir:—I saw sometime ago in *FOREST AND STREAM* an article pertaining to habits of the mink and muskrat. They of course occupy old streams and sunken meadows. Muskrats are very clean in their habits, perhaps the cleanest of all animal kind, their food undergoing two or three washings before eating it. They are very quick in their movements, oftentimes dodging the flash of the gun. They have a great many enemies, the mink being one of its most persistent. They often engage in fierce battles, the mink always coming off victorious. A few years ago, while fishing on the Great Egg Harbor river, I cast my eyes eastward, and lo! I saw upon the mud flats a streak of mud going up, not a hundred feet high! As I gazed upon it I began to be more anxious to know the cause, and behold, a mink and muskrat were having a fearful struggle. I hastened to the spot, and while on my way picked up a stone. They were so busily engaged in fighting they did not notice me until I was right over them, and with one throw, with all my strength, I ended the struggle. I struck them on their heads and drove them into the mud. Then I grasped the tails of the dying victims and with one swing apart and one together I ended their career. It was not only an exciting occurrence, but one that netted me \$5 80, quite a sum for a boy. *HUNTER.*"

Mansfield Island, in Lake Erie, has been bought by a man who intends to stock it with black cats, and kill their progeny for their fur. He will feed them at first on fish caught off the shore by men who will live on the island; but after the enterprise is well started he will utilize the meat of the slaughtered cats as food for the living cats. We also read that a Georgian is making an extensive business of raising dogs, tanning their hides, and selling the leather for glove making and other purposes.

Sea and River Fishing.

FISH IN SEASON IN FEBRUARY.

SOUTHERN WATERS

Pompano, *Trachinotus carolinus*. Grouper, *Epinephelus nigritus*.
Drum—two species. Family Sciaenidae. Trout (black bass) *Centropomus atrola*.
Kingfish, *Menticorax nebulosus*. Striped bass or Rockfish, *Roccus lineatus*.
Sea Bass, *Sciaenops ocellatus*.
Sheepshead, *Archosargus probatocephalus*.
Snapper, *Lutjanus caesus*.
Tailorfish, *Pomatomus saltatrix*.
Black Bass, *Micropterus salmoides*.
M. nigricans.

FISH IN MARKET.—Since our last report was written on fish market has been without material change. Our quotations for the week are as follows:—Striped bass 25 cents per pound; smelts, 15 to 20 cents; bluefish, 15 cents; salmon (frozen), 40 cents; California, 30 cents; shad (southern), 50 cents each; white perch, 15 cents; Spanish mackerel, 75 cents per pound; white perch, 18 cents; green turtle, 20 cents; terrapin, \$12 to \$24 per dozen; frofish, 8 cents per pound; halibut, 20 cents; haddock, 8 cents; codfish, 10 cents; blackfish, 15 cents; flounders, 15 cents; eels, 18 cents; lobsters, 10 cents; sheepshead, 25 cents; scollops, \$1.75

per gallon; whitefish, 20 cents per pound; pickerel, 18 cents; salmon trout, 18 cents; ciscoes, 12½ cents; hard shell crabs, \$6.50 per 100.

MIRAMICHI FISH SHIPMENTS.—We are in receipt of a copy of the *Miramichi Advance*, published at Chatham, New Brunswick, of which nearly an entire page is devoted to valuable statistics regarding the shipment of fish from this very important point. From it we learn that the shipments by rail alone reached the following figures: Alewives, 9,100 lbs.; bass, 157,023 lbs.; eels, 7,841 lbs.; salmon, 556,389 lbs.; smelts, 196,072 lbs.; trout, 678 lbs.; codfish, 1,800 lbs.; frost fish, 1,110 lbs.; mackerel, 2,980 lbs.; unenumerated, 94,366 lbs. In the aggregate the totals foot up to 1,027,369 lbs. of fish, 1,239 bbls. of oysters, and 5,000 lbs. of game, the latter comprising wild geese, brant and partridges. The value of the fish and oysters is set down at \$54,507, figures which strike us as being astonishingly low, and even less than we should have placed the wholesale value of the salmon alone. The heaviest shipments were for the New York markets, aggregating 87,361 lbs. bass, 126,386 lbs. salmon, and 109,283 lbs. smelts. Boston comes next with 20,956 lbs. bass, 102,195 lbs. salmon, and 41,770 lbs. smelts. The rest is scattered over the United States and the Dominion. To those interested in the fish trade the statistics given in the *Advance* are most valuable, and it is a little surprising that the Government which is equally interested, should have left so important a portion of its labors to be performed by a single individual. It is not too late, however, to take advantage of Mr. Smith's enterprise and example, as there is no good reason why similar statistics should not be officially compiled at every station.

Moreover, we are aware that few statistics of the kind are published in the United States. Some months ago we were waited upon by a scientific deputation from Germany in search of commercial statistics relating to the sea and inland fisheries of the United States. Only meagre figures could be obtained. The matter of collection and publication ought to be placed in charge of the U. S. Fish Commission, with an appropriation sufficient to defray expenses. And each State Fish Commission should be required to collect such information within its own jurisdiction, to be published in connection with the annual reports. In some States—Connecticut, for instance—the fishermen are furnished with blank forms which they are required to fill up, but we have not heard whether the attempt has been productive of tangible results.

MOVEMENTS OF THE FISHING FLEET.—The early Georges fleet are making active preparations for their first trip, and some forty vessels will be ready to sail in a few days, and will be upon the Banks in season to improve the occasion of the early arrival of the codfish schools upon these fishing grounds. The number of fishing arrivals reported at this port the past week has been fourteen—ten from the Banks and LaHave, and four from Grand Menan. The New Brunswick herring fleet bring good cargoes, and the supply, being greater than will be needed to bait the fishing fleets, will be marketed in part in other markets. The fish receipts for the week have been about 400,000 lbs. codfish, 130,000 lbs. halibut, and 800,000 frozen herring in number.—*Cape Ann Advertiser, Jan. 26th.*

COMBINATION TROUT RODS.

MONTPELIER, Vt., Jan. 15th, 1877.

Seeing a number of enquiries in *FOREST AND STREAM* about Greenheart trout rods I will give you my experience in manufacturing a "General Rod" last season.

I procured the wood of J. B. Crook & Co., and made the rod in four joints, each three feet long, with hollow butt, holding two tips. I also made a tip twelve inches long, of whalebone, and extra butt fifteen inches long. By using the short tip and butt I have a short, rather stiff rod, just the thing for brooks where the bushes are so thick there is not much chance for throwing any amount of line. In using short butt and long tip I have one of the finest fly rods for ordinary brook fishing I ever used, the natural spring and toughness of the wood being just right for fly casting, and by using the long butt I have a rod just the thing for fishing in lakes and large streams.

The only objection to having the entire rod made of Greenheart is the heaviness of the wood; it requires a strong arm for a day's fly fishing. The wood will bear a beautiful polish by rubbing down in coach varnish, and as far as looks are concerned makes as handsome an article as one could ask for, besides being very tough and durable. *W. A. BRIGGS.*

THE TROUT OF WASHINGTON TERRITORY.—A valued correspondent sends the following from Olympia, for which our readers will feel thankful. It is gratifying to the editors of *FOREST AND STREAM* to recognize nearly all the gentlemen named in the letter as subscribers of this journal. "Success to their fishing!"

"Our territory is truly 'a sportsman's paradise,' but owing to its remoteness from the great centres of civilization, and the great expense incurred in reaching it, but little has been said by those of us who are fortunate enough to be almost surfeited with such luxuries.

"The waters that are tributary to Puget Sound are all full of speckled trout, more especially the Snohomish, Skagit and Nisqually. The latter stream is fed by McAllister lake, where the average Olympian goes to procure his mess of the finny game. Gen. Wm. McMicken, James B. Pray, Thomas Whiting, A. G. Harker and J. M. Ryerson are among the favored sons of Izaak Walton in that locality, and can always take a visitor to some place where a full basket will be his recompense. The Snoqualmie Falls will be the great summer resort of the anglers when we are gone over to the majority. There in the water-drip of snows that are eternal, fed by the springs that pour from mountains crowned with the tempests of untold centuries, are streams that will teem with the silver trout when our arms are nerveless to ply the rod. That will be the Niagara of the North.

"Gravelly Lake, near Steilacoom, will be another temporary abode of wealth and luxury. In all the famed summer resorts of the Eastern States, we have seen nothing half so beautiful. Here is one lovely cottage, owned by Gen. Sprague, of the Northern Pacific Railroad, while near him is Oklahoma Lodge, the abode of that sterling gentleman, Capt. J. C. Ainsworth, President of the Oregon Steam Navigation Company. The waters of this lake are clear as crystal, and as the tiny yachts sail across its pellucid waters, the voyagers can see far below them the silver-sided trout darting like falling stars through the silvery sheen of water. If a good breeze springs up, this lake is the finest place extant for a troll with a spinning bait, behind a good sail boat.

"Utsalady Lake is another favorite resort of Waltonians in the summer months. Back of Port Ludlow is another lake, about five miles off, where trout can be caught as fast as we can wet a line. The trail is steep and narrow, however, and he must be a thorough sportsman who will essay the trip."

Yachting and Boating.

HIGH WATER. FOR THE WEEK.

Date:	Boston.	New York.	Charleston
	H. M.	H. M.	H. M.
Feb. 1.	1 28	10 48	9 58
Feb. 2.	2 20	11 38	10 41
Feb. 3.	3 11	0 7	11 27
Feb. 4.	4 3	0 53	mid
Feb. 5.	4 56	1 40	0 42
Feb. 6.	5 53	2 23	1 41
Feb. 7.	6 55	3 23	2 44

ICE YACHTING.

Two regattas were sailed on the Hudson last week, and notwithstanding the fact that the ice was by no means in condition to please the fastidious ice-yachtsmen, both events were productive of much interest. The first was sailed at New Hamburg on the 26th ult., between yachts of the New Hamburg Club. The race as intended was not sailed, owing to lack of wind, but in the afternoon a scrub race was organized, the boats going three times around a course making twelve miles in a straight line. Mr. Philip Schuyler of the Regatta Committee, dispatched the boats shortly after two o'clock and a lively race ensued, particularly between Commodore Grinnell's Flying Cloud and the Zephyr and Phantom. The following table shows the result:—

Yacht.	Start.	Home.	Elapsed time.
	H. M.	H. M. S.	M. S.
Flying Cloud....	2 10	3 03 10	53 10
Zephyr.....	2 10	3 03 12	53 12
Phantom.....	2 10	3 03 15	53 15
Zero.....	2 10	3 04 33	54 33
Quickstep.....	2 10	3 05	55
Whiff.....	2 10	3 06 40	56 40

Thus the Flying Cloud won the race, beating the Zephyr two seconds only, and the latter crossing the line but three seconds ahead of the Phantom. The finish of these three boats was very pretty. Commodore Grinnell sailed the winner.

On the following day the Poughkeepsie Association had their Regatta and were rather more fortunate as regards wind. A number of new yachts were entered, among them Mr. Aaron Innis' Haze, ex-Commodore O. H. Booth's Restless, Mr. John A. Roosevelt's Icicle, Mr. Theodore V. Johnston's Ella, Mr. Jacob Buckhout's Gracie and Mr. Aaron Innis' Hail. The course was four miles south, turn flag off Roe's Glenwood House at Milton dock and return, or eight miles in all. The judges or Regatta Committee were Messrs. Hudson Taylor, Henry Frost and William C. Arnold. The judge at the Milton flag was Mr. Theodore Van Kleeck, of the ice yacht Flying Dutchman. The timer was Mr. Peter Hulme. The word to go was given shortly after half-past eleven, and the little Ella was the first to get off, and holding her lead was the first to turn the Milton flag, followed at intervals of only a few seconds by the Gracie and Restless, a position which she held to the finish although she lost the race on time allowance. The following table gives the result:—

Boat.	Owner.	Start.	Finish.	Time of Race.
		H. M. S.	H. M. S.	H. M. S.
Restless—O. H. Booth....		11 53 30	12 51 15	0 57 45
Hail—Aaron Innis.....		11 53 15	12 51 10	0 57 55
Haze—Aaron Innis.....		11 54 15	12 53 46	0 59 31
Icicle—J. A. Roosevelt....		11 53 45	12 53 20	0 59 35
Gracie—J. Buckhout.....		11 54 00	12 57 35	1 03 35
Ella—T. V. Johnson.....		11 53 00	12 58 45	1 05 45

By the above it will be seen that ex-Commodore Booth's yacht, the Restless, bore off the honors, beating the Hail 10 seconds, the Haze 1m. 40s., the Icicle 1m. 50s., the Gracie 5m. 50s. and the Ella 8 minutes.

N. Y. YACHT CLUB.—The annual election of officers of the New York Yacht Club will take place at the rooms, Madison avenue and Twenty-seventh street this evening. The following ticket has been agreed upon, and the several candidates will undoubtedly be selected: Commodore, S. Nicholson Kane; Vice-Commodore, James Stillman; Rear Commodore, J. J. Alexandre; Secretary, Charles A. Minton; Treasurer, Sheppard Homans; Measurer, A. Cary Smith; Fleet Surgeon, G. S. Winston, M. D.; Regatta Committee, Philip Schuyler, William Krebs, G. L. Haight. House Committee, Fletcher Westray, N. D. White, D. T. Worden, J. O. Proudfoot, George L. Jordan and H. N. Alden. Committee on Admissions, A. S. Hatch, William H. Thomas, R. Center, John H. Draper and Charles H. Stebbins.

ALCYONE BOAT CLUB.—The reports of the various officers made at a recent meeting of this club show a prosperous condition of affairs. The club now numbers 72 active and 53 honorary members. Of these 63 enjoyed the privileges of the club during the season.

The report of the coxswain, Mr. A. H. Tupper, was exceedingly interesting, as it gave the number of miles rowed. The ten leading scores are as follows: O. E. Wilmott, 611 miles; H. Hewitt, 458; W. C. Howard, 435; L. Saulnier, 405; L. Switzer, Jr., 408; W. V. Tupper, 370; J. J. Aalholm, 339; A. H. Tupper, 270; T. G. Wells, 260, and N. C. Heidenheim, 254. The club has one eight-oared barge, two six-oared gigs, one four-oared barge, two four-oared gigs, two pair-oared shells, one double-scutt gig, one double-scutt wherry, and one whitehall.

The Finance Committee reported that the club entered the new year with \$10,000 assets invested in club-house, boats and other property.

The officers of the club are William V. Tupper, President; Charles H. Hunter, Vice President; Thos. A. Thornton, Secretary; Henry W. Maxwell, Treasurer; William C. Howard, Captain; Daniel Chauncey, Jr., Lieutenant; and Arthur H. Tupper, Coxswain.

Rational Pastimes.

CRICKET.

The St. George Club held their annual meeting at Delmonico's on January 15th, at which they elected the following officers for 1877: J. T. Soutter, Esq., President; G. T. Green, Esq., Vice-President; F. Satterthwaite, Treasurer; M. H. Talbot, Esq., Hon. Secretary. Committee: Messrs. Moeran, Bowman, Sleight, Mostry and Gilbert. Mr. Soutter has made himself a general favorite by his courtesy and genial style of managing affairs. Mr. Green is a hard worker in the good cause and so is Mr. Satterthwaite. The latter's financial policy in 1876 resulted in a handsome surplus for the season of 1877. Mr. Talbot will see that the press gentlemen are kept posted in the movements of the clubs, and the Executive Committee include gentlemen who are in favor of making the season an active and lively one.

SKATING.

The Brooklyn Rink is now an established institution as the fashionable resort of Brooklyn for roller skating exercises. On Jan. 25th the first grand fete occurred, and the building was crowded to excess, nearly four thousand people being present, of whom over five hundred were on the floor on skates during the evening. The scene was gay and picturesque in the extreme. The programme of the entertainment was as follows:—

PROMENADE SKATING DURING FIRST PART OF THE CONCERT.

1. Boys' race, won by F. Wenterson; 2. Pursuit of the butterfly, won by Miss Sadie McCormick; 3. Figure skating (by gentlemen amateurs), won by Mr. France; 4. Beginners' race (by novices on skates), won by F. Colson; 5. Ladies' chase. Prize, diamond ring. The prize, borne by a gentleman skater, to be open to pursuit thirty minutes or until caught, won by Miss Minnie Plunkett. These fetes will take place every Thursday night. On these occasions subscription tickets do not admit, nor complementary tickets, the press excepted.

—Carnival day at the Capitoline Lake has been changed from Wednesday to Tuesday of each week. The boys' races occur on Tuesdays and Saturdays.

—There are boys' and girls' races at the Rink on every Saturday afternoon, open to subscribers only.

CURLING.

CURLING MATCH—TROY vs. UTICA.—The match for the Grand National Club medal, between the Utica and Troy Clubs, was played on the rink of the Utica Club, on the 26th ult., and resulted in a victory for the Utica Club. The ice was in splendid condition, and there was some very fine playing on both sides. Major John A. Halloway, of the Caledonian Club, of Buffalo, umpired the game, and at the close declared the result and presented the medal to Benj. Allen, the President of the Utica Club. The game lasted from 10 a. m. to 3 p. m. The following is the score:—

TROY CLUB. RINK NO. 1.	UTICA CLUB. RINK NO. 1.
Thomas Hogg.....	L. V. Beebe.....
Joseph Gilmore.....	Dr. Hugh Sloan.....

PICQUET.—In answer to your correspondent's, Mr. Micawber, query as to the game of picquet, a "lurch," or as it is more generally known a "double," counts as two games. When a player fails to score at all his adversary counts three. In answer to Wm. H. S.'s first query "A" counts for a pique; to his second, "B" wins the game, the score being marked 1st point, 2d sequence and 3d quatorze. 101 is still the number of points generally played in England.

Chicago, Jan. 26.

Mr. Micawber himself writes: "In reply to the questions of Mr. 'Wm. H. S.' of Bangor, about picquet, restated in your issue of the 18th inst., I quote, substantially, from Bohn's Hand-Book of Games, (London, 1850): 1. A does not count '10 for inches' (i. e. cards?) 'and 40 for the capot—50' because 'whichever player wins all the tricks wins what is called a capot, and, instead of 10, adds 40 to his score.' And he does not 'count also a pique,' because a pique is made only 'by the counting of 30 in the hand and play.' 2. B wins the game, because both the 'point' and the 'quint,' or 'sequence,' counts before a 'quatorze.' I shall be glad to have Mr. 'Wm. H. S.' or any of his friends of the game, answer my queries relative to 'the lurch.'"
MR. MICAWBER.

THE LARGE GAME AND NATURAL HISTORY OF SOUTH AND SOUTHEAST AFRICA. By Hon. Wm. Henry Drummond. Edinburgh, 1875.

Here is a Briton of the higher classes, who leaves the easy and pleasant life provided for him in his comfortable little island, and goes to the wilds of Africa, where he lives for years in palm leaf huts, among savage negroes, for the pleasure of measuring himself in combat against lions, panthers, elephants, buffaloes, rhinoceroses, crocodiles, etc. He kills all these animals—not singly, but in battalions. He is trampled on by the elephant and buffalo, slashed by the tusks of the boar and the horns of the giant antelope, and is bitten and stung by all the creeping things of the jungle. He goes alone by night into the woods to meet a man-eating lion. He passes nights alone in the swamp, among wild elephants and crocodiles, and he is hunted by wild dogs. A hundred times his life depends on his steadiness of nerve and accuracy of aim, and yet he tells us he never was a particularly good shot, but that his success came from his study of the methods of the native hunters, added to considerable bodily strength and endurance. His hunting stories are

wonderful, but they are told in so plain and unambitious a style as to carry conviction of their truth.

Here is an account of an attack upon his camp by one of those man-eaters, which we commend to the attention of our holiday sportsmen in the Adirondacks.

The heat was excessive, and unable to sleep, I had been sitting for some time on my mat smoking and looking at the magnificent constellations of the Southern hemisphere, when my eye fell upon my favorite gun, which had been placed against the fence within reach of my hand, and I noticed that the boy whose duty it was to do so had omitted to oil it, and to wrap something around the nipples to keep off the dew. I was still in the act of hunting for a piece of rag to tie around the nipples after oiling them, when the terrified yelp of a dog struck my ear, and raising my eyes I saw a tawny yellow mass bound into the opposite camp, and uttering a muffled roar like distant thunder, seize the nearest human being and carry him off shrieking in the direction it had come from.

It had all occurred in far less time than I take to describe it, and I had neither time nor presence of mind sufficient to do anything; but now, as it passed the outermost fire on its way towards the reeds, I raised the gun, covered the shoulder, and fired, causing it to drop the man, and with a tremendous roar that seemed to shake the ground, to spring upwards—how many feet I should not like to say for fear of correction from stay-at-home naturalists—and as it did so I put the second barrel in. It fell to the ground, and struggled there, still roaring in the most fear-inspiring manner, and in its agony tearing up great clods and tufts of grass with those terrible claws. Seizing another gun I fired again right and left, as quick as I could, and then catching up a little small bore rifle, I emptied it also, thus expending my whole battery.

Shouting to the hunters to fire I hurriedly commenced loading, glancing meanwhile to see what had become of the men. There was a cluster of some dozen round the trunk of the fig tree, impeding each other in their eagerness to place themselves in safety, while its branches were as crowded as it appeared possible they could be. My reiterated cries of "Fire" were at last responded to by a solitary shot from some hunter who had taken his gun up with him, and the lion, who had never ceased his furious struggle, nor ceased to roar, answered it by regaining his legs and tottering towards the tree. The men around it rushed frantically away in the darkness, but as I rammed my bullet home, I could distinguish the dark outlines of two figures crouching at its roots. The lion staggered on, weak but vindictive, and seemed to me almost to have reached them, when two flashes of red fire blazed out, and he fell without a movement, shot simultaneously through the heart and brain, while the two hunters, uncertain of the effect of their bullets, bounded away in opposite directions. As soon as I could see that the brute was really dead I went to look after the man who had been seized. We carried him into camp and examined his injuries; the lion had merely bitten him; had not used its claws at all; but what a bite it was! It had held him by the neck and shoulder, and literally crushed in the whole side of the chest, and had probably damaged the spinal cord, for he never recovered consciousness, and breathed his last in a few hours after.

One day Mr. Drummond being out with his hunters, armed only with spears, discovered a large baboon sitting on an ant-hill.

"We got within a hundred yards unperceived, and then, as he made off, I had the dogs slipped, and they had him at bay in a quarter of a mile. He got hold of one that ventured too near, and simply tore it to pieces with his great claws. I was the first to reach the scene of action, and running in hurled a spear at him; it missed its mark, but stuck quivering in the tree against which he was, and he instantly drew it out and shied it back at me, though it came crossways and not point first as a spear ought to. In hurriedly trying to throw a second time I slipped and fell but my aim was more true, and it struck him under the forearm, and as the natives declared—I could not see—the brute snatched the weapon from its body and would have stabbed me had not three or four spears been thrown by the Kaffirs, one of which penetrated to the brain and killed him on the spot. A great ugly brute, with a most disagreeable resemblance to human beings."

Well for Mr. Drummond that the brain of this poor relation of his was not sufficiently developed to allow him to throw the spear point first.

S. C. C.

A VALUABLE BOOK FORTHCOMING.—We learn that Mr. D. G. Elliot is about to publish, in London, two valuable monographs, which will, it is promised, be in no way inferior either in the beauty of their illustrations or in the importance of the matter contained in them to those which he has already issued. The splendid plates of his "New and Heretofore Unfigured Birds of North America," and of his "Monograph of the Tetraoninae," are so well known in this country as to need no mention.

The first of these proposed monographs, that on the *Felidae*, is to include, besides the living, the extinct members of the tribe, and will therefore be almost a necessity to every naturalist working in the departments of vertebrate Zoology or Paleontology. The plates have been drawn by Mr. Wolf, well known as a skillful delineator of animals, and will, no doubt, be all that could be desired. The edition, however, is to be limited to one hundred and fifty copies, after which the drawing will be erased from the stones. The work is to be printed by subscription, and is to be issued in parts at £2.10 each.

The other work to which we have referred is a monograph of the *Bucerotidae* or Hornbill. This is also to be printed by subscription and will be issued in nine parts at one guinea each. The plates will be drawn by Mr. J. G. Keulemans and will be all colored by hand. The size of the monograph of the *Felidae* will be Royal Folio, that of the monograph of the *Bucerotidae* Imperial Quarto. We shall await the appearance of both books with much interest.

MAGAZINES.

We should not be "true to our traditions" did we not give pre-eminence to Mr. Seymour's article on "Trout Fishing in the Rangeley Lakes" among the contents of the February issue of *Scribner's*. If we have a fault to find with it, it is that the statistical predominates over the descriptive; yet it has one quality which is too often overlooked in articles of the kind. It gives a clear and comprehensive itinerary of the routes by which the locality is to be reached. The giant trout of Rangeley were long looked upon as mythical—that is, myths as regards their being simply pure *Salmo fontinalis* or brook trout. The question is now definitely set at rest, and Mr. Seymour's account of the monsters annually taken will whet with keen desire the appetites of those sportsmen who have not yet visited these famed waters. Many interesting articles on the Rangeley Lakes and stream have appeared in our own columns. Gen. McClellan's "Winter on the Nile" is continued, and we are taken above the cataracts and fairly into Nubia. Dr. Holland's serial story entitled "Nicholas Minturn" increases in interest, and the hero finds himself not only a "hero" but home again after a remarkably short voyage. The other serial, "That Lass o' Lowrie's," is a capital story, with the characters drawn with remarkable strength. Among the other contributors, particularly of short stories, we find the names of Saxa Holm, Boyesen, Kate Field, and others. The engraving work in *Scribner's* is capitally and carefully executed.

St. Nicholas for February provides the usual and anxiously-looked-for feast for boys and girls. The picture of Major Andre drawing his own portrait with the aid of a looking-glass forms the frontispiece. Then we have a very funny little rhyme called the "Sandhopper Jig," followed by a funny story about an old king who lost his treasures, and a smart pastry cook called Joe. Mr. Ernest Ingersoll has a long "Talk About Canaries," which is full of valuable hints and instruction to those who keep, or propose to keep, these cheerful little pets. Mr. Trowbridge contributes a very exciting instalment of his serial story, "His Own Master," in which the hero saves a life and perhaps loses another not half so valuable. Prof. Proctor's lessons in Astronomy are continued, and any boy or girl who reads them carefully and asks for explanations when required, will find that they are acquiring a

deal of useful and interesting information regarding the heavenly bodies. Then there are lots of other stories and articles, among which we must not forget to mention Mr. Copeland's faces of Fishes. The very little folks are provided for, and old Jack-in-the-Pulpit sits up on his flower and discourses as wisely as ever. As nearly all of the *St. Nicholas* articles are illustrated their interest is greatly enhanced.

In *Appleton's* for February we find a very valuable paper from the pen of Mr. Ernest Ingersoll, an able writer and an observing naturalist, on "Our Winter Birds," a classification that we do not remember to have met with before. It is illustrated with cuts of eleven of the birds whose habits are clearly described. A brief abstract from the pages of Mr. Theodore Martin's "Life of the Prince Consort" gives us an insight into the character of "Albert the Good," and the means by which his marriage with England's Queen was brought about. The paper forms a very interesting lesson in British History. George Sand's novel, "The Tower of Percefont," is continued, and a new serial, "Cherry Ripe," by the author of "Comin' Thro' the Rye," etc., is commenced. It promises to be interesting. The shorter articles are contributed by Junius Henry—we beg his pardon, Henri—Browne, who discourses of "The Men who Fascinate Women," Charlotte Adams, James Payne and others. Ella Rodman Church (why will not lady writers name their conditions in life and not compel us to be so brusque?) writes very sensibly about "How to Furnish a House." In fact, to young people about to marry we know of but one better piece of advice, and that is Mr. Punch's.

We miss from the February number of *Lippincott's* those cherry letters of Lady Barker's, but still cannot complain of the change of *menus* when we see the course furnished in their stead. We allude to the new serial of Berthold Auerbachs, whose "On the Heights," and "Villa on the Rhine," have been so extensively read in this country. The title is "Young Aloys, or the Gawk from America." One can imagine what a fund there is in the subject for the novelist—the emigrant's son, Americanized and yet thoroughly posted on life in the Fatherland, returning to his father's native village. Mr. Brooks has certainly translated well, but we would say to Mr. Auerbach that youths of German extraction in this country do not often wear diamond pins in scarlet cravats. A pleasant little sketch is Mr. McKay's "Cruise of the Heron," and even more so is "Hebe," by an anonymous writer. Mr. McDonald's story, "The Marquis of Lossie" is continued, but we confess that we prefer reading Macdonald's works when they are completed. The current issue of *Lippincott's* is a capital number.

Speaking of Macdonald, there is a portrait of him forming the frontispiece of the February *Electric*. We had not the pleasure of seeing the original when he was in this country recently. It is said, however, to be a capital likeness, and certainly it betokens a man of noble presence and large intellect, such as we know the poet-novelist to be. The table of contents in the *Electric* comprises the following selections: "On Popular Culture" by John Morley; "Towards the North Pole," "The Secret Chamber, A Ghost Story," "Automatism and Evolution," by Charles Elam, M. D.; "A Rhymer's Wish," "Notes on the Turk," by Edwin DeLeon; "Charlotte Bronte, A Monograph," "The Ring of Saturn," by Richard A. Proctor, B.A., F.R.S.; "Henry the Fourth and La Belle Gabrielle," "A Year Ago," "The Fabulous in Zoology," "Tollers of the River," "Letty's Globe, A Sonnet," by Charles Tennyson Turner, and the usual copious editorial miscellany of literature, science and art.

The *Popular Science Monthly* for February opens with an article of absorbing interest on "The Trial of Galileo." The author of the paper, which is translated from the *Revue des Deux Mondes*, finds his materials in the recent publication by Domenico Berti of a M.S. preserved among the Secret Archives of the Holy See. In the article referred to the history of the M.S. is briefly given, after which follows the account of the astronomer's movements and sufferings from 1611 until his death. The whole narrative is written in a most moderate and fair-minded tone, and is extremely attractive in its style. "Distance and Dimensions of the Sun," by Prof. C. A. Young, "Ups and Downs of the Long Island Coast," by E. Lewis, Jr., and the "Physiology of Mind—Reading," by Dr. Berard, are some of the longer articles of this issue. Among the shorter ones are "An American Astronomical Achievement," by R. A. Proctor, "Nature and Life in Lapland," by Mr. Chamberlain, and "Compressed Air Locomotive," by C. M. Garlel.

"Gas Manufacture and Gas Companies" will be anxiously read by house-holders, and is indeed one of the most interesting and practical papers of the number. As a whole the *Monthly* is fully up to its usual high standard.

—Carl Rosa is considered the wealthiest operative manager living. Parepa left him a large fortune, and his own efforts have been a remarkable financial success. Report says that he is about to marry again.

Tiffany & Co., Silversmiths, Jewelers, and

Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their timing watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. Tiffany & Co., are also the agents in America for Messrs. Patek, Philippe & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Boston, Mass.SOLD everywhere in the U. S. by all first-class
dealers in

SPORTSMEN'S GOODS.

EACH GARMENT DISTINCTLY MARKED

"BOSTON SHOOTING SUIT,"

made by

G. W. Simmons & Son.

This new design of WATERPROOF SHOOTING SUIT,
made from extra quality duck, has attained such
popularity as to be called for from all parts of the
country, and even from England."Shipping clothing to England strikes us very much
like sending 'Coals to Newcastle,' but the merits
of the 'BOSTON SHOOTING SUITS' have been
heard of in the Old Country, and that land of sports-
men has sent an order to Messrs. Simmons & Son,
which will doubtless be followed by many others."—
Boston Paper.The design embraces the best points of the English
and French Suits, combined with the necessary re-
quirements for American service. Particular atten-
tion has been paid to color.Each suit is water-proofed by a new patent process.
The seams and pocket corners are securely fastened,
and nothing neglected to render the suit perfect in
every respect.THE PRICE HAS BEEN FIXED AT \$13, TO IN-
CLUDE HAT OR DOUBLE VISOURED CAP, DE-
TACHABLE HAVELOCK, COAT, VEST, AND
PANTALOONS.One hundred suits will be kept ready in stock, so
that we can furnish to order any size required, at a
moment's notice.In the Golden Rule (Rev. W. H. H. Murray's paper)
the enthusiastic editor writes:—"We were shown, the other day, a new water-proof
suit, specially adapted for sportsmen, designed and
made up by Simmons & Son, of Boston, and to which
we call the attention of all brethren of the out-door
and shore-shooting fraternity, because it meets the
demand of personal comfort and convenience beyond
anything of home manufacture seen by us before.
As a sportsman, we give it our unqualified endorse-
ment, as combining the best points of the English
suits, and in addition skilfully adapted to the ne-
cessities of the American service. It is a most admirable
and satisfactory contrivance in color, style, water-
proof quality and capacity. The coat is a marvel
in this latter respect."PERSONS ORDERING FROM A DISTANCE NEED
SEND ONLY THE FOLLOWING TO BE SURE OF
A PERFECT FIT: BREAST MEASURE, WAIST
MEASURE, INSIDE SEAM COAT SLEEVE,
INSIDE SEAM PANTALOONS; MENTION HEIGHT
AND WEIGHT.G. W. SIMMONS & SON,
"OAK HALL," BOSTON, MASS."THE BOSTON SHOOTING SUIT.—One of the most
successful manufacturers of Waterproof Shooting
Suits is the firm of G. W. Simmons & Son, Oak Hall,
Boston. We had one of their suits on duty at Hun-
ter's Camp at Philadelphia Centennial Exhibition.
It has grown gray in service, but is good
for use yet. This suit is known as the 'Boston
Shooting Suit,' in contradistinction no doubt, from
the garments which are manufactured out west and at
Washington, each of which has a local demand of its
own. It is said that the western prairie fowl can
distinguish any sportsman who visits their domain
by his clothes. They can tell him 'by the cut of his
jib,' and the old educated birds (which no one cares to
eat, by the way), know exactly what distances to
keep from the rail-shooters, the brant men, and the
chicken-killers respectively, to be safe. They have
'got them all down fine.' This used not to be so be-
fore the waterproof shooting suits were invented.
Bostonians, Hoosiers and Buckeyes all stood the same
chance then. But now it is—with a sarill pipe to le-
ward by the old-weather cock—'here comes a Sim-
mons; cheese it!' or, 'Ere's a 'Enning-lie low!' or,
'Look out for Holbird! Scatter! you beggars, scat-
ter!'—FOREST AND STREAM.]
